The Sulphur of the dissolved Antimony here greedily unites with the ignited Iron; and hence produces sulphurous Scorizæ of Iron. Upon adding the Nitre, this is strongly deflagrated with some Portion of the same Sulphur; and hence the Whole is made to flow by the Intensity of the Fire. When the Matter, then, is in this very liquid State, the metalline Part of the Antimony, which is heaviest, sinks, by its proper Weight, to the Bottom; whilst the Sulphur of the Antimony, the corroded Iron, and Nitre, are cast to the Top. *Paracelsus* asserted, that Iron would more intimately separate the sulphurous Part of Antimony from the mercurial, than could be effected by a vegetable Alkali; and hence that this Regulus was much the fittest to furnish us with the Mercury of Antimony, for the profounder Chymical Operations. And certainly, we see, by this Experiment, that Iron is capable of extracting the Sulphur from metalline Glebes, and giving them Fixity and Malleability. *Alexander Suchtenius*, a Scholar of *Paracelsus*, wrote two whole Treatises of Antimony, from which is borrowed the following Process.

P R O C E S S VI.

Another Regulus, called the Alchemistical Regulus of ANTIMONY.

1. Take of Iron Nails, half a Pound; put them into a strong, large, sound Crucible, cover it with a Tile, place it in a Wind-furnace, and cautiously raise a Fire till the Nails are perfectly ignited. Then, by a little at a time, add of the best powdered Antimony, made very dry and hot, sixteen Ounces, and cover the Crucible a little with the Tile. As soon as ever the Antimony is thrown in, it emits a white Fume; and, not a great while after, is put into Fusion, and at the same time causes the Iron to melt also. When they are reduced to a very liquid State, which may be examined by a long Tobacco-pipe, throw in, gradually, of the hottest, driest Powder of Nitre, three Ounces. Upon every Injection, there is excited a prodigious Ebullition, Noise, and Conflict, and sometimes a Crackling; and if a Person should unwarily throw in the Nitre damp, the Whole would fly about with imminent Danger to the Operator. When they have stood in this Condition some time, the Matter casts out lucid Sparks. Let it flow, like Water, for the Space of four or five Minutes, and then pour it out into a melting Cone, which strike gently; and when the Mass is grown cold, knock it out. In this manner I have had eleven Ounces six Drams of Regulus, and eleven Ounces of Scorizæ; so that, with what stuck to the Crucible whilst it was pouring out, there were lost four Ounces two Drams.

2. Put this Regulus into another Crucible, set it in the Fire, melt it, and, when it is in Fusion, add to it three Ounces of Antimony, reduced to Powder, and made very hot and dry; and when this is melted, throw in, by degrees, three Ounces of Powder of Nitre, very hot and dry also; and then fuse them with an intense Fire, and keep the Matter in a perfect liquid State for the Space of five Minutes; after which pour it into a melting Cone as before. By this means I have procured ten Ounces and six Drams of Regulus, which were purer than the former.
3. Take this second Regulus, put it into a fresh Crucible, melt it again, and throw into it three Ounces more of Nitre, with the same Caution as before. Melt the Mixture with a very intense Fire, for otherwise it will not flow, and then pour it into a Cone. By this third Fusion I have had nine Ounces two Drams of an exceeding white Silver-colour'd Regulus, that was surprisingly starry, and two Ounces seven Drams of Scoriz; so that there was lost one Ounce five Drams.
4. Once more melt this third Regulus in another Crucible, and then add three Ounces of Nitre as before, which will then require a prodigious strong Fire to melt it, tho' the Regulus flows at the Bottom of the Crucible like Water. Keep them in perfect Fusion for the Space of an Hour, and then pour them into a Cone. Thus then I have obtained seven Ounces three Drams of an exceeding pure and beautiful starry Regulus, that looked just like Silver, together with two Ounces seven Drams of Scoriz, of a golden Colour, and a perfect fiery Taste; which is a pretty extraordinary Phenomenon.
5. For this Operation, the Crucibles must be very sound, strong, and large, and must be heated very gradually: The Fire must be equally kept up to its greatest Strength, for otherwise the Nitre will not melt; and the Cones must be moderately warm, very clean, and perfectly dry, and, within, rubbed over with Tallow. If you attend to these Cautions, you will meet with Success.

R E M A R K S.

There are many useful things to be learned from this Operation: Iron, which is extremely difficult of Fusion, melts in Antimony, as all other Metals do in Lead; and then the Iron, being corroded by the melted Antimony, becomes combined with its Sulphur; whilst both the mercurial Part of the Iron and the Antimony are expelled, and, uniting into one Mass, fall to the Bottom; and the Sulphur of them both rises together to the Top. The Nitre that is thrown in burns furiously with these sulphureous Bodies, agitates the melted Elements to their very inmost Parts, and hence unites those that are similar, and separates the heterogeneous: By the Force of the Antimony the Iron is destroy'd, and its metallic Sulphur, which is the Gold of the Alchemists, unites with the internal metallic Sulphur of the Antimony, and thus both remain combined with the mercurial Part of the Antimony; and hence you have a Regulus, which is beautified with a Star, and by its fine silver Colour teaches us the exceeding Purity of its Mercury. The Scoriz contain Iron, Sulphur of Antimony, and Nitre, united together, and changed into a wonderful Body, whose secret medicinal Virtues, when it is properly managed, and rightly applied, those who are acquainted with these things greatly extol. These Scoriz puff up surprisingly in the Air: But let this suffice concerning the first Fusion. In the second, the external Sulphur is still farther extracted, and the metalline Sulphurs of the Iron and Antimony are more fixed, with their Mercuries, into a purer Regulus. In the third Fusion, the surprising Power of the sulphureous metallic Fire, that lies concealed in the Regulus, begins to discover itself, which, by fixing the Nitre, renders it exceeding difficult of Fusion, tho' it was before melted by a more gentle Fire than any other native Salt; and impresses upon it a remarkable igneous Quality, so that, upon being applied to the Tongue, it truly burns it, tho' its proper Taste is naturally exceedingly cold; it makes it, moreover, alcalicent, without the Addition of any vegetable Substance, and causes it to run spontaneously in the Air, tho' it would remain dry in it before. The fourth Fusion discovers the same things more evidently: Here the pure Sulphur, only by its odorous Exhalation, as it were, and simple Contact, changes the Nitre more powerfully, and thus demonstrates the secret Power of metallic Sulphurs. This Regulus has almost turned the Heads of some of the profoundest Chymists. Consult *Paracelsus*, *Suebenius*, *Philaletha*, *Pantaleon*, *Becher*, and *Stahl*. For my own Part, when I reflect upon the Time and Pains I have employed in examining into the Nature of this Regulus, I cannot forbear being surprised at my own Patience, and can scarcely help being ashamed to think, that so great a Part of my Life should have been spent in this Inquiry.

The Colour of Gold is exalted, or restored, when impaired, by means of this Regulus; as the exceeding white Nitre, by

being thrown into this Regulus, in Fusion, immediately contracts a golden Hue. The Regulus, depurated even in this manner, will vomit. The Scoriz give a beautiful Tincture to Alcohol.

P R O C E S S V I I

Golden Sulphur of ANTIMONY.

Boil the Scoriz of Process 5. till they are all dissolved; into the inodorous Liquor drop Vinegar, and there will instantly arise a most noisome, stercoraceous Smell, and the Liquor, which, before was thin, will become very thick. Drop in more Vinegar, stir the Mixture about, and proceed in this manner, till nothing more will precipitate. Let the Vessel stand quiet, and a Precipitate will gradually subside to the Bottom, which will be reduced to a much less Compass than one would expect. Pour off the Liquor that swims at Top; wash the Precipitate with Water till it is absolutely insipid, dry it gently, and keep it under the Title of SULPHUR AURATUM ANTIMONII.

R E M A R K S.

The Sulphur of Antimony mix'd with an Alkali, makes the Scoriz of Process the fifth. These, boil'd in Water, make a sulphureous Lixivium; and from this, by the Acid, the Sulphur is precipitated. This has a mild emetic Quality. If this is rubbed upon Silver, it makes it of the Colour of Gold, and hence it is called *Auratum*. *Boerhaave*.

Boerhaave, we see, directs the Golden Sulphur of Antimony to be made with the Scoriz of the Martial Regulus above described; but it is usually made with the Scoriz of the common Regulus.

Dr. Plummer has, in the *Edinburgh Medical Essays*, given a different Method of preparing the Sulphur of Antimony, from *Angelus Sala*, which is somewhat like that of the first and second Process above, tho' not exactly the same.

Reduce Antimony to a gross Powder, or rather break it in small Pieces like Grains of Barley; separate the fine Dust by a Searce, and lay it aside; then put the small Pieces into a flat-bottom'd Glass, pouring in Aqua Regia, till it rises a Finger's Breadth above the Antimony. Let the Solution go on without Heat; and when there appears a sulphureous or pitchy Matter swimming on the Liquor, and the Antimony is covered with a yellowish Crust, gently pour the Aqua Regia into another Vessel, keeping back the sulphureous Matter, and wash the remaining Antimony several times with fresh Water, till it acquires no Acidity; then pour upon the Antimony Oil of Tartar *per deliquium*, to the Height of two Fingers; place the Vessel in warm Sand, and increase the Fire till the Liquor boils; pour out this Tincture, and add new Oil of Tartar, proceeding as before. To these Tinctures or Solutions, while warm, add distilled Vinegar, till the Effervescence ceases. Place the Vessel again on warm Sand, and a Powder will fall to the Bottom, which separate by a Filtre, and dry upon brown Paper. This Sulphur, or rather *Lac Sulphuris Antimonii*, *Tachenius* imagines, is the same that *Helmont* hints at in some obscure Expressions, where he says, the true Sulphur of Antimony very much resembles common Sulphur, only its Colour has more of a greenish Cast; with this Sulphur he prepares a Cinnabar, which, when six times sublimed, and infused in Wine, produces most surprising Effects; and this Cinnabar seems to be the same with the *Mercurius Diaphoreticus*, which he mentions in the same Treatise. *Tachenius* also affirms, that he found by Experience this Sulphur to be an admirable Remedy in the Tympany: Of the same he prepares a Liniment, with two Simples not named, which, rubbed upon the Spine, Wrists, and Soles of the Feet, infallibly cures Tertian Agues. *Angelus Sala* likewise reckons this Sulphur a powerful Aperient, Discutient, and Sudorific. *Edinburgh Med. Ess. Vol. 1.*

The Sulphur of Antimony is prepared different ways; and, on account of its excellent Qualities, has been called by different Names. It is termed *Sulphur*, because it is inflammable like common Sulphur, and emits a foetid Smell; but it differs from it in this, that it always retains some reguline Parts, and is therefore specifically heavier. It is called *Golden Sulphur*, because Chymists have imagined, that it came near the Nature of the Sulphur of Gold; and because, when mixed with Silver over the Fire, it gives it a gold Colour. Chymists likewise name it *Sulphur Embryonatum*, procured from the Saturnine *Magnesia*, believing it to contain some Portion of the Sulphur of Gold got from Antimony, which they term *Magnesia Saturnina*. *Glauber* calls it *Panacea*, and the universally purging Sulphur; and it was given, for a long time, by *Cardilucius*, a famous German Chymist, by the Name of the *Lesser Centaury*. It is likewise the same Powder which has lately been so much in Vogue, by the Name of *Kermes Mineral*, or Powder of the *Carthusians*.

A N T

Carthusians, because it was first disguised under that Title by the Monks of that Order; and it is the same with *Russel's Powder*, which has been so famous in *England*. All the Ways of preparing this Golden Sulphur may be reduced to two. The first and most common is, by first dissolving the Sulphur of Antimony by some alkaline Salt, and then precipitating it by distilled Vinegar, or some other Acid. The second is, by precipitating the same Sulphur of Antimony, at first by an Alkali, without the Help of an Acid.

PROCESS VIII.

Crocus of ANTIMONY.

Take of Antimony and Nitre, equal Parts, and reduce them to a very fine Powder. Set an iron Ladle on the Fire, and make it almost red-hot, and throw into it a little of this Powder, which will take Fire like Gun-powder. When all is grown quiet, throw in a little more, which will go off like the former, and so proceed till the whole Mixture is deflagrated. You will then have a Matter of a brown yellowish Colour, the Bottom of which will somewhat resemble Glass, upon which there will be some lighter Scoriz. Reduce the Whole to a fine Powder, and then wash it with hot Water, till the Calx, of the Colour just mentioned, remains insipid. The Waters this is washed with, being filtered, are pellucid; but, upon dropping a little Vinegar into them, become of an orange Colour, and let fall a fine Powder, very much like that of the preceding Process, but more subtil.

REMARKS.

The Sulphur, Nitre, and black Antimony, make a sort of Gun-powder, which therefore goes off in the same manner. The metalline Part is by this means calcined into Glass and Scoriz, both which are violently emetic; and being infused in Wine, will give that the same Quality. The Change of the Colour is here remarkable. If this Operation is performed in a large Crucible, with an intense Fire, and a large Quantity of Ingredients, and the Matter is then made to flow, you will have an extemporaneous Glass at the Bottom; which, being separated from the Scoriz, has the same medicinal Effects with the laborious Preparation of Process 3.

Geoffroy's Method of making the *Crocus Metallorum* is exactly the same.

This is called also *Terra Sancta Rulandi*. When given in Substance, from two to five Grains, it is a strong Emetic, and from it is prepared the Emetic Wine, by infusing it to the Quantity of three Ounces in three Pints of White or Spanish Wine, for two or three Days, shaking the Vessels often. The clear Wine swimming at the Top is given for a Vomit, from one to four Ounces. *Geoffroy*.

I shall give an Account of another Sulphur of Antimony, under the Title of *Kermes Mineral*, or *Powder of the Carthusians*, in the latter Part of these Processes upon Antimony.

PROCESS IX.

A milder Emetic of ANTIMONY.

Mix one Part of Powder of Antimony with two of Nitre, and throw them by a little at a time into a red-hot Crucible, and you will have the same Detonation as in Process 8. but the Matter will be white, which, being thoroughly washed, gives you a white insipid Calx of Antimony. The Water with which it is washed, when it is filtered, is salt.

REMARKS.

The Proportion of the Nitre here being increased, produces another Colour, though the Deflagration happens in the same manner. This Calx is much milder than the preceding, often exciting Nausea's only, and slight Vomiting, with a Discharge of a good deal of Saliva, and a thick Urine from the stimulated Viscera. The Lixivium of this, upon dropping in of Vinegar, precipitates a white Calx, nearly of the same Virtues.

PROCESS X.

A Diaphoretic nitrated ANTIMONY.

Take of Antimony, one Part; of Nitre, three Parts; reduce them to Powder, throw a little of the Mixture into a red-hot Crucible, and it will deflagrate as before. Proceed in this manner till you have used all your Powder, taking a great deal of Care not to throw in any of it till the preceding Portion is perfectly deflagrated. Keep the Matter in the Fire for the Space of a quarter of an Hour, the Cru-

A N T

cible all the time being perfectly red-hot; and then let it cool, and you will find in it a hard, white Mass. Take this out, powder it, and keep it under the Title of *Antimonium Diaphoreticum Nitratum*.

REMARKS.

If you take half a Dram of this Medicine well prepared, it produces scarce any sensible Alteration, except that on account of the fixing Nitre which adheres to it, it moderately opens, and hence in acute Distempers does some Service. The Chymists call it a Diaphoretic, and think that the arsenical Poison of the Antimony is fix'd by means of the greater Quantity of Nitre. But in the Antimony there was at first nothing emetic, tho' you took it without any Preparation, or the Addition of any Nitre; and yet an equal Quantity of Nitre gave it an emetic Quality. As we may conclude safely therefore from Experiments, let us not give too much into Hypotheses. Let the Followers of *Basil Valentine* here learn, that there is no Need of so much Caution to free this Diaphoretic Antimony nicely from its fixing Nitre; for it neither produces Anxieties, Nauseas, or Vomiting, but stimulates kindly and safely. There is more to be feared from the Calx after washing.

PROCESS XI.

The common DIAPHORETIC ANTIMONY, called SWEET ANTIMONY.

Take the calcined Antimony of Process 10. reduce it to a fine Powder, pour hot Water upon it, and stir them about with a Stick, by which means the fixing Nitre, that adheres to it, will be dissolved. Let the white Calx subside, pour off the saline Liquor, put on more Water, and thus render the Calx perfectly sweet, so that there shall be no Nitre sensibly adhering to it; and then dry it, and it will be white, insipid, and heavy, and is the thing you want.

REMARKS.

This is called Diaphoretic, for the Reason given in the preceding Process. But it is an inert, noxious Calx, without any thing active in it, as far as one can judge by its Effects; and wants every thing valuable that it had before. It acts only in a sensible manner, when it is mix'd with half as much of a Purgative; for then it truly quickens its Operation, as appears by undoubted Experiments in the *Pulvis Cornachini*. But otherwise I dissuade the Use of it. How surprisingly are the Colours chang'd in the Antimony, by simply varying the Proportion of the Nitre in the Calcination? And what a surprising Alteration do we find in the Strength?

Boerhaave, we see, has a much better Opinion of Diaphoretic Antimony before the Nitre is wash'd out of it, than afterwards; and in this I believe he is right. But his representing the common *Diaphoretic Antimony* as noxious, seems to favour much of Whim, or Love of Contradiction; for I never met with an Instance myself of any ill Consequences from the taking it, nor ever heard of any one that did.

Geoffroy's Character of Diaphoretic Antimony is, that it is an excellent Diaphoretic, when given inwardly in a sufficient Dose, resolving Obstructions, attenuating thick and viscid Fluids, and forcing them, either sensibly or insensibly, thro' the Pores of the Skin. It is prescribed with Success in all malignant Diseases, in a Pleurisy, Erysipelas, and Diseases of the Skin; and it makes an Ingredient in the *Pulvis Cornachini*, and *Pulvis Febrifugus* of *Morton*. *Vigani* says, it has no more Virtues than Tobacco-pipe Clay.

PROCESS XII.

Nitrum Stibiatum. Antimoniated Nitre.

Take the Waters with which the preceding Calx was washed, filtre them, put the Lixivium into a clean Urinal, and exhale to a Dryness, keeping it constantly stirring to the End. By this means you will have a white saline Matter, of a singular, and not disagreeable Taste, not like that of Nitre, but softer, which keep under the Title of *Nitrum Stibiatum*.

REMARKS.

Hence we learn, that Nitre, by Detonation with Antimony, is converted into a new Salt. This Salt is gently aperient, and in a phlogistic Disposition of the Blood, agreeably dissolves the inflammatory Density without Violence, and happily disposes to Perspiration, gentle Sweats, and a Discharge by Urine; and hence cools, and proves of Service in the Small-pox, Measles, Pleurisy, and Peripneumony. How unseasonably therefore is this Water thrown away, as being of a hurtful Nature!

Fix'd Sulphur of ANTIMONY.

Into the filtered nitrous Liquor of Process II. put into a Urinal, whilst hot, and very pellucid, drop some very strong distilled Vinegar, and it instantly grows milky, and precipitates an exceeding white, and very fine Powder. Shake them together, and proceed to drop in more; shake them again, and repeat this till the Liquor will not be affected by the Vinegar any longer. Let the Vessel stand quiet till all the Powder is subsided to the Bottom; pour off the Liquor into a clean Vessel, wash the Powder with Water till it is perfectly insipid, and then dry it, and you will have a very white, insipid, fine Powder, which is called *Sulphur fixum Antimonii*.

R E M A R K S.

In the Deflagration of the Antimony with the Nitre, the Sulphur of the former unites with the latter, as in Process 8. And the Sulphur, thus resolv'd and combin'd with the Nitre, is dissolv'd with it in Water; but as soon as ever an Acid comes to it, it precipitates from the Nitre, as we see here upon the Infillation of Vinegar, and at the same time the Acid unites with the Nitre without any Sign of an Effervescence. The Powder then that falls to the Bottom, being wash'd, is true Sulphur of Antimony. *Tachenius* extols this Powder taken in Vinegar, as the most powerful anti-peffential Medicine. But for my part, I confess, I think it ought to be look'd upon as an absolutely inert Calx, noxious on account of its Weight and Indissolubility, or at least doing no manner of Good. The Vinegar, however, taken along with it, I acknowledge to be particularly serviceable in the Case mentioned. In this manner are the Chymists too apt to cry up the Preparations of their Art, particularly those from Antimony, and then especially when they do not produce any sensible Effects. But that acetose, nitrous Liquor, that swims above the precipitated Powder, has the most efficacious Virtues in acute febrile Disorders, both on account of the Vinegar, and the soft Nitre, which is now freed from the inactive Sulphur: Thus, in the Chymical Art, is the best Part frequently thrown away. From all these Instances we perceive, how surprisingly Sulphur is dissolved, lies conceal'd, and is resuscitated in various Forms, and various Colours.

P R O C E S S XIV.

The Distillation of ANTIMONY into an icy Butter, and Cinnabar.

Take of corrosive Sublimate of Mercury, two Pounds; rub it in a warm dry glass Mortar with a glass Pestil, till it is reduced to a very fine Powder. Then take of the best Antimony, one Pound, which also powder separately very fine. Mix these as nicely as possible in a glass Mortar, and they will grow warm, and emit a Fume, of which beware with the utmost Caution. Have by you at the same time a clean, dry, glass Retort, that will hold three or four times as much as your Powder, which should have a large Neck, and be cut off so low, that the Mouth may be very wide. Dry the Powder very well, and then put it into the Retort made hot and dry likewise, taking care that nothing black adheres to the Inside of the Neck. Place the Retort thus charg'd in a Sand Furnace, so contriv'd for this Purpose, that the Belly of the Retort may almost touch the Bottom of the Pot, and yet its Neck may lie in a declining Position. This being done, apply a large Receiver, so cut that the Mouth of it may exactly admit the Neck of the Retort, and cover the Retort with Sand. Let the whole Apparatus stand under a Chimney that will carry up the Fumes without dispersing them; make a little Fire, and when the Retort is grown moderately hot, with a Paste made of Clay and Lime lute the Joint; then raise your Fire very gradually, and in the first place the Receiver will begin to be clouded, and there will be a small Quantity of a Liquor collected in it. Carefully keep up your Fire in this Degree, till nothing more of this Liquid will come over: When this ceases, increase your Fire, but very cautiously, till you perceive a pinguious Matter rise into the Neck of the Retort, and distil into the Receiver, coagulating whilst it passes from one to the other; keep up this Fire to the same Height, and there will be a white icy Matter concreted in the Neck of the Retort. On both Sides of it therefore lay some live Coals, first at a Distance, and afterwards nearer and nearer, till the Neck of the Retort is grown as hot as the Belly of it; and then the Matter will melt, and drop into the Receiver. Proceed with this Degree, and then very gently increase it till no more Butter rises into the Neck, and all that has risen, is distill'd into the Receiver; then remove the Receiver, taking all possible Care, that none of the Vapour

comes to your Lungs; and presently stopping it, set it by. Lute on another properly fitted for this Purpose, and increase your Fire, and you will have a Matter come off, of a yellow, red, blackish, and various other Colours; upon which raise your Fire to the highest Degree, and at last place Fire upon the Sand at the Top of the Retort, that the Sand may be almost red-hot, and so leave them for the Space of two Hours. Let the Whole spontaneously cool, and then remove the Receiver, in which you will have some Quantity of crude Mercury, and a Butter rendered impure by the sulphureous Fumes of the Sulphur of the Antimony. In the Neck of the Retort too you will find a Matter of various Colours made up of the Mercury, Sulphur, and Butter; and upon breaking the Retort, there will be some antimonial Fæces at the Bottom; but at the Beginning of the Neck, you will find a dense, hard, opaque, and very heavy Mass, the Surface of which, that is contiguous with the Glass, will have a shining Appearance, whilst the other is rough, and which, being reduced to Powder, is true Cinnabar of Antimony, and is sufficiently costly. In this Process there is need of a great deal of Patience and Caution; for if the Fumes should insinuate themselves through the cracked Glass, or Lute, or any other way, and be received into the Lungs, by their caustic Quality, they would prove fatal.

R E M A R K S.

If we consider the Nature of Antimony, and of Mercury Sublimate, the Chymical Ratio of this Process is easily understood. Whilst the Fire acts on the Sublimate, the Aqua Regia that is in it, unites itself with the mercurial, metallic, reguline Part of the Antimony; and thus leaving the Mercury, with which it was combined before, that returns to its original Form, and runs at the Bottom of the Retort: Hence the Regulus is sublimed with the Spirit of Salt, and becomes a volatile Vitriol of Antimony, call'd a Butter, consisting of an exceeding pure Regulus, and Spirit of Sea-salt, combined together. When these are separated and sublimed, then the Sulphur of the Antimony discharged from the reguline Part, and the crude Mercury freed from its Acid, remain at the Bottom of the Retort, and by the Action of the Fire become united together, and sublime into Cinnabar. This Butter of Antimony is the most speedy Caustic we are acquainted with, producing an Eschar the soonest of any thing, which separates in a very short time; for the most part, the same Day it is made. It easily dissolves with the Moisture of the Air, and then it loses its Pellucidity, grows white, and precipitates a very white Powder. It dissolves with Heat, but in the Cold returns again to its icy Form. The Variety of Colours, in this Process, arises from the Sulphur of Antimony. If instead of crude Antimony you take the very pure Regulus of Process 6. and proceed exactly in the same manner, you obtain only a Butter, and a Mercury, both exceedingly pure, because then there is no Sulphur; and the Acid being intirely received into the Regulus, the Mercury returns in its greatest Purity. Here then we see what a singular Effect the Spirit of Salt, which adhered to the Sublimate, has, whilst it sublimes the fix'd Regulus of Antimony in a Sand Heat: But it has the very same upon all metalline Bodies, Gold itself not excepted. How wonderful a Body then is Sea-salt? The Chymist certainly can never too much employ his Art upon it, as he will always discover something that will make him Amends for his Trouble.

Geoffroy says, the Cinnabar, which sticks in the Neck of the Retort, is powdered, mixed with its own *Caput Mortuum*, then sublimed by a gentle Fire. It is of a dark-red Colour, and is recommended in all Diseases of the Head, especially in Epilepsies. It is likewise used in Venereal Cases, and operates by Sweat. The Dose is from six to fifteen Grains.

Cinnabar of Antimony may also be extracted from antimonial Mixtures, and from several other Preparations of Mercury, besides the corrosive Sublimate; and among those there is not one from which we may extract so much, or with so great Ease, as from an equal Mixture of crude Antimony, and *Æthiops Mineral*, prepared by Calcination; because this Preparation of Mercury is, as it were, a Cinnabar half made, which readily unites itself to the Sulphur of Antimony, and which rises with it to the Neck of the Retort: For this Operation 'tis necessary, that the Neck of the Retort be considerably long.

Cinnabar of Antimony is generally much more esteemed as a Medicine, than the common Cinnabar. Yet after examining the Effects of both, upon many Occasions, I have found them alike, only that of the Antimony, when exhibited in a large Dose, sometimes excites a *Nausea*. Care must be taken, that a Drop of the Butter of Antimony has not fallen upon this Cinnabar, during the Operation; for in that Case, it may become somewhat emetic.

Cinnabars often produce good Effects in such Disorders of the Brain, as are caused by a gross and corrupted Phlegm, which intercepts,

intercepts the Motions of the Spirits; because these Medicines, mounting to the Brain in Consequence of their volatile Nature, attenuate and colligate the pituitous Humour, which afterwards finds proper ways for dissipating itself. But these Remedies must be exhibited in small Doses; for the excessive Colligation of the Humours occasioned by them, either when administered in large Doses, or too often, frequently brings on more terrible Disorders than those they were design'd to remove.

Cinnabars are also used in Asthmas; and in these Cases they act not only by their Sulphur, which is well calculated for promoting Respiration, but also by the Mercury contained in them, which contributing to rarefy and dissolve the Obstructions of the Lungs and Diaphragm, restores to the Fibres of these Parts a Power of dilating and extending themselves. *Lenery Cours de Chimie.*

PROCESS XV.

The Distillation of Butter of ANTIMONY into a Liquid Oil.

Take the Butter of Antimony of the preceding Process broken to Pieces with some glass Instrument, the Neck of a Phial, for Instance, and put it into a clean glass Retort, taking care that it does not dissolve in the Air, nor offend you with its Vapour. With a gentle Fire, gradually increased, draw it off into a dry clean Receiver, raising it till all the Butter is come over, which at last will require a Heat considerably intense, and you will have it nearly in the Form of a liquid Oil of Antimony. If you distil this Oil a third time, it will still become more limpid; and if it is rightly secured in a close Vessel, will continue in this Condition. May not this, which is a pretty surprising Experiment, illustrate some obscure Places in *Paracelsus*?

REMARKS.

This beautiful Experiment gives us a great Insight into the Method of rendering Metals volatile, and converting them into the true Form of a liquid Oil, and discovers to us the wonderful Power of Sea Salt in giving Volatility to Metals, and its surprising Quality, whilst it remains united with Antimony; for so long it is extremely poisonous, sending forth a truly arsenical Vapour; and yet, when it is separated from the Antimony again, it becomes quite innocent. Is there not some room therefore to suspect, that there lies hid here something of an alchemical Virtue? Certainly it renders all Metals distillable in a Retort, without any Alteration in their Weight, and is recovered from them again almost in its full Power. This Oil is extremely caustic, and supplies skilful Surgeons with the most speedy Escharotic. This Process has been ranked amongst the profoundest Arcana. If you have a mind therefore to try it, whatever you do, be sure take care of the Fumes: I knew a very worthy and famous Man, to whom they proved fatal. Again therefore let me caution you to beware of them.

PROCESS XVI.

Mercurius Vitæ of ANTIMONY, and its REGULUS, otherwise called PULVIS ALGAROTH, from Victorius Algaroth, its Inventor.

Put some Water in a clean clear Glass, into which let fall one Drop of the Oil of Antimony of the preceding Process, melted and depurated. You will observe the very Instant it comes to the Water, from pellucid, it becomes white, and falls to the Bottom. Proceed to drop in the Oil, till a Quantity of it equal to One-fourth of the Water, is instilled into it, and it is all converted into an exceeding heavy white Powder, which is collected at the Bottom. Stir them well together with a glass Rod, so as to mix them as thoroughly as is possible; and when they have stood quiet for some time, there is a very limpid acid Liquor swimming at the Top, which gently pour off. Upon the Powder then put more Water, and when by this means you have washed it till it is perfectly insipid, dry it with a gentle Fire, and you have a white, insipid, heavy Powder.

REMARKS.

Thus we see, that the Acid of Sea Salt adheres to the Antimony so long only as it continues exceedingly strong, receding from it as soon as ever it comes to be lowered with the least Quantity of Water, and then is attracted into the Water. This Powder, given to two or three Grains, is a violent Emetic; and from the fatal Effects it has sometimes had, has been called *Mercurius Mortis*. If it is laid upon Glass, and exposed for a good while to a gentle Fire, being kept constantly stirring all the time, it loses its Strength, and becomes less active, and then is thought by many Persons to be the *Arcanum* of *Riverius*. This Powder contains nothing of Mercury in it, whatever *Billichius* says to the contrary in his *Paradoxa Chymiatricæ*, but the purest Regulus of Antimony. I took eleven Ounces of this *Mercurius Vitæ*, pre-

pared with my own Hands, and, putting it in a strong large Crucible, placed it in a Wind Furnace; and by this means the Powder was melted as soon as ever the Crucible came to be thoroughly red-hot. When it was perfectly in Fusion, I poured it out into a melting Cone, and had ten Ounces of a shining Regulus, but a little upon the greyish, consisting of Spicula surprisingly disposed amongst each other.

PROCESS XVII.

Philosophic Spirit of VITRIOL.

Take of the limpid acid Liquor of the preceding Process, filtre it, and inspissate it to one half, and you will have the *Spiritus Vitrioli Philosophicus*.

REMARKS.

This very limpid, and gratefully acid Liquor, has the Taste of Spirit of Sea Salt, and has the very same Effect in every Chymical and Medicinal Operation. Nor is there any thing in the least emetic in it, but it is an exceeding pure Spirit of Sea Salt, which through all the Operations it has undergone, with the Sublimate of Mercury, the Antimony, its Butter, Oil, and the Water, has still retained its proper Nature, nor is so much as tainted by any Admixture, but has an admirable salutary Acidity. It is improperly therefore called a *Vitriolic Liquor*; for it contains nothing at all of Vitriol; but with the alkaline Salt of Tartar, it regenerates Sea Salt. As I am a great Admirer of Sea Salt, on account of its surprising Effects in Chymical Operations, I had a mind to examine into the Nature of this Production of it. To this Purpose I took a large Quantity of this Liquor, and distilled it in a tall, clean, glass Cucurbit, and the Liquor came off exceedingly pure, nor left any thing at all at the Bottom. Hence therefore I learned, that the Water, by simple Affusion, in an Instant extracted the Spirit of Salt, in such a manner, from the Butter of Antimony, that nothing at all of the Antimony remained united with it, though it before rose out of the Retort combined with the Regulus, in form of a Butter. I then distilled all the Liquor again in a tall Cucurbit, and afterwards once more with a gentle Fire of one hundred Degrees, and there then came off a pure Water, which had not the least Taste of an Acid: This Degree of Heat I kept up, till nothing more would rise. The remaining Liquor I urged with a Fire a very little stronger, so that there rose a Liquor that was somewhat acidish; I carefully separated what was thus elevated, and kept it under the Title of *An acidish Phlegm of Philosophic Spirit of Vitriol*: This is of considerable Service, where acidish Medicines are wanted. The Liquor that was left, I distilled with a Cucurbit, and I found it a very acid, limpid, pinguious Spirit of Sea Salt, that fum'd a little. Thus then I learned the wonderful Nature of this Salt, its easy Combination, and easy Separation.

PROCESS XVIII.

Van Helmont's Flowers of ANTIMONY.

1. Take of Antimony, dissolved in Aqua Regia, according to Process the first, one Pound; put it into a low, open, glass Vessel, and expose it for a good while to a gentle Fire, keeping it continually stirring with a glass Rod, till the Matter is become very dry; then in a glass Mortar, and with a glass Pestil, reduce it to a very fine Powder; to which add as much of the driest Sal Ammoniac, as there is of the Calx, and then rub them together, the longer the better, that they may be mixed as intimately as is possible. Put this Mixture into a low glass Cucurbit with a wide Mouth; fit on a very large clean Alembic, and lute the Joint with a Lute made of Lin-seed Flower. Place the Cucurbit in a Sand Furnace, in such a manner as to stand a little leaning forwards, that the Water in the Sublimation may easily pass out of the Alembic into the Receiver. Then cover the Cucurbit with Sand up to the Rim of the Alembic, raise a gentle Fire, and there will come over a limpid, acid Water, which, by increasing your Fire a little, will be all expell'd. Gently raise your Fire, and something white will begin to rise, upon which keep it up to such a Degree, that you can just bear your Hand upon the Head; and then Substances of all kinds of Colours will ascend into the Alembic. Continue the Fire in this Degree, for the Space of eight Hours, and you will be entertained with the Beauty of the Appearance. Let the Whole cool, very gently take out the Cucurbit, clean both this and the Alembic from the external Dirt, and then carefully remove the Head, taking care of the first Vapour, and you will find almost all the Antimony sublimed with the Sal Ammoniac into a variegated Matter. Take this out presently, and put it into a dry, hot, glass Vessel, under the Title of *Helmont's Salt Flowers of Antimony*. These, if they are taken in the smallest Quantity, are a very powerful Emetic. At the Bottom you will

A N T

will find something that may be sublimed with fresh Sal Ammoniac.

2. Put these Flowers into Water, and stir them well about, and the Water will grow milky. Let it stand quiet, and settle, and at Top there will swim a saline, ammoniacal Liquor, which pour off. Wash the Flowers in this manner till they are quite insipid, and then dry them with a gentle Heat, and you will have a very fine, red, insipid Powder, which is greatly emetic. These are called *Van Helmont's sweet emetic Flowers of Antimony*. If the Lixivia these are wash'd with, are inspissated, you have a Sal Ammoniac fit for the same Use again.

REMARKS.

Here we have an Instance of the Manner in which *Paracelsus* thought a Chymical Death and Resuscitation, as he express'd himself, opened Metals, and by this means made them exert themselves efficaciously in the human Body. Here we see a fixed Body become volatile; and here we observe the Production of all Sorts of Colours. Thus the black Powder of Antimony, or Head of the Crow, being reduced to a white Calx, becomes the Neck of a Swan; and afterwards acquiring a great Variety of beautiful Colours, is changed to the Tail of a Peacock. But it is emetic, under all these Alterations.

PROCESS XIX.

Van Helmont's fixed Diaphoretic Flowers of ANTIMONY.

Take of the sweet Flowers of the preceding Process, one Part; of the purest and driest Nitre, three Parts; and rub them well for a good while in a glass Mortar. At the same time, have a clean Crucible standing in the Fire red-hot, into which throw a little of this Powder, first heated, and it will deflagrate, but very weakly. When every thing is quiet, throw in a little more, and so proceed till you have made use of all your Powder. When the Matter in the Crucible is grown cold, it will be of a white Colour, inclining to yellow. Take this out carefully, pound it, wash it with Water, and dry it, and you will have a fine white Powder. Put this into a China Dish, pour *Alcohol* upon it, set it on fire, and whilst it is burning, keep the Powder continually stirring about with a Tobacco-pipe. When the *Alcohol* is burnt out, there will remain *Van Helmont's Diaphoretic*, thirty-six Grains of which are said, by promoting Sweat, to cure all intermittent, and continued Fevers.

REMARKS.

Here we have an Instance of fixing a volatile Body, for Chymical Uses. This Diaphoretic its Author greatly extols. I have made it myself, however, and tried it frequently; but I could never find any such extraordinary Virtues in it, as he mentions in his *Aurora Medicinæ*, written in *Dutch*; and hence I am inclined to believe, that, in other Cases likewise, he has indulged himself a little too much in extolling his own Preparations.

PROCESS XX.

The Purgans Diacelatesson of Van Helmont with fixed Flowers of ANTIMONY.

Take of the fixed Diaphoretic Antimony of the preceding Process, eighteen Grains; of Resin of Scammony, sixteen Grains; of Cream of Tartar, seven Grains; mix them, and reduce them to a fine Powder: Or, take of the fixed Diaphoretic Antimony, nine Grains; of Resin of Scammony, nine Grains; of Cream of Tartar, three Grains; and make them into a Powder. This is the Description of the Purge given us by *Helmont*, which *Paracelsus* called the *Diacelatesson*: The first is the greatest, the last the least Dose for an Adult. It must be taken without any Acid, and may be stopp'd by an Acid, if it operates too violently. It must be given in Intermittents in such a manner, that it may finish its Operation as nearly as possible by the Time the Fit is expected. The Author says, it always cures Quartans before the fourth Day, and proves efficacious in all intermittent, and continued Fevers. *Auror. Medicin. published in Dutch, p. 187, 188, 289.*

REMARKS.

Here we have another Chymical Arcanum, under the Name of a *Purgans Diacelatesson*, as you may find in the *Dutch* Edition just cited. Concerning this, *Van Helmont* says, that it radically cures the Gout and Fevers, that it heals Ulcers of the Larynx, Bladder, and Oesophagus, and that it purges the Body only so long as it is not found, and no longer. See the *Latin* Edition, p. 775, 776. where he says the Dose is eight Grains; so that the Account in the *Dutch* Edition does not agree with this. But I am always ready to suspect, that this great Man, by a Subtlety of Reasoning, extended the Virtues of these Arcana farther than could be fairly warrant-

A N T

ed by Experiment. These things I have prepared myself, and, upon making use of them, have seen very good Effects from them, but not such superlative ones as he insinuates. *Boerhaave.*

From Geoffroy. PROCESS XXI.

The Universal Antimonial Panacea is prepared from the Butter of ANTIMONY in this manner:

Take of Butter of Antimony, half a Pound; Crystals of Tartar, well powdered, a Pound; pour on them a Pint of common Water in a large Matrafs; mix, and boil them in a Sand-heat for eight Hours; and while the Liquor is hot, drop into it a Pound of Oil of Tartar *per Deliquium*. After the Effervescence is over, strain the Whole through Cap-paper, and evaporate it to Dryness, in a glass Vessel, over a slow Fire. A Salt will remain at the Bottom, which is to be set in a cool Cellar, till it runs into a limpid Liquor, which must be carefully separated from the Fæces. It purges gently upward and downward, being given from eight to twenty Drops, in a proper Vehicle. It differs from Emetic Tartar only in running *per Deliquium*.

PROCESS XXII.

EMETIC TARTAR.

Take Liver of Antimony, Crystals, and Cream of Tartar, of each equal Parts; boil them in a sufficient Quantity of common Water, for six or eight Hours; then strain the Liquor, and evaporate it to Dryness. The dry Mass is Emetic Tartar, which is given as a Vomit from two to six Grains.

This is by far the best Emetic, that can be prepared from Antimony, and may be given in any Form; and as the Doses of it are easily adjusted, they may be safely increased or diminished in any requisite Degree, that the Physician shall judge the Strength of the Patient, or Nature of the Disease, to require; whereas the same Quantity of the Emetic Wine may be more or less emetic, according to its Acidity, or other Circumstances. In making the Liver of Antimony, some add to the Antimony and Nitre, decrepitated *Sal Ammoniac*, and thus make what is called the *Opalin*, or *Ruby-coloured Magnesia of Antimony*, from its red Colour, which is a much weaker Emetic than the Liver of Antimony, and does not cause Vomiting in Horses, and other Quadrupeds, but only makes them sweat, or increases Perspiration. It is given to such Brutes from one to three Ounces, once every Day, for several Weeks together, to fatten them, and cure their cutaneous Diseases, or other Indispositions. *Crocus Metallorum* is likewise used to take away Spots in the Eyes, and to cure Ulcers, Itchings, and *Psores* of the *Cornea Adnata*, or Eye-lids.

PROCESS XXIII.

BEZOAR MINERAL.

Antimony has neither any emetic, or cathartic Quality, (all its Effects being to increase insensible Perspiration, or provoke Sweat) if its Sulphur be fixed by mineral Acids; as is seen in the Preparation of Bezoar Mineral, which is in this manner:

Put into a Retort any Quantity of Butter of Antimony, and drop upon it Spirit of Nitre, till the Effervescence ceases. Having then digested them for twelve Hours, draw off the Spirit in a Sand-heat. On the remaining Mass pour the same Quantity of fresh Spirit, and distil as before. Then calcine the remaining Mass in a Crucible, till it ceases to emit Fumes; wash the Powder in warm Water, and then dry it.

This Preparation is commended by *Van Helmont* in the Plague, and other malignant and contagious Diseases, as a most excellent Diaphoretic, given from half a Scruple to half a Dram.

It may be made a shorter way, by pouring four Ounces of *Aqua Regia* on an Ounce of *Regulus of Antimony*, and digesting them for some Days in a gentle Heat, shaking the Vessel every now-and-then, till all the *Regulus* is turned to a very white Powder, which is to be washed and edulcorated by a large Quantity of common Water.

Various Tinctures are drawn from Antimony, and Authors are of various Opinions about them. We shall give one simple, and one more compounded Tincture, as Specimens of the rest.

PROCESS XXIV.

Take of Salt of Tartar, eight Ounces; melt it in an ignited Crucible; and then immediately throw into it, by Spoonfuls, six Ounces of crude Antimony. Cover the Crucible, and let the Whole be calcined in a strong Fire for half an Hour; afterwards throw the Mass into a Brass Mortar, and, as soon as it hardens, reduce it to Powder. Throw this Powder into a large Matrafs, and pour upon it as much

A N T

much rectified Spirit of Wine, as will cover it to the Height of four Fingers Breadth. Then stopping the Vessel very close, digest for several Days, till the Spirit is tinged with a deep-red Colour. Afterwards filtre the Tincture, and keep it for Use.

This Tincture excites Sweat, seldom excites a Nausea; sometimes purges gently, and proves diuretic. It is recommended in Hysterical Affections and Melancholy; to break the thick Parts of the Blood, in Apoplexies and Palsies; and to open Obstructions in the Viscera, in malignant Fevers. The Dose is from four to twenty, forty, or even sixty Drops, in a proper Vehicle.

PROCESS XXV.

The more compound Tincture, much celebrated by the Name of *Lilium*, or *Tinctura Lilii Paracelsi*, is made from Metallic Reguli, in this manner:

Take of thin Copper-plates, an Ounce; ignite them in a red-hot Crucible; and then throw in upon them half an Ounce of powdered Martial Regulus of Antimony; and, the Whole being presently melted, add four Ounces of Tin, stirring the Mass now-and-then with an iron Rod; and when it is in perfect Fusion, throw it into a well-greased Cone, and it will soon harden into a reguline metallic Mass. This Mass, being reduced to Powder, is to be mixed with a Pound and half of Nitre, and half an Ounce of powdered Charcoal. Throw this Mixture by Spoonfuls into a red-hot Crucible; and after each Projection, cover the Crucible, till the Fulmination is over. Calcine the Whole in a very strong Fire, for two or three Hours, stirring it at times with an iron Spatula. Then pour it into a brass or iron Mortar, and, before it has time to cool, powder it well, and immediately throw it into a proper Matrafs, and pour upon it as much Spirit of Wine, as will stand four Fingers Breadth above it. Digest in a Sand-heat for fifteen Days, and the Tincture will be what is called *Tinctura Lilii*, or rather, *Tinctura Metallorum*, which is both sudorific and diuretic; given from ten to an hundred Drops, in a convenient Vehicle.

It is much commended in malignant Fevers, Apoplexy, Palsy, Scab, Rheumatism, Scurvy, Dropsy, and a Suppression of the Menfes.

PROCESS XXVI.

From the *Martial Regulus* of Antimony, the Silver Flowers, known by the Name of *Antimonial Snow*, are prepared in this manner:

Take of the *Martial Regulus*, a Pound; put it into a large earthen Pot, placed in the midst of burning Charcoal: Let a Cover be perforated in the Middle, and so placed, as that there may be the Breadth of two Fingers between it and the reguline Powder; and place another Cover over the Mouth of the Pot. Give a very strong Degree of Fire for an Hour, till the Regulus is perfectly melted. Then, the Vessels being suffered to cool, the Silver Flowers are found in Form of small *Spicula*, in the void Space between the first Cover and the Regulus.

These Flowers cause a Diaphoresis and Sweat, and are therefore prescribed in malignant Fevers, and other Diseases where a Diaphoresis is required. They often cure intermitting Fevers, given from ten to forty Grains, a little before the Fit.

PROCESS XXVII.

On the 19th of December 1700. Mr. Charas laid the following Method of drawing an acid Liquor from Antimony before the Academy:

He reduces the Mineral Antimony to a Powder, mixes it with three times the Quantity of common Sand, and distils it, by a large Fire, from a Retort, into a capacious Receiver half full of River-water, which he afterwards rectifies by a second Distillation. It often happens, that Antimony in this Process yields an acid Liquor, and often none at all. Mr. Charas maintains, that the Success of the Process depends upon the Application of the precise Degrees of Fire proper for this Operation; and that, when these very Degrees are applied, the Experiment must necessarily hold.

This Process is described in a Treatise of Antimony, written by John Agricola, and printed at Leipsic 1639. I have often tried this Experiment, but I can't say, that I have found Mr. Charas's Assertion true in its whole Extent. Certain it is, that in this Process an Acid is produced; but this Acid is by no means yielded by the Antimony, but by an Earth of a whitish Colour, and a clayey Nature, which is almost always found in Mineral Antimony, and which, by a strong Distillation, yields an acid Spirit, as other Clay, under the like Circumstances, generally does; but if we take pure Mineral Antimony, with-

A N T

out any Mixture of this whitish Earth, or even the best common Antimony without any *Scoria* or Dross, we cannot possibly extract an Acid from it, whatever Degrees of Fire are applied to it. This Acid therefore cannot be said to be a Vinegar of Antimony.

For my own part, I am persuaded, that the Acid of Antimony does not differ from the Spirit of common Sulphur; and as Antimony abounds with a burning Sulphur, which resembles the common Sulphur, I believe that the Acid yielded by it is nothing more than the Spirit of that burning Sulphur, or common Sulphur, contained in the Antimony; and that the reguline Part, which alone is the true Antimony, contributes nothing to the Production of this Acid.

I do not advance this at random, and without a sufficient Reason; for, having extracted the Acid of Antimony without Addition in different Manners, and with uncommon Pains, I have employed it in several Processes; but always found, that it bore a perfect Resemblance to the Spirit of common Sulphur; that is, it produced no Effect but what was produced precisely in the same manner, by the Spirit of Sulphur.

One of the Methods I used to extract this Acid, is as follows: I reduced the Antimony to a small Powder; I put it into an unvarnished flat earthen Pan, about a Foot in Diameter; I covered this Pan with an earthen Pot without a Bottom. I placed three Aludels upon this earthen Pot, and covered the Mouth of the uppermost with a large glass Bell, the Edges of which were supported about three or four Lines above a Reservoir of warm Water, which by its Steams moisten'd the internal Side of the Bell; and the Water, which ran down from its Sides, fell back again into the Reservoir.

I had made a Hole about a Finger's Breadth in Diameter, about the Middle of the earthen Pot, through which I had pass'd the Stalk of an iron Spoon, in order to stir the Antimony under the Bell, just as when one calcines Antimony, in order to transform it into Glass. By this means I had Flowers of Antimony in the Aludels, a small Quantity of Acid in the Reservoir of Water under the glass Bell, and calcined Antimony in the Pan under the earthen Pot.

In this Process, a small Quantity of Acid is indeed drawn, but one may be sure of its being unmix'd. It also very often happens, even when this Method is follow'd, that no Acid at all is yielded. But this depends, first, upon the Accuracy of the Chymist; secondly, and principally, upon the Temperature of the Air, and the State of the Weather, at the Time the Process is carrying on. The colder and moister the Air is, the greater Quantity of Acid is yielded; but when it is hot and dry, none at all can be obtained. Upon the Whole, the Chymist must follow all the Circumstances and Directions necessary to be observed in extracting the Spirit of Sulphur *per Campanam*, and take it for granted, that this Process is still more difficult than that which yields the Spirit of common Sulphur without Addition. *Mem. de l'Acad. Royale 1700. by Mr. Homberg.*

PROCESS XXVIII.

KERMES MINERAL, or PULVIS CARTHUSIANORUM,
Poudre des Chartreux.

Take of Antimony, four Pounds; Solution of fixed Nitre, one Pound; Rain-water, three Pounds; and boil them for two Hours. Then the boiling Decoction is passed through Cap-paper, and set in a quiet Place for twenty-four Hours, till a yellowish, or Saffron-coloured Powder sinks to the Bottom of the Vessel, the Liquor remaining clear. This Liquor being poured off by Inclination, the Powder is first washed by frequent Affusions of warm Water, till it is deprived of all its Salts; and then about four Ounces of Spirit of Wine are burnt upon it, and it is afterwards dried, and kept for Use.

This Powder is looked upon as a kind of *Panacea*, or universal Remedy. It sometimes excites Vomiting, especially when it meets with any Acid in the Stomach, and is sometimes cathartic, diaphoretic, and sudorific, according as it is determined by the Disposition of the Patient to act upon any one Humour more than on another. It is given from one to four Grains, or sometimes, when it is designed only to attenuate and divide any Viscidities in the Fluids, in the Quantity of half a Grain, repeated every three, four, or six Hours. In acute Fevers, where there is a great Crudity and Spissitude of the Humours, it is given in small Doses with Success. It changes the crude and ferous Evacuations by Stool, into a more bilious Consistence, by attenuating the viscid Bile, and so disposing it to pass off by Stool. It is often given with Success in the Beginning of the Small-pox, and Measles, when they are apprehended to be of a bad Kind, at small Doses mixed with Bezoardic Powders, or Absorbents, such as Crabs-eyes, red Coral, Pearl, Egg-shells, Crabs-claws, and the like; for thus it excites a Spitting and Diaphoresis, removes Anxieties, corrects the Lympha, and coagulated Serum, and raises such an Effervescence in the Blood as tends to purify it. Glauber confirms these Virtues by the Examples of seven Children in the Small-pox. *Frederic Hoffman* commends the Use of this Powder

Powder in stubborn autumnal Agues, because it powerfully opens Obstructions, particularly of the Liver, by which these Fevers are produced, especially when taken in the Quantity of a Grain, mixed with detergent anti-febrile Salts; such as the Salt of Wormwood, the febrifugous Salt of *Sylvius*, vitriolated Tartar, and the like. *Schroder* ordered it in the Quantity of half a Grain, or a Grain, three or four times a Day, in the Intermitting Fevers of Children; and commends it very much in correcting the Acrimony of the Serum, and especially that of Tears, which give Pains in the Eyes, and produce very bad Ophthalmias. The same Author mentions a Woman labouring under scorbutic Symptoms and Defluxions of so acrid a Kind as to corrode her Lungs, and bring on a Spitting of Blood, who, by using this Sulphur of Antimony in very small Quantities, corrected the Acrimony, and stopped the Motion, of this Serum; and thereby prevented the Growth of a Disease, which must otherwise have been of very fatal Consequence. *Hoffman* says, it is a most effectual Remedy in such Chronical Diseases as arise from long Obstructions of the Viscera. In a Dropsy, for Instance, it is very properly mixed with Filings or Crocus of Steel and Nitre; in Epilepsies, with all the Cinnabars; in the Scurvy, with the *Arcanum Duplicatum*; in Dysenteries, with the *Confectio de Hyacintho*; in a Dysury, or Complaints of the Stone, with white Nettle, or Pellitory-water; and even in Pleurisies and Peripneumonias, he frequently gives it, in the Quantity of three or four Grains, in a Glass of strong Spanish Wine, in Carduus-water, in an Infusion of red Poppies, or in the Juice of Dandelion, or Borage. *Junker* observes, that this Powder has in many Patients suspended, in one Moment, the Effects of a suffocating Catarrh, sometimes by producing a gentle Vomiting, sometimes by Sweating, and sometimes without any sensible Evacuation; and he advises it to be mixed in these Cases with a certain digestive Salt. It may be given very advantageously to cachectic Girls, in the Quantity of a Grain, mixed in ten Grains of *Crocus Martis Aperiens*, and of the *Arcanum Duplicatum*, the Dose being repeated twice a Day. This Powder may be given either alone, or mixed with a little Sugar, and diluted with Wine, or Water, or any other proper Liquor. It is likewise sometimes given with Oil of sweet Almonds, or in Conserve of Violets, Borage, &c. in form of a Bolus.

It is however to be carefully observed, that this Powder is not to be given till the Quantity of Blood has been lessened, and all the Fluids sufficiently diluted and attenuated; for, as by the Use of it the Blood is very suddenly rarefy'd, and put into a kind of Effervescence; if the Vessels are before full, they must be still more distended; by the increased Heat and Motion of the Blood and other Fluids, and hurtful Congestions may be form'd in the Viscera. It ought therefore never to be given, till the Dangers from a Plethora are taken off, and till the Humours have been rendered fluid by great Quantities of Diluents often repeated.

The Lixivium in which Antimony has been boiled, passed through Cap-paper, is recommended by some in Scabs, and other Diseases of the Skin.

The Fumes which arise from ignited Antimony, may be collected in white, yellow, and red Flowers, if proper Vessels are made use of, and, by adding powdered Glass, Sal Ammoniac, or Nitre, that they may rise in greater Quantities; and these Flowers being edulcorated by frequent Lotions, are emetic, cathartic, and sometimes sudorific, being given from two to twelve Grains. *Geoffroy*.

History of KERMES MINERAL.

In the Year 1714. a new Medicine appeared in Paris, and not only then acquired, but still preserves, an uncommon Character for its Virtues and Efficacies. It is called the *Carthusian Powder*, because at that Time one *Dominic*, a Frier of the *Carthusian* Order, was seized with a violent Defluxion in his Breast, which increasing more and more in spite of a due and careful Administration of all the known Medicines against that Disorder, seemed to threaten the Patient with certain and unavoidable Death. Upon which one *Simon*, a Frier of the same Order, begged, that since the Patient's Life was despaired of, he might be permitted to give him a newly invented Medicine, which he had in his Possession, and which at that time succeeded so well, that Frier *Dominic* was soon cured of his Disorder by its means, to the great Surprise of all that knew his Case. This Remedy was before in the Hands of Mr. *De la Ligerie*, of whom the *Carthusian* frankly acknowledged he had it. But for want of some remarkable Cure to command the Attention of Mankind, and a Concurrence of such other lucky Circumstances as are requisite in an Affair of that Nature, the Powder had not, in his Hands, become so famous, as it afterwards did in the Possession of the *Carthusian*. The Reputation of this Medicine growing pretty universal, the Secret of its Composition was soon discovered by some skilful Physicians, and, among the rest, by Mr. *Lemery*, who confided so much in its Efficacy, and was so sure of his being in the Right, with regard to the Method of its Preparation, that he used it in a Case of great Importance, an Account of which we shall give in his own Words,

Towards the latter End of December, in the Year 1718. the Marquis of *Bayers* was seized with a violent continued Fever, accompany'd with terrible Paroxysms, a severe and frequent Cough, a Spitting of Blood, a smarting Pain of his Side, and a considerable Difficulty of Breathing. Nothing that Art can do in a Case of this Nature, was forgot; and though all the Means, commonly judged proper, were used, both with the greatest Care and Expedition imaginable, the Patient nevertheless, in the very Beginning of the next Year, and upon the seventh Day of his Disorder, was reduced to a truly deplorable State: His Belly swell'd, and became prodigiously tense; his Spitting was entirely suppress'd, which produced an uncommon Oppression, and a Rattling of his Throat; his Pulse became small, unequal and intermitting. His Reason left him; he neither spoke to any one, nor made a Reply to any one who spoke to him: In a word, he was in just the same Condition that People on the very Verge of Death, and in their last Moments, use to be. I shall not here exaggerate the Matter, or insist upon the Importance of some Circumstances, such as that the Patient was a Person of Distinction, and a Branch of the House of *Rocheaucault*, or that he was continually surrounded, during his Indisposition, by a Crowd of Persons of Distinction, and others who were interested in his Life and Health, and who can attest the Truth of the Facts I advance. Mr. *Pradignac*, the Apothecary, and Mr. *Momblau*, the Surgeon, who attended the Patient on this Occasion, can also vouch the Truth of what I say. In fine, tho' the Extremity to which the Marquis of *Bayers* was reduced, seemed to cut off all Hopes of a Cure, I nevertheless, in spite of unfavourable and discouraging Appearances, thought it incumbent upon me, both in point of Duty and Prudence, to repeat my Attempts to the very last Period of the Patient's Life. I therefore had recourse, upon this Occasion, to the *Carthusian Powder*, the good Effects of which I had formerly experienced, especially in Disorders of the Breast; and as, of all the considerable Distempers I have known cured by this Powder, none, even that of Frier *Dominic* not excepted, had gone such a Length, or demanded so speedy Assistance and Relief, as this, I gave the Patient, at different times indeed, but very soon after each other, nine or ten Grains of this Powder; and perceiving, that it neither operated by Vomit, Stool, nor Sweat, and that his Pulse, in the mean time, became a little better, and his Oppression less, I repeated every fourth Hour, for twenty-four Hours, a Dose of three Grains of the same Powder, which, at the End of that time, produced no other Effect, than to render the Pulse a little better, and the Oppression a little less; and all this without any Evacuation either by Stool, Vomit, or Sweat. The Patient, in the mean time, remain'd without his Reason, and without Spitting, and his Belly continued preternaturally tense. But as we afterwards continued to give him some Doses of the Powder, his Breast began to grow easy, by discharging a considerable Quantity of Spit, which was hard, baked as it were, and mixed with black coagulated Blood, and which the Patient expectorated for three or four Days. And as soon as this remarkable Crisis came on, the Patient's Reason returned, his Oppression, the Tension of his Belly, and, in a word, all the other Symptoms, disappear'd; and in a short time, the Marquis of *Bayers* was completely cur'd. But what is particularly remarkable in this Cure, is not only the Recovery of the Patient from so desperate a State, but also the Manner in which the Medicine operated, and the Quantity necessary to be successively given, in order to produce the Cure; and, indeed, the Patient took thirty-six Grains of this Powder in the Space of forty-eight Hours; and these thirty-six Grains, instead of working by Vomit, by Stool, or by Sweat, as the Medicine generally does, when exhibited in a much smaller Dose, in Cases where it is attended with Success, insensibly cleared the Parts serving the Purposes of Respiration, and the Expectoration becoming, by that means, much more easy, the Patient found himself, all on a sudden, able to expectorate that prodigious Quantity, which remaining there for some Days, had become dry by the feverish Heat of the Patient, just as if it had been exposed to the Influences of the Air and Sun.

This surprising Cure, perform'd upon a Person of such Distinction as the Marquis of *Bayers*, gain'd the *Carthusian Powder* such an high Reputation, that in short, the King purchased the Secret of its Composition from Mr. *De la Ligerie* in 1720. since which Time the Public has been well enough acquainted with it. It is a Sulphur extracted from Antimony, by means of the Alkali of Nitre fixed by Charcoal. It is less emetic than the ordinary *Golden Sulphur of Antimony*, employ'd for Purposes of that Nature. It purges gently, and sometimes operates only by Transpiration, though its Effects are even then sufficiently sensible. It is principally adapted to Disorders and Indispositions of the Breast. Mr. *De la Ligerie* did not pretend to be the Inventor of this Medicine; he openly acknowledged, that he had it of Mr. *Chastenei*, to whom it had been communicated by an Apothecary, who was Scholar to the famous *Glauber*. Thus *Glauber* should, in Justice, be esteemed the original Inventor; and, indeed, this Medicine is actually described in

in his Writings, but in so enigmatical a Manner, as cannot fail to disgust People of Sense and Taste.

It is also contained in the late Mr. *Lemery's* Treatise of Antimony, not that this Chymist caught the Hint, or decypher'd the Secret in the mysterious *Glauber*; but, as he design'd in that Work to discover the Qualities of Antimony, by turning it into all the various Shapes imaginable, and combining it with all Substances from which any Effect might be expected, it was impossible but he must light upon a Combination so simple and so natural. 'Tis nevertheless certain, that Mr. *Lemery's* Process is different from that of *Glauber*. The Intention is to extract the Sulphur of Antimony. *Glauber* extracts it by the Alkali of Nitre fixed by Charcoal; then, in order to free the Sulphur of Antimony of that Alkali, with which it is impregnated, he employs Spirit of Wine, and digests it for some Days upon the nitrous Liqueur; after which he evaporates the Spirit of Wine, which leaves the Sulphur of Antimony, at the Bottom of the Vessel, either in a liquid Form, if the Spirit of Wine is not totally evaporated, or in a dry one, if it is. In the latter Case it is a red Powder, and is what is called the *Carthusian Powder*. But the deceased Mr. *Lemery* did not use the Spirit of Wine in his Process, since, by only leaving his Materials at Rest, and, as it were, to themselves, he had the same Powder, which precipitates of its own accord. Mr. *de la Ligerie's* Method is intirely the same; and Mr. *Lemery* the younger has found by Experiments, that the Spirit of Wine is of no Use, unless for the sake of having the Medicine either in a dry or liquid Form; for without the Spirit of Wine it can only be obtain'd in a dry Form.

Besides, in order to extract the Sulphur of Antimony, *Glauber* knew of nothing except the Alkali of Nitre fix'd by Charcoal: But the late Mr. *Lemery* found, that every Alkali was proper for that Purpose. Hence *Lemery* the younger concludes, that as Oil of Tartar is the strongest of all fixed Alkalies, it must of consequence be of all others the most proper in this Preparation; and a great Number of Experiments made with this very View, concur to prove his Assertion. The peculiar Property of this Medicine consists in its not being too emetic. If its emetic Quality was as strong as that of the other Preparations of Antimony, it would be thrown up by the Stomach as soon as they are, and would not have sufficient Time to diffuse and insinuate itself into all the small Vessels, where it produces its most considerable Effect, or, at least, that Effect which is peculiar to itself. Now, in order to render it less emetic than the other Preparations of Antimony, there must necessarily remain in it a certain Quantity of Alkali to bind up, and, as it were, entangle the Sulphur. And there remains more or less of this Alkali in the Sulphur, or its Action is stronger or fainter, in proportion as the fix'd Alkali, which originally acted upon the Antimony, is stronger or weaker.

In fine, the late Mr. *Lemery* has not, like *Glauber*, made this red Powder an universal Medicine, but very accurately determin'd its particular Uses, and the precise Cases in which 'tis proper, which he learnt from Experience, and in the Course of his Practice, long before the *Carthusian Powder* was heard of in the World. So that if Mr. *Lemery* has not the Glory of being the original Inventor, he has at least an Equivalent accruing from the Additions and Improvements he has made to this famous Medicine. *Hist. de l'Acad. R. 1720.*

Memoir on EMETIC TARTAR, and KERMES MINERAL.
By Mr. GEOFFROY.

The Use of emetic Tartar, when the Intention is to vomit, and of *Kermes Mineral*, when the Design is to prepare and dispose the Humors to a salutary Evacuation, can possibly be liable to no just Exceptions, if those Medicines are prescribed on proper Occasions, prepar'd with all the necessary Precautions, and the best Method of Preparation uniformly and universally follow'd: But this is not the Case; for it often happens, that three Grains of some emetic Tartar produce very considerable Effects, whereas six or seven Grains of another emetic Tartar, differently prepared, shall produce no Effects at all, and that in Constitutions nearly alike.

The Case is the same with the *Kermes Mineral*: Three or four Grains of some Kinds of it excite very faint Nausea; whereas one Grain of another Sort actually vomits, and this too in Cases where we cannot ascribe this Difference of Effects to the greater or smaller Quantity of Acid lodg'd in the Stomach, or introduced into it.

This surprising Variety calls aloud for our Attention, and deserves to have its Causes inquired into, since 'tis a Point wherein the Good of Society, and the Welfare of Mankind, are nearly concern'd.

That I might therefore discover the Causes of this Variety, I collected twelve different Parcels of different emetic Tartars, and a like Number of different Preparations of *Kermes Mineral*. The Manner in which I analysed them, and the Differences of the Substances they yielded, make up a considerable Part of this Memoir; because these Differences will be certain and infallible *Criteria*, or Marks by which we may know

the Effects to be expected from such and such an emetic Tartar, or such and such a *Kermes Mineral*, taking it for granted, in the mean time, that the Constitutions of the Patients are nearly equal. I shall, at the End of the Memoir, propose a very simple Remedy, which may in many Cases be substituted in the room of the *Kermes*, and that very often with less dubious Success.

Antimony, of which 'tis well known that emetic Tartar and *Kermes Mineral* are two Preparations, is a Mineral compos'd of a small Quantity of easily vitrifiable metallic Earth, a considerable Portion of a vitriolic Acid, and a Bitumen, or Oil of the Earth.

This Acid, in Conjunction with the Bitumen, forms the inflammable Sulphur, which sometimes abounds so much in mineral Antimony, that some of it is frequently found to burn like common Sulphur. It is this Sulphur, united with the metallic Earth of Antimony, which, when this Mineral has only undergone its Meltings for Purification, discovers, and renders observable, that surprising Multiplicity of Needles of which it is compos'd; but 'tis to the vitriolic Acid, united with the Bitumen, and forming the common Sulphur, that these Needles are owing, and not to the oily Matter alone: For, if one melts Glass of Antimony with a simple Phlogistic, such as Charcoal, reduced into a Powder, the Glass is revived into a Regulus, which is not like Antimony, adorn'd with Needles, but full of little shining Plates or Laminæ. If, on the contrary, we employ common Sulphur to revive the Glass of Antimony, we shall find in the Crucible an Antimony adorn'd with Needles, like the common Antimony; because all that this Mineral had lost, during its Calcination, is by this means restored to it; that is, its vitriolic Acid, and the Fat of the Earth, which, in Conjunction, form that common Sulphur which is necessary to constitute it Antimony.

That a vitrifiable Earth is contain'd in Antimony, may be prov'd from its being so easily vitrify'd, when by Calcination one evaporates the Overplus of the vitriolic Acid, and of the Phlogistic which hinder'd the Continuity or Contact of the constituent Parts of this metallic Earth.

1. Thus it follows, from what I have said, that this Earth, disjoin'd and divided by a great deal of inflammable Sulphur, is Antimony.

2. That some Part of the inflammable Matter being carry'd off, so that no more of it may remain than what is sufficient to continue a metallic Form to the Antimony, in that Case, a Regulus is produced.

3. That if that inflammable Matter is almost intirely carry'd off by a moderate Calcination, the metallic Earth of Antimony assumes the Form of Glass, when put in a melting Heat.

4. and lastly, That if this Calcination is carry'd on gradually, till the highest Degree of Fire is employ'd, we shall have a disanimated or inert Calx or Earth, which will be entirely destitute of the emetic Virtues of Antimony itself, of its Regulus, and of its Glass.

Some Authors, and among the rest *Kunkel*, suppose, that in Antimony there is a mercurial Principle concurring with the Sulphur and the vitrifiable Earth, to the Formation of this Mineral. This Author even describes, but in an enigmatical Manner, several Ways of discovering this Mercury; but I dare not admit this mercurial Principle, till, by some clear and unexceptionable Process I have convinced myself, that there is a liquid Mercury in Antimony.

Upon the Authority of *Kunkel*, who was an excellent Chymist, I have already begun some of these Processes, by which 'tis said this Mercury is obtain'd; and if my Experiments succeed, they will furnish me with Materials sufficient for another Memoir.

At present, I only know of three secondary Principles, which discover themselves in Antimony; a vitriolic Acid like the Spirit of Sulphur; a sulphureous, bituminous, or oily Substance, no matter which, provided, in Conjunction with the vitriolic Acid, it is capable of forming a common Sulphur; and, lastly, a vitrifiable metallic Earth.

Common Sulphur, the vitriolic Acid, and most of those oily Liquors with which it is capable of producing Sulphur, have no emetic Quality; and the inert Calx of Antimony produces no Nausea; but yet, of all these Substances combin'd together, a Mineral is form'd, from which a Regulus, a Glass, and other Preparations, may be obtain'd, which are of a violent emetic Quality.

If pounded Glass of Antimony be digested in White-wine Vinegar, till the Vinegar is so fully saturated as to receive no more Tincture from it; if this Powder is again melted, so as to vitrify; if after this it is pounded afresh, and digested in fresh White-wine Vinegar; and if this Operation is repeated several times, to a fourth or fifth Vitrification, the Glass will in this Case be black, scarce transparent, and entirely destitute of an emetic Quality, tho' the two or three first have a considerable one.

All these Vinegars are emetic in different Degrees; the first are a little more salt than the last, which seem to have an astringent Taste. They all assume a reddish Colour, by digesting upon the pulverized Glass of Antimony; but if digested upon any purely sulphureous Matter, they would assume the same Colour, but would not, on that Account, acquire an emetic Quality. The oily Part of the Vinegar must then have extracted the Tincture from that Part of the sulphureous Matter, or Phlogistic, which was concentrated in the Glass of Antimony; and the Acid of the same Vinegar must have corroded or dissolved a Portion of the Reguline Part of the Glass, or, in other Words, of that Part which is most easily reduced into a Regulus. Now 'tis already known, and I shall farther prove, that it is the Reguline Part of Antimony, in which its emetic Quality consists; or, in other Words, its emetic Virtues reside in some Combination of Sulphur, composed of a very small Quantity of vitriolic Acid, and a Portion of inflammable Matter united to a vitrifiable Earth. If this Earth has few Interstices filled with Sulphur, it will be very emetic. This is the Case with Glass of Antimony, which is one of the most emetic of all the Preparations of this Mineral. If these Interstices are either large, or very numerous, as is the Case with Regulus of Antimony, which contains more of Sulphur than its Glass, the Preparation will be a little less emetic. In fine, if these Interstices are so large as to contain more gross Sulphur than there is of this vitrifiable Earth, it will retain no emetic Quality at all, unless convey'd to it by some accidental Circumstance; as in Antimony, which does not vomit without the Aid and Assistance of some Acid.

The principal Reason why crude Antimony is not emetic, is, because the vitriolic Acid contain'd in it, is united to an unctuous Phlogistic, with which it forms a gross and bituminous Sulphur, which so ties up the Particles of the metallic Earth, that they cannot act upon the Stomach, without some foreign and adventitious Aid. But when the greatest Part of this Acid, and this bituminous Phlogistic, are carried off by Fire, or any other Means, then there only remains in the Regulus a Sulphur capable of Expansion, and consequently in a Condition to carry along with it some Particles of the metallic vitrifiable Earth, which by their Rigidity are capable of irritating the Nervous System, and exciting violent Contractions; for I suppose, that this Irritation is the first Cause of Vomiting.

It will, perhaps, be objected to me, that all I have said upon the emetic Quality of Antimony, was in a great measure known before: That may possibly be true; but, considering the relation these Things bear to what I am afterwards to advance, I could not forbear shewing, that the phlogistic or inflammable Principle of Antimony is not emetic, but so far as, after its Disengagement from its vitriolic Acid, it is united to its vitrifiable Earth; that is, so far as it approaches the Form of the Glass, or, at least, that of the Regulus; and that, in Consequence of this, the more the emetic Tartar and the Kermes contain of a Regulus that is easy to be reviv'd, the more emetic they must of course be. I now come to give an Account of the Experiments which prove this Truth.

I made use of an Ounce of each of the different emetic Tartars I collected: I beat them separately with an equal Quantity, or a little more, of black Flux-powder, compos'd of two Parts of red Tartar, and one of Nitre, calcin'd together: I put these Mixtures into different Crucibles, shap'd like inverted Cones; I held them in a melting Heat, till the Salts, being melted, had sunk down and appear'd like a settled Oil at the Bottom of the Crucible: I allow'd the Fire to go out, and the Crucibles to cool; then I broke them, and found the Regulus, which had been revived, collected at the Bottoms of the Crucibles.

I had from an Ounce of the weakest emetic Tartars, from thirty Grains to one Dram eighteen Grains of Regulus; from those of a middling emetic Quality, a Dram and an half; and from such as were most violent in their Effects, two Drams ten Grains.

The Scorize of these Essays, which were at first yellow, became afterwards green; then they assumed a blackish Colour; last of all, they were dissolved per Deliquium.

The Action then of the strongest emetic Tartars depends upon the Quantity of the Regulus of Antimony, which the Cream of Tartar has dissolved; and the more Antimonial Preparations, which have been boil'd in the Solution of Cream of Tartar, approach to the Form of the Regulus or Glass, the more violent the emetic Tartar is; because then the vegetable Acid of the Tartar acts more immediately, and dissolves more of the emetic Part of the Antimony.

If, on the contrary, this Solution of Tartar is boil'd with crude Antimony, the Reguline Parts of which are sheathed up, and defended by the gross Sulphur, this Acid will scarcely act upon it.

I powder'd two Ounces of the Cream of Tartar with one Ounce of Antimony, which had already been levigated: I boil'd that Mixture, in a large Quantity of Water, for eighteen Hours. The Liquor having assum'd a yellowish Colour, and a styptic Taste, resembling that of Vitriol, I filtrated it, whilst

as yet hot, thro' a double Paper. The Mass, remaining in the Bottom of the Matrafs, sent forth a sulphureous Smell. This impregnated Liquor being evaporated, I had Crystals of Tartar; two Grains of which, when given for a Dose, only excited a slight Nausea.

I took an Ounce of these Crystals of Tartar, thus slightly impregnated with the emetic Part of Antimony; I melted it, like other emetic Tartar, with the black Flux-powder, and found in the Crucible, when cold and broken, a great many yellow Scorize, intermingled here and there with some Grains of Regulus, which were so minute, and in so small a Quantity, that they could not, by their own Weight, collect themselves at the Bottom of the Crucible.

Tho' it is evident from this Experiment; that the Acid of Tartar acts upon Antimony, and that it corrodes a little of its Reguline Part, yet this Corrosion is so weak, that it is not possible by the Reduction to collect the Particles of the Regulus carry'd off by this vegetable Acid: It is also certain, that however fine the Powder of the Antimony is, every one of its small Parts remains always wrapt up in its gross Sulphur, and that this Sulphur defends it, and proves, as it were, a Covering against the Action of the Acid of the Tartar.

It is then proved, that before a vegetable Acid can become sufficiently emetic by its remaining upon Antimony, that Mineral must be freed as much as is possible from its gross Sulphur; that it is reduced into a very pure Regulus; and that the nearer it approaches to the Form of the Glass, without the Addition of any foreign Matter to facilitate its Vitrification, the more the Acid of Tartar, in Conjunction with the Sulphur, will carry off these rigid Parts of the metallic Earth, which I formerly said was the Cause of Vomiting. Thus all emetic Tartar, which has been prepared with the Glass of Antimony, and the Liver of Antimony wash'd, which is a Species of Vitrification, will be much more emetic than any other emetic Tartar, that has not been so prepared.

I have already shewn, by the Quantity of Regulus contained in the different emetic Tartars, which I reduced, that it is a Matter of Importance to know to what Degree this Remedy is emetic, and that very considerable Accidents may be produced by those random Prescriptions, in which four, five, or six Grains of emetic Tartar are order'd for a Vomit. If then it should be thought proper to follow my Method, in order to know in what Degree any Emetic ought to vomit, without the Operation being follow'd with any troublesome Accidents; I shall here draw up a Table of what was yielded by my several Reductions. I made Choice of emetic Tartar upon two different Extremes, that is, the weakest and the strongest; to these I always added that which to me appeared to contain the most suitable Proportion of the Regulus.

An emetic Tartar, from an Ounce of which thirty-two Grains of Regulus may be produced, contains four Grains of the Regulus in each Dram, and each Grain the eighteenth Part of a Grain, and consequently may be look'd upon as too weak.

That which yields two Drams of Regulus in an Ounce, contains eighteen Grains of it in each Dram; that is, each Grain the fourth Part of a Grain. This works very violently, unless given in a very small Dose.

Lastly, that which yields a Dram and an half of Regulus in an Ounce, contains thirteen Grains and an half in each Dram, that is, three Sixteenths of a Grain in each Grain. This is a due Proportion, and I know two Grains, or two Grains and a half of it, will vomit sufficiently; since by that Dose six or seven Sixteenths of a Grain of the Regulus are convey'd into the Stomach.

Tho' I here determine the Quantity of Regulus contain'd in each Grain of emetic Tartar, with relation to the total Product of a simple Reduction by the black Flux-powder, I do not from that mean to conclude, that each Grain of unreduc'd emetic Tartar contains precisely the Dose above specified. I know that it contains a little more: But as this Surplus remains in the Scorize of the Reduction; it would be necessary to dissolve them in Water, to precipitate the Powder of them, commonly called *Sulphur of Antimony*; and then to reduce this Powder by the black Flux-powder; in this Case we should also have from it a little Regulus. But I omit this Reduction, that my Process, serving as a Proof, may be the more short and easy.

Examination of KERMES MINERAL.

This Preparation, published by Order of the King in 1720. is made by boiling Antimony in Rain-water, quickened by the Liquor of Nitre fixed by Charcoal; which is the Alkalest of Glauber. After the Filtration of the Liquor, as yet warm, a Powder is precipitated, which, when well edulcorated, is the very Remedy of which we are treating.

The *Kermes Mineral* was, for some time, look'd upon as a Sulphur of Antimony; and, taking it for such, I examin'd it first by Desflagration, in order to know whether it burn'd in a

different Manner from Powder of Antimony, or from Golden Sulphur of Antimony.

I made three Pieces of thick China red-hot in the same Fire; upon one I let ten Grains of levigated Antimony drop; upon another I let fall ten Grains of the Golden Sulphur of Antimony of the fourth Precipitation, because that is the finest; and upon the third, as much well-chosen and high-colour'd *Kermes*. The *Kermes* affords a more bluish Flame than the other two; it consumes sooner than the Golden Sulphur of Antimony, which in burning boils like Antimony itself; these two last sending up Vapours, or a Smoke much thicker. The Smell of the *Kermes* was, in this Experiment, much less sulphureous and pungent than those of the other two. By continuing the Fire these three Substances were evaporated, and when they ceas'd to smoke, the Antimony left upon the China a reddish-brown Spot, of a Coffee-colour.

The Golden Sulphur of Antimony left a reddish Substance intermix'd with some white Points.

As for the *Kermes*, it only left a thin, white, spongy Earth, interspersed with some little yellow Spots.

I have already said, that I made Choice of high-colour'd *Kermes*, because 'tis necessary to observe, that if this red Powder has not been sufficientlyedulcorated by frequent Ablutions in Water, and that if too much alkaline Salt remains in it, it loses its Colour, when exposed to the Air, and becomes colour'd with a Flower, or white Stratum. I myself have a Mass of *Kermes* of this Sort, the Whole of which is become white, and which, as it whiten'd, lost almost all its sulphureous Odour; which Circumstance is a strong Presumption, that there is a great deal of Volatility in the sulphureous Part of this Powder; for Sulphur of this Preparation is no longer of the same Nature with the gross Sulphur of Antimony, because in it the vitriolic Acid has had its Nature alter'd by the Alkali of the fixed Nitre. In order to be satisfy'd as to this, I took of welledulcorated *Kermes*, one Part; with this Powder I extinguished in a Glass Mortar two Parts of very pure Mercury, which I had revived, without Distillation, from corrosive Sublimate, by Filings of Iron. From this Mixture there was a black Powder or *Æthiops* formed, just as when one extinguishes Mercury with common Sulphur. Yet there was this Difference between these two Preparations: The *Æthiops* made by common Sulphur is a Preparation which always yields an artificial Cinnabar by Sublimation. If the *Kermes* had been a Sulphur of the same Nature, that is, if it had contained a vitriolic Acid at Liberty to act, I should have obtain'd from my *Æthiops* of *Kermes* a Cinnabar of Antimony. Notwithstanding this, after having subjected it to the Fire in a Retort till it was almost melted, the Mercury pass'd into the Recipient without any Diminution of Weight. Only in that Part of the Neck of the Retort where it comes immediately from the Furnace, there was a small red Circle, which, by the way, was only a kind of Tincture, almost without any Consistence. At the Bottom of the Retort I found the *Kermes* melted into several small Masses detached from one another, and of a darker Colour than Liver of Antimony; some of these Masses were full of Bubbles of Air, and all of them were brittle. None of these Masses had either the Needles of Antimony, or the Laminæ of its Regulus. I believe that what facilitates this Fusion of the *Kermes*, tho' so imperfect as that it cannot be look'd upon as a Reduction, is the Portion of alkaline Salt necessarily contained in this Powder, but which is not sufficient to produce a complete Revivification of the Regulus. All these Masses were rough, with small, transparent, rigid, and brittle Needles. The Arch of the Retort was cover'd with a very fine, white Powder, interspers'd with small Groupes of the like Needles rang'd almost like a Star, with many Rays darting out from it. These Groupes of Needles were most apparent near the Neck of the Retort, where they had stopp'd upon a Bed of yellow Dust. The Difference of Colours in this sublim'd Dust and Groupes of Needles, was not easy to be discover'd, unless when I made the Experiment with a small Quantity of Matter; for when I employ'd a large one, the Fire, in melting the *Kermes*, rais'd a more turbid and brownish Substance to the Top of the Retort.

If then a Cinnabar produced by *Kermes* and Mercury is desired, we must either add a vitriolic Acid to them, or disengage that which has been laid hold on by the Alkali of the fixed Nitre, that, in Conjunction with the inflammable Part of the *Kermes*, it may act like a common Sulphur reproduc'd.

First EXAMPLE.

I took an Ounce of *Kermes*, and, during Trituration, pour'd upon it sixteen Drops of the Oil of white Vitriol, which was not sulphureous. After Trituration for an Hour, the Powder did not to me appear acid; afterwards I extinguish'd in it, by little and little, four Grains of purified Mercury: I continued the Trituration for fifteen or sixteen Hours; for the Mixture was a long time before it assumed the blackish Colour of *Æthiops*. Then, upon putting this *Æthiops* into a Retort, a yellow Sulphur, in a

small Quantity, rose into the Neck of the Retort, and then a very black and bituminous Substance; the Mercury, in the mean time, pass'd in a liquid Form into the Receiver. When I observed, that nothing ascended any longer, I augmented the Fire, melted the Bottom of the Retort, and next Day found, upon the Top of the Retort; and on the Surface of the Mass which remain'd at the Bottom, a pretty considerable Quantity of a very beautiful Cinnabar of Antimony; but it required a Melting-heat in order to sublime it.

Second EXAMPLE.

In order to disengage the vitriolic Acid from the *Kermes*, entangled and wrapp'd up in the alkaline Salt of the fixed Nitre, I took three Parts, or nine Drams, of *Kermes*; and four Parts, or twelve Drams, of corrosive Sublimate; for these are the Proportions fix'd by the late Mr. Lemery, who analysed Antimony so accurately: I put this Mixture into a Retort, and forced it by a reverberatory Heat. The Distillation yielded me Butter of Antimony in a liquid Form; which is a Proof of a Regulus being contained in *Kermes*; then a revived Mercury, and, last of all, a true Cinnabar of Antimony. I also found, at the Bottom of the Retort, a Substance like melted Antimony, with few *Scoriae*. The Top of the Retort was covered with white Flowers of Antimony.

By this Experiment it appears, that the Acid of the Sea-salt, which was contained in the corrosive Sublimate, has quitted its Mercury, in order to attack the Reguline Part of the *Kermes*, dissolve it, and convert it into Butter of Antimony: It also appears, that this Regulus, converted into Butter, has left at Liberty the Portion of vitriolic Acid, which, in the *Kermes*, before the Process, was united with the Alkali of the fix'd Nitre, with the sulphureous Part, and with the metallic Earth of the Antimony; for these are the four Ingredients in this Powder. It also appears, that at this time the Portion of vitriolic Acid, being partly disengaged from the Substances with which it was entangled, has resumed that Proportion of the Phlogistic, which was necessary for its being again converted into common Sulphur, and rising in Cinnabar, by uniting with the Mercury. I took the Mass in the Bottom of the Retort, and having reduced it by the black Flux-powder, I had twelve Grains of Regulus from the nine Drams of *Kermes*, which I used in this Experiment; that is, one Grain and a Third of Regulus were yielded by each Dram of the *Kermes*. As I repeated the whole Steps of this Process twelve different Times, upon twelve different Sorts of *Kermes*, the Products of the Reduction varied; for I have found two Sorts of *Kermes*, which, by the reductive Flux-powder, have yielded two Grains and an Eighth for each Dram of Powder, upon which the Experiment was tried: Thus that *Kermes*, the Regulus of which is so easy to be revived, is of all others the most emetic. To these Products of revived Regulus, we must add that Portion of the Regulus which has pass'd into the Butter of Antimony, and that which remained in the *Scoriae* of the Reduction.

In order to prove, still more effectually, that there is no common Sulphur in the *Kermes*; or, at least, if it contains any in the Form of common Sulphur, that it is in too small a Quantity to rise in Cinnabar with the Mercury, I put into a Retort half an Ounce of *Kermes*, well wash'd, without any Addition: I augmented the Fire by degrees, and, with a moderate Heat, there was formed, at the Neck of the Retort, a yellow Circle of real Sulphur; but it was in as small a Quantity as the red Circle without Consistence, in my first Experiment upon *Kermes* triturated with Mercury.

I have then shewn, that the *Kermes* and Mercury, joined together, cannot yield Cinnabar without the Aid of a vitriolic Acid, or the Help of corrosive Sublimate: Let us now inquire, what it will produce with the vitriolic Acid concentrated in Mercury.

For this Purpose, I put into a Retort a Dram of Turbith Mineral, rubb'd with an equal Quantity of *Kermes*: The Retort being placed in a reverberatory Heat, a little insipid Phlegm was first yielded; afterwards there was fix'd, about the Mouth of the Retort, a Vapour, which was at first white, then yellow, afterwards a pale Red, and, last of all, a deep Red, like Cinnabar. This red Colour was a little on the brownish Cast, in that Part of the Neck which was most exposed to the Fire: The interior Sides of the Retort were cover'd with a yellow and red Stratum, upon which were sublimed Groupes or Clusters of Needles, resembling those I have already mention'd. Upon taking away the Receiver, there came forth a sulphureous and very penetrating Smell: I took from the Receiver fifty-two Grains of revived Mercury; and the Retort being cut, I found at its Bottom a Mass, divided into several Parts, which, as to their Colour, had a Metallic Appearance; but were spongy and rough, with many white and shining Needles.

Thus, in this Experiment, the vitriolic Acid of the Turbith Mineral abandons its Mercury, in order to seize or attack the

the Phlogistic, the Alkali, and the Metallic Part of the *Kermes*; a Part of this Acid, being united to the Phlogistic, was again converted into burning Sulphur: This made up the yellow Circles about the Neck, and at the Top of the Retort; for, upon taking some of it off, I saw it burn like Sulphur. A Part of this regenerated Sulphur was joined to some Portion of Mercury, and sublimed into Cinnabar; at least the red Circle to me appear'd a true Cinnabar. At last the rest of this Acid was concentrated with the Reguline Part, and was the productive Cause of all those Needles with which the Masses, in the Bottom of the Retort, appear'd rough.

This same vitriolic Acid of the Turbith Mineral finds, in the red precipitate Mercury, Materials for subliming another Substance, which is neither a Cinnabar, nor a corrosive Sublimate. Tho' the two following Experiments seem to have little relation to our present Subject, they nevertheless deserve our Attention.

I put into a Retort a Mixture of one Dram of Turbith Mineral, and one Dram of red Precipitate: These two Substances, at first, yielded an Acid, which was of a nitrous Taste and Smell; afterwards there appear'd a Steam of a very strong sulphureous Odour; which must have proceeded either from the Phlogistic of the Mercury, or from that of the Spirit of Nitre, no matter which.

One Dram and twenty-four Grains of Mercury pass'd into the Receiver, and the Remainder was sublimed to the Neck of the Retort, in the Form of a white Mercurial Salt; which is not a corrosive Sublimate, but a Turbith sublimed, since it does not dissolve in Water, but becomes yellow in it, just as Turbith Mineral does.

Turbith Mineral, put alone into a Retort, only yielded thirty-one Grains of liquid Mercury each Dram: Besides, it was necessary to augment the Fire so far as to melt the Retort, at the Bottom of which there remain'd a white Spot, which had penetrated the Substance of the Glass; and in the Neck of the Retort, I found, sublimed, a little yellow Sulphur, regenerated, probably, with the Phlogistic of the Mercury, and a white compact Substance, which neither dissolved nor changed its Colour in Water; which was also the Case with the white Spot at the Bottom of the Retort. This white indissoluble Substance is, according to *Kunckel*, the Salt which was lodged in the Oil of Vitriol, and which the Mercury had Strength enough to raise. This may possibly be what the same Author, in several other Passages, calls the Salt of Metals; for, according to him, that Salt is contained in the Oil of Vitriol. It is well known, that the red Precipitate, forced by a great Fire, revives of itself without Addition: Each Dram of it yields from sixty-five to sixty-six Grains of Mercury: There remains in the Bottom of the Retort a reddish-grey Earth; and about its Neck there appear three Circles, one red, another yellow, and the third white.

A Dram of the same Precipitate, being distill'd with an equal Weight of well-washed *Kermes*, yields an acid sulphureous Liquor: There appears on the Top, and about the Neck of the Retort, a very small Tincture of Red, and sixty-five Grains of Mercury are revived.

A Dram of the same red Precipitate being distill'd with an equal Quantity of levigated crude Antimony, the Mercury was less quickly revived than in the two preceding Experiments; because the Flowers which rose from the Antimony being in great Quantity, the interior Sides of the Retort were, by that means, render'd less smooth, and the mercurial Vapours must of Consequence have slipp'd over them with the more Difficulty: Nevertheless, when all the Mercury was collected, it amounted to sixty-six Grains, full Weight. Thus it appears, from these three Experiments, that in one Dram of red Precipitate there are only six or seven Grains of the Acid of Nitre.

But to return to *Kermes*; I have shewn, that this Powder, which one would be inclined to take for a Sulphur, is the very Metallic Part of Antimony, since both a Butter and a Regulus of Antimony may be procured from it; but the inflammable Sulphur of Antimony has changed its Nature: The Alkali of the fixed Nitre has, in Conjunction with it, formed a Liver of Sulphur, which is divided and suspended in the Liquor, during the Ebullition, by which the *Kermes* is to be extracted. It is sufficiently known, that Liver of Sulphur has a Power of dissolving all Metals, Gold not excepted, when fused with it. It is true, *Kermes* is not prepared by a Liver of Sulphur in Fusion; nevertheless, when simply dissolved in Water, there is nothing to hinder it from attacking the Metallic Part of Antimony: And this is so true, that if Rain-water be too much charged with alkaline Salt, there is precipitated from it a *Kermes*, from which, by the black Flux-powder, one procures a great deal more of Regulus, than if the *Kermes* had been prepared by a less acid Liquor. *Kermes*, then, is nothing more than a Liver of Sulphur, impregnated with the Metallic Part of Antimony; but this Metallic Part is, in it, divided into extremely small Particles; and the finer these are, the less emetic will the *Kermes* be: Thus, after the *Kermes* is prepared according to the Process published by the King's Order, which is, of all others, the best,

if a Species which shall only act, as it were, by colliquating the Humours, without exciting a Nausea, be desired, we must take a Dram of *Kermes*, put it into a pretty large Matrafs, pour four Pounds and an half of Water upon it, in which two Drams and an half of fix'd Nitre must be dissolved, which has been before dissolved, filtrated, evaporated, and reduced into a dry Form, in order to depurate it from a pretty considerable Sediment, which it leaves upon the Filtre; lastly, it must be boil'd: A greyish Earth, and the grossest Portion of the Regulus will precipitate, and by pouring off the Liquor, and allowing it to cool, we shall have a *Kermes* very fine, very red, and much surer in its Operation, when it is not given with a View to vomit; for this corrected or rectified *Kermes* can never prove emetic, unless by Accident, when some other Circumstance concurs to make it so. It is true, by this Rectification near one half of it is lost.

As to unrectified *Kermes*, as we often find some of it, which is not prepared with all the necessary Precautions, that the Reguline Part may be sufficiently divided and attenuated in it, I believe one may, with Safety, substitute in its room Antimony itself, prepared in the following manner:

Take Hungarian Antimony, in small Pieces; make Choice of that which has beautiful shining Needles; reduce it to a Powder, and pass it thro' the Searce; then levigate it with Water till it ceases to crackle under the Teeth: Afterwards put it in a Bowl-full of Water; stir the Water with a wooden Spatula; and after having allowed the grossest of the Powder to subside for twelve or fifteen Seconds, pour off the Water, by Inclination of the Vessel, upon one or more Filtres. Take the subtle Powder which remains upon these Filtres, and dry it in a Stove: When it is sufficiently dry, levigate it afresh, adding a Dram of very dry Sugar-candy, powder'd, to each Ounce of the Powder of Antimony; and continue to pound it till such time as when you spread a little of the Powder with a Knife, you may not, in a clear Light, perceive any shining Particles.

'Tis long since the Powder of Antimony was extoll'd as an excellent Remedy against Disorders of the Lungs, as a fine Resolvent in an Asthma, and in many other Disorders.

In 1674. *Kunckel*, being racked with very smart Pains in his Right Arm, consulted *Sennertus*, a Physician in *Wittemberg*, and Son to the famous *Sennertus*, who ordered him to use Antimony; which he did for the Space of a Month, and by its means had his Pains removed.

In 1679. the same *Kunckel* had recourse to levigated Antimony, for severe Gout-pains both in his Hands and Feet. He formed it into Troches, and got cured by its means. These Antimonial Troches are still known in some Towns of Germany, by the Name of *Kunckel's Troches* (particularly at *Frankfort and Nuremberg*).

If my Testimony can add any Sanction to this Matter, I can boldly venture to assure the World, that this Mineral, in fine Powder, is a sovereign Remedy for Rickety Children, or such as have Knots on their Joints, and for all those who have obstructed Glands. It produces very good Effects in Children tormented with Worms; and I have known Women labouring under a *Fluor Albus*, who, after using the common Remedies in vain, have been cured by this Powder: But, at first, it should only be given in very small Doses, not exceeding a Grain. And tho' Antimony is not of itself emetic, it is, nevertheless, proper to add to the Powder of it three or four Parts of some Alkali, such as Crabs-eyes, or any other of the like Nature. The Dose should be augmented by degrees; and thus one may, at last, venture upon eight or ten Grains a Day. If the Doses were increased too fast, they would produce Gripes in the Intestines, purge the Patient, or bring on a Nausea: The Patient must also be cautioned against the Use of Wine, except it be very mellow. He must also abstain from Vinegar, and every other Acid, and even from Soups, in which acid Herbs, such as Sorrel, &c. have been boiled.

From what has been said, it follows:

1. That the emetic Quality of Antimony is lodged in its metallic vitrifiable Earth, which is already well enough known to Chymists; that emetic Tartar does not vomit, but because it is impregnated with a great many gross Particles of this Earth; and that by reducing it, by the black Flux-powder, we may know in what Degree it is emetic.

2. That the *Kermes* is a Liver of Sulphur, which has dissolv'd a Portion of this Metallic Earth, but more subtly than the Acid of Tartar does: That one may rectify Antimony so as to render it simply resolvent and diaphoretic: And lastly, that a fine Powder of Antimony may be substituted in the room of the *Kermes Mineral*. *Mem: de l'Academie Royale, 1734.*

Farther Observations on KERMES MINERAL, by Mr. Geoffroy.

In 1734. I presented a Memoir in two Parts; the first on Emetic Tartar; the other on *Kermes Mineral*. This second Part

Part not containing a sufficient Examination of that Preparation of Antimony, I thought it necessary to add thereto the Supplement which follows; in which I first examine the *Kermes* prepared by Ebullition, then the *Kermes* prepared by Fusion, but both with the Assistance of Alkaline Salts; after which, I hope to shew, that Antimony, treated with Acids, yields a Preparation not much different, as to its Effects, from the Preparations obtained by Alcalis:

Antimony, tho' already analysed by an able Hand, may still supply us with a Set of Facts, which, if sufficiently adverted to, will only confirm what the late Mr. *Lemery* has published concerning it, and render our Chymical Examination of this Mineral the more complete.

KERMES prepared by Ebullition.

The following Experiment required an indefatigable Patience, since the Process was seventy-eight times repeated upon the same Antimony, and with the same Lixivium of Alkaline Salts. There are not, indeed, any dazzling Circumstances in such a tedious Operation; but the Mind is sufficiently recompensed for its Labour, by being satisfied with regard to the Truth of a Fact which was formerly dubious; and by being put in a Capacity of proving, that, by a still greater Degree of Patience and Perseverance than I used, it is possible to reduce the Whole of Antimony into *Kermes*, except some Sediments, which shall be examined separately.

I shall shew, at the same time, that *Kermes* is no more than a Magistery, or a Precipitate of the Reguline Part of Antimony, divided into extremely fine Particles, which are cover'd, as it were, with a Stratum of Liver of Sulphur, and consequently with a sort of Varnish, composed of an alkaline nitrous Salt, and a gross or inflammable Sulphur of the Mineral: That the alkaline Salt may be disengaged from the *Kermes*, and subjected to the Senses, by being made a Basis for regenerating the Nitre, and the Sea-salt, in order to form a vitriolated Tartar: That we may also separate from the *Kermes* a white Earth, difficult to be perfectly known, and which belongs either to the alkaline Salt, or to the Antimony, or to the Water employ'd in the Ebullitions, or perhaps to all the three.

In order to procure this Magistery, I have exactly followed the Process published by the King's Order; that is, I took a Pound of *Hungarian* Antimony, broken in small Pieces, according to the Direction of its Needles; four Ounces of the Liquor of Nitre, fixed by Charcoal, and well filtrated; and a Pint of Rain-water. After two Hours Ebullition I filtrated the Liquor, whilst as yet hot, which precipitated the *Kermes* as it cool'd. At a second Ebullition I added three Ounces of fresh Liquor of fixed Nitre, and one Part of Rain-water. At a third Ebullition I pour'd, upon the decanted Lixivium, two Ounces more of the same alkaline Liquor, and a Pint of Rain-water. This is the Process published by the King's Order, strictly followed. I extracted from it a *Kermes*, which, when welledulcorated, and sufficiently dried, weighed only one Dram sixty Grains, tho' the Antimony had lost two Drams.

I repeated the same Process with four Pounds of fresh Antimony, one Pound of the Liquor of fix'd Nitre, and four Pints of Rain-water. At the second and third Ebullitions, I added, first, twelve Ounces of alkaline Liquor, and four Pints of Water; afterwards eight Ounces of the same saline Liquor, and four Pints of Water more. These three Preparations yielded an Ounce and two Drams of *Kermes*; and the four Pounds of Antimony lost seven Drams and an half.

If the Products of these two Processes, when compared, had born a Proportion to the Substances employ'd in them, I should have only had, by the second Operation, seven Drams and twenty Grains of *Kermes*, and the four Pounds of Antimony should have lost an Ounce. But 'tis probable, that this Difference in the Diminution of the Weight of the Antimony proceeds from the Difference of the Surfaces of that Mineral; which, in the second Operation, did not amount to four times the Sum of the Surfaces in the Pound of Antimony employ'd in the first Operation: As for the Augmentation of Weight in the *Kermes*, in the second Operation, may not one account for it by saying, that a large Quantity of alkaline Salt sooner forms a proportionably greater Quantity of Liver? That the more Liver there is, the more Reguline Particles will be disengaged; and that the more of these Particles are disengaged, the more there is of this saline and sulphureous Varnish, which I mentioned; and that there must consequently be more Weight, since more Circumstances concur to augment it? Besides, 'tis well known, that the Products of a great many Operations, when perform'd upon small Parcels, are never equal, in Proportion, to the same Operations when performed upon large ones.

That I might still more effectually discover what passes in the Process of *Kermes*, and what Substances are separated from the Mineral, I took the Antimony of the two preceding Operations, weighing five Pounds all but nine Drams and an half of Loss. I also took the Liquor of the fixed Nitre, which had served in the six preceding Ebullitions, and of which I had two

Pounds thirteen Ounces; and, without adding any thing to it at each Operation, except well filtrated Rain-water, I made thirty Ebullitions, and as many Precipitations, one after another. From the Vessel there arose a sulphureous Steam, which blacken'd Silver when held above it: One might also not only discover this sulphureous Smell, but likewise that of a strong Lixivium, mixed with a small Quantity of an urinous volatile Substance.

This Steam, being condensed and collected in a Glass Head, turned the Syrup of Violets green, slightly render'd the Solution of corrosive Sublimate milky, and precipitated into a bright citron Colour the Solution of Mercury in the Spirit of Nitre.

At each Ebullition the Liquor of the Nitre, as I have already observed, disengaging some of the Particles of the gross Sulphur of Antimony, there was a Liver of Sulphur form'd by them. This Liver dissolves or divides the Reguline Part of the Mineral, and this Division is facilitated and promoted by the Attrition of the Parts of the Antimony, which the Ebullition keeps in continual Agitation.

This Attrition, caused by the Ebullition, appears to be necessary in this Process of the *Kermes*, because the alkaline Salt of the Lixivium cannot act upon the Reguline Part till the gross Sulphur of the Mineral is disengaged from it, in order to join itself to this Alkali, and form the Liver, which proves a Dissolvent to this Reguline Part: Now, without this Attrition, the Alkali could only form the Liver, with the Sulphur of the first Surfaces of the Pieces of Antimony. In this Case there would be a small Quantity of Liver, and consequently a small Dissolution of the Reguline Part. For this Reason, the first Ebullition never yields so much Precipitate as the second, nor the second so much as the third. This Progression has, nevertheless, its Bounds, beyond which it does not go.

The alkaline Liquor, being sufficiently impregnated with the Sulphur, and the Regulus of Antimony, ceases to act, and must be filtrated; first, that, upon the Filtre, it may disengage itself from the gross and unattenuated Parts of the Antimony, which have been detach'd from that Mineral by the reiterated Attritions during the Ebullition; and secondly, that, as it cools, it may deposit the Parts of the same Mineral, which have been sufficiently divided by the Liver, and which are become fine enough to pass through the Filtre with the Liquor as yet warm.

As long as the Liquor is hot, it is kept in a Motion rapid enough to hinder the fine Particles of the *Kermes* from reuniting into too large Molecules. In this Case the Particles pass thro' the Pores of the Paper with the same Ease the Liquor does: But, in proportion as the Liquor grows cool, the Rapidity of the Motion ceasing by degrees, these same Particles are collected, agglutinated to each other, and compose Molecules of such a Size, that they can no longer be suspended in the Liquid, but fall to the Bottom in a Magistery. It is impossible but the Lixivium must, at each Ebullition, lose a small Portion of its alkaline Salt; since this Portion must have been employ'd to compose the Liver, which has corroded the Reguline Part of the Antimony, precipitated with this same Portion of the Liver, under the Form of a red Magistery: For I shall afterwards shew, much more clearly than I have hitherto done, that *Kermes* is a Magistery of the Regulus of Antimony, united to the gross Sulphur of that Mineral, and to a small Portion of the alkaline Salt, which may be disengaged from it; or, in other Words, it is an Antimony which is not, strictly speaking, destroy'd, but of which the Arrangement of the Parts is changed by disengaging the gross Sulphur from the Interstices it possesses, which occasions a Rupture of the Sides of these Interstices, which, changing both their Situation and Form, mix with the new Compound of the Liver, and make it appear a Magistery, more or less coloured, in proportion to the Quantity of Alkali and Sulphur which is united with it.

But if it is not possible, that the alkaline Liquor shall not lose a small Portion of its Salt at every Ebullition, one may easily conceive, that it must only lose very little at each time; since, without the Addition of fresh Salt, it is able, after the Filtration, to act again upon the Antimony for a considerable Number of Times; and since thirty repeated Ebullitions of five Pounds of Antimony yielded seven Ounces of *Kermes*, always as beautiful and fine as the *Kermes* yielded by the first six Ebullitions, performed upon one Pound, and afterwards upon four Pounds, of this Mineral.

Observing that, at the thirty-sixth Boiling, this Liquor acted almost as well as at the six first, I made it serve for twenty more Boilings, without any other Precaution than putting aside the small Needles of Antimony, which increased, in Quantity, in proportion as the Boilings were multiplied. These twenty additional Ebullitions still yielded me five Ounces three Drams and an half of *Kermes*; whereas I had only seven Ounces from the first thirty Ebullitions.

I made ten Ebullitions more, which still yielded me four Ounces one Dram and an half of *Kermes*. Thus these thirty last Ebullitions yielded me two Ounces and five Drams of *Kermes* more than the first thirty. This Augmentation of the Product proceeds, as I have above observed, from this, that the Attritions

Attritions of the Pieces of Antimony being multiplied, new Surfaces are thereby discovered, which furnish a new Sulphur to the alkaline Liquor; and this Sulphur, being added, renders the Liver more active and penetrating; or, in other Words, makes, as it were, a new Liver at each Ebullition.

There remains, as I have said, upon the Filtres a pretty considerable Quantity of fine Needles, mixed with a sort of earthy Sediment: I boiled this Sediment, which weighed near eight Ounces, twelve times, with the same alkaline Liquor, and it yielded me two Ounces three Drams and an half of *Kermes*.

By these seventy-eight Ebullitions I had, from my five Pounds of Antimony, one Pound four Ounces four Drams and twenty-four Grains of *Kermes*. It is not easy to tell, precisely, how much the Antimony lost of its Weight; for, perhaps, it retained, in the Interstices of its Needles, a certain Quantity of alkaline Salt, since it still weighed three Pounds six Ounces; which, joined to the Weight of all the *Kermes* drawn from the seventy-eight Ebullitions, yields an Augmentation of two Ounces four Drams and twenty-four Grains, including the Weight of the muddy Substance, deposited on the Filtres: Thus 'tis evident, that this Augmentation must be owing either to the Union of a Portion of the alkaline Salt with the rest of the Pieces of Antimony, or to the Union of this same Salt with the precipitated Magistery. There is no Doubt to be made but the alkaline Salt is united to this Magistery: This I asserted in my former Memoir, but shall prove it in this: But I cannot, in like manner, prove the Union of this Salt with the Antimony; so that this Point must remain conjectural. I shall now examine the Lixivium, which remained, of the seventy-eight Ebullitions: I distill'd it, and the first Steams furnished a gently sulphureous Liquor, which gave Marks of an urinous Volatile, of which I shall afterwards speak. About the Middle of the Distillation, a small Quantity of white Earth was precipitated.

After the Separation of this first Earth, I continued the Distillation of the Liquor, till a Pellicle appeared on its Surface, upon which long Crystals were formed in it, the finest of which melted a little on the Coals, and consequently must have been nitrous.

But as these Crystals were still mixed with a muddy, fat, and coarse Matter, I made a fresh Solution of them in Rain-water, and there was precipitated a second white Earth like the first, and which weighed four Drams sixty Grains. The Liquor which was separated from this Earth being evaporated, new Crystals were formed in it, but like those of a foliated Earth, that is, in flat Leaves almost square, some of which were nevertheless triangular. They only preserve this Figure so long as they are kept dry; for as soon as they are exposed to the Humidity of the Air, they quickly run *per Deliquium*, and in that State, tho' indeed slowly, crystallize themselves again; and in a fat Sediment which is deposited, resume the Forms of prismatic Crystals, no Part of which is any longer fusible upon Coals; upon which they crackle, and break like vitriolated Tartar; tho' that Crackling does not in the least resemble the Decrepitation of Sea-salt.

However hot the Coals may be render'd by blowing them, these Crystals do not melt upon them, but are converted into an earthy white Substance, which has the same Appearance with that Earth which had subsided before their first and second Crystallization.

These Crystals, as I have said, were form'd in a fat and unctuous Sediment proceeding from the Solution *per Deliquium*, or Mother-water of the Crystals, in the Form of foliated Earth. I shall now examine this Solution by Distillation. I made use of five Ounces of it, which at first yielded an aqueous Liquor, which smell'd like animal Substances when under Distillation. There was afterwards yielded a volatile urinous Spirit, which was sufficiently pungent, of a beautiful Yellow, and which weigh'd two Drams. And lastly, there remained in the Retort two Ounces two Drams and an half of a Caput Mortuum, which, being subjected to a greater Fire, yielded six Grains of a volatile Salt, in a concrete or dry Form. After having broken the Retort, I found a white and red Mass, from which exhal'd an ammoniacal Smell, like that which comes from Vessels in which Sublimations of Sal Ammoniac have been made.

This Mass, when broken, resembled the *Scoriae* of Regulus, and was full of Bubbles or Cavities, which were interspersed with small Grains of a fine and sparkling Regulus, which had been reviv'd during the Fusion. These *Scoriae*, or saline Masses, as they became moist by being expos'd to the Air, assum'd a greenish Colour, and smell'd like Liver of Antimony. They would have been entirely dissolv'd *per Deliquium*, if I had left them long expos'd to the moist Air; but that I might produce this Effect the sooner, I pour'd boiling Water upon them, which assum'd a brownish-green Colour. Upon filtrating it when hot, there remain'd upon the Filtre a green Matter, which consisted of Sulphur; and there pass'd thro' the Pores of the Paper a Liquor, which, as it became cool, allow'd a pretty considerable Quantity of *Kermes* to subside.

VOL. I.

This saline Liquor, swimming above the new *Kermes* when evaporated, yielded me Crystals of different Nature from those of the foregoing prismatic Salt. These Crystals melt pretty soon, and appear to be a crystalliz'd Alkali, or an alkaline sulphureous Salt, which, while it remains in that State, may be call'd a Salt of the Liver of Antimony; for it has at one and the same time a lixivial Taste, and a Taste of the Liver; but if that sulphureous Salt is dissolv'd with cold Water, there remains a true vitriolated Tartar at the Bottom of the Solution.

This sulphureous Salt or Liver bubbles upon burning Coals, and becomes yellow, which is a Proof, that there is Sulphur contained in it. It blackens and corrodes the Plate of Silver upon which it is melted by the Fire, and turns the Syrup of Violets green. It makes an orange-coloured Precipitation in the Solution of corrosive Sublimate, and on the Surface of the Liquor leaves a sulphureous Pellicle floating, which, when taken off, burns like the common Sulphur. In a Word, it has all the Characters necessary to give it the Denomination of a sulphureous Salt, or Salt of the Liver of Antimony. It is different from the Salt which may be extracted from the Liquor of fixed Nitre, which has not pass'd thro' the Ebullitions with the Antimony; for from that Liquor evaporated, I had only some few long and prismatic Crystals, like those I have above described, and which, like them, became white upon the Fire, without either melting or decrepitating; and which also, like them, burst with a crackling Noise.

I now return to the white Substance deposited during the Crystallization of the sulphureous Salt, or Salt of Liver of the Lixivium of seventy-eight Ebullitions of *Kermes*. To look at it, one would take it for diaphoretic Antimony; but it is no such thing, because Aqua Regia dissolves it, but has no Effect upon common diaphoretic Antimony. It ferments with the Acids of Nitre and Vitriol. A Regulus is reviv'd from it upon burning Coals; and before it rises, one sees small Flashes break from it of the same Colour with the Flame of Sulphur, and which disappear instantly. As this Powder is not diaphoretic Antimony, so neither is it the *Materia Perlata*, since Acids do not act upon this last Preparation, any more than on diaphoretic Antimony. All the white Substances which I separated from melted Antimony, with different alkaline Salts, were of the same Nature with that I have now mention'd. And as I know no Preparation of Antimony to which I can compare it, why may we not call it a white *Kermes*, or a white antimonial *Magnesia*, since, when taken internally, in a small Dose, it proves diaphoretic, and does not excite a Nausea?

I now resume the Examination of *Kermes*, which I propos'd to make, and which is a necessary Supplement to my former Memoir.

This Powder is always found of different Colours, in proportion as the alkaline Liquor employ'd has been more or less concentrated. If it is richly impregnated with Salts, the *Kermes* will be of a very deep Red; or, which amounts to the same, if the Ebullition has only lasted for a short time, the *Kermes* will be pale; because there will not be enough of Phlegm evaporated from the Liquor, in order to concentrate the Salts. In order to prove this, we need only pour a fresh, pure, boiling Water upon the Filtre, on which the boiling Liquor which contains the *Kermes* was pour'd, and the *Kermes* will by that means be much paler than it would have been without this Addition of Water.

When we let a Dram of *Kermes* drop into three Drams of Aqua Regia made of the Spirit of Nitre, and the Spirit of Salt, the Dissolution is made with a great Ebullition, and an intense Heat, and from the Spirit of Nitre arise very red Vapours. When the Ebullition is at an End, the Smell of the Mixture is chang'd, and becomes sulphureous. After the Fermentation is totally over, there remains a yellow Sediment, above which there is a Liquor upon whose Surface a sulphureous Pellicle appears, which, when taken off with a Piece of Paper, burns like common Sulphur. I wash'd and dry'd this Sediment, and next Day found a Globule of liquid Mercury, weighing somewhat more than the Fourth of a Grain. Now, on Supposition, that this Globule of Mercury was found there, without any Circumstance that could lay a Foundation for our suspecting, that it exist'd formerly in the Antimony, it would be no more than the two hundredth and eighty-eighth Part of the Dram of *Kermes*, upon which this Experiment was made, which is far from being the Quantity of Mercury which several Authors maintain may be extracted from Antimony, by raising it in Flowers with Sal Ammoniac, and by reducing these Flowers by fixed Salts. I can affirm, by the way, that the Glass Vessels I used on this Occasion, had never been employ'd in any Process where the least Mercury had been an Ingredient: But I must at the same time confess, that having repeated the same Process with other *Kermes* of the same Preparation, and the like Aqua Regia, I could never see any more Mercury.

The white Powder, in the Middle of which this Mercury was found, weigh'd forty-two Grains. I put it into a Retort, in order to raise the Quantity of Sulphur it might contain.

This Sulphur rose with the first Fire, and adher'd to that Part of the Neck of the Retort, where it comes out of the Furnace. Afterwards there appeared a black Circle, then a third white Circle of the Flowers of Antimony, or rather of the Regulus, interspersed with small Needles. The Liquor in the Receiver was charg'd with sulphureous Flakes. In fine, the red Mass, at the Bottom of the Retort, was a Species of *Crocus Metallorum*, or rather a *Magnesia Opalina*, which is made, as is well enough known, with Nitre and Sea-salt. Now in this Experiment, I employ'd an *Aqua Regia*, compos'd of the Acid of Nitre, and of the Acid of Sea-salt. These two Acids reassum'd a Basis in the alkaline Salt of the *Kermes*, became regenerated, and operated during the Fusion; which Effect these two Salts, mix'd with Antimony, produce in the ordinary Process of the *Magnesia Opalina*. The Regeneration of these two Salts with the Alkali of the *Kermes* will be more fully prov'd afterwards. From this long Detail it follows, that the *Aqua Regia* does not dissolve the whole reguline Part of the *Kermes*; that, in all Appearance, it only attacks those Particles of it, some of whose Surfaces present themselves naked to the Action of this Acid; that such of them as are cover'd with a continued Layer of the sulphureous Matter of the Liver, resist the Action of the *Aqua Regia*; that one cannot by means of this Acid exactly separate the sulphureous Parts of the *Kermes*, because the white Powder which precipitates from it, contains, together with the gross Sulphur, a considerable Portion of the Regulus, which may well be supposed to make up the half, or thereabouts, of this Powder. But notwithstanding this Inconvenience, *Aqua Regia* is the most proper Acid for making the Separation of the gross Sulphur which is still naturally in the *Kermes*; for if I employ the Spirit of pure Salt, it corrodes the reguline Part, and subtilizes and attenuates the Sulphur so strongly, that for the most part it evaporates; so that when I pour Rain-water upon this Dissolvent, all the Regulus of the *Kermes*, and that which remains of the Liver, and of the alkaline Salt, are confusedly precipitated into a white Powder, which would be a true Powder of *Algaroth*, (or *Mercurius Vita*) if we had not Reason to suspect, that it precipitated itself with a Portion of the alkaline Salt of the *Kermes*. In fine, there is no floating Sulphur separated from this Precipitate, as happens when I make use of *Aqua Regia*.

If instead of the Spirit of Salt I employ the Spirit of pure and concentrated Nitre, there happens, so soon as it is poured upon the *Kermes*, so great an Effervescence, that there is no Doubt to be made, but the Mixture would take Fire, if the oily Principle of the gross Sulphur of this Powder was more disengaged from the vitriolic Acid which retains and clogs it. The red Vapours of the Spirit of Nitre even become impregnated with a Part of this Sulphur, which volatilizes itself during the Effervescence, since being collected by a Glass Head, or any other means, they turn to a Spirit of Nitre of a greenish Tincture. But notwithstanding this great Effervescence, there is no Dissolution of the reguline Part of the *Kermes* made; since, if the Mixture is allow'd to settle after the Effervescence is over, and if after this you pour off the Acid which swims above the Powder now become white, you precipitate nothing of that Regulus by pouring Oil of Tartar upon it.

This *Kermes* becomes white by the Action of the nitrous Acid, and, forc'd by the Fire in a Retort, yields a great deal of burning Sulphur, and red Flowers of Antimony, and leaves a whitish Mass of the Calx of Antimony; yet this Mass being still united to a considerable Portion of the gross Sulphur of Antimony, which it quits with Difficulty, remains a little yellowish, and interspersed with red Points on its Surface. If it is strongly forced by the Fire, it vitrifies in some measure; and the Acid of the most fixed Sulphur, or even the entire Sulphur, which the Fire has not been able totally to expel, forms antimonial Needles, with the rest of the reguline Part, which is not become vitrified.

By substituting in the room of *Aqua Regia* the Spirit of Salt, and the Spirit of Nitre, a well concentrated Oil of Vitriol, there only ensues a Smeil of Sulphur, which the Fermentation augments; but no gross inflammable Sulphur is separated, as it happens, when *Aqua Regia* is employ'd. We must then use a Menstruum capable of dissolving the reguline Part of the *Kermes*, if we incline to prove the Existence of a gross Sulphur united with the *Kermes*; and this Menstruum or Dissolvent is *Aqua Regia*. I now go on to other Operations.

I shew'd, in my former Memoir, that from an *Æthiops* compos'd of *Kermes* and Mercury, I had a Cinnabar of Antimony, especially when I employ'd a certain *Kermes* among the Number of those I had bought. I can now affirm, with a kind of Certainty, that this *Kermes* was chang'd by an Addition of common Sulphur, since with the Mercury and *Kermes* of my seventy-eight Ebullitions, I could not sublime a true Cinnabar, but a red, sulphureous, or bituminous Substance, which, by a violent Fire, melts and runs along the Sides of the Retort like *Spanish Wax* melted, which it resembles in its Colour and Lustre. This same Experiment laid a Foundation for my examining the following Phenomenon:

I mixed two Drams of my *Kermes* with two Drams of very pure Mercury. We have pretty good Reason to suspect, that during the Trituration, which lasted for a considerable while, there might have been some small Globule of the Mercury lost. Nevertheless, by forcing this *Æthiops* with a strong Fire, two Drams and five Grains of Mercury were reviv'd. We can only ascribe this Augmentation of Weight to the *Kermes*; and this I had observed in my Experiments made in 1734: tho' I made no mention of it in my Memoir. I do not from this pretend to conclude, that the *Kermes* supply'd the Mercury I employ'd with this additional Mercury, but that there was an Amalgama form'd of five Grains of the Regulus of *Kermes* with the two Drams of Mercury. This is prov'd by the Mercury's remaining fat, less shining, and leaving a Tail, as all Mercury incorporated with any metallic Substance does. Thus this might be a way, tho' indeed a pretty tedious one, of making the Amalgama of Regulus of Antimony and Mercury, which is known to be a pretty difficult Affair, and for which the late Mr. *Homburg* employ'd a Regulus of Antimony, in the Preparation of which Copper was an Ingredient.

The Mass of *Kermes*, reduced to a *Crocus Metallorum*, which remained in the Retort, being separated from some sublim'd Parts of the inflammable Sulphur, and from some of the antimonial Flowers, weigh'd only one Dram and thirty-nine Grains. I boiled this in Rain-water, in order to dissolve its Salt; and this Lixivium precipitated into a yellow turbith Colour the Solution of Mercury in the Spirit of Nitre. Now this yellow Colour shews, that I was not mistaken, when, in my former Memoir, I advanced, that by the Assistance of a great Fire, and by the Interposition of Mercury, which yet only serves in this Case to divide the different Substances composing the *Kermes*, one might disengage from the gross Sulphur united to this Matter a Portion of the vitriolic Acid essentially join'd to this gross Sulphur, transfer this Portion of Acid to a Part of the alkaline Salt of the same Powder, and form by this new Union a vitriolated Tartar, since in the present Experiment I precipitate the Mercury into a yellow turbith Colour, as happens when a Solution of common vitriolated Tartar is used for that Purpose.

This same Mass, when its Salts were thus dissolv'd, weigh'd only eighty-four Grains and an half; so that there were in my two Drams of *Kermes* twenty-seven Grains of a Salt which I cannot ascertain to be entirely a vitriolated Tartar, because there might have still remain'd in it a Portion of the alkaline Salt, which might not have been acted upon by the Acid of the Sulphur. But this Precipitation of the Mercury into a yellow turbith Colour is sufficient to prove what I have said upon this Point, which is, that the Acid may be disengaged from the inflammable Principle, since in the present Case it quits it, in some measure, in order to unite itself with the alkaline Salt of the *Kermes*. And indeed it is shewn not only by this, but also by the preceding Experiments, that *Kermes* is a Mixture of the Regulus of Antimony, of the gross Sulphur of that Mineral, and of a perceptible enough Portion of alkaline Salt. It is by these Experiments also shewn, that this gross Sulphur may be decomposed by Fusion in a strong Fire, as common Sulphur is decomposed in the Operation for the Spirit of Sulphur. From this Phenomenon a Reason may be easily drawn, why we cannot extract Cinnabar from this Mixture of *Kermes* and Mercury, which is, because in this Operation the gross Sulphur of the Antimony being decomposed, at least in a great measure, by the Force of the Fire, the Acid, which with the Bitumen of the Earth, or, if you will, an oily Principle, compos'd common Sulphur in the entire Mineral, has quitted this fat Substance, in order to unite itself with the alkaline Salt, which greedily receives an Acid, and form a vitriolated Tartar, whilst the rest of the undecomposed Sulphur remain'd united with the Surplus of the Alkali under the Form of Liver. Now so long as the Sulphur remains united with a fixed Salt, it cannot leave it in order to join Mercury, and rise with it in Cinnabar.

There is yet another Experiment which proves this; and tho' I have already given an Account of it in my former Memoir, yet for the sake of Perspicuity I shall here repeat it. I took one Dram nine Grains or eighty-one Grains of *Kermes*, and a Dram and an half of corrosive Sublimate; the Mixture, when well rubb'd together, was put into a Retort. The Butter of Antimony came off first, the Mercury came next, which was follow'd by a little Cinnabar sublim'd to the Arch of the Retort, and by a Sulphur which was sublim'd in yellow Flowers; and which burned upon Charcoal. The Mercury reviv'd weigh'd seventy Grains, so that there were thirty-eight Grains of Acid concentrated in my hundred and eight Grains of corrosive Sublimate, that is, twenty-five Grains and one Third in each Dram, exclusive of the Acid which was united with the Alkali of the *Kermes*, as I shall afterwards shew.

We have therefore no Reason to be surpris'd, if Sublimate is the most corrosive Preparation of Mercury, since the red Precipitate, for Instance, contains only seven Grains of Acid in each Dram. The Mass, almost of a blackish-brown Colour, which

which remain'd at the Bottom of the Retort, weigh'd thirty-two Grains and an half, tho' by its Strata it resembled fus'd Antimony; it nevertheless contain'd fifteen Grains of Salt, since after beingedulcorated with distill'd Water, it only weigh'd seventeen Grains and an half. The Water of this Lotion gave a deep-green Colour to Syrup of Violets, just as a Solution of Sea-salt does, tho' it produc'd its Effect more slowly. It makes a white and plentiful Precipitation with the Solution of Mercury in the Spirit of Nitre. It produces no Change in the Solution of corrosive Sublimate. It precipitates Silver into a Luna Cornea, and at last, crystallizing, it yields a cubical Salt which decrepitates on Charcoal. Thus it is a common Salt, regenerated by the Union of a Portion of the Acid of the Salt, which has quitted the Mercury of the corrosive Sublimate, with an alkaline Basis, and this Basis could be nothing else than the alkaline Salt of the KERMES. This Experiment then is an additional Proof, that this Salt is contained in the KERMES. It is now my Business to determine how much the KERMES contains of each of the three Ingredients which enter its Composition. The preceding Experiments could give me no Satisfaction in this Point, but the following seems to decide the Matter pretty exactly. I levigated twenty-four Grains of the Filings of Needles, which I afterwards mix'd in a Crucible, with a Dram of KERMES MINERAL. The Fusion was made as in the common Process of Regulus, and there were *Scoriae* form'd in it; but during the Fusion there rose to the Edges of the Crucible, which was cover'd, a white Powder interspersed with Needles, which was nothing but Regulus. I separated the Regulus from the *Scoriae*, and found that I had of it ten Grains and an half. When these *Scoriae* were put into Spirit of Nitre, the Iron dissolved, and the sulphureous Part of the *Kermes* continued separate from the Solution of the Iron. I poured off the Liquor, and precipitated the Iron by Galls; and the inflammable Sulphur being separated, I then had ten Grains and an half of pure Regulus in a Lump, and near four Grains of Reguline Flowers, which in all amount to fourteen Grains and an half.

Two Grains at most made up the Reguline Portion, which might have remained in the *Scoriae*, since to me they appeared to contain nothing but Iron, alkaline Salt, and Sulphur. Thus, according to this Experiment, there must have been sixteen or seventeen Grains of Regulus, in a Dram of *Kermes*; thirteen or fourteen Grains of alkaline Salt, and forty or forty-one Grains of common Sulphur.

I here finish the Examination of *Kermes* made by Ebullition, and come to consider a quicker Method of preparing it by Fusion, observing at the same time both the Choice and Proportions of the alkaline Salt, without which the *Kermes* would neither have the Fineness, the Lightness, nor the Colour, which are essential to it. *Mem. de l'Acad. R. 1735.*

Continuation of Mr. GEOFFROY's Observations on KERMES MINERAL.

That no Circumstance might be defective in our Chymical Examination of the KERMES MINERAL, it was necessary to imitate the Practice of some Chymists, who have substituted the Fusion of Antimony with an alkaline Salt, instead of the Ebullition of that Mineral with the same Salt; and this will, at the same time, determine the Proportion of Salt necessary to be used, for obtaining the *Kermes* as fine, beautiful, and well-colour'd, as by means of Ebullition.

In order to arrive at a greater Certainty, with respect to this Proportion, I always used Hungarian Antimony, very finely pulverized, which facilitated its thorough Mixture with the alkaline Salt; and performed all my Fusions in Glass Retorts, that nothing might be lost of those Substances which might separate from the Compound during the Operation. At last, after I had try'd Experiments with Antimony, I substituted instead thereof its Regulus, and put it in Fusion in like manner with an alkaline Salt.

An Ounce of Antimony levigated, and half an Ounce of Nitre fixed by Charcoal, having been well mixed, and put in a Retort, yielded a Phlegm with white and thick Vapours. The Surface of the Matter, after some time, took a red Colour, which was a sure Sign, that the gross Sulphur of Antimony began to unite with the alkaline Salt, and to form a Liver. Afterwards it distilled some Drops of a yellow Liquor, and then there appeared, in the Neck of the Retort, a concrete, volatile Salt, which was as penetrating as common volatile Sal Ammoniac.

If you have a Mind to separate this Salt, you must take the Retort off the Fire as soon as it is formed, or else the Continuance of the Heat, with the succeeding nitrous Vapours, will make it disappear; and then the Liquor in the Receiver, being no longer acid or alkaline, smells of nothing but an Empyreuma. When you have taken away the volatile Salt, in order to make Experiments of it, and to be assured, that it has all its due Properties, if you replace the Retort over the Fire, and augment it by Degrees, the Matter heaves and puffs up, and be-

comes of a lively Red, over all its Surface, and at last some white and farinaceous Flowers arise to the Top of the Retort.

This Proportion of two Thirds of Antimony to one of fixed Nitre, leaves no Regulus in the Bottom of the Retort. This I am assured of, by repeating the Operation five or six times.

If you make use of equal Parts of Antimony and fixed Nitre, for Instance, an Ounce of each, the Mass sooner becomes red upon the Surface, runs more equably in Fusion without swelling, and deposits at the Bottom a Regulus, which, in this Quantity, usually weighs eighteen or nineteen Grains, besides the small Particles which are not reunited to the main Lump, but remain dispersed in the saline and sulphureous *Scoriae* that are found above the little Mass of Regulus.

In performing the same Operation with two Parts or one Ounce of Antimony, and three Parts or an Ounce and half of the same nitrous Alkali, we shall find, for one Ounce of Antimony, forty Grains of Regulus, besides the scatter'd Particles. It is remarkable, that more white Vapours are elevated with this, than with the two preceding Proportions; and also, that more volatile concrete Salt is thence extracted.

That I might render my Account of Processes on the *Kermes* complete, I try'd the Fusion of Antimony with other alkaline Salts, substituted in the room of Nitre fixed by Charcoal. I knew very well, that they all formed a Liver with the gross Sulphur of the Mineral; but it was necessary to know if there were any Difference, and whether the Products were uniform.

First then I made use of Nitre fixed by Tartar: This alkaline Salt had been dissolved, filtrated, and afterwards reduced to a white, dry, saline Mass. Half an Ounce of this I mixed with an Ounce of Antimony, reduced, as I said, to a very fine Powder. After the Phlegm there arose red Vapours, which had the Smell and Taste of Spirit of Nitre, but lasted not long. These were succeeded by white Vapours, and these again by a volatile Salt in a dry Form. When I lifted up the Dome of the Furnace, I perceived, that tho' the Salt which I used had, in common Essays, shew'd all the Signs of a true fixed Alkali, there were yet some Particles of Nitre, which had not been alcalified by the Detonation of that Salt with the Tartar; for they ran into Fusion anew with the Sulphur of the Antimony, and kindled one after another. This Fulmination was much more sensible in another Experiment, where I used four times the Quantity of the Mixture. I observed, moreover, that in the Places where the Nitre fulminated, it left white Spots, which, taken off with Care, consisted of a diaphoretic Antimony. But I took no Care to prosecute my Observations this way any farther.

The Mass which at last remained in the Retort afforded me no more collected Regulus, than in the first Operation which I made, in the same Proportion, with Nitre fixed by Charcoal. When I augmented the Proportion of the Nitre fixed by Tartar, I recover'd a Regulus, as in the preceding Experiments.

Thus these two Alkalies, proceeding both from fixed Nitre, either by means of Charcoal, or Tartar, afford us no perceptible Difference in their manner of acting upon Antimony. This, indeed, ought to be the Case, but it was good to be assured of it from Experiments.

Let us now proceed to the Trial of Salt of Tartar, which we know is the purest of all Salts. When it is well made, we find in it nothing of a foreign or of a volatile Salt, which we almost constantly meet with in Nitre, in whatever Manner it is alcalified. This Salt of Tartar, when I used four Drams of it with an Ounce of Antimony, separated nothing at all of a Regulus; but every time I repeated the Operation with six Drams or an Ounce of that Salt, I obtained forty or fifty Grains of fine Regulus from every Ounce of Antimony.

In this Operation, no volatile Salt is sublimed, because I use a pure fixed Alkali, whereas when I make use of Nitre, fixed either by Charcoal or Tartar, I meet with Particles not alcalified, which still retain all their Acid. These Particles of Nitre, completing their Decomposition, abandon their alkaline Salt to the Acid of Sulphur, which together make a kind of vitriolated Tartar; and the Portion of nitrous Acid, when disengaged from the other Parts of the Nitre, unites with another Portion of the inflammable Principle of Sulphur, and forms with it the volatile Salt which I found, and just now spoke of. Perhaps we might account for this in a more simple way, by supposing something Ammoniacal in the Nitre; and in this Case, the Explication I just now gave of it would be useless.

The Salt extracted by Lixivation from the calcin'd Lees of Wine, after it is dry'd and calcin'd, ought to be a pure Alkali of the same Nature as Salt of Tartar, because it has an Original almost like it; and hence also this Salt, being melted with the Antimony, produced no Alteration. There appeared, as in the Experiment with the Salt of Tartar, a white Vapour, some farinaceous Flowers, and a salt Liquor somewhat urinous, and such as I had obtained from a Process with Salt of Tartar. Both of them produce a white Precipitate in a common Solution of Mercury in Spirit of Nitre, which Precipitate afterwards becomes greyish. As long as I used but one half Ounce

of this Salt of Wine-lees, with an Ounce of Antimony, I found no Separation of a Regulus; but when I put six Drams, it produced forty Grains of Regulus, as the six Drams of Salt of Tartar had done before.

It remain'd to know what Effect the Salt of Pot-ash would produce. Half an Ounce of this Salt, which had been purify'd by a Solution in cold Water, in order to separate it from the vitriolated Tartar which it contained, afterwards dry'd, and then mixed with an Ounce of Antimony, shew'd no Sign of volatile Salt. But the slight farinaceous Dust, which was sublimed, as in the preceding Experiments, was of an Orange-colour, which shew'd some small Difference between this Salt and the other alkaline Salts which I had made use of before. The Liquor, convey'd into the small Receiver, had a weak, volatile Smell, and precipitated a Solution of Mercury to a white Coagulum, which afterwards assum'd the yellow Colour of Turbith. Hence we may conclude, that it contains a little of the Acid of Sulphur, which was disengaged during the Fusion of the Mixture; and that besides these Acids, there is also in the Liquor a small Quantity of an urinous, volatile Spirit, since it makes a white Precipitation in a Solution of corrosive Sublimate: Besides, after Precipitation, it forms upon the Liquor a Pellicle with all the Colours of the Rainbow, which is a sure Mark of a sulphureous Acid. In this Operation, where we took two Parts of Antimony for one Part of Salt of Pot-ash, we obtained no Regulus.

Being sensible therefore, that this Proportion of alkaline Salt, of whatever Kind it may be, afforded no Regulus, which, when that Proportion was augmented, gather'd into a Mass sufficiently sensible, I was willing to try what would happen from the Diminution of that Proportion, and, in pursuance of this Resolution, took but two Drams of Salt of Tartar for one Ounce of Antimony.

There was no sulphureous Matter sublimed, but there were always some white Vapours; and that small Quantity of Liquor which pass'd into the Receiver, was in a slight Degree urinous; the Mass melted in the Retort was half vitrify'd, and the Needles of the Antimony were totally destroy'd. One might compare it to those Livers of Antimony which are prepared for Horfes, in the Preparation of which we have been saving of Nitre, in not allowing the common Proportion, which is of equal Parts of that Salt and Antimony.

To make it appear, that the Comparison is exact enough, I melted an Ounce of Nitre with four Ounces of Antimony in a Crucible. The Nitre, in fulminating, carry'd off from the Mineral a Part of its Sulphur, and even of its Regulus; for, during the Detonation, there was an Elevation of Flowers, and these Flowers were very red. The Detonation being at last ceased, I kept the Mixture for some time in Fusion, and there remained a *Crocus Metallorum*, resembling that which was the Result of my Operation by the Retort: But this last had lost nothing of its Sulphur, nor of its Share of Regulus, because I used an alkaline Salt, which does not fulminate, whereas, in the Experiment which I made in the Crucible, I made use of Nitre which fulminated.

When I augmented the Proportion of alkaline Salts to three Drams, for one Ounce of Antimony, I found in the Retort a reddish Mass nearly of the Colour of Liver of common Antimony, with its interior Substance divided into little Surfaces, striated, in form of Needles, like the Lapis Hæmatites. Thus it appears, that the Proportions of two and three Parts of Nitre, to eight Parts of Antimony, are too weak to open the Antimony to a sufficient Degree; for the Mass which remains after Fusion, contracts no Humidity from the Air. There must be, at least, four Parts of alkaline Salt to eight of Antimony, that the melted Mass may be capable of Solution; and it plainly appears, that it ought to be soluble, and soluble in all its Parts, that it may afterwards be capable of precipitating the *Kermes* by Ebullition in common Water, without any Separation of its Portion of Regulus.

This Proportion being settled as the Standard, throughout all the Experiments which I made, most of which I have suppressed, that I might not make this Paper of an unnecessary Length, I go on to examine the *Kermes* precipitated from Masses capable of Solution.

I boil'd them two Hours, or thereabouts, in two Pints of Rain-water, and when the Liquor was reduced to Half, or a Quarter, I filtrated it. It must be observed, that, in the Time of Boiling, the Liquor had a very sulphureous Smell, and shew'd Signs of something volatile and urinous, as in the simple Operation on the *Kermes*, performed in the ordinary way by Ebullition.

The Liquor, having been filtrated boiling-hot, thro' a double Paper, into a China Basin, into which, by way of Precaution, I had before poured two Pints of boiling Water, for Reasons which I shall declare hereafter, as it cool'd, there was commonly precipitated a red Powder. I decanted and filtrated the cold Liquor, and poured it again upon the Residuum, and boiled them together; I filtrated again, and repeated the Boiling and Filtration three times.

As to the Masses, which contract not the least Humidity from the Air, as those where I put but three Drams of alkaline Salt to an Ounce of Antimony, after long boiling, there was precipitated nothing but a gross Magistery of the Colour of Oker, which is always the Colour of *Kermes*, when it is ill prepared, whether it be by Fusion, or in the ordinary Way, by simple Ebullition. This proves, that the Proportion of three Drams of alkaline Salt to an Ounce of Antimony is no good Proportion.

The Mass which results from hence, is to be look'd upon as a *Crocus Metallorum*, since we also find some Particles which resemble it upon the Filtre. 'Tis true, if we repeat the Boilings, and add a little alkaline Salts to each Boiling, we shall come at last to reduce the whole Mass to a colour'd *Kermes*; but the Work would be as long as what I spoke of in my preceding Memoir, and the Chymists, who prepared the *Kermes* by Fusion, had no other View than to shorten this Labour.

However, tho' this Proportion be not sufficient to reduce Antimony to a *Kermes*, it opens it enough to render it of some Service in Ptisans made of the sudorific Woods, in which it is customary to boil crude Antimony ty'd up in a Knot, without considering that it can communicate nothing to the Decoction, if it be not first open'd by some acid or alkaline Salt. For this Reason a famous Empiric, whose Ptisans were in great Repute during his Life, prepared his Antimony by Fusion with Salt of Wormwood, and then boiled it with the Woods.

If the Liquor be too much evaporated before Filtration, there is precipitated, during Refrigeration, a gross Matter like a grumous Mucilage; because the *Kermes* is not dispersed in a sufficient Quantity of Liquor to admit of its precipitating by Degrees; besides the Concentration of the alkaline, saline, sulphureous, and reguline Liquor in this Case, the great Quantity of Sulphur, collected into too small a Space, is much more disposed to reunite, and the Molecules of this Sulphur, approaching one another, form, in spite of Lotions, a kind of resinous and shining Covering upon the Mass of these Magisteries, which is very perceptible after drying.

But the Proportion of alkaline Salt being such as is agreed, and such as my Experiments have taught me, there is no greater Quantity of Liver formed than what is necessary to divide the Reguline Part, to reduce it into Particles fine enough to pass thro' the Pores of the Filtre, and to keep those Particles clean and free from that glutinous Pellicle, which would reunite them in gross Molecules, and render the Precipitation grumous. Besides, if there be too much alkaline Salt, the Excess of that Salt reduces the Regulus; and this Regulus, so reduced, is purely lost, as to the *Kermes*, the Preparation of which we have in View.

In order to remedy this Inconvenience, of the too sudden Coalition of the Particles of the *Kermes*, I put, as I have already said, boiling Water into the Bowl placed under the Filtre, that if the Evaporation of the Liquor has been carry'd too far, the Salt, which by that means alone would be too much concentrated, may extend itself afresh in this warm Water, and become more capable of keeping the Parts of the Antimony, which it has attenuated, at a Distance from each other. This Method I propose, retards the Condensation occasioned by the Cold of the external Air, which, without this, would be too sudden. And, indeed, Experience has convinced me, that, by this means, the *Kermes* was precipitated much finer, and of a much more lively Colour, than when I put no boiling Water into the Bowl. Besides, the *Kermes* must be dry'd in the Shade, because a too brisk Heat makes the Particles of the Sulphur coalesce, and form the above-mentioned Varnish.

I shall not give the Preference to any one of the Salts in particular which I employ'd in these Processes of the *Kermes* by Fusion, because, with each of them, I procur'd a Magistery equally beautiful, when I us'd them in the same Quantity.

I have also observ'd, that whatever alkaline Salt I employ'd, whether in the Preparation of the *Kermes* by Ebullition, or by Fusion, there was always a considerable Quantity of white Earth, separated from the Mixture when dissolved in boiling Water. I have spoken of this Earth in the former Part of this Memoir.

From all I have said, it should seem, that the precise Quantity of alkaline Salt, which must be mix'd with two Parts of Antimony, in order to reduce it to a fine *Kermes* by Fusion, cannot be discovered but by making Experiments. I confess it was in this Manner that I arriv'd to a Certainty about it; but I might have also discover'd it, by reflecting on the Analogy which this Process bears to the common Manner of preparing the *Liver of Sulphur*; which, if well made, ought to dissolve Gold by Solution, or render it, if I may so speak, soluble, so that it may pass thro' the Filtre, when the Mixture has been dissolved in Water: Now this Proportion of a Liver of Sulphur, well prepared, consists in equal Parts of alkaline Salt and Sulphur mix'd together; and the entire Mass, resulting from the Mixture, dissolves totally in Water, without any Part of the Sulphur separating from it. The Truth of this is well enough known; but however exact the Analogy, or, rather, the Relation

lation between these two Processes may be, it was still necessary to know the precise Quantity, or at least very near so, of the inflammable Sulphur that Antimony can contain. This can no otherwise be done, than by finding by different Experiments, what Quantity of common Sulphur must be used in order to restore a purified Regulus to an Antimony richly furnished with Needles. This Attempt I myself made; however, I gave a Detail of my several Essays for that Purpose. By making all my Experiments in Retorts, that I might lose none of the Mixture, I was assur'd, that by mixing two Drams of Sulphur with one Ounce of Regulus, we shall find a Piece of Antimony regenerated, with beautiful Needles, and which does not differ from the best chosen *Hungarian* Antimony, without any Part of the Sulphur being sublim'd, or raised to the Neck of the Retort, which happens when a larger Quantity of it is used. There is still another Method of ascertaining the Proportion of Sulphur contained in Antimony, which I shall reserve for another Memoir, where I shall lay down the Method of trying Antimony, and the distinguishing Characteristics of its Purity.

Not satisfied with having regenerated the Regulus into a true Antimony, by a just and exact Proportion of Sulphur, resembling a Piece of well-chosen *Hungarian* Antimony, to which I chose to compare it; I made use of this regenerated Antimony, in order to make *Kermes* by Fusion: I took an Ounce of it reduced to Powder, to which I added half an Ounce of Nitre fixed by Charcoal; and I had the same Sublimations, and the same Masses, I used to have, when I made use of *Hungarian* Antimony. All the Difference I could possibly observe was, that the Substance was more difficultly fused, and the Mass was of a more brownish Colour; but when I dissolved it in boiling Water, a Magistery precipitated from it almost as beautiful as when *Hungarian* Antimony was used.

After the entire Precipitation of the *Kermes*, the Liquor or Lixivium yielded me a white Earth perfectly like that before-mentioned.

That I had given the Regulus the Proportion of Sulphur, necessary to regenerate it into Antimony, is proved from this, that if there had not been a sufficient Quantity of it, I should have found a Regulus in melting this Antimony with half the Quantity of alkaline Salt; because an alkaline Salt does not destroy the Regulus when it acts alone. If, on the other hand, there had been too much Sulphur, its Excess would have been sublim'd in Flowers during the Regeneration. Now in order to shew, that the alkaline Salt alone does not attack the purified Regulus, and cannot separate from it a Magistery like the *Kermes*, let it only be observed, that if we melt Powder of Regulus mixed with fixed Nitre, the unfixed Part only of that Salt acts by fulminating gently, and reduces the Parts of the Regulus, which touch it, into a Powder of a yellowish Colour, which is a Species of *Diaphoretic*; the Remainder of the Regulus is fused, and rises above the Salt in little Drops, which being collected by the Solution of the Salt in the boiling Water, amounted almost to the Weight of the Regulus employ'd; what is wanting of it, is that Part of the Regulus which has been reduced to a *Diaphoretic* by the momentaneous Detonations; and from the Solution of the Salt, not one Particle of *Kermes* is precipitated. The whole Process is finished without any sensible Loss of the Regulus, if, instead of the fixed Nitre, we employ a purer alkaline Salt, such as that of Tartar: But the momentaneous Detonations prove, that in the common Process of the Regulus, the Regulus itself, however well purified it may have been by reiterated Fusions, still contains a considerable Portion of sulphureous Matter, more subtle indeed than the gross and inflammable Sulphur separated from it; but which is still sufficient to make the Nitre, which is not alcalized, fulminate; and, in all Probability, this sulphureous Principle is the Vehicle of the rigid Parts of the vitrifiable Earth, and assists them to stimulate and twitch the nervous System, and thereby produce Vomiting.

Having then shewn, that the alcalized Part of the fixed Nitre does not attack the Regulus during the Fusion, we have no Reason to be surpris'd, that the *Deliquium* of the same does not act upon this Regulus in the Ebullition, and that from a Pound of Regulus we can scarce separate and disengage one Grain of *Kermes*.

From all I have said, I conclude, that in order to procure *Kermes* by Fusion, we must employ a very pure fixed alkaline Salt; that the Proportion of that Salt is, one Part to two Parts of Antimony reduced to a fine Powder, that they may be the more intimately mixed; that the Mass drawn from the fused Mixture after it is reduced to a Powder, when hot, ought to be put into boiling Water, and remain in it for an Hour or two, before it is filtrated; that there ought to be boiling Water in the Bowl which receives this saline and antimonial Liquor, for the Reasons above-mentioned; that every Ounce of Antimony, thus treated, yields, after three Ebullitions of the Mass dissolved in Water, from five Drams sixty Grains to six Drams thirty Grains of *Kermes*, almost as beautiful as that which is yielded by Ebullition, according to the Process published by the

King's Order; that it is not nevertheless so smooth to the Touch, and that it wants that downy Softness, which is always the distinguishing Characteristic of that which is prepared simply by Ebullition: As to the Effects both of the one and the other, considered as a diaphoretic Medicine, I believe them perfectly alike.

I have said, in the Beginning of the first Part of this second Memoir, that from Antimony treated by Acids, we might have a Remedy, which, if exhibited in a small Dose, should produce the same Effects with the *Kermes*: As the Preparation of it is very easy, it might be substituted in its room, especially in the Hospitals. In this Case, Acids act upon this Mineral in the following manner:

I took for my Experiments *Hungarian* Antimony, split into Laminæ, according to the Direction of its Needles, that I might the better observe the several Phenomena that should occur.

Neither the white and concentrated Oil of Vitriol, nor that which has been weakened and diluted with common Water, act, when cold, either upon these Laminæ of Antimony, or upon the Pieces of Regulus; this Acid only darkened the Lustre of the shining little Surfaces of the Regulus. But if we put into a Retort half a Dram of the like pure Regulus, and pour upon it four Parts or two Drams of white and concentrated Oil of Vitriol, with the first Degree of Heat, the Oil of Vitriol will become brown, a suffocating sulphureous Smell will arise from it, which will augment in proportion as the Regulus is penetrated and corroded by the Acid; for there is no true and real Dissolution happens to it.

By augmenting the Fire, an apparently mucilaginous Matter is separated from it; and when the Oil has begun to boil, the Regulus is reduced into a white saline Mass, just as it happens to Mercury in the Process for Turbith Mineral; a true Sulphur is sublimed, or raised to the Neck of the Retort; and lastly, all the Oil of Vitriol passes into the Receiver, and leaves in the Retort the Regulus reduced to a white, tumified, and saline Mass: The Fire being extinguished, I separated the Retort from its Receiver, and as soon as the external Air enter'd, there burst out a sulphureous Vapour as white and thick as the Steam of that Liquor, which is prepared with corrosive Sublimate and Tin.

The white and saline Mass remaining in the Retort weigh'd seventy Grains; so that it had augmented thirty-four Grains, which must have come from the vitriolic Acid which was concentrated in the Regulus; and the Oil of Vitriol, conveyed to the Receiver, had lost almost as much, and had, besides, become considerably less acid. This saline Mass to me appeared to be too much of a caustic Nature for internal Use.

I did not perform this Experiment with Antimony, because it is described in the Observations of *Frederic Hoffman*, and because I could say no more concerning it than he has there done.

The purest Spirit of Salt does not act sensibly either upon Antimony, or its Regulus; but it disengages, tho' slowly, from Antimony reduced to small Pieces, some light sulphureous Flakes.

The Case is not the same with the Acid of Nitre; it attacks by little and little these Laminæ of Antimony, and there arise from it a great many Bubbles of Air; the Spirit of Nitre, during this Fermentation, gradually assumes a greenish Colour with a faint Cast of Blue; and if more of this acid Spirit than is necessary is not put into the Vessel, it is almost wholly absorb'd by these Laminæ, which it penetrates, and separates from each other, according to the Direction of their Needles. If there is too much of this Acid, that is, if it swims above the Antimony, it destroys these Laminæ, and reduces them to a white Powder.

But if the Absorption of this Acid is slowly made, we discover among these distended Laminæ, little saline and transparent Crystals, which grow gradually in the same manner with the *Pyrites*, in which we often perceive little Crystals of Vitriol, which have not as yet assumed very determined Shapes and Figures. These little Crystals of the antimonial Laminæ are intermixed with the yellow Parts, which, being carefully disengaged, burn like common Sulphur.

I used all my Endeavours to separate a certain Quantity of these little Crystals, but my Attempts were in vain; for they disappear soon after they are formed, and are apparently cover'd with a white Powder or Magistery, which is successively form'd in proportion as the Acid of the Nitre disengages and separates the spiculated Particles of the Antimony. But though I cannot shew these little Crystals formed by the Union of the Spirit of Nitre with the Antimony, the Formation of that nitrous antimonial Salt is not for that Reason the less real. Besides, I find the like Appearances, when I substitute the Regulus instead of the Antimony itself. A good deal of Attention is nevertheless requisite to separate these Crystals; as soon as the Air acts upon them, they lose their Transparency; and if the Regulus is allow'd to reduce itself into a Magistery to a certain Degree, they are no longer distinguishable.

Thus, in order to observe these Crystals, it is necessary to break the Regulus into Pieces, to put these Pieces into a small glass Vessel, and pour Spirit of Nitre upon them, to the half of their Height only, that they may not be all covered by it. This Acid penetrates them, makes them exfoliate into white Scales; and it is upon the Surfaces of these Scales that these white unpolished Crystals are formed. These Crystals grow and increase, in the Form of Collyflowers, in the Space of two or three Days. It is then necessary to withdraw them, that they may not be confounded in the white Magistery, which is still forming itself, and which would prevent their being distinguished.

The Spirit of Salt, which alone does not appear to attack the Antimony, yet reduces it to a white Magistery, when Spirit of Nitre is added to it. But the Mixture of these two Acids with this Mineral produces no Appearance of Crystals. The Laminæ of the Antimony soon become yellow, and very foetid; nitrous Vapours rise from them, and yet the acid Liquor does not seem to retain a great many Parts of the Mineral; or, which amounts to the same, it very quickly precipitates what it had retain'd; after which, Oil of Tartar, poured upon it, no longer produces any Precipitation.

Thus 'tis not enough to say with some Chymists, that Aqua Regia is the Dissolvent of the reguline Part of the Antimony; we must add, that the Aqua Regia ought to be poured upon the Antimony and its Regulus in large Quantities. Besides, the Aqua Regia, which produces this Dissolution, ought to be composed of four Parts of the Spirit of Nitre, and one Part of the Spirit of Salt. The Spirit of Nitre, converted into Aqua Regia by Sal Ammoniac, does not dissolve without Precipitation, as this Aqua Regia does.

In two Ounces of an Aqua Regia, composed as I have now said, I dissolved a Dram of Regulus broken in small Pieces; and that the Dissolution might be made without a Precipitation, I was oblig'd to wait till one small Piece was totally dissolved, before I put in another. The Experiment takes up a great deal of Time; but 'tis reasonable to have recourse to all Means, in order to satisfy ourselves of a Fact which may be contested. 'Tis necessary I should also observe, that this Liquor, in proportion as it is impregnated with the Regulus, assumes a beautiful gold Colour, which it insensibly loses by the Evaporation of the white Vapours which are continually rising.

The same Aqua Regia, used with the same Precautions, also dissolves in Antimony the reguline Part, which is in the Pieces of this Mineral, when thrown into it one after another. The Dissolvent having carried off this reguline Part, the remaining Pieces of Antimony, becoming by that means lighter, swim above. If we take them off, and examine them, we shall see, that they are Part of the Sulphur which the Antimony contained.

Hitherto I have found nothing but this Aqua Regia, composed, as I have said, of four Parts of the Spirit of Nitre, and one Part of the Spirit of Salt, employ'd to the Weight of sixteen Drams upon one Dram of Regulus, and upon a somewhat less Weight of Antimony, which occasions a total or complete Dissolution of the Regulus; whereas the Spirit of Nitre, made with Sal Ammoniac, quits, and soon allows the small Quantity of Regulus it had dissolved, to precipitate, as the late Mr. Lemery has observed.

Mr. Lemery made many Experiments with this Magistery; and I am surpris'd the Use of it is not continued in Hospitals, and Country Places, where this Remedy, which costs little, and which is easily prepared, may be substituted in the room of a great many other antimonial Medicines, more difficult to be prepared. I have often observed, that the Precipitate of Antimony produced by the Spirit of Nitre, when well edulcorated by several Affusions of boiling Water, purges and vomits like the *Kermes*, when given in a Dose of three or four Grains. I have also observed that prepared by common Aqua Regia, when well washed, to operate by Stool, if given in the same Dose; and that a Grain of it, given for a Dose, operates as a Diaphoretic. Many poor Peoples Children, attack'd with Disorders, Obstructions and Fevers, have been first relieved, and afterwards thoroughly cured, by taking a Grain of this Medicine for a Dose. Besides, it may be swallowed with less Reluctance than any other Preparation which should be either unpalatable, or more bulky. *Memoires de l'Acad. Royale, 1735.*

Continuation of Mr. Geoffroy's Remarks on ANTIMONY.

In the Memoir which I read last Year upon the *Kermes*, I oblig'd myself to examine what might be the Quantity of common or inflammable Sulphur, which the different Antimonies, which we meet with in *Paris*, contain; and, at the same time, to determine the Quantity of pure Regulus, which might be expected from that Mineral by Operations attended with less Loss, than in the ordinary Methods.

Such an Inquiry is the Subject of this Memoir, and that you may know before-hand what I design to illustrate, my Business shall be,

1. To reduce Antimony to a Calx, as much desulphurated as

possible, in order to know, by the Diminution of the Weight, how much Sulphur is evaporated, I mean inflammable Sulphur.

2. To make it appear, that every Calx of Antimony, that is well exhausted of inflammable Sulphur, is scarce any more than a Regulus; and that what is not such is an Earth, which may be regarded as foreign to that Mineral, and a Remainder of Sordes, from which it was not thoroughly purg'd in the Furnace.

3. To propose a Method whereby we may obtain a much greater Quantity of Regulus from Antimony, of whatever Kind it be, than by the way of Process so celebrated by M. Stahl, and by those that have copy'd it from him. And,

4. lastly, To teach a way of purifying the Regulus, without an Addition of Salts, and with inconsiderable Loss.

All this supposes long Details, but then these Details will be accompany'd with Observations which will render them the more supportable. And tho' the Means which I use may not be proper for those who perform these sorts of Operations by the Great, and have nothing in View but to work quick, and to get Money by it, yet they who prefer Exactness before such Views, will, perhaps, thank me for my Labour.

We commonly meet with three Sorts of Antimony in this Place (*Paris*): One comes from the old Mine of *Auvergne*; this, as it was formerly worked, was so salt, and so little depurated, that it was used in nothing but gross Preparations, and it was almost impossible to make the diaphoretic Antimony of it. This grew out of Use, and the *Antimony of the new Manufacture* became in Repute, which, for Purity, may vie with the choicest *Hungarian* Antimony. If the Undertakers, who work that Mine, continue to furnish us with as good Antimony, as that upon which I have performed my Operations, and if the Mine be rich, we may be almost sure, that there will be no Occasion to get it from *Hungary*, which would be a considerable Advantage to the Kingdom. Those Authors who have written best upon Antimony, generally say, that this Mineral ought to yield about half its Weight in a Regulus; but it is possible to obtain a far greater Quantity. This I shall prove in the Course of this Memoir, by describing the different Methods which have been most successful in collecting the Reguline Part of Antimony into one single Mass.

While I was in the Course of my Essays on the Reduction of the various Preparations of Antimony, I discover'd by chance a new Phosphorus, being a Preparation of Antimony, which fulminates with a Noise and Explosion, as soon as it comes into Contact with the Air; this I try'd by repeating the Operation several times one after another, and always with the same Success. I believe the Invention is new, and I shall give it as such at the End of this Memoir.

According to the Order of operating, of which I have already given an Account, I begin with the calcining of Antimony. I have nothing to add with respect to the ordinary Method of Calcination, except that the finer this Mineral is pulverized, the better does the common Sulphur evaporate from it. The Reason of this is obvious: I always made use of it thus prepared: As I was to compare the Weight and Colour of the Calxes of different Antimonies, it was necessary for me to fix an equal Time to each Calcination of an equal Quantity of every one of those Antimonies.

I found by Experience, that ten Hours was the most convenient Time for the perfect Calcination of twelve Ounces of this Mineral pulverized. The Proportion of Fire was not so easy to be fixed; however, I came as near to it as possible, by using in every Calcination, the same Vessel, the same Furnace, and the same Quantity of Charcoal, and employing the same Operator, who always kept stirring the Powder of the Antimony, to prevent it from running into Lumps.

It may be proper to observe in this Place, that the Vapours of Antimony are not so dangerous as is generally imagined, and as they would really be, did Antimony contain an arsenical Sulphur, as most of the *German* Chymists pretend; for the Person whom I employ'd in this Work, perform'd above fifty Calcinations, almost continually one after another, without feeling the least Inconvenience, tho' the Chimney, under which the Furnace was placed, was none of the best for drawing of Smoke.

The different repeated Calcinations of *Hungarian* Antimony, of which I always took the Weight of twelve Ounces, being the Quantity which suited the Capacity of my Vessel, constantly reduced that Mineral to nine Ounces two Drams, and sometimes to nine Ounces three Drams.

The same Number of Calcinations of the old Antimony of *Auvergne* made greater Variations. I had Calxes which weigh'd ten Ounces wanting twelve Grains, some ten Ounces one Dram, others ten Ounces three Drams. I also bought this old Antimony, which I calcined, from different Shops. These Variations do not proceed from the Time of the Calcination, which was always the same, nor from the Degrees of Fire, as you may see by the Precautions which I always took to keep it nearly equal. I can impute them therefore to nothing but the greater or less Impurity of those different Antimonies purchased of different

ferent Druggists; for tho' they all came from the same Mine, 'tis plain they were smelted at different Places. By *Impurity* here, I mean, that Portion of Sordes which is more considerable in them than in those Antimonies which we call pure, and remains fixed in the Fire without diminishing its Weight; because, being a pure Earth, it contains no Matter for Evaporation.

The Calcinations of the Antimony of the new Mine, or new Manufacture, reduced the Calx to nine Ounces two Drams and an half, nine Ounces three Drams, and nine Ounces four Drams; so that I may with Reason affirm, that it was almost as pure as *Hungarian* Antimony. Besides, the Calx, when stripp'd of its Sulphur, is of a light-grey-ash Colour, like the Calx of *Hungarian* Antimony, whereas that of the old Antimony of *Auvergne* is of a much more brownish Colour: The Purity of the Antimonies we are now examining, is known from what I have now said, concerning the greater or less Loss they sustained during Calcination; the more it loses, the more it contains, *ceteris paribus*, of common Sulphur, which, as is sufficiently known, is an essential Ingredient in the Composition of this Mineral; and the less it loses, the more it contains of heterogeneous Parts, which do not yield to the Action of the Fire in Calcination; that is, its Fusion has been ill performed, or the Mine from which it has been taken, has been very poor. There is no Occasion for my enlarging further on this Observation. The thing required was to arrive at a Certainty, that these Calxes of Antimony were as thoroughly divested of Sulphur as they could possibly be; for this Purpose I calcined them with Nitre; their Detonation was more languid than that of the Regulus treated in the same manner, for the same Space of Time, by the same Fire, and with the same Salt. The Mass thrown into the Water yielded me a diaphoretic Mineral full as white as the Diaphoretic prepared with Regulus, and almost in the same Quantity, which Circumstance contributes in some measure to prove, that the Calx of a good and well prepared Antimony is all Regulus; and that, in order to make it so, nothing is wanting but to collect its divided Parts.

These same Calxes with corrosive Sublimate, in the Proportions ordinarily employed to make Butter of Antimony, are with Difficulty attack'd by the Acid of the Sublimate.

The Translation of this Acid from one Matter, so as to lodge it upon the other, is so difficultly performed, that only a very small Quantity of Butter of Antimony is distill'd: The Remainder of the Sublimate is sublim'd afresh. There arises neither Cinnabar nor Sulphur, because these Calxes are entirely divested of the latter of these. But why, may one say, does not the Sea-salt act upon this Calx? Why is not the Translation I have spoken of, made? I answer, that this happens, because in calcining the Antimony there is a Commencement of Vitrification, and because the greatest Quantity of the Particles of the Calx being covered with a Stratum of Glass, the Acid slips over them without finding any Pores at which it may enter; and if it has reduced any small Portion of it to Butter, 'tis because this small Portion has not been vitrified. This may also probably happen, because a Portion of the Acid of the Sulphur is concentrated in the Calx, in which Case the Acid of the Sea-salt could not attack it.

By the common Method of preparing Regulus, too well known to stand in need of a Description here, the late Mr. *Lemery* extracts six Ounces one Dram of it from each Pound of Antimony. Mr. *Stahl*, in his Tracts, says, that a fourth Part of it is only extracted when we use equal Parts of Tartar, Saltpetre, and Antimony; but that the Product of the Regulus is more considerable, if to six Ounces of Antimony we add five Ounces of Nitre, and six Ounces of Tartar. Then he subjoins his Discovery, which consists in separating or reducing the Antimonial Powder from the Scorizæ, by casting them into the Crucible with half their Weight of Nitre, in order to make a gentle Detonation, and by throwing Powder of Charcoal upon them immediately after. We shall, continues he, by this second Operation, have another Regulus, which shall almost be equal in Weight to the Regulus first extracted from it. But he does not precisely determine the Weight of that first Regulus: Besides, this Process is difficult; there are two Detonations, and consequently some Loss. The Sulphur is so intimately united with the crude Antimony, that in these Detonations of the Nitre with the Tartar, especially in the first, a considerable Portion of the Antimony is carried off partly in Smoke, and Part of it entire, whilst the other Particles stripp'd of the Sulphur which they contained, by Detonation, collect themselves into a Regulus.

I myself went otherwise to work, and quitting my Supposition, that the Calx of Antimony is a Regulus divided into extremely fine Particles, my Business was only to find a Dissolvent or Reductive, which might at one and the same time restore to the Particles of the Calxes, too much stripp'd of the Phlogistic, that inflammable Principle in which they were defective, and reduce itself into a Flux, liquid enough for allowing these Particles to pass through it easily, and precipitate below it by their proper Weight; and that, being thus precipitated, the Reunion should be made by Fusion. I have tried

the reductive Salts, the Oils, the Fats; but nothing has succeeded so well with me as black Soap. This Reduction is also made by Charcoal; for nothing ought to be omitted, and Charcoal is even a Reductive employed in the Preparations of Regulus in great Quantities. As for the Oils and Fats, they reduce also; but they ferment too much, and inflame; and as they are reduced to a Coal, no fluid *Scorizæ* are form'd; what floats above the Antimony in the fluid Part is rugged and coarse, and the fused Mineral being naked, the Evaporation of it is carried on with a considerable Loss.

Nitre too quickly carries off the Sulphur of the Antimony in Detonation: Besides, 'tis known, that it reduces it to a Diaphoretic; and we cannot afterwards reduce this Diaphoretic into a Regulus, without a great deal of Loss to the whole Mass of the Antimony, with which the Operation has been begun.

Salts already alcalized, when fused with the crude Antimony, reduce it into that Form which we call *Kermes by Fusion*, or *Golden Sulphur of Antimony*; if they are fused in equal Quantities with the Calx of the Mineral, they reduce it to a Species of Glass.

Red Tartar, or white Soap, may be employ'd; but I have found, that neither the one nor the other collected so much of the Regulus as black Soap. I wave an Account of the Essays of this Kind I have made, in order to avoid a superfluous Prolixity: I shall then confine myself to this Reductive. 'Tis well enough known, that it is composed of a strong and whitest Lixivium of Pot-ash and Quick-lime, united by Ebullition to Lin-seed Oil, Rape Oil, Hemp-seed Oil, and sometimes even to Fats. I am not indeed the first who used this Method; for I have seen in the *English* Edition of Sir *Kenelm Digby's* Chymical Experiments, that this Philosopher recommended Soap and Tartar, for the Reduction of a Regulus of Antimony, which he calls *Spirituos*; and which, according to him, is the precipitated Butter of Antimony, and the Mercury probably reunited; for he says no more of it. Whatever the Case is, if it was a Reduction of the *Mercurius Vita*, which he was talking of, the Soap was sufficient without the Tartar.

But since black Soap is so good a Reductive of the Reguline Part of Antimony, it may be asked, why this Mineral is converted into a Calx in order to reduce it afterwards, and why the Powder of Antimony is not mixed all at once with the Soap; since by this means the Operation would be less tedious: As I was apprised before-hand of this Objection, I prepared myself to answer it by an Experiment, which proves, that crude Antimony does not yield; even with this Reductive; all the Regulus that may be separated from it by my Method. I took two Ounces of *Hungarian* Antimony, like to that which I had reduced to a Calx; when reduced to a fine Powder, I mixed it with two Ounces and an half of black Soap, and had a Mass of Regulus well reduced, and very clean, but it only weighed two Drams six Grains; so that two Ounces forty-eight Grains would be yielded by each Pound of Antimony: By the Process of Mr. *Stahl*, seven Ounces and an half, or at most, eight Ounces, can only be extracted; and by mine, I have very near ten Ounces, as may be seen afterwards. Thus the Soap, which well enough reduces the Calx of the Antimony, cannot in the least separate the Regulus of that Mineral when crude.

The Scorizæ which float above this small Part of the collected Regulus, are, when cold, a sort of black compacted Glass, which resembles Jet, melts at the Flame of a wax Candle, like Bitumen, and diffuses a sulphureous Smell: These Scorizæ, which do not become moist by being exposed to the Air, would have been of the Colour of Liver of Antimony, if the alkaline Salts, which are contain'd in the Soap, had only been employ'd: But in using the Soap, we see its oily Part must burn, unite itself to the Acid of the Sulphur of the Antimony, and with it form a Bitumen: The alkaline Salt is covered and wrapt up in it which so defends it, that the Action of the Air cannot dissolve it. What I have now said, is sufficient to prove, that there is more Advantage in reducing the Calx of Antimony into a Regulus, than in attempting the Reunion of the Reguline Parts in crude Antimony.

The Process of *Kunkel* is not more advantageous than that of Mr. *Stahl*. He takes a Pound of the Calx of Antimony, which he reduces into a Paste with Suet, or any other Fat, and Charcoal. He puts the Whole into a Crucible slightly covered, till nothing rises in Smoke; after which he gradually puts into it a Pound of Nitre; by this means we have seven Ounces three or four Grains of a very beautiful Regulus; but I draw a great deal more from it by the Soap: *Kunkel* joins to the Fats, which already form of themselves a slight Coal and Soot, another grosser Charcoal, which obliges him to add Nitre to it, in order to destroy these two different Charcoals by Fulmination: This Nitre melts, alcalizes, and becomes fluid: The Grains of the Regulus, already reduced by the oily Principle, easily precipitate through that Salt when in Fusion, which they could not have done through the Scorizæ, which would have remained in an almost solid Mass, without the Addition of the Nitre; for every one knows, that the whole

whole Art of Reduction consists in reuniting into weighty Molecules the too much divided Particles of the Metals, and in keeping these weighty Molecules in a liquid Medium, thro' which they are capable of passing.

But the Nitre, becoming alkaline, has not, in fulminating, carried off all the fat Part of the Mixture; it becomes therefore *Liver*, with what remains of the Sulphur; and under this new Form, it converts into *Kermes* the smallest Parts of the Regulus, which it corrodes. If this same Salt prevails over the Sulphur, it reduces another Portion of the Regulus into a *Diaphoretic*. Thus two Subtractions must be made from the Quantity of Regulus, which should have been collected at the Bottom of the Crucible, without taking into the Account what rises in Smoke during the Operation, which is sufficiently long, and during the Detonation.

We have formerly seen how much Calx, without Sulphur, twelve Ounces of the different Antimonies I calcined, yielded: 'Tis therefore unnecessary to repeat in this Place, what was said on that Occasion. I reduce this Calx with the Soap in the following manner:

I take two Ounces of every one of these Calxes, of which I form a somewhat liquid Paste, with an Ounce and an half or two Ounces of black Soap. I put this Mixture by little and little into a Crucible, which I make moderately red-hot in the Middle of burning Coals, in order to burn the Soap slowly, to give the Oils a greater Propensity to imbibe every Part of the Calx of the Antimony, and to avoid the Loss of the Reguline Particles, which, being then very much divided, would rise so much the sooner into Smoke, if the Fire should happen to be too hot at first.

When the whole Mixture is put, by little and little, into the Crucible, and when I perceive, that the Fat of the Soap is burnt, I cover the Crucible: Then I apply a very hot Fire, in order to put the whole Mixture in Fusion. It is, at first, heard to ferment or boil considerably; but at last that Noise ceases: Then I allow the Crucible to become cool in the Middle of the Coals; and find, upon taking off its Cover, congeal'd Scorizæ, with Circles of different Colours. The Middle of these Scorizæ is sometimes rough, having Cavities, in which we may discover white and saline Vegetations.

Then I break the Crucible, and find a Lump of Regulus well collected; which is not indeed, as yet, pure, but which must be purified, as I shall afterwards direct; and which, internally, appears to be an Assemblage or Collection of small shining Grains, as yet not sufficiently reunited, nor placed in a sufficiently compact Arrangement, for forming *Lamina*, or little Surfaces.

Two Ounces of the Calx of the Antimony of *Auvergne*, of the new Company, yielded me, in three repeated Fusions, always the same Weight: An Ounce five Drams and some Grains of the imperfect Regulus, I have just now mention'd.

Two Ounces of the Calx of the old Antimony of *Auvergne*, which I had lying by me useless since 1712. when melted also with two Ounces of black Soap, yielded only an Ounce and four Drams of Regulus.

Other Antimonies of the same Mine, bought at different Shops, yielded me an Ounce and five Drams, all but twelve Grains; but it was less pure than the former.

Lastly, the Calx of the *Hungarian* Antimony yielded an Ounce four Drams and forty-eight Grains of a purer Regulus than that I just now mentioned, having, on its Surface, Furrows in the Form of Fern; and, internally, some little Surfaces already well formed.

When I put these Lumps of Regulus, as well cleaned of the adherent Scorizæ as they possibly could be, into a *China* Bowl full of pure Water, I observed a very strong Ebullition, which, in some of the Lumps, lasted for twenty-four Hours: Being surprised at this, I discovered, with a magnifying Glass, that there were in the Regulus little Holes, imperceptible to the naked Eye. I endeavoured to find out what might be the Cause of this strong Ebullition, and at last found, that it was a Portion of the Quick-lime, precipitated by its Weight with the Reguline Parts, which occasioned this Ebullition; because it had been calcined afresh with the Regulus, in a State of Fusion, at the Bottom of the Crucible. If it should be asked, whence this Earth, of the Nature of a Calx, proceeds; I answer, 'Tis from the Soap; for the acrid Lixivium, with which it is made, is composed, as I have said, of alkaline Salts and Quick-lime.

The above Reductions, being made in larger Quantities, yielded Products, in proportion, differing very little; so that I can say, that one Pound of *Hungarian* Antimony, reduced, by Calcination, to twelve Ounces three Drams and twenty-four Grains of Calx, furnished me with nine Ounces six Drams and fifty-four Grains of Regulus, which Quantity is not much short of ten Ounces; that the Fire carried off from that Mineral, when crude, during Calcination, three Ounces four Drams and forty-eight Grains of inflammable Sulphur; that the twelve Ounces three Drams and twenty-four Grains of Calx ought to be looked upon as a Regulus, mixed with a Portion of Earth; and that, without this superfluous Earth, all the Calx would be

converted into a Regulus, with a little oily or inflammable Principle. This Supposition, however, cannot amount to a Certainty, except we could be sure of the Quantity of the Regulus evaporated during the Fusion, which to me appears impossible; but it is of no great Importance, whether what is wanting of the Weight of the reduced Regulus, compared with the Weight of the Calx of the Antimony, was an Earth reduced to Scorizæ by the Salts of the Soap, or was evaporated: It will, however, follow, from my Experiments, that by the Method of calcining Antimony into a Calx, and reducing this Calx into a Regulus by Soap, I extract more Regulus than by the Methods of *Stahl* and *Kunckel*.

I now come to consider how this Regulus may be purified without Loss: For this Purpose I use a Method, which, I believe, is entirely new; at least, I know of no Author who has made mention of it. I take the Regulus, well clean'd of the Scorizæ: I reduce it to a Powder, and mix it with half its Weight of the Calx of Antimony, as well purified from the Sulphur as that of which I made that Regulus. I fuse them together, in a cover'd Crucible, till the Scorizæ, which ought to float above the Regulus, are in a smooth and even Flux. The Result of this is, that a Lump of Regulus, weighing, when impure, one Ounce five Drams and some Grains, and which was procured from two Ounces of the Calx of Antimony of the new Manufacture, was reduced to one Ounce three Drams and sixty-two Grains of pure Regulus; that is, with $\frac{7}{8}$ of Loss. The Calx reduced to Scorizæ, and which covered the Regulus, became an opaque Glass, a Sort of *Enamel* of a greyish Colour, lying in the fine Furrows of the Surface of the Regulus.

Another Lump of Regulus, yielded by the Antimony of the old Manufacture of *Auvergne*, weighing, when impure, one Ounce four Drams, purified in the same manner, was reduced to one Ounce two Drams and forty-eight Grains; that is, with $\frac{1}{2}$ of Loss. The Scorizæ were reduced to a black Enamel.

The Lump of impure Regulus, yielded by the Calx of the common Antimony of *Auvergne*, bought at different Shops, weighing, when impure, one Ounce five Drams, was reduced to one Ounce four Drams eighteen Grains; that is, with $\frac{1}{4}$ of Loss. The Scorizæ were less black than in the former Case.

Lastly, the impure Regulus of *Hungarian* Antimony, which weighed one Ounce four Drams and forty-eight Grains, was reduced into a pure and starry Regulus, weighing one Ounce four Drams and fifteen Grains, in which Case there were thirty-three Grains, or $\frac{1}{6}$ of Loss. The Scorizæ were a rough Enamel of a greyish Colour, a little inclined to the Yellow, and pretty like the Scorizæ of the purified Regulus of the Antimony of the new Manufacture of *Auvergne*.

These Scorizæ, which I call Enamel, were blacken'd by the impure Matter, which they carry off from the Regulus during the Fusion: When they are opaque, and of a greyish Colour, it is a Sign, that they have not found enough of sulphureous Matter to convert them into transparent Glass; for 'tis known, that a Calx of Antimony, that has been deprived of all its Sulphur, vitrifies very difficultly without some Addition: That, for this Purpose, a Fire of the most violent Heat is requisite; and that 'tis necessary to add a little crude Antimony, or common Sulphur, if we are inclin'd to have a Glass of Antimony that is transparent, and of a fine Colour. I have lately found this Observation to hold good upon the Calx of *Hungarian* Antimony, which I could never transform into Glass without the Addition of a little Portion of Antimony. For this Reason, when I purify my first Regulus, I make use of a Calx of Antimony, very well freed from Sulphur; because I only stand in need of a Substance, which, without vitrifying entirely, might become impregnated with the impure Substances which prevented the Reunion of the Reguline Parts of the first Calx, reduced by the Assistance of the oily Matter of the Soap.

'Tis true, I may also purify that first granulated Regulus, by melting it alone, and without the Addition of the Calx; but its Surface, in that Case, is never clean; it is always sullied by Scorizæ, which adhere very strongly to it, and no Stars are form'd in it. Besides, it must be a long time kept in a very liquid Flux, that the drossy Matter, which hindered the Reunion of the truly Reguline Parts, may have sufficient time to gain the Surface, in Consequence of their Lightness: Now the longer it is kept in Fusion, the more it loses; so that this is not the most expeditious Way of purifying it.

But the Addition of the Calx makes a Difficulty arise. I shall, undoubtedly, be told, that what blacken'd these Scorizæ can be nothing but the fuliginous Matter of the Oil contained in the Soap; or that Oil reduced to a Coal, which before stain'd the internal Part of the Lump of my first Regulus, and hinder'd the Reunion of the Reguline Parts, as I said above; that as I myself admit the Presence of an actual Matter, which really contains an inflammable Principle, it necessarily follows, that a Portion of the Calx, which I only take to be productive of Scorizæ, ought to be reduced to a Regulus by that inflammable Principle; and augment, so much the more, the Weight of the Regulus, which I put a second time in Fusion with this Calx; and that thus, tho' I there find a Diminution of some Grains,

Grains, yet nothing is thereby proved, because the Diminution would have been greater, if I had not added to it a Calx, a Portion of which might be reduced into a Regulus. I have not sunk any Part of the Force of this Objection, which has been, and may still be made.

I shall answer it, by giving an Account of two or three Experiments. In the room of Calx of Antimony I substituted factitious Crystal, reduced to Powder; and, in another Essay, alkaline Salt. In the first Essay made with the Crystal, the impure Regulus, which weighed two Ounces two Drams and thirty-six Grains, was reduced to two Ounces two Drams and six Grains, that is, with thirty Grains of Loss. In the second Essay, made by Salt of Tartar, the same Weight of impure Regulus was reduced to two Ounces one Dram and sixty-six Grains; that is, with forty-two Grains of Loss. If I perform the same Operation by mixing the Calx of Antimony with the Regulus, in the same Proportion, in order to purify it, I have forty-nine Grains of Loss; that is, the same Weight of Regulus, consisting of two Ounces two Drams and thirty-six Grains, is reduced, pure, to two Ounces one Dram and fifty-nine Grains. Thus, if with the alkaline Salts, which always corrode some of the Reguline Particles, I had only forty-nine Grains of Loss; if, with the Calx of Antimony, I lost fifty-nine, this is a Proof, that the Calx only acts in this Purification like a Flux-powder, which reduces the Impurities of the first Regulus into Scorizæ; and that it does not supply it with any Addition of Reguline Parts.

If, nevertheless, any one should obstinately deny it to be productive of Scorizæ only, this Denial could not possibly destroy the Usefulness of the Operation; and the End I aim at, is to draw from Antimony the greatest Quantity of Regulus possible. I have shewn, that, in order to obtain this End, it must be reduced to a Calx. It is a Matter of no Moment after what manner I regulised this Calx: If a Part of that which I put upon the Regulus, to purify it, is converted into a Regulus, the Affair is so far completed; the Remainder is reduced to Scorizæ, which I easily melt into a Regulus with the black Soap.

Whatever Precautions the Chymist takes, there is always a considerable Loss of the Reguline Portion of the Antimony: That Mineral, whose volatile Nature is demonstrated by so many Experiments, ought to be fused with Care and Attention, if we design to lose little of it. If, in my Essays, I had made the Reduction of my Calx into a Regulus, and the Purification of that Regulus, with one and the same Fire, I should have lost much more of it. I therefore perform the Operations by two different Fires; and as soon as I perceive, by the Fluidity of the Scorizæ, that the Reduction is about to be made, I take the Crucible from the Middle of the Coals, that the Fumes of the Regulus may cease.

Besides, I have observed, that by holding it for some time in the Fire, after the Calx is reduced to Scorizæ, this Enamel corroded the Sides of the Crucible, so as to pierce them.

I shall put an End to this Part of the Memoir by repeating what I said above; which is, that the best Means I have hitherto known, of extracting the greatest possible Quantity of Regulus from Antimony, is to calcine it till its Calx, when put upon live Coals, affords no longer any sulphureous Smell; to reduce this Calx into a Regulus, by uniting it with a Reductive, which may, at once, furnish a fat Matter, and yield liquid Scorizæ, such as black Soap; and to purify that Regulus with the same Calx of Antimony. By this Method I extract two Ounces of Regulus from each Pound of Antimony, more than *Kunckel* and the late *Mr. Stahl* have extracted by their Processes: And I shew, at the same time, that there is not, in this Mineral, such a large Quantity of inflammable Sulphur as is generally thought, and as I myself believed there was, when I publicly read my former Memoirs upon the *Kermes*; since, in calcining it with Attention, no more than three Ounces and five Drams, at most, are burnt or evaporated. If the Mineral, of which I am speaking, was more fixed when subjected to the Fire than it really is, I should have come nearer to the Exactness of Proportions; but as the greatest Chymists have not been able to check its Volatility, I hope Impossibilities will not be required at my Hands.

I now proceed to some other Observations, which to me appear independent of the Operation, and which I have reserv'd for the End of this Memoir, that I might not interrupt the Order I propos'd to myself.

I have shewn, that by reducing the Calx of Antimony by black Soap, I obtain'd a Regulus, which I call'd *impure*, because it was not compact. If a Quantity of this Regulus, of a moderate Size, is look'd into, it is found full of Cavities; and in the largest, by the Assistance of a magnifying Glass, we perceive Laminæ of Regulus, full form'd, which the Air, shut up and rarefied in these Cavities, has hinder'd from embracing each other: Some of these Laminæ are triangular, but the greatest Number of them are *hexagones*. Lastly, some of them are considerably long, which, joining themselves in right Angles by one of their Sides, form a kind of small Canals; some Needles are also observed in them, but very few. As to the external Surfaces of these Quantities of Regulus, we observe nothing

remarkable in them, except some Furrows diverging, as it were, from a common Centre, and forming a Species of Rays. The unpurify'd Part of these Masses of Regulus, which appears the most compact, are possibly no more than the same Laminæ fasten'd to each other, and which discover themselves by their sharp Edges, and by the Summits of their Angles. Whether these Laminæ are the original and constituent Particles which ought to compose the Regulus, or whether they are only the Result of an accidental Arrangement of Particles, previously smaller, are Points which I will not take upon me to determine.

In Regulising the Calx of Antimony by black Soap, I have twice or thrice had saline Vegetations, in the Form of small Trees, rais'd considerably above the Surface of the Scorizæ: These were undoubtedly occasioned by the sudden Refrigeration of the Matter in Fusion. I shew'd one of these Vegetations to the Academy, that they might be sure, that it corresponded exactly to the Representation given of it. But I cannot lay down certain Rules for producing such Vegetations at Pleasure; for whatever Pains I could take, I could not afterwards succeed in procuring others.

All these Reductions of the Calx of Antimony into Regulus are not made without the Rising of a sensible Quantity of silver Flowers, which are ordinarily call'd the Flowers of Regulus: These are long, slender, and rigid Filaments, as pungent as very fine Needles. If they are view'd thro' a Microscope with a single Lens, but furnish'd with its *Corrector*, they appear opaque; but when the *Corrector* is removed, and they are exposed to the clearest Light possible, they appear to be diaphanous Filaments of Glass: Yet this Observation does not absolutely prove, that they are really Glass; since most Objects, view'd thro' a fine Lens, appear transparent, provided they are considerably small. *Newton* has observed, that by placing a very small opaque Body before the Hole thro' which the Light enters into a darken'd Chamber, that same Body appears to be transparent. The Microscope, in this Case, produces almost the same Effect with the darken'd Chamber; so that what I take to be Glass, may only to me appear so thro' an Error of Vision.

I also succeeded in reducing the Glass of Antimony by Soap, by treating it in the same manner with the Calx; but as this might be expected, I wave giving any farther Account of it: I imagin'd I might have, in like manner, succeeded with the *Diaphoretic*, excepting some small Difference which would have regard'd the Weight: But the *Diaphoretic Antimony*, prepared in the common Way, being mix'd with black Soap, and then forced by the Fire, like the Calx of that Mineral, was converted into a Mass, which I allowed to cool, hoping to find a Regulus at the Bottom of the Crucible when I should break it. Having examin'd it when almost cold, in a Place expos'd to the open Air, I perceived, that the Mass became hot in proportion as it absorb'd the Humidity of the Air. I applied some Pieces of it to the Flame of a wax Candle, upon which they kindled and crackled: Upon throwing back some of these kindled Pieces into the Crucible, they kindled the rest of the Mass, which also burnt and crackled.

I repeated this Operation, and made use of a very beautiful *Diaphoretic Mineral*, which I had prepared, some Days before, of two Parts of Regulus and three Parts of Nitre: I mix'd an Ounce of it with two Ounces of black Soap: This Mixture, when put by little and little into the hot Crucible, kindled and was very much puff'd up: When the Flame was over, the Mass subsided, and assum'd a reddish Colour, like that of a live Coal; whilst luminous Vapours, of a bluish Green, arose from it: All these Circumstances happen'd, without Variation, upon every Projection of the Matter. When all the Mixture was projected, and ceased to send up Flames, and luminous Vapours, there was a Sort of reverber'd Mushroom form'd, which was hollow, porous, and black. I crush'd the Edges of it, and added a fresh Ounce of black Soap, that I might the better cover the Matter I intended to reduce. When this last Soap was burn'd, and I perceived a small bluish Flame on the Surface of the Mass, I cover'd the Crucible with its Lid, and a great deal of Charcoal; after which I produced a strong Heat, by about an hundred Puffs of the Bellows: But notwithstanding the Violence of the Fire, which was both stronger, and longer continued, than in all the Operations I have hitherto mentioned, there were no fluid Scorizæ form'd, and the Mass remain'd spongy. I allowed the Fire to go out, and carried the Crucible to a Corner of my Laboratory, where it remained for five Hours without being touch'd: Towards Night I was inclin'd to examine this Matter: Accordingly the Person who held the Crucible, which was quite cold, not guarding against an Effect, which indeed could not be foreseen, uncover'd the Top of the Mass with a Piece of Iron; but as soon as the Air had Access to it, it took Fire, and there was a sudden Explosion made, with a Noise, which threw a very considerable Quantity of Fire upon his Cloaths, and burnt several Holes in them: There was a strong Smell of Sulphur diffus'd, resembling that of those Phosphori in Powder, of which the late *Mr. Lemery the Younger* has given several Descriptions in his Memoir of 1714: See ALUMEN.

I did not obtain the Reduction of the Diaphoretic I wanted, but Chance afforded me a very singular Phosphorus, which I did not seek after. I repeated the same Experiment since, with the same Success, whether I used the common *Diaphoretic*, or my own *Diaphoretic of Regulus*: 'Tis true, the latter succeeded better than the former, provided neither too strong nor too weak a Fire was applied, after the Addition of the last Ounce of Soap.

When, in order to make my *Diaphoretic*, I detonate the Regulus with pure Nitre, I wash it generally, in order to separate from it the Nitre alcalized during the Deflagration. Its Lixivium, which is of a very caustic Nature, assumes a bluish Colour; which probably proceeds from a Portion of the inflammable Principle, which that Salt has carried off from the Regulus: And as a Proof of this, that Lixivium blackens Tin and Silver, which it would not do, if it was not sulphureous. If instead of throwing this Matter into Water, after the Detonation, I throw it into Spirit of Wine, it assumes, almost immediately, a beautiful red Colour, which, by Digestion, is still heighten'd more and more. This Liquor, which *Stahl* has called *Tinctura Alcalica acris*, is a Tincture of Antimony, not of an emetic Quality, but only simply alkaline and diaphoretic, which, by means of the Nitre, has carried off from the Antimony a Portion of its Metallic Sulphur; if, by the way, a Metallic Sulphur has an Existence in Nature; from whence it follows, that a well prepared *Lilium* is not simply a Tincture of alkaline Salts, as some People imagine. It is true, that Spirit of Wine, digested upon a simple fixed Salt, well alcaliz'd, assumes at last a reddish Colour; but that same alkaline Salt, when it is pure and unmixed, will never give a bluish Colour to Water, as Nitre alcalized with Regulus does.

This Digression is not so unseasonable as at first Sight it may possibly appear to be; for it serves to prove, that there is a considerable Quantity of an inflammable Principle in the Regulus. Besides 'tis well enough known, that by converting the Regulus into a *Diaphoretic*, its Weight is considerably increased. Eight Ounces of Regulus, for Instance, yielded me eleven Ounces and two Drams of *Diaphoretic*, even when well edulcorated, and sufficiently dried. This Augmentation can proceed from nothing else than the Concentration of the Acid of the Nitre in the Parts of the Regulus: Now, upon this Supposition, I can discover the Cause of the Deflagration of my Phosphorus.

I account for it in this manner: There is a great Quantity of the Parts of the Calx, which was formerly Quick-lime, in that gross and unfiltered Lixivium, of which the black Soap is made: When I calcine the Mixture, of which my Phosphorus is made, I burn some Part of the inflammable Matter of the Soap, and the remaining Part is reduced to a Coal. During the Action of the Fire, the Acid of the Nitre, by little and little, quits the Reguline Parts which retained it, in order to unite itself to the alkaline Salt of the Soap, with which it is formed into a regenerated Nitre: But all the alkaline Salt is not employ'd in this Regeneration; because there is not, in all Probability, enough of the nitrous Acid. By the same Fire the earthy Particles of the Calx, scattered up and down in the Soap, are calcined afresh, and once more become a *Calx Viva*. As all these Particles of different Natures are contiguous to each other in the Crucible, they will, by their Actions, contribute to produce the Effect we speak of, as soon as an external Cause shall concur to its actual Production. Taking this for granted, I raise the Crust which covers the Mass of Phosphorus, upon which the Moisture of the Air, or those aqueous Particles with which it is impregnated, and which are greedily absorbed by the alkaline Salts contained in the Mixture, are introduced. Upon this the Calx becomes moist, grows warm, kindles, and lays hold of the Parts of the Charcoal, and regenerated Nitre, which are contiguous to it; and hence follows the Detonation of the whole Mass. That Nitre is actually contained in this Mixture, whether by Regeneration, which I believe to be the Case, or by some other Means, is proved from this Circumstance, that upon trying the same Experiment three times, with Powder of *Algaroth*, it did not succeed; because, in that Powder, the Antimonial Parts are not united to the nitrous Acid, but to the Acid of the Sea-salt.

If this is not looked upon as a sufficient Proof, I shall here subjoin an additional one. When, with an Intention to reduce the *Diaphoretic* into a Regulus, I continued to augment the Fire, there happened a Detonation of that Nitre, which was fused with the Coal of the Oil of the Soap, like that which would have been produced by a Mixture of Nitre and common Charcoal: The *Diaphoretic*, in the mean time, was dissipated in white Vapours; and there only remained in the Crucible a black hard Crust, which adher'd to its Sides, without any Marks of Detonation. For this Reason, the Success of my fulminating Phosphorus depends upon the Degree of Calcination which I give to the Mixture; for this Reason we must also take care, not to carry the Fire to such a Height as to fuse the Nitre.

As to the Probability of the Concurrence of a Matter,

which is become a *Calx Viva*, and which kindles and burns, I shall relate the following Fact: About five Years ago, upon the breaking of the Ice on the River *Seine*, a Boat full of Lime was flayed by the Ice; upon which the Water, getting Access to the Lime, kindled it. The Lime burnt the Boat, and the Fire was convey'd from that to the Boats that were next it, so that a considerable Fire ensued; and my Situation at that time gave me an Opportunity of being satisfied, as to the Truth of its Origin.

We have several Chymical Mixtures, which take Fire as soon as they are exposed to the Air; such as sulphureous, vegetable, and animal Substances, calcined with Alum.

The Mixture of Regulus of Antimony, and corrosive Sublimate, sometimes takes Fire.

Mr. *Stahl*'s Antimonial Crocus of Mars took Fire in the King's Garden, where Mr. *Boulduc* exposed it to the Sun, in order to dry it with the greater Expedition.

Aurum Fulminans fulminates by the Heat produced by a somewhat rapid Trituration.

The Rod of Iron, used in stirring the several Mixtures in the Reduction of my Calces of Antimony, being scraped with a Knife, yielded Sparkles of Fire.

Mr. *Reaumur* observed, that from an almost equal Mixture of Antimony and Iron, a Metallic Mass is produced, which, when filed down pretty strongly, yielded a great many Sparkles of Fire capable of kindling any combustible Substance.

Thus it seems, in order to prepare Phosphorus, nothing more is required than to concentrate a Matter, capable of taking Fire, in certain *Cellulæ*, where it may remain calm and dormant, till, by some Cause or other, the Sides of these *Cellulæ* are broken, and Access given to a more subtle Matter, capable of communicating an extremely rapid Motion to it. Whether this Theory sufficiently accounts for the Inflammability of Phosphorus, or whether more ingenious Hypotheses are invented for that Purpose; yet still it must be owned, that Speculations of this Nature are more curious than useful. *Memoires de l'Academie Royale*, A. 1736.

Of the REGULUS ANTIMONII MEDICINALIS, from Hoffman.

The Regulus of Antimony has not been exempted from the Fate of other chymical Medicines; for upon its appearing some Years ago, it was at first looked upon as an *Arcanum*, or Secret of the last Importance, especially in the *Netherlands*. Who its Inventor might have been, is a Point as yet not fully agreed upon; for some ascribe the Discovery to *Cranius*, and others to *Mæstius*, who has inserted the Preparation of this Regulus in his *Chymia Rationalis*: It is also to be met with in the *Med. Chym.* of *Vigani*. As Mankind are not agreed, with regard to the Inventor of this Medicine, so they also run into opposite Sentiments, with regard to its Qualities and Effects; for there at first were, and still are, a great many who rank it among the principal and most important Secrets of Physic; whereas others assert, that it is of no Use at all, or, which is worse, ascribe a noxious and poisonous Quality to it.

For these Reasons, I thought it would be no unuseful Task, briefly to inquire into the Nature of this Medicine, that we may be the better able to judge, which of these two Classes of Men, who run into so opposite Extremes, are in the Right, and which in the Wrong; and as no profess'd Attempt of this Kind has been made before, I hope I shall the more readily meet with a favourable Indulgence, if I handle the Subject with less Accuracy than its Importance deserves. Now, that I may execute my Design with the greater Perspicuity, I shall first briefly touch upon the Principles of which this Regulus is made up; secondly, I shall give its Preparation; and, lastly, its various Uses.

The constituent Principles, then, of this Regulus, are, first, Antimony itself, which is indeed the principal, since it constitutes the very Matter of the Regulus. Secondly, common Salt, whose Acid is very fine, and of a highly volatile Nature. Thirdly, and lastly, an alkaline Salt, which produces very singular and remarkable Effects upon sulphureous Substances, especially of a Mineral Nature; as also upon the sulphureous or oily Parts of animal and vegetable Substances.

Of the Preparation of the MEDICINAL REGULUS.

Having thus enumerated the several Principles of which the Regulus is composed, it now remains, that we take a View of the Method of preparing it. But tho' several Authors, and among the rest *Mæstius*, in his *Chymia Rationalis*, & *Alf. Curiof. Leyd.* *Koenig* in his *Regnum Minerale*, *Barkhyisen* in his *Pyrotophia*, have laid down Directions with regard to this Particular; yet I think myself obliged, in like manner, to give an Account of it.

Take then five Parts of pure Antimony, four Parts of common Salt, and one Part of Salt of Tartar. Some, indeed, alter the Proportions of the Ingredients, and take eight Parts of Antimony, seven of common Salt, and one of Salt

Salt of Tartar; but the former Proportions are most generally adher'd to. These Ingredients, when beat and mix'd together, are to be successively put into a red-hot Crucible: Let the Action of the Fire be rais'd to such a Height, that the Matter may be sufficiently and thoroughly fused; that is, let the Fire applied be a *moderate fusory one*. Then after the Matter is sufficiently fused, which generally happens in a Quarter of an Hour, if right Measures are taken, let it be pour'd into a Vessel of a conical Form, besmear'd with Tallow, or smok'd with a Candle: This Vessel is to be shaken in the manner observed in other Fusions of *Regulus*, that by this means the *Regulus* may be sufficiently separated from the Scorizæ, and carried to the Bottom of the Vessel: Some reckon this Circumstance of shaking so much the more necessary, because as this *Regulus* is lighter than any others prepared from Antimony, it must of Consequence be separated from the Scorizæ, and fall to the Bottom with more Difficulty. Thus, if such a Concussion, or Shaking, should be neglected, and the Mixture pour'd when boiling, as it were, from the red-hot Crucible into a cold conical Vessel, it frequently happens, that during the Continuation of the Ebullition, a Portion of the Scorizæ is intermixed with the *Regulus*; and, *vice versa*, a Portion of the *Regulus* remains in the Scorizæ; so that, by this Oversight, we do not obtain it so pure and uncontaminated, or at least so beautiful and shining, as it would otherwise be. The *Regulus*, when separated from the Scorizæ, resembles polished Steel or Iron; but if either in a Mortar, or upon a Marble, with or without the Addition of Water, it is reduced to a Powder so fine, that the shining Particles entirely disappear, it assumes a reddish, or rather a purple Colour.

But since there is no great Difficulty in the Whole of the Process, I shall not, at present, spend more Time in enumerating or describing any more of its Steps: But 'tis to be observed, with regard to the Addition of the alkaline Salt, that some who maintain, that there is a vast Difference betwixt Alcalis, adhere so inviolably to Salt of Tartar, either for the sake of its superior Purity, or on account of its nobler Effects, or occult Qualities, that they will not allow any other Salt to be substituted in its room. I have some Reason to think, that the Observation of *Vigani* may have laid a Foundation for the Doubts of People, with regard to this Matter; since, in *Med. Chym. p. 20.* he brings an Experiment for establishing the Difference of Alcalis; and affirms, that he himself, by preparing Antimony with common Salt and Salt of Tartar, obtained a reddish *Regulus*; whereas by a like Fusion of Antimony with Salt of *Carduus Benedictus*, instead of Salt of Tartar, a simple *Regulus* was only yielded. But I must own, that tho' I have with this very View made several Experiments, and that with a great deal of Caution, yet I could never observe so considerable a Difference between the *Reguluses* produced, but obtained the same, with Salt of *Carduus Benedictus*, and other Alcalis, as that procur'd in the common way by means of Salt of Tartar. I therefore suspect, that this simple *Regulus* of *Vigani* was produced by a fortuitous Intermixture of Charcoal, and some other sulphureous Concretion. As I have not therefore been able either *à priori*, or *à posteriori*, to discover the Difference of alkaline Salts, so I think we have no Occasion to be over-scrupulous in our Choice, provided we only make use of an Alkali that is pure, duly prepared, and not adulterated by any adventitious or heterogeneous Substance.

It is still more superfluous to hesitate about our Choice of common Salt, or make nice Disquisitions, whether Sea-salt, Sal Gemmæ, or Fountain-salt, are most proper for this Purpose, since the End seems to be equally well obtain'd by all of them.

This then is the most common and usual Method of preparing the *Medicinal Regulus*; but it is not always adher'd to by some, who either add or omit Ingredients, or alter the Proportions of the Weights, just as Caprice, or some particular View, directs them. Thus some omit the alkaline Salt, and substitute in its Place crude Tartar, but in a larger Quantity. They therefore take eight Parts of Antimony, seven Parts of common Salt, and six Parts of Tartar. This Mixture is put into a red-hot Crucible for Fusion, which indeed is more difficultly brought about, than in preparing the common *Medicinal Regulus*. By this Method a *Regulus* resembling the medicinal one is yielded, and I take it to be of the same Species, tho' it is not so beautiful, being of a darker Colour, and of a more porous Contexture: But when reduced to a Powder, it assumes a purple Colour, just as the *Medicinal Regulus* does. Its Scorizæ are light, porous, and resemble the Flakes which fly from hot Iron when hammer'd. Others, who in the Production of *Regulus* perhaps ascribe too much to common Salt, order the Salt of Tartar to be entirely omitted, and the common Salt to be augmented by the Addition of a Quantity equal to the omitted Salt of Tartar. This is ordered by *Barkhyisen in Pyrosophia, Libro 3. Sectione 3. Capite 2.* where he maintains, that the same *Medi-*

cinal Regulus may be obtained from Antimony slightly fus'd with an equal Portion of common Salt; but upon Trial, the Effect promis'd is so far from being produced, that there is not so much as a perceptible Change induc'd upon the Antimony, by means of the common Salt. Lastly, among the several Methods of preparing *Reguluses* of this Kind, we may reckon that, in which, for correcting the *Crocus Metallorum* of *Rulandus*, Chymists add common Salt, and thence promise a like *Medicinal Regulus* as to its Effects. For this Purpose, they therefore order three Parts of Antimony, two Parts of Nitre, and one Part of common Salt: See *Le Mort in Artis Curiosis Leidens.* Others reject this Proportion, and prefer equal Quantities of each Ingredient. Now these Ingredients, when beat and mixed together, are to be put into a red-hot Crucible, and reduc'd to a due Degree of Fusion, which is soon obtain'd. After this, the Matter is to be pour'd into a conical Vessel, or as *Le Mort* intimates, in the above-cited Passage, it may be left in the Crucible, from which, when cold, it is to be taken. The *Regulus* yielded by this Process, is not unlike the *Crocus* of *Rulandus*; it is, like the *Medicinal Regulus*, of a porous Consistence, not very smooth, but clean and beautiful. When reduced to Powder, it acquires a dark-reddish Colour like that of red Bole. Its Scorizæ are light, of a yellowish-amber Colour, and not unlike those obtain'd by the Depuration of *Regulus* of Antimony with Nitre.

Of the Use of this REGULUS.

The Medicinal *Regulus* may be apply'd, first, to a chymico-physical, secondly, to a pharmaceutic, and, thirdly, to a medico-therapeutic Use, upon each of which I shall briefly touch.

Its Use then in Chymistry may be plainly perceived, from an *Ætiological* Research into its Nature, and the Manner of its Production; so that I shall say no more upon this Point, but proceed to a View of its Use in Pharmacy.

And tho' Chymists have not hitherto been solicitous about extracting other Medicines from this *Regulus*, yet I shall briefly enumerate such Preparations of it as are in Use. Our learned President then, in his Notes to *Poterius, Cap. 12.* has propos'd a Preparation of antimonial Sulphur from the *Medicinal Regulus* boiled in Lime-water, and which is to be precipitated with Spirit of Vitriol. This Sulphur, he says, is of the same Efficacy and Virtues with the *Panacea* of *Glauber*; he also prefers it to the *Regulus* itself, because, as he says, in it the arsenical Virulence, being corrected by the Spirit of Vitriol, is weaker than in the *Regulus*. In the same Work he also gives Directions for the Preparation of an antimonial Tincture, to be extracted from the *Medicinal Regulus*, fus'd with an Alkali, by means of Spirit of Wine, either tartariz'd, or drawn off from antimonial Scorizæ. He also teaches us how to prepare an anodyne Tincture from the *Regulus*, which is done by dissolving Opium in a Decoction of the *Medicinal Regulus* with Lime-water, and by extracting the Essence from the inspissated Solution by means of *Malmsey-wine*, or Spirit of Wine. Concerning the Virtues of this Tincture he speaks thus: "This Medicine is exquisitely calculated for easing Pains, and procuring Sleep; for by the Lixivium of the Quick-lime impregnated with the antimonial Sulphur, the narcotic and stupifying Qualities of the Opium are corrected, and thus the Symptoms usually brought on by the Use of Opium are prevented, whilst, in the mean time, the attenuating and anodyne Qualities of the antimonial Sulphur, which check the impetuous Motions of the Spirits, prove a happy Balance for each other." Here we may also take Notice of what is said by *Basil Valentine*, in his *Currus Triumphalis ANTIMONII*, concerning an antimonial Tincture and Balsam, which are prepared from a Mixture of Tartar and Antimony, in Form of a Liver, not unlike the *Medicinal Regulus*. Besides, an antimonial Calx, and a Cerus of Antimony, may be easily prepared from the *Medicinal Regulus*; a Glass may also be prepared from it, if after washing out the alkaline Portion, it is gently calcin'd, and the Sulphur by that means carried off, upon which the calcareous Remains are easily fus'd into a Glass. Let this suffice for the Use of the *Medicinal Regulus* in Pharmacy. The Subject might indeed be much farther protracted; but as that is not necessary, I shall only repeat, that in many Shop Preparations the *Medicinal Regulus* may be us'd, as a proper Succedaneum to Antimony itself.

I now come to the third and last thing propos'd, which was, to inquire into the Use of this *Medicinal Regulus* in the Practice of Physic; and here I cannot help condemning those who with exaggerated Encomiums extol this *Regulus* as an universal and divine *Panacea*; as for my own Share, I can with greater Cheerfulness go into the Sentiments of those who observe a due Medium in this Point. Its Efficacy is highly extoll'd in chronic Disorders, and such as arise from long-continued Obstructions of the Viscera: Hence our learned President, in his Notes upon *Poterius*, commends it in Dropsies, Epilepsies, Scurvies, and Fevers; for as these Disorders are of a stubborn and obstinate Nature, they require Medicines which do not, like vegetable Substances, too quickly produce their Effects, but remain

for a considerable time in the Body; and by often impelling the tenacious Matter, at last entirely break and subdue it. Hence we may easily conceive why this *Regulus* must be a Medicine of singular Efficacy in surmounting the Obstinacy of chronical Disorders. There are also not a few who highly extol its Efficacy against Fevers. *Maetsius*, in his *Chym. Ration. & Actis Curios. Lugd.* says, that it is a *Specific Diaphoretic in Fevers of all Sorts*. The same Author commends it in all Disorders where, to use his own Words, *Sweats are wanted, because it does not, like vegetable Substances, inflame the Blood*. I myself am inform'd by People who were acquainted with this Author when alive, that he made daily Use of this *Regulus*; and his own *Praxis Chymiatrica* is a concurring and additional Proof, that he did so; for in that Work he maintains, *That it is of uncommon Efficacy in all Diseases where the Motion of the Lymph, and insensible Transpiration, are to be promoted*. Thus he commends it in the Gout, the Apoplexy; &c. but more particularly in Fevers. This he has also done in *Actis Curios. Lugd.* where he orders it to be used with a diaphoretic Regimen. *Barkhyisen* joins Issue with *Maetsius*, and highly extols its sudorific Virtues in Fevers, and cutaneous Disorders. *Keenig* declares himself of the same Sentiments in his *Regnum Minerale, Cap. 9.* where he also proposes a Form of a Medicine consisting of the *Medicinal Regulus* reduced to a Bolus, with *Peruvian Bark*, and *Theriaca*; to be taken a few Hours before the Paroxysm of the Fever. But notwithstanding the high Encomiums bestow'd upon this Medicine by its Inventor, I should not advise any one to use it in violent Quartan Fevers; because Dropsies, and other Disorders, are very often brought on by the Use of Medicines that are so astringent, and capable of producing such strong Commotions. This Medicine is also commended by some in Cases where the State of the Lymph is bad, in Dropsies, Anasarca, &c. as I have already observed. But particularly with regard to its Use in an Anasarca, I have been satisfied by the learned and judicious Mr. *Hennike*, who mixed it with *Mercurius Dulcis*, and used it under that Form with uncommon Success. Our learned President, in his Notes upon *Potterius*, orders it to be prescribed in small Doses, with the Bezoardic Powders, in the first Stages of malignant Fevers, Small-pox, and Dysenteries, *Because, says he, by its Means a gentle Salivation and Diaphoresis are brought on, and the Mucus of the Primæ Viæ being attenuated, the Heaviness and Uneasiness of the Præcordia are remov'd*. I also remember, that when malignant Fevers rag'd pretty much in my own Country, that excellent Chymist *Rollwagius* often us'd this *Regulus* with the greatest Success; of it, together with some other earthy Absorbents, he compos'd an alexipharmic Powder, which is in constant Use at this very Time. This Powder is accurately describ'd by the learned *Apinus*, in his *Traëtatus de Febribus epid.* where, from his own Experience, he ascertains the Efficacy of it, but particularly of the *Regulus*, in malignant and epidemical Fevers. I also know, that the *Regulus* was used by the above-mentioned Dr. *Hennike* in these Disorders; but in Process of Time he desisted from using it so frequently as he had formerly done, on account of some Inconveniencies that arose from its being negligently prepared; and chose the *Bezoardicum Joviale*, or the *Antibædæicum Poterii*, as a Succedaneum to it. *Maetsius* commends the Lixivium of its Scoræ apply'd externally as a proper Medicine for the Itch; and I remember, that, by my Father's Advice, not only I myself, but a great many others, labouring under this Disorder, us'd this Medicine with incredible Success. I also remember to have seen the *Regulus* itself mixt with earthy Substances used in the Itch, and have known it in that Form, and in Conjunction with a sudorific Regimen, to remove oedematous Swellings, especially of the Feet. Hence we may plainly perceive the Efficacy of this *Regulus*, in augmenting the Motions of the Humours, which, in this Case, were hinder'd from rising to their greatest Height, by the Addition of the earthy Astringents. Having thus said something concerning the Use of the *Medicinal Regulus* in the Practice of Physic, I shall now subjoin a few Hints relating to the Manner in which it operates.

Now, as the *Medicinal Regulus* produces two Effects, which are promoting a Diaphoresis, and removing the Lensor of the Humours, so it seems to operate in two different manners, one of which consists in promoting the several Motions, and the other in correcting the Qualities of the Humours; but this latter does not exert itself so strongly as the former. It acts in the former of these manners both in Consequence of its sulphureous and its reguline Parts. As for Sulphur in general, 'tis sufficiently known, that it not only contains the very Matter of Fire, which is itself easily susceptible of the quickest Motions, and sufficiently capable of augmenting the Motion of the Humours; but also, that from its being a Mixture of a phlogistic with a vitriolic Acid, it possesses a tonic Force, as daily Experience teaches us, upon observing its Efficacy in repelling the Itch. By this tonic Force the relaxed Vessels recover their natural Tone; and by this means the Blood being not only put into a more violent Motion, but also forc'd thro' narrower Ducts, must of course be more attenuated, and acquire a greater

Degree of Subtily. As to its *Reguline* Part, we are to observe, first, that it receives a stimulating Force from an Addition of the arsenical Parts, and thus becomes capable of exciting strong and brisk Motions in the Spirits. Secondly, That by reason of its mercurial Nature it is capable of penetrating and dissolving not only the thick and viscid Humours lodg'd in the Primæ Viæ, but also those which are intermix'd with the Mass of Blood itself, and retard its progressive and intestine Motion. Hence we see in what manner it may correct the Defects of the Lymph, clear the Viscera, when obstructed with Crudities of this Kind, promote the several Secretions, and render the Juices fit for Motion. In these last mentioned Effects, or in changing the Qualities of the Fluids, its second Manner of operating consists.

It now only remains, that I say something concerning the Method of administering this *Medicinal Regulus*. It may then be commodiously enough exhibited in the Form of a Powder, since the Dose necessary for any Purpose is neither large nor nauseous. If it should happen to be a little too heavy, it may be mixed with the lighter Absorbents, as they are call'd, prepared of Mother of Pearl, Crab's-eyes, &c. Such other Substances may also be mixed with it, as the Diversity of Disorders shall be judged to require. Thus our learned President orders it to be exhibited with gentle Chalybeats in Dropsies; in Epilepsies, with cinnabarine Preparations; and in intermitting Fevers, with digestive Salts, Absorbents, &c. I have above taken Notice of its uncommon Efficacy in an Anasarca, when mixed with *Mercurius Dulcis*; for by its Means, half a Scruple of *Mercurius Dulcis* has sometimes prov'd of more Efficacy, than two Scruples would have done without. Some add it to Vomits as a Stimulus, and by way of a Digestive. In Form of a Potion it may be mixed with other Diaphoretics, Anodynes, &c. with *Diafcoridium*, the *Theriaca Cœlestis*, the Bezoardic Tincture, the Tincture of Opium corrected with Salt of Tartar, and with the diaphoretic Waters of Germander, Chervil, and Cherries. *Maetsius* in his *Chymia Rationalis*, and *Apinus*, in his *Treatise de Febribus Epidem.* have given Formules of this Kind. It may also be exhibited in the Form of Pills, with resinous and solvent Gums, and with the aperient bitter Extracts of Wormwood, *Carduus Benedictus*, Germander, Fumitory, Scurvygrafs, Saffron, Gum Ammoniac, Sagapenum, Hedera, Myrrh, Aloes, &c. When the *Regulus* is prudently and skilfully mixed with such Substances, it becomes a far from despicable Medicine in menstrual Disorders, and Infarctions of the Viscera. Its Dose is from six Grains to one Scruple, and upwards, as the State of the Patient shall require. But before this *Regulus* is used, it must be so thoroughly triturated, and, upon a Marble, reduced to a Powder so fine, that none of the shining Sparkles may in the least appear: For this Reduction of it to so fine a Powder is absolutely requisite, both to its easy Solution, and its speedy Operation; and if this Caution should not be observed, it remains too long in the Intestines, and may possibly give Rise to very terrible Symptoms; and it also even passes off with the Excrements, which is often the Case with cinnabarine Preparations. *Hoffman. Medicin. Rational. System. Vol. 4.*

Dr. *John Pringle* has, in the *Edinburgh Medical Essays*, oblig'd the World with an Account of an antimonial Remedy for a Dysentery, made public by Dr. *Young*. This at the first Appearance seems to be one of the most unlikely Remedies that could be contriv'd to answer the End propos'd. But as I have it from very good Hands, that Experience, the only thing which can determine the Value of a Medicine, is much in favour of this, I apprehend an Account of it ought not to be omitted in a Treatise of Antimony, tho' I have not myself been a Witness of its salutary Effects.

Vitrum Antimonii Ceratum.

Take Glas of Antimony in Powder, one Ounce; Beeswax, one Dram: Melt the Wax in an Iron Ladle; then add the Powder; set them on a slow Fire without Flame, for the Space of half an Hour, continually stirring them with a Spatula; then take it from the Fire, pour it upon a Piece of clean white Paper, powder it, and keep it for Use.

When I prepared this Quantity, it lost a Dram of its Weight. The Glas melts in the Wax with a very slow Fire.

I was at first so scrupulous in preparing the Medicine, that I wish'd the Degree of Heat had been assign'd, as well as the Space of Time necessary in the Preparation; but I have since found, that I both vary the Time and Degree of Heat, without perceiving any Difference in the Operation of the Medicine.

After it has been about twenty Minutes on the Fire, it begins to change the Colour; and in ten more, comes pretty near the Colour of Snuff: By that Colour I know it is sufficiently prepared, without attending to the Degree of Heat, or Space of Time.

The ordinary Dose for an Adult, is ten or twelve Grains ; but for the greater Safety, I commonly begin with six ; to a strong Man I have given a Scruple, which sometimes works so mildly, that I have thought it too weak.

To weakly Constitutions give five or six, increasing the Dose afterwards, according to the Operation.

To a Boy of ten Years of Age, give three or four Grains.

To a Child of three or four Years, two or three.

This Medicine has been practised with Success for the Dysentery, and the Preparation of it was kept a Secret for many Years.

When first it was communicated to me, I thought it so harsh and dangerous a Medicine, that I had no Courage to try it for some Years ; and even then I began the Dose with one Grain, and increased it gradually to twenty, which is the largest I have yet given. As soon as I was convinced, by a Number of Experiments, that it was both mild and efficacious in curing the Dysentery, I published the Receipt in our *Edinburgh News-papers*, being under no Promise of Secrecy with regard to this, and being resolved never to make a Secret of any Medicine whatever.

I do not expect, that any Physician will incline to give a full Dose at first, without better Authority than I can give to Strangers ; but the Cautious may give a small Dose as they please, and make first Trials almost in any Disease where Purgatives will do no Harm, and increase it gradually as they find it operate.

I gave it in Dysenteries with or without Fever, whether epidemic or not.

I have tried it often where Bleeding and Vomits have been premised, and where they have not, with very good Success.

I never chuse to give Opiates in the Beginning, especially where there is a great Sickness ; because, altho' Opium gives great Relief to some, yet at other times I have thought both the Sickness and Purging thereby increased the following Day.

I never began with a larger Dose than ten Grains, because it frequently operates as violent at first, as twenty Grains at last, even upon the same Patient.

In its Operations, it sometimes makes the Patient sick, and vomits ; it purges almost every Person, but I have known it cure without any sensible Evacuation or Sickness ; nay, in violent Dysenteries, they purge seldom with it, than without it.

If it purge sufficiently, or fatigue the Patient any way, I intermit a Day or two betwixt each Dose, the same way as I do with other Purgatives.

As I have cured some with one Dose, I have been obliged to give others five or six, especially when the first Doses have been too mild, and I have often thought a weak Dose did no good in Chronic Cases.

After the second or third Dose, the Stools are seldom bloody, the Gripes and Sickness are much abated, and the mucous Stools are less viscid.

Give it with an empty Stomach ; for then, I think, it operates most mildly.

Forbid drinking any thing after it for three Hours, unless the Patient is very sick, or disposed to vomit, in which Case give warm Water as in other Vomits.

Beware of giving it for a Diarrhoea in the End of a Consumption. I have cured some other Diarrhoeas of long standing with large Doses of it ; but it has failed oftener here than in Dysenteries.

I forbid the Use of all fermented Liquors, and recommend a Milk-diet with Rice or Bread, Chicken-broth, or Water-gruel.

I give nothing cold, unless it be a Tea-spoon-full of Gelly of Hartshorn, as often as the Patients please ; and sometimes I indulge them with the Gelly of Currans to refresh their Tongue.

It may be given safely to Women with Child, and to Children on the Breast you may give half a Grain. *G. Y. Edinburgh, Med. Essays, Vol. 5.*

Antimony has in all times, since its Medicinal Virtues were first discovered, afforded the Empirics their most boasted Secrets, as may be known by the Irregularity of their Operations ; for *Antimonial Remedies* have this singular Property, that they will sometimes operate with great Violence ; and sometimes even in the same Dose, and same Person, without any apparent Alteration of Circumstances, shall have no visible Operation.

This, if there was no other, is a sufficient Evidence, that the Pill Mr. Ward first set out with, was *Antimonial*, of which there is now no room to doubt : As to the specific Preparation he makes use of, it is not very material, since there are many different Sorts of them made, by depriving this Mineral of a Part of its Sulphur, and laying the Reguline Part naked, which will have much the same Effects, in the same small Dose.

I shall conclude this Article of *Antimony* with an Account of a Remedy, which has lately been advertised, and for which a Patent has been obtained ; I mean, Mr. Hayward's Powder for the Rheumatism and Gout, which promises no less than

the Cure of the last-mention'd Distemper, after it has puzzled all the Physicians in the World for so many Centuries. It seems therefore to be of some Importance to examine how far this Remedy is likely to answer the Character given of it by the Persons concern'd in point of Interest to promote the Sale, because these may be prejudic'd in its Favour. I must, however, first inform those who are unacquainted with it, that every one who takes out a Patent for any Invention, is oblig'd by Act of Parliament to specify the Particulars of it, and enroll them in the Court of Chancery, within four Kalendar Months, that the World may have the Advantage of the Discovery, and the Monopoly for fourteen Years is the Reward for making it. After this Specification is enrolled, I apprehend every body, who thinks it worth while to pay the Fees, has a Right to have recourse to the Enrollment.

Mr. Hayward's Remedy then, is a Preparation of *Antimony* and Nitre, made by rubbing them together, till no shining Particles of the *Antimony* are apparent. Of this each Dose for an Adult is twenty-seven Grains.

I have before observed, that *Kunckel* found some Relief in Pains with which he was afflicted, by taking, pursuant to the Advice of the younger *Sennertus*, crude *Antimony* ; and that *Kunckel's Troches* are, at this Day, famous for erratic Pains, at *Frankfort* and *Nuremberg*, which are prepar'd of crude *Antimony* ; and I cannot doubt but that crude *Antimony*, join'd with Nitre, may sometimes do Service in slight Rheumatic Cases, if duly persisted in. But I am far from believing, that it is possible to cure any Degree of the Gout by such a Remedy.

With respect to Patents for Medicines in general, it is to be observed, that it is not very easy to come at a Knowledge of the real Efficacy of such Remedies ; for, in the first Place, it is not always certain, that the Cases which are published by the Proprietors, are literally true in every Circumstance ; or, tho' they are, we should only hear of those Cases which were attended with Success, whereas a thousand Cases, where the Remedy had no good Effect, would be suppressed.

There are, however, People enough in the World of more Faith than Understanding, to make it worth the while of designing Men, to vend for Secrets the most common Preparations of the Shops, to their own Benefit at least, because the Prices of these Secrets are usually very exorbitant.

I don't know, that the Price of the Remedy I have spoken of above is more extravagant than those of other Nostriums ; if not, we may judge of the rest by this.

The Price of crude *Antimony* is Four-pence a Pound, and never above Six-pence, when bought in Quantities. Nitre is, I believe, at this time, worth a Shilling a Pound, tho' seldom so much. Supposing then a Pound of each to be sold at five Shillings, for every twenty-seven Grains, the whole two Pounds will sell for 142 l. and some little more, enough to pay for the Ingredients.

Stahl calls that Tincture of *Antimony*, which is made by throwing *Diaphoretic Antimony*, immediately after Detonation, into Spirits of Wine, and digesting it, *Tinctura Antimonii Alcalica acris*.

I omitted mentioning above, that the *Liver of Antimony* and *Crocus Metallorum* are the same, except that the former is unwash'd, the latter wash'd.

ANTIMONIUS LAPIS. The *Antimonial Stone*. *Myrepus*, *Serapion*, and some others, reckon *Antimony* among the Kinds of Stones ; and *Myrepus* particularly, in *Sec. 1. Cap. 470.* as *Fuchs* observes in his Notes thereon.

ANTIMOROS, ἀντιμωρός, from ἀντί, against, and μωρός, Death, or a Disease. The true Name, according to *Fuchs*, of an Antidote in *Myrepus*, *Sec. 1. Cap. 25.* instead of *Diatamaron*, as it is there read ; which plainly shews, that *Myrepus* translated this Composition from some barbarous Author, who miserably corrupted the Word ; for some of the more correct Latin Copies read *Antimoros*. *Fusch. Note on the Place above named.*

ANTINEPHRITICA, ἀντινεφριτικά, from ἀντί, and νεφρός, a Pain in the Kidneys. Remedies against Disorders of the Kidneys. *Blancard.*

ANTIOCHI HIERA, the *Hiera of Antiochus*. A compound Medicine, prepared as follows :

Take of *Germander*, *Agaric*, the Pulp of *Colocynthis*, *Stechas*, each ten Drams twenty-five Grains ; *Opopanax*, *Sagapenum*, *Parley*, *Birchwort*, white Pepper, each five Drams twelve Grains ; *Cinnamon*, *Spikenard*, *Troglodytical Myrrh*, *Indian Leaf*, each four Drams ten Grains ; Honey a sufficient Quantity. It is good against *Melancholy*, *Madness*, *Epilepsy*, and for all those whose Blood abounds with Impurities. *Actius Tetr. 1. Ser. 3. C. 114.*

ANTIOCHI THERIACA. The *Theriaca* which King *Antiochus* the Great used against all sorts of Poison, the Prescription of which was cut in Stone, at the Entrance of the Temple of *Æsculapius*.

Take of *Thyme*, *Opopanax*, *Millet*, each two Drams five Grains ; *Trefoil*, one Dram two Grains and a half ;

the Seeds of Dill, Fennel, Anise, Bishops-weed, and Smallage, each sixteen Drams fifteen Grains; Meal of the bitter Vetch, twelve Drams thirty Grain. Pound them, and sift them, and afterwards, with the best Wine, make them up in Troches of half a Dram, one of which in a quarter of a Pint of Wine, is a Dose. *Pliny, Lib. 20. Cap. 24.*

ANTIPARALYTICA, ἀντιπαρηλυτικά, from ἀντί, and παράλυσις, the Palsy. Medicines against the Palsy.

ANTIPATHES, ἀντιπαθής. What they call *Antipathes*, is to be accounted *Coral*, tho' of a different Kind from the common Sort. It is of a black Colour, has the Form of a Tree, and is more branched than the other. It agrees in Virtues with the common Coral. *Dioscorides, Lib. 5. Cap. 140.*

ANTIPATHIA, ἀντιπάθεια, from ἀντί, against, and πάθος, an Affection. Antipathy. It is said to be a kind of occult Quality, opposite to Sympathy, when there is a natural, but unaccountable Hatred or Aversion between two Things, which endeavour to remove or destroy one another. Thus *Galen, Lib. 11. de Simp. Med. Fac. §.* says, that some have written, that old Leather, burnt, cured Galls by a sort of Antipathy.

Charlton thinks, that the whole Affair of Sympathy and Antipathy might be accounted for from the various Motions and Configuration, the mutual Cohesion and Combination, or the reciprocal Embracing or Repulsion, of the perpetually exhaling Corpufcles or Effluvia which meet together. *Castellus.*

ANTIPATRI THERIACA, *Antipater's Treacle*. It is thus prepared :

Take of Gentian, four Drams ten Grains; Trifolium, (stinking Trefoil) four Drams ten Grains; Seed of the fame, two Drams five Grains; Poley, four Drams ten Grains; Sowbread, two Drams five Grains; Hog's-fennel, Galbanum, each two Drams five Grains; Parsley, four Drams ten Grains; Wood-rue, three Drams seven Grains; Pellitory of Spain, one Dram two Grains and a half; Staves-acre, two Grains and a half; Mace, three Drams seven Grains; the Root of the white Vine, two Drams five Grains; as much white Pepper; Gum Ammoniac, one Dram thirty-four Grains; Mullein, Ground-pine, Mezereon, small Horehound, the lesser Fleabane, Ethiopian Cummin, Opium, Castor, Fennel-seed, Agaric, Cassia Rufa, the Flower of Juncus Odoratus, Rhubarb, each two Drams five Grains; *Cretan* wild Carrot, one Dram thirty-four Grains; as much Opopanax, Sagen, two Drams thirty-six Grains; Southern-wood, one Dram thirty-four Grains; Styra, Dittany, each one Dram thirty-four Grains; Cinnamon, Spikenard, each three Drams seven Grains; Myrrh, four Drams ten Grains; Frankincense, one Dram two Grains and a half; Saffron eight Drams twenty Grains; Anise, one Dram two Grains and a half; Cyrenaica Lacryma, (I suppose he means *Asia Foetida*) one Dram two Grains and a half; Hind's-runner, three Drams seven Grains; *Attic* Honey, a sufficient Quantity. The Dose is the Quantity of a Hassle-nut. It prevents or cures the Bite of an Asp. *Scribonius Largus, Cap. 42.*

ANTIPERISTASIS, ἀντιπερίστασις, from ἀντί, and περίσσεια, to surround. A Strengthening, Cohibition, or Compression all around, as for Instance, by the circumambient Air or Water; and thus there is an Antiperistasis, or Compression of Heat or Cold by the circumfus'd contrary Quality. Thus *Theophrastus, Lib. de Igne*, imputes the Cause why Men are more robust, and have better Digestions in the Winter, to a more potent Collection of Heat by an Antiperistasis, συνέστασις ἐν τῷ χειμῶνι καὶ συγκύκλιξις τοῦ θερμῶν πρὸς τὴν πέριξ αὐτοῦ, καὶ τὰ σώματα πέριξ τὰς τετραὰς μάλλον, καὶ ὅλας ἰσχυροῦσι τοῖς χειμῶνιν ἐσιν, ὅτε συνιθροῦνται καὶ ἀντιπερίστανται τῷ θερμῷ. "In the Winter Heat is contracted and inclosed by the circumambient Air, and Bodies better digest their Food, and are on all Accounts stronger and more robust in cold Seasons, from a Coacervation and Antiperistasis of the Heat." *Theophrastus.*

ANTIPHARMACUM, ἀντιφάρμακον, from ἀντί, against, and φάρμακον, Poison, Medicine. An Antidote or Preservative against Poison. Thus *Dioscorides, Lib. 2. Cap. 185.* speaking of Nasturtium, or Water-crelles, says, ἐπεὶ δὲ ἐστὶν ἀντιφάρμακον, "It is a Remedy against the Poison of Rep-tiles." In this Sense it is the same as **ALEXIPHARMACUM**.

ANTIPHTHISICA, ἀντιφθισικά, from ἀντί, against, and φθίσις, a Phthisis, or Consumption. *Blancard.*

Tinctura Antiphthisica, a Tincture against a Consumption.

Take of Saccharum Saturni, and Vitriol of Iron, each an Ounce; French Brandy, a Pint; and, without Heat, draw a Tincture. *Edinburgh Dispensatory.*

Quincy, in his *English Dispensatory*, gives it thus :

Take Salt of Steel, and Saccharum Saturni, each four Ounces; put them into a Matrafs with two Pints of good French Brandy. Twenty Hours Digestion will make a beautiful Tincture.

This is by some accounted a Specific in Hectic Fevers: And it is not an unlikely Medicine in such Cases, because it will astringe and draw up the Fibres, whereby their Tone will be render'd more rigid, and the Pores and secretory Passages streighten'd, so that the Juices and Nourishment itself will not so soon run off by those Ways. It will also procure a firmer Texture to the Blood itself, which, in those Diseases, is almost fused and broken. This is also good in many Hysterical Affections.

ANTIPTHORA, ἀντιφθορά, from ἀντί, against, and φθορά, Corruption. A Species of Wolf-bane, so called because it resists Corruption. *Blancard.*

ANTIPHYSCA, ἀντιφυσκα, from ἀντί, and φυσάω, or φυσάω, to blow. Remedies against the Wind. See **CARMINATIVES**.

ANTIPHYSON, a Name for the Loadstone in *Marcellus Empiricus, Cap. 1.*

ANTIPLERICUM, ἀντιπλερίκον, from ἀντί, against, and πλερίτις the Pleurisy. A Remedy against the Pleurisy. *Blancard.*

ANTIPODAGRICA, ἀντιποδαγρικά. The same as *Antiarthritica*, which see before.

ANTIPRAXIA, ἀντιπραξία, from ἀντί, and πράσσω, to work. A Word which signifies a Contrariety of Functions and Temperaments in different Parts, and was used by the Antients to express the Variety of concurring and often contrary Symptoms in Hypochondriacal Affections, as when a cold Stomach is join'd with a hot Liver. *Castellus.*

ANTIPTYRETON, ἀντιπυρέτων, from ἀντί, against, and πυρετός, a Fever. A Febrifuge, or Remedy against a Fever. *Castellus.*

ANTIPTYREUTICON, or, **ANTIPTYRETICON**. The same as the preceding. *Blancard.*

ANTIQUARTANARIUM, **ANTIQUARTIUM**. A Medicine against a Quartan. *Blancard.*

ANTIQUI MORBI, old or inveterate Diseases, which are lengthen'd out beyond the fortieth Day, perhaps to very many Years; Chronical Diseases.

ANTIRRHINUM, Offic. *Antirrhinum minus*, Ger. 439. Emac. 549. *Antirrhinum sylvestre medium*, Park. Theat. 1334. Mer. Pin. 9. *Antirrhinum primum Matthiolo*, Merc. Bot. 1. 20. Phyt. Brit. 9. *Antirrhinum arvense*, Rivin. Irr. M. 82. Dill. Cat. Giff. 127. *Antirrhinum arvense majus*, C. B. Pin. 212. Tourn. Inst. 168. Elem. Bot. 137. Boerh. Ind. A. 233. Rupp. Flor. Jen. 196. *Antirrhinum arvense minus*, Hist. Oxon. 2. 505. *Antirrhinum angustifolium sylvestre*, J. B. 3. 464. Raii Hist. 1. 760. Synop. 3. 283. *Antirrhinum angustifolium quibusdam, minus aliis*, Chab. 483. **SNAP-DRAGON**, or **CALVES-SNOUT**.

Antirrhinum is also called *Anarrhinum*, and by some *Lychnis Sylvestris*. The Stalk and Leaves of this Plant resemble those of Pimpernel; the Flowers are purple, and like the Stock-gilly-flower, but smaller, for which Reason it has the Name of *Lychnis Sylvestris*. It bears a Fruit like a Calf's-Snout, and of a carnation Colour.

The Plant, worn as an Amulet, is said to have a secret Virtue against Poisons, and to confer Gracefulness on the Person who is anointed with the same, together with the Oil of Lillies, or of Cyprus. *Dioscorides, Lib. 4. Cap. 133.*

Antirrhinum, apply'd as a Pessary, with Honey, and Oil of Roses, helps the Strangulation of the Uterus, and a Difficulty of the Menses. *Plin. Lib. 26. Cap. 15.*

Antirrhinum has the Virtues of the *Bubonium*, (Starwort) but in a weaker Degree. *Paulus Aeginet.*

Of this Herb there are several Species, such as the *Antirrhinum Officin.* the *Primum Matth.* the *Minus Tab.* the *Minimum Lob.* the *Sylvestre Dod.* the *Sylvestre Medium*, Park. the *Arvense majus*, C. B. and some others. It is the *Bucranion* of *Galen*, the *Cynocephalon* of *Apuleius*, and the *Os Leonis* of *Columella*.

It is found in great Abundance in the Fields, and sometimes in Gardens; but this latter Species is larger than the former, and must be renewed by fresh Seed. Its various Species are of various Colours, yellow, for Instance, red, purple, and carnation, but all of them have prickly Mouths: For this Reason *Columella, Lib. 10.* calls it *Saxa Leonis Ora*.

The Whole of this Fruit is sometimes found in Apothecaries Shops. But it is never used except by some foolish and superstitious Women, who fondly imagine it to be a Preservative against Spectres, Sorceries, and Witchcraft. For this Reason they put it into their Childrens Cradles, perfume their Beds with it, put it into their Shoes, and keep it in their Houses, in order to banish Spectres, and prevent Witchcraft. *Theophrast. H. Plant. Lib. 9. Cap. 21.* says, that it contributes, in some measure, to a Person's acquiring Fame and Reputation. It is also said to cure the Falling-sickness, when worn about

Inside; the Figure of the Leaves resembles those of Chervil, or that of *Hemlock*, beautiful, almost insipid; the Flowers are form'd in Umbels at the Top of the Branches, each compos'd of five white Leaves; the Seeds are slender, longish, black, of an aromatic Taste, resembling those of Chervil, but smaller; the Root is simple, woody, white, and aromatic, of the Taste of a Parsnip: it grows under Hedges. It contains essential Salt, Oil, and a great deal of Phlegm.

It is aperitive, but little used in Physic. *Lemery des Drogues.*

ANTRUM BUCCINOSUM, the Cochlea, or Labyrinth of the Ear. *Castellus.*

ANTYLION, ἀντίλιον, the Name of a very astringent Malagma described by *P. Æginet. Lib. 7. Cap. 18.*

ANTYLLUS, or ANTILLUS, a very famous ancient Physician, cited by *Oribasius, Lib. 2. Euporist. by Aetius, Tetrab. 1. Serm. 3.* and in many other Places; by *P. Æginet.* who calls him the SURGEON, *Lib. 3. Cap. 40. and Lib. 6. Cap. 33. and Lib. 7. Cap. 10. and 33. by Stobæus, Serm. 99. Avicenna, Lib. 5. and Rhazis, Lib. 2. Continentis, Cap. 2.* and in many other Places, being I suppose the same Person as his *Antilis*, or *Antiles*; for this Diversity in proper Names, in him and other Arabian Authors, proceeds from the Fault of the Translator, as well as the Transcribers. *Fabricius.*

ANUCAR. Borax. *Rulandus.*

ANUS. The Orifice of the *Intestinum Rectum*, by which the excrementitious Fæces are discharg'd out of the Body, by Stool.

Affections about the Anus are difficult to be cured for many Reasons. The Part is endued with a very tender Sense, and therefore is easily irritated by acrimonious and austere Medicines. Besides, the Superfluities of the Aliment in their Passage are not only acrid in themselves, but much more so on account of the bilious, and sometimes serous Humours, which pass along with them. Moreover, the Physician can fix no certain Times for attending his Patients, who sometimes go forth to ease Nature this way at an inconvenient Season. The Humidity and Heat of the Places also, which require drying as well as cooling Remedies, are no small Obstacle to the Cure of Ulcers in those Parts. For Astringents are acrid, which the Place, by reason of its exquisite Sense, is not able to bear. Wherefore such Medicines agree with them as are astringent without Asperity; of which Quality are principally Metals, which are neither acrimonious, nor extremely rough; these, washed, answer the Intention, and do the Work effectually without Mordacity. *Aetius, Tetrab. 4. Serm. 2. Cap. 1. from Galen.*

Of the RHAGADES of the ANUS.

The Anus is subject to many, and those very troublesome Diseases, which are cured by Methods not much different from one another. First of all, the Skin often chaps in many Places, which Disorder is by the Greeks called *paydæia*. If it be recent, the Patient ought to keep himself at Rest, and sit in warm Water. Pigeons Eggs also are to be boiled, and when they are hardened, are to be cleansed, and while one lies in hot Water, the Place is to be fomented with another, that the Patient may for some time use them both in their Turns. Then the Tetrapharmacum, or Rhypodes Plaisters, [See the Composition of Tetrapharmacum under ABSCESS, and of RHYPODES, under that Word] are to be diluted with Oil of Roses, or fresh greasy Wool is to be moistened with liquid Cerate made of Oil of Roses, or Lead washed is to be added to the same liquid Cerate, or Myrrh mixed with Resin of Turpentine, or old Oil with Litharge, and the Place is to be anointed with any one of them. If the Disorder lies all outwardly, and the inner Parts are sound, Lint impregnated with the same Medicine is to be laid upon the Place, and whatever else is apply'd must be covered with a Cerate. In this Case we must abstain from tart and acrimonious Meats, and such as bind the Belly. No dry Food is proper, but in very small Quantities; but liquid, smooth, fat, and glutinous Aliments are best. Nothing hinders but that the Patient may drink the mild Sorts of Wines. *Celsus, Lib. 6. Cap. 18.*

Of a CONDYLOMA.

A Condyloma is a Tubercle usually generated from an Inflammation. When it is form'd, the same Directions as to Meat, Drink, and Rest, are to be observed as were before prescribed for the Rhagades. It will be proper to foment the Tubercle with the same Eggs; but before this, the Patient must sit in a Decoction of some Repellent, as Vervain; after this, you would do well to apply some Lentils with a little Honey, Melilot boiled in Wine, or Leaves of the Bramble-bush bruised with Cerate made of the Oil of Roses; or a Quince; or the inner Part of the Rind of Pomegranates bruised with the same Cerate; or Vitriol first boiled and bruised, and then mixed with greasy Wool, or Oil of Roses; or the following Composition:

Take of Frankincense, one Dram two Grains and an half; Plumous Alum, two Drams five Grains; Cerufs, three Drams seven Grains and an half; Litharge, five Drams

twelve Grains and an half; bruise them, and while you are so doing, infill thereto Wine and Oil of Roses by Turns. The Bandage for the Place must be of Linen, or a square Piece of Woollen, which at two of its Angles has Loops, and opposite to them as many Fillets. The Piece being placed underneath, the Loops come against the Belly; and the Fillets, being brought about behind, are passed through the Loops; and where they are streightened, cross one another; and proceed the Right towards the Left, and the Left towards the Right, and, being brought about the Belly are at last ty'd together in a Knot.

If the Condyloma be grown inveterate and hardened, and will not yield to the Remedies before-mentioned, it may be consumed by the following Caustic:

Take of Verdigris, two Drams five Grains; Myrrh, four Drams ten Grains; Gum Arabic, eight Drams twenty Grains; Frankincense, twelve Drams thirty Grains; Antimony, Opium, Acacia, each sixteen Drams forty Grains.

Some use this Composition to renew Ulcers in the Rhagades. If the Condyloma resists this Medicine, a stronger Caustic may be apply'd. When the Tumor is consumed, we must exchange it for gentle Remedies. *Celsus, Lib. 6. Cap. 18.*

Of RHAGADES and CONDYLOMATA.

A Tubercle in the Anus, which they call a *Condyloma*, consists in a preternatural Intumescence of some Wrinkles of the folded Bodies of the Anus; for the Anus being sinuous, or full of Folds, must be set with Wrinkles. When this Wrinkle is elevated into a considerable Tumor, it becomes a *Condyloma*, which is sometimes without an Inflammation, and sometimes attended with an Inflammation, Pain, and Hardness.

The Rhagades, or Fissures, sometimes affect the *Sphincter*, sometimes the Anus, and owe their Original sometimes to the Acrimony of the Humours, sometimes to a *Condyloma*, which, being inflamed and distended, causes a Rupture, or Fissure, in the Parts about it.

They are cured in the Beginning by Medicines; but, if neglected till they grow hard and callous, will require the Assistance of a Surgeon. In this Case, for the *Condyloma*, the Patient must be placed in a fit Posture; and the *Condyloma*, being taken up and distended with the Forceps, must be cut quite away; but for the Rhagades, they must have their callous Lips scraped with the Knife, that there may be a new Ulceration, which shall be more easily cured. After the Operations, Digestives, Mundificatives, and Cicatrizers, are to be apply'd.

Medicines proper in the Beginning are, for a *Condyloma*, which contract and consume it, the following:

Put Misy roasted into liquid Turpentine, and make them into a Plaister, and apply the same, after fomenting the Place with warm Water. This is an admirable Remedy.

Another; the Author, *Lucius*, for Inflammations, Rhagades, or Condylomata of the Anus; it is good also for inflamed Rhagades of the Pudenda:

Take of Cerufs, six Ounces forty Grains; Litharge of Silver washed, two Ounces fifty Grains; Recrements of Lead washed, Plumous Alum, Frankincense, each two Ounces forty Grains; bruise them in old white Wine, and mix them with Cerate of Myrtle and Roses. It is good for foul Ulcers of the Anus, but especially about the Corona Glandis, and the Præputium, which cannot be deterged with Lint, and are exasperated by Medicines adapted to the Nomæ. In short, astringent Embrocations are to be used in Condylomas, and their Remedies ought to participate of an astringent Quality.

Another of *Andromachus*, which he uses, as he says, for inflamed Rhagades and Condylomas:

Take of the Lapis Hæmatites, or Blood-stone, Gum Ammoniac, Frankincense, Round Alum, each twelve Drams thirty Grains (in another Copy, sixteen Drams forty Grains); Galls, Saffron, each one Dram two Grains and an half; Turpentine, four Drams ten Grains; Tyrrhenian Wax, twelve Drams thirty Grains; Oil of Roses, ten Drams twenty Grains; use it for the Anus with Oil of Roses; for the Uterus with Oil of Salca. [See SALCA]. *Aetius, Tetrab. 4. Serm. 2. Cap. 3.*

Of CONDYLOMAS, EXTUBERANCES, and RHAGADES.

A Condyloma in the Anus differs only in the Place from a Condyloma in the Pudendum Muliebre, being a rugous Excrescence consequent upon an Inflammation or Fissure. First, it is called a *Tubercle*; but when it is grown callous, a *Condyloma*.

loma. Both the one and the other are to be taken with the Forceps, and cut off; and the Cure is to be managed with Cicatrizers. As for the *Rhagades* which are caused by hard Fœces, and are slow of healing on account of their Callosity, we heal them; or by scratching them with the Nails, or the Knife, dispose them the more readily to cicatrize. *Paulus Aeginet. Lib. 6. Cap. 80.*

Of a THYMUS of the ANUS.

The Appellation of *Thymus* is taken originally from the Tops of the Herb of the same Name, [*Thyme*] which grows upon Hills. A *Thymus* in the Body is a rough, reddish, oblong, tuberculous Eminence, which, when it is taken off, discharges more Blood than in proportion to its Bigness. It very commonly affects the Parts about the *Anus* and *Pudenda*, and also the Middle of the Thighs, and sometimes it appears in the Face. This Sort of Excrecence, when small, is called a *Thymus*; when of an excessive Bigness, a *Ficus*; and sometimes it is mild, sometimes malignant. The mild *Thymus* is a small uneven Caruncle, which has its Superficies exasperated by obscure, or scarce perceptible Eminences, of a whitish Colour, or somewhat red, and void of Pain. But the malignant *Thymus* is harder, rougher, and larger, and of a fœculent and livid Colour, painful, and causing a pungent Sensation, and is very much exasperated by Handling, or the Application of Medicines. A mild *Thymus* is easily cured, but a malignant one is incurable; tho' this latter is sometimes cured not by local Excision, but by taking off the Part in which they grow.

For a *Thymus*,

Take dry'd Sage, and pound it with dry'd Figs, and let the Patient eat thereof, and the *Thymus* will disappear. For the same Disease in Cattle, expose Barley to the Dew, and strew the same Herb among it, and let them feed thereon, and you will see Wonders.

For a THYMUS in the ANUS, PUDENDUM, or any other Part of the Body.

Take of Plumous Alum, Vitriol burnt, Glew, each one Ounce twenty Grains; of Squama *Æris*, two Ounces forty Grains; bruise them, and put them in Glew that has been before dissolved in Water, and anoint the Place. *Actius, Tetrab. 4. Serm. 2. Cap. 4.*

Of a FUNGUS of the ANUS or UTERUS.

An Ulcer, like a Fungus, frequently affects the same Parts, which, if it happens in the Winter, must be fomented with warm, in the Summer, with cold Water. After this, the Place must be sprinkled with Squama *Æris*, and upon this must be apply'd a Cerate made of Oil of Myrtle, mixed with a little Litharge, Soot, and Lime. If it cannot be removed by these or such-like Medicines, or by others of greater Vehemence and Force, it must be cauterized with a hot Iron. *Celsus, Lib. 6. Cap. 18.*

Of the HERPES and NOMA of the ANUS.

Sometimes the *Anus* is infested with a *Herpes* and *Noma*: If a *Noma* affect the Sphincter of the *Anus*, the Disease must be carefully treated in a Method adapted to the Cure of a *Noma*; for the Sphincter, being one of the interior Parts of the *Anus*, and very nervous, cannot bear cutting or burning, an Abcision of any Part of that Muscle being followed with Convulsions, with a Wasting and Decay of the Caruncle. This we know by Experience; for oftentimes when, for want of due Surgery, the Sphincter has been consumed by the *Noma*, the Wasting of the Caruncle has been the Consequence. We must therefore have recourse to such Remedies as are proper for a *Noma*; such are daily Embrocations with the Decoction of Myrtles, Rind of Pomgranate, the Bramble, and the like. And first let us cauterize the preternatural Corpuscles with the Troches called *Faustine*, [See *FAUSTINE*] or some such thing; then use burnt Paper, and afterwards apply the Plaster *Isis*, [See *ISIS*] dissolved in Plenty of Oil of Roses, and spread on Linen.

When a Phagedenic Ulcer in the *Anus* spreads by eating, something must be attempted, and a Stop put to it by dividing the corrupted Parts from those which are sound; with the Knife; after which, apply an actual Cautery to the Place; for the *Podex*, being a fleshy Part, can easily bear the Operation. The Cure, after the Operation, is to be managed like that of other Ulcers; but where Burning has been used, it will be proper to use the same Remedies as we have before prescribed in the like Circumstances under a *Prolapsus Ani*. *Actius, Tetrab. 4. Serm. 2. Cap. 10.*

Tubercles, Condylomas, Cristas, Ficus, and Fungus, of the ANUS.

Sometimes the *Anus* is infested with Tubercles at the Extremity of the Intestinum Rectum, which arise both on the Inside and Outside. Though these Tubercles are divided into various Species according to their Magnitude and Figure, and are

sometimes called *Condylomata*, sometimes *Crista*, sometimes *Ficus*, or *Fungi*, yet they all seem to agree in owing their Original partly to a Redundance, and partly to a Corruption of the Blood, that stagnates about these Parts, and especially the Glandules, whence they insensibly increase in Magnitude like a Polypus in the Nose, or those Tubercles which arise in the Uterus. They often molest those who are subject to the Hæmorrhoids; nor are they only troublesome, but sometimes accompany'd with acute Pains; so that the Patient cannot sit down without much Difficulty, and is forced to implore the Help of a Surgeon. Such Tubercles in the *Pudenda* are judg'd by *Celsus* to be of the worst Kind; and I have often discovered in them some Seeds of the Lues Venerea. Hence it is no Wonder, that the Antients, who knew no Remedies for the Venereal Distemper, judged these to be the worst Sort of Tubercles.

The Cure of these must be managed like that of other Tubercles, and carnosus Excrecences, which is by Extirpation, by means of a Ligature, or Abcision with the Knife or Scissars, except their Root be too large; by this Operation I have cured several Sorts of them. If their Root be so large as to admit of no Ligature, the Tubercle is to be distended with the Hook or Forceps, and most exactly cut off with the Knife or Scissars. The Wound being made, the Blood must be suffered to run for some time, according to the Strength of the Patient, in order to prevent an Inflammation; then, after the Use of Styptics, Lint and Bolsters are applied, and the Wound is bound up. The Cure is carried on with Vulnerary Balsams, and some drying Ointment, and at last with dry Lint, to promote Conglutination. If in the subsequent Dressings any foreign Matter is observed to remain after the first Operation, Care is to be taken, that it be exactly cut off with the Scissars, or eaten quite away with blue Vitriol, Lapis Infernalis, or such-like Caustics. In many Cases the entire Tubercles themselves may conveniently enough be extirpated by the Use of Corrosives, as *Celsus* formerly advised, if Care be taken, that they do not hurt the Intestine or Sphincter. The Antients, when they could not remove them by Medicines, advised the Application of actual Cauteries. *Heister. Instit. Chirurg.*

Of an imperforated ANUS.

Sometimes in new-born Children the *Anus* is naturally imperforated, being closed up with a Membrane. In this Case the Membrane is to be broken with the Finger, if it be possible, or else cut off with the Knife, and the Place must be healed with Wine.

Often also in grown Persons, by means of an Ulcer ill cured, there happens a Coalition of the *Anus*. In this Circumstance also the Part must be opened with an Instrument, and for the more convenient Management of the Cure, and to avoid a new Coalition, a leaden Pipe, or Cannula, anointed with some Epu-lotic, is to be put in the *Anus*, and worn till the Cure be perfected. *P. Aeginet. Lib. 6. Cap. 81.*

The Method of making an Aperture in the *Anus* when imperforate.

It sometimes happens, that a Child is born with the *Anus* quite closed up, contrary to the Disposition of Nature. These are called by Physicians *Atreti*, [from a Neg. and *rete*, to perforate] *imperforate*. The Child is immediately perceived to labour under this Defect, if it has not been observed before, by voiding no Excrements the first Days after its Birth. It might indeed be sooner known, if the Midwives, immediately after washing and cleansing the new-born Infants, did, according to their Duty, inspect this Part, and observe whether it is rightly conform'd. If this be neglected, the Physician often comes too late, as *Roonhuysen, Observ. 5. Part. 1.* well remarks.

The Quality and Degree of this Defect vary according to the different Thickness of the Tegument that closes up the *Anus*. Generally some Sign or other, as a Prominence or Pit, shews the Place where Nature designed a Perforation; but sometimes no such Mark can be perceived; sometimes only a thin Membrane comes over the Part; sometimes solid Flesh, either thicker or thinner, obstructs the Passage of the Excrements. Whatever may be the Cause of the Disorder, 'tis certain, that if the *Anus* be not speedily perforated, and a Way laid open, it cannot be avoided, but that the Excrements, call'd *Meconium*, being retained beyond their due Time, the Child will be seized with dreadful Gripes of the Belly, Vomiting, Jaundice, Convulsions, Epilepsy, and at last, vomiting up the Excrements, and so perish in a miserable manner. If only a Membrane, or thin Piece of Flesh, stops up the natural Passage, the Place where the Aperture is to be made, will be marked by a sort of Cicatrix, or shewn by the Protrusion of that Membrane, or Flesh, by the Excrement of the Child. In this Case the Cure is easily performed: On the contrary, it is with great Difficulty, and not without Danger, that the *Anus* is perforated, when a pretty thick Piece of Flesh shuts up the Rectum in such a manner, that neither Pit nor Prominence can be perceived. In the last Place, as I have more than once myself observed, either the whole Intestinum Rectum, quite up to the Colon, or highest

Part of the Os Sacrum, is closed up, or is wholly wanting, and the Intestines end about the lowest Part of the Loins, or Top of the Os Sacrum. In such a Case, we are to lay aside all Thoughts of a Cure. *Roonhuysen* relates an Instance, where the Rectum terminated in the Bladder.

If the Nature of the Defect be such as to admit the Hopes of a Cure, all we have to do is to make a convenient Aperture in the *Anus*, or Extremity of the Rectum. That this Operation may be successful, observe the following Directions: First of all, the Child is to be laid, or held in a Lap by an Assistant, in such a manner, that the Surgeon may have a clear View of the *Anus*, and have it in his Power to treat it as he pleases. Then with a Lancet, or a two-edged Incision-knife, a little bigger than a Lancet, he is to make an Incision through the Membrane, or thin Flesh, into the Rectum, almost in the same manner as in opening Abscesses. That the Operation is effectually performed, will be shewn by the Efflux of the Mæconium, or black Fæces, which must be suffered to run till they stop of themselves. This done, he is next to thrust his Finger, rubbed with Oil, through the new-made Aperture into the Rectum, and nicely feel whether the Passage be wide enough for the Excrements. If he finds it is too narrow, it will be necessary to lengthen the Incision either upwards or downwards, or both ways, as he shall see most convenient; or to enlarge the Aperture by making a new Incision crosswise, by which means the *Anus* will be the better disposed to assume its annular Figure. After this, the Surgeon is still to wait till the Child discharges whatever Fæces may be yet left behind; which being evacuated as much as shall be thought necessary, he is to thrust a pretty large Tent anointed with Oil, or some vulnerary Ointment, and ty'd with a strong Thread, or small Cord, into the fresh Wound, that there may not be a new Coalition of the *Anus*, the Thread hanging out, that if the Tent should happen to slip inwards, it may serve to draw it back, as often as the Child shall evacuate by Stool: Afterwards it will be convenient to use a new Tent, which after some Days should be rubbed over with some drying Ointment, such as that of Cerufs, till the Lips of the Wound are dried up, and there is no Danger of a new Coalition of the *Anus*. *Hildanus*, about the End of the Cure, instead of a Tent put up a leaden Pipe, anointed with Ointment of Cerufs. But that the Tent, or Pipe, may not easily fall out, a fit Bolster is to be applied to the Wound, and firmly fasten'd upon it by the Bandage. Lastly, if, perhaps the next Day, or the Day after, it be perceived, that the Aperture, which was made the first Day, is yet too small, nothing ought to hinder the Surgeon from dilating it, as much as may be convenient.

What we have often recommended in other Operations, which is, that all things pertaining to the Dressing of a Wound, should be provided before it is inflicted, is not so necessary in the present Case, and sometimes is pernicious; because Delays in this Circumstance are often dangerous, especially when the Child has lived some Days in this Condition. For as the miserable State of the Infant often requires the most expeditious Opening of the closed *Anus*; let us forthwith make the Incision, and the Things, necessary for Dressing, may be conveniently enough provided while the Fæces flow out of the Aperture.

If a thick Membrane, or Piece of Flesh, intercept the natural Passage of the Excrements, it will be more difficult to save the Life of the Child. But it seems better, tho' perhaps in vain, to attempt the Operation, while any Hope remains, than to abandon the miserable Infant to certain Death, without the least Help. Under this Circumstance our Method of Cure must proceed in the following manner: First, let the Surgeon try, with the Help of his Finger, to discover some Mark of the *Intestinum Rectum*, as a Cavity or Passage; then the Place, under which they are perceived, is to be marked with Ink, and an Incision made therein of the Length of a Finger's Breadth. If no Fæces issue from the Wound, the subjacent Passage of the Rectum is to be anew investigated by pressing with the Finger; and, as soon as it is discovered, the *Anus* is to be perforated, either with one Stroke, or by Degrees, to the very open Passage of the Intestine: But this must be done with Discretion, and the Instrument must not be carried with its Edge towards the Pubes and Vesica, but towards the *Os Sacrum*; for, otherwise, there is Danger of hurting the Bladder in Boys, or the *Vagina*, or both, in Girls. The *Anus* being perforated, the Patient is to be treated as before directed.

If there be no Sign at all of an Opening in the *Intestinum Rectum*, then either that Part is solid, or, as I myself have seen, is wholly wanting; and this consequently renders the Cure extremely difficult, if not desperate. However, even in so deplorable a Case, it is not fit to leave the Infant destitute of all Assistance, lest we should seem to chuse rather to wait for a most certain Death, than to attempt a doubtful Cure; wherefore, fixing on a Place, which seems the safest and most convenient for the Purpose, we enter it with a triangular perforating Instrument, (*Tab. 45. Fig. 2.*) or a narrow Incision-knife, which we plunge so far in the *Anus*, till some Perforation of an Intestine discovers itself by the coming out of the Fæces. *Saviar-*

us has an Example to this Purpose, where he was obliged to thrust in a Knife to the Depth of three Fingers Breadth, by which he saved the Child's Life, *Observat. 3.* The Aperture, thus made, is to be enlarged with the Knife, upward or downward, as much as shall be thought fit; and the Fæces, as was before directed, being evacuated, Care is to be taken, that if there should happen a more than ordinary Profusion of Blood, from the cutting of so many Vessels, a proper Remedy may be applied. For this Purpose it seems necessary to thrust into the Wound a Tent that is big enough, and fitted with a small Cord, and rubb'd over with a proper Medicine to stop the Blood; after this we are to follow the Directions before given. At the End of twelve, or four-and-twenty Hours, it will be proper to take out the Tent, if it has not fallen out of itself, and, immediately after evacuating the Fæces, to supply its Place with another; which at first, for some Days, must be rubb'd over with a digestive Ointment, and afterwards with one which is drying, till the Conglutination be perfected: But if the Intestine cannot be opened, even by so deep an Incision, the Child can by no means be preserved; but, after long and violent ster-coraceous Vomiting, will die in Convulsions.

ROONHUYSEN, in the Appendix to his Observations, *Part 2. Obs. 1.* relates an Instance of a Female Child, four Months old, who had a Perforation in the *Anus*, but so small and streight, that the Mother was always obliged, with a great deal of Pains, to extract the Fæces with her Hands. The *Anus* at last swelling, because, perhaps, of the frequent Compression, the Passage of the Fæces closed up in such a manner, that there was not the least Vent: Of consequence the Belly swelled, and violent Pains, together with a Fever and Restlessness, arose, which threatened the Life of the Child. He made no Delay therefore, but first cut the *Anus* with a Lancet, and then enlarged the Incision both Ways with the Scissars; upon which issued out a vast Quantity of Excrements; the Belly soon after fell, and the rest of the Symptoms remitted, and the Wound was healed by the Method before prescribed. So *Scultetus*, in his *Armamentarium Chirurgicum*, *Obs. 71.* gives us an Example of an *Anus*, that was not sufficiently perforated. In some Girls, who have naturally a closed *Anus*, the Fæces make their Way from the Rectum to the *Vagina*. This Misfortune very seldom finds a Remedy; but the miserable Patients, if they survive, are afflicted with the same during Life. *Heister, Institut. Chirurg.*

Mr. Jussieu, according to the History of the Royal Academy of Sciences, for 1719. mentions a Girl of seven Years old, whose *Anus* was imperforate, and who discharged the Excrements by the Vulva.

How to cure a Falling down of the ANUS, or the Orifice of the Uterus.

If the *Anus* itself, or the Orifice of the Uterus, which sometimes happens, falls down, we are to consider, whether the prolapsed Part be clean, or encompass'd with a mucous Humour; if clean, the Patient is to sit in Water, either salt, or what has had Vervain, or Rind of Pomgranates boiled in it; if it be humid, it must be washed with austere Wine, or anointed with burnt Lees of Wine. When you have done either of these, the Part is to be replaced, and Plantain bruised, or the Leaves of Willows boiled in Vinegar, are to be laid upon the Place; upon these, Linen and Wool; and over all must come a Bandage, the Legs being also bound together. *Celsus, Lib. 6. Cap. 18.*

For the Falling down of the ANUS.

We use, first, to foment the prolapsed *Anus* with Brine or Sea-water, and oftentimes there needs no other Remedy. Sometimes we sprinkle the Part with pounded Salt, the Patient being conveniently placed for that Purpose, and wait a sufficient Time till the distilling Humidity comes forth. Then, after using Embrocations, and astringent Lituses, as Acacia or Hypocistis, in Wine, we put back the prolapsed Part into its Place. The next Day we prepare an Infusion, or astringent Infusion, such as a Decoction of Myrtle, or Olive-leaves, or Bark of Pomgranate, in harsh black Wine. But, for Children, we must avoid Astringents, and use milder Remedies: If the Case be urgent, we apply astringent Cataplasms, of Dates, Quinces, and the like, to the Loins, and also to the *Anus*. The Diet must be of good Juice, as Milk-meats, Rice-milk, and the like; and the Patient must drink Milk. Remedies for this Disorder are as follow:

Boil a Gall, and, reducing it to Powder, sprinkle therewith the *Anus*: If you want a strong Remedy, boil it in Wine; if a more gentle one, boil it in Water. Or,

Take of Bark of Pine-tree, eight Drams twenty Grains; Pills of Cypress, Plumbage, each two Drams five Grains; first wash them with four astringent Wine, then pulverize them, and sprinkle therewith the Part affected. Or,

Take

Take of the Recrement of Lead, eight Drams twenty Grains; Frankincense, two Drams five Grains; wash and pulverize them.

Take of Balaustines, one Dram two Grains and a half; Bark of Pomgranate, two Drams five Grains; Seeds of Henbane, Cerufs, each eight Drams twenty Grains; Myrrh, two Drams five Grains; wash and reduce them to Powder.

Another Remedy, which is my own, for a prolapsed *Anus*.

Take of the Fruit of Heath, Galls, Acacia, Cerufs, Juice of Hypocistis, Bark of Pine-tree, Myrrh, Frankincense, each a like Quantity; pulverize them, and sprinkle the Powder, after you have washed the *Anus* with austere Wine.

Take burnt Lentils, burnt Bread, Meal of the bitter Vetch, each a like Quantity; apply them with Vinegar and Soap.

First, wash the *Anus* with Wine; then sprinkle thereon the Powder of dry Pitch, or of calcined earthen Pots.

Wash the Part with the Decoction of Cypress; then sprinkle it with the Powder of *Album Græcum*; and make a Suffumigation of dry Pitch, Bitumen, and Cypress. Or,

Anoint the Part with Coriander-seed and Laser in Wine; and every Day apply a Cramp-fish, and it will contract.

Take of Bitumen and Galls, an equal Quantity; dry and pulverize them, and sprinkle the Part with the Powder. This is a very celebrated Remedy. *Aetius, Tetr. 4. Serm. 2. Cap. 7.*

Of curing the PROLAPSUS ANI by Burning, from Leonides.

When the Disorder is grown inveterate, and next to incurable, and no Relief is to be had from Physic or Diet, recourse must be had to Burning: For tho' the rest of the Intestines are reckoned among the principal Parts, the outward Extremity of the *Intestinum Rectum* is not of that Number; but may be cut and burnt without Danger, as Experience shews. It will be convenient therefore to apply an actual Cautery, in form of a Nucleus, (or Fibula) to the external Part of the *Anus*, at moderate Intervals of Time; which, by raising a solid Eschar round the *Anus*, causes in it a Constriction capable of repressing the Part, and retaining it in its due Place. After the Burning, apply Lint, moisten'd with Milk and Honey, to the Place, and bind it up: When the Crust is fallen off, apply Lentils and Honey; and when you have destroyed the Ulcer, use a Plaister of Barley, or any other Cicatrizer proper in Affections of the *Anus*. *Aetius, Tetr. 4. Serm. 2. Cap. 8.*

In some Persons, as well Infants as Adults, the *Intestinum Rectum* (strait Gut) often falls through the *Anus* in a surprising Manner, so as to hang out some Inches, a Hand's-breadth, or more. *Muraltus* has a remarkable Example of a Woman, who, after difficult Labour, had the *Intestinum Rectum* fallen out an Ell in Length: And *Saviardus* gives an Instance of another, who was but an Infant, in whom the same Part hung out no less than a Foot. This is not only a troublesome, but usually a very painful Disorder, especially to those whose Business requires Labour and Travelling; and sometimes a dangerous Inflammation, and a Tumor, with a Gangrene or Cancer, seizes the prolapsed Part of the Intestine; an Example of which kind you have in *Meckrenius*, at the End of his Chirurgical Observations.

The original Cause of this Disorder is, without Doubt, the too great Laxness or Debility of the *Rectum Intestinum*, which is afterwards promoted by the Accession of other concomitant Causes; such as some great Vociferation, or, in Infants, vehement Crying; also a Tenesmus, excessive Pains of the *Anus* from the Hemorrhoids, a Dysentery, Stone in the Bladder, or Exulcerations of the same, difficult Child-birth, Costiveness, and the like. The Disease, in the Beginning, is, for the most part, easy to be cured; but the more inveterate it grows, the more difficult is the Cure, especially if the Patient be infirm, and of an ill Habit of Body; and if it proceeds from an inveterate Debility of the Intestine itself, there is but little room to hope for a perfect Restoration: But when a Gangrene or Cancer has seized the prolapsed Part, the Surgeon can do no more than apply to it lenient Remedies, and Fomentations; or, if it may be done with Safety, that is, when only a small Part protrudes, entirely cut it off.

The Surgeon who attends the Patient is to make no Delay, but restore the prolapsed Part of the *Anus* into its natural Situation, without much troubling himself about inquiring into the

Causes of the Disorder, or the Method of Dressing; for the longer the Intestine hangs out, the more are the Tumor and Inflammation exasperated, and the more difficult is the Cure.

In order to the replacing of the Intestine into its proper Place, the following Method is to be observed: First of all, the Patient is to lie flat upon his Face, either upon a Bed or a Table; then the prolapsed Intestine is to be very carefully fomented, especially where it is dry, with warm Wine, or common Spirit of Wine, or Milk, or with warm Water, by means of a Sponge, or folded Linen, squeeze'd out of some such Liquor warmed: Soon after let the Surgeon, with his two Fingers wrapp'd in fine Linen, gently put back the Intestine into its Place, in the same manner as he would the Intestines in a Perforation of the Abdomen. This is done without much Difficulty, if the Tumor and Inflammation are inconsiderable: But if the prolapsed Part of the Intestine be very much tumefied, we are to use, besides Phlebotomy, digestive Fomentations, till the Tumor be entirely repressed, and the Part in a Condition to be restored. However, the Operation is sometimes so difficult, that one Surgeon alone is not able to reduce it without calling in another of the same Profession to his Assistance. Where the Intestine, through Debility, has been long and often subject to a Fall-down, which to some happens as often as they go to Stool, the Patients may themselves replace the Part with their Fingers, without the Help of a Surgeon, or at least the Surgeon may easily do it for them. In this Case, the Method of Cure turns wholly upon corroborating the Intestine by proper Remedies, that it may be enabled to preserve its right Situation, without Danger of a new Prolapsus.

To answer this End, and to keep the Intestine in its Place by convenient Strengtheners, so as that it may fall down no more, greater Art and Industry are required than for the Replacing of it. The Means to be used for this Purpose are such as follow:

First of all, two pretty thick Bolsters are to be provided; one of which, of an oblong Form, is to be applied lengthwise between the Buttocks; the other, which must be square, is laid over the former and the *Anus*, and carefully secured by a linen or cotton Fillet. It would be proper also, that the Bolsters should not be laid on dry, but moisten'd with some warm corroborative Decoction: A very powerful one, in this Case, is prepared of the Roots of Bistort and Tormentil, with the Bark of Pomgranate and Oak, Galls, and Oaken Leaves, and other things of that Nature, boiled in Wine, especially red Wine. The prolapsed Intestine is also, on Occasion, to be fomented with the Decoction; that is, whenever it falls down again, which, to some Persons who have been long afflicted with this Disorder, happens, as I said, almost as often as they go to Stool, or whenever they walk, or any way exert their Strength. If the Disorder be somewhat above the ordinary Degree, an excellent Powder, for corroborating the Intestine, may be prepared of Mastich, Colophony, Japan Earth, and Dragon's-blood, which, after Fomentation, must be plentifully sprinkled on the Part that hangs out, before it be replaced, and secured with a Bandage. *Saviardus*, after replacing the Gut, thrust up a Tent, sprinkled over with Astringents, through the *Anus*. Strengthening Clysters are also of good Use, such as those prepared of a Decoction of corroborating, aromatic, and astringent Herbs in red Wine, particularly what is commonly call'd *Pontiac*. These Directions being carefully observed, the Patients, except the Disease be grown inveterate and desperate, are very often restored.

If the Disease will not give way to the Remedies mentioned, the Patient must not only be treated with Suffumigations of Mastich, Frankincense, Amber, black Pepper, and other powerful Drugs of that Kind, placed under a perforated Chair; but all hard, gross, dry Food, and such as binds the Belly, must be strictly forbidden, lest in Over-straining, by reason of Costiveness, the Intestine should be again protruded. The Fomentations above-mentioned, with the Bandage, must be renewed after every Stool. The Patient must abstain, as much as possible, from Vomiting and Sneezing, and all violent Motion of the Body, and must resolve to live in a State of Rest till the Disease be subdued. *Dionis*, with some other Authors, tells us, that the Patient may effectually guard against a new Prolapsus, by taking care, whenever he eases Nature, to sit on a Stool that has a Cleft of about two Fingers Breadth, or is perforated with a Hole of the Compass of a large Piece of Money; by which Means he will restrain the Falling-out of the Intestine. Some, after replacing it, intrude a leaden Pipe into the *Anus*, and endeavour, that way, to prevent a new Prolapsus: But if the Disorder be grown inveterate, and occasioned by a remarkable Debility of the Parts, all these Kinds of Remedies, and Artifices of the Surgeon, are of no Use; but the Patients are to be treated with Bolsters and Bandage, that the Intestine may be constantly retained in its natural Place, unless we have a mind to expose them to greater Danger. *Heister, Institut. Chirurg.*

Of a Fistula of the Anus, from Leonidas.

An Ulcer ill cured, especially about the *Anus*, is often succeeded by a Fistula. When this happens, let the Patient be placed on a Couch, or some other plain Place; and let the Surgeon seat himself before him, somewhat on the Right: Then let him take a Probe, and, introducing its Head into the Fistula, thrust it forwards through the Cavity. After this, let him intrude the middle Finger of his Left Hand into the *Anus*, and, with it, taking hold of the Head of the Probe, bend it; and bringing both Extremities of the Fistula upon a Level, distend them with his Left Hand, and so cut off all the callous Corpufcles round about them, at one Stroke, if it may be done: If there remains any Callosity after the Section, it must be scraped with the Knife. A Callus is known by its whitish Colour and Renitency. If there appear any Rhagades near the Place, they must be distended with the Forceps, and cut off, that the Sore, being made plain and smooth, may the more easily be healed. After the Operation the Wound must be filled with *Manna Thuris*, on which Lint must be laid, and a proper Bandage must be made upon it; and the Cure managed like that of common Ulcers.

If the Patients, out of Tendernefs or Timidity, intreat us to cure them by Medicines, we are, first of all, to use such as are proper to dry and close up a Fistula. If these are ineffectual, we must have recourse to those which have the Virtue of corroding and consuming the callous Particles, and are called *Fistular Collyriums*. Medicines adapted to dry up a Fistula are, a Plaister prepared of Litharge of Silver, Vinegar, and Oil, *Galen's Emplastrum sine Cera*, the Plaister called *Harmonia*, *Emplastrum ex Salicibus*, *ex Lolio*, and such-like. The following is a good Remedy for *Rhagades*, *Condylomas*, and in the Beginning of a *Fistula*:

Take of the Root of Peony, burnt, four Ounces; Bitumen Judaicum, two Ounces forty Grains; crude Sulphur, one Ounce twenty Grains; Wax, two Ounces forty Grains; Oil of Myrtle, a sufficient Quantity. Or,

Burn Quinces to Ashes, and strew them upon the Orifice of the Fistula; then apply Lint, and upon that a Plaister of Wine or Oil, or some such thing, and bind it up: Dress it once in two Days.

Troches for a Fistula of the *Anus* are thus prepared:

Take Chalcitis burnt, eight Drams twenty Grains; Copper burnt, Cadmia, Earth of *Crete*, each four Drams ten Grains; Pompholyx, Box-thorn, each three Drams seven Grains; Aloes, Saffron, each two Drams five Grains; Gum *Arabic*, two Ounces forty Grains: Bruise them in the Juice of Groundsel, or that Species of *Serapias* which has a Root resembling three Testicles; and make them into Troches, which may be used dry, or with Vinegar, or Cerate. *Aetius, Tetr. 4. Serin. 2. Cap. 11.*

Fistulas in the *Anus*, which are of the occult Kind, and have no apparent Orifice, are known by a Pain, and a purulent Humidity issuing from the *Anus*: They are also very often the Consequences of an Abscess: The conspicuous Sort are discovered by introducing a Probe, or a Hog's Bristle, which, penetrating the Cavity, meets with the Fore-finger, supposed to be introduced into the *Anus*, the Fistula being perforated towards the internal Parts; but in Fistulas not internally perforated, the Instrument and Finger are hindered from mutual Contact, by the imperforated Medium. Fistulas are known to run obliquely, and winding like a Labyrinth, when the Instrument meets with Resistance, and can penetrate but a little Way; and yet a more than proportionable Quantity of Sanies is discharged. Fistulas seated near the Intestine are known by the coming off sometimes of Worms and Fœces through the Orifice. They have all, or most of them, their Orifice surrounded with a Callus: A Fistula which has perforated the Neck of the Bladder, or is seated by the Joint of the Thigh, or has proceeded to the *Rectum*, is incurable. Those which have no Orifice, are occult, end upon a Bone, or spread into Branches, are difficult of Cure; but all the rest are easily cured.

The Operation for a Fistula is performed in the following manner: The Patient is laid upon his Back, with his Legs raised aloft, and his Thighs bent towards his Belly, in the same Posture as when he is to take a Clyster; and if the Fistula terminate in the Superficies, with the Knife or Probe introduced through the Orifice, we cut the incumbent Skin with a plain Incision: If the Fistula terminate deep within the *Anus*, with one Hand we introduce a Probe through the Orifice; and, if the Fistula be perforated, we lay hold of the Head of the Probe with the Fore-finger of the other Hand, and, bending it, bring it forth thro' the *Anus*, and cut thro' the Substance, betwixt the

two Sides of the Probe, with a plain Section. If the Fistula be not yet perforated, but has deeply penetrated into the *Anus*, and the Head of the Probe is hinder'd from meeting with the Finger, only by the Interposition of some squamous and membranaceous Body, we violently perforate it with the Head of the Probe, which we bring out through the *Anus*, and cut the intermediate Substance as before: Or, we first perforate the Bottom of the Sinus, in the *Anus*, with a Falx (*σφαλερ*) made on purpose for cutting of Fistulas, and, transmitting it through the *Anus*, cut through all the intermediate Parts with the Edge of the Falx; then taking hold of the circumjacent Substances, which are all callous, with a Forceps, we cut them off, taking care to avoid hurting the Sphincter: For some, in making a deep Incision, after an unskilful manner, have wounded that Part; whence the Patient has been molested with involuntary Excretions of the Fœces. If any, through Fear, refuse the Operation, we must have recourse to *Hippocrates's* Line, and make use of a Ligature of Thread. For *Hippocrates* orders us to take a double-headed Needle, perforated, and threaded with a five-fold Thread of raw Flax, and pass it through the Fistula; then tying the Ends of the Thread in a Knot, to strengthen it, every Day, till the Thread has cut through all the intermediate Substances between the two Orifices, and falls off. If the Parts are slow in separating, the Thread may be sprinkled with dry Sand, and so drawn through the Place. Some put a Thread through a Hook, made hollow like a Pipe, and pass it as above related: But these are Methods which I can by no means approve; for while they avoid the Operation, and refuse to be cut, besides other Inconveniencies, they greatly prolong the Cure.

As for occult Fistulas, *Leonides* says, "When the Fistula, which has perforated the Sphincter, lies deep, whether it began from the *Anus*, or, after making a great Progress, has seated itself in that Muscle, the Part being first searched as before, the *Anus* is to be dilated with an Instrument called a *Speculum*, in the same manner as the *Sinus Muliebris* is dilated; and when you can discern the Orifice of the Fistula, the Head of the Probe is to be introduced, and carried to the Bottom of the Fistula; and the whole Fistula, thus discovered, must be laid open with the Knife or Instrument appointed for cutting of Fistulas." But we, for our Parts, when we happen'd to meet with an Instance of this Kind, could not perform this Piece of Surgery; because we could have no Sight of the Place where the Fistula resided, which was on the Right, between the *Anus* and the Sphincter. But after we had dilated the *Anus* with our Fingers, a Fissure appeared, which was seated near a Wrinkle of the *Anus*, and seemed to be a Vent-hole for the Fistula; for it discharged Pus. Through the Fissure we introduced the Head of the Probe, as the ready Way to the Fistula; then intruding the Fore-finger of the Right Hand within the Sphincter, and finding but a thin Substance between the Finger and the Instrument, we pushed the Probe, with some Force, towards the Finger, and so perforated the Bottom of the Fistula; and, with the Finger, brought out the Head of the Probe through the *Anus*: This done, with an Incision-knife we divided the whole Substance between the two Orifices of the Fistula; that is, between the Fissure where we enter it, and the Perforation we had made; and so freed our Probe. *P. Aegineta, Lib. 6. Cap. 78.*

Ulcers which infest the *Anus*, and the Parts about the *Rectum*, while recent, and discharging a laudable Pus, are called Abscesses of the *Anus*; but when grown inveterate or callous, and continually running with a thin foetid Sanies, which is sometimes more, sometimes less copious, they have been by Physicians, from the most early Times, called *Fistulas* of the *Anus*, and distinguished into various Species, according to the Condition of the Distemper: For some of them are small and recent, or at least not so inveterate; some penetrate deep, but are of narrow Extent; others, on the contrary, are grown inveterate, and so severe, deep, and extensive, as to render the *Rectum* conspicuous, and quite bare of Skin and Fat. Some very bad Instances of this kind I remember to have observed. Sometimes a *Fistula*, while recent, is without any remarkable Callus; but most of them are observed to have a Hardness, or Callus, of a thinner or thicker Substance, especially about the Orifice. Sometimes a *Fistula* takes but one strait Course; sometimes it makes its Progress by a Multiplicity of Ways, that turn and wind about. For the more convenient and distinct Consideration of them, we shall, in Imitation of the most noted Surgeons, make a three-fold Division of these Fistulas.

The first Sort are those which, from one or two conspicuous Orifices near the *Anus*, discharge, as we said, a thin and foetid Matter, and almost constantly appear hard, the *Intestinum Rectum*, and *Sphincter* of the *Anus*, not being yet perforated, but remaining intire. How deep, and towards what Parts, they penetrate, is best discovered by introducing a Probe into the Sinus, and the Fore-finger of the other Hand, first rubb'd with Oil, into the *Anus*: For, if there be no Perforation, the Instrument and Finger will be prevented from coming together by the sound

found and unperforated Intestine; whose Thinness or Thickness may, at the same time, be discovered. But when we are determin'd to probe these *Fistulas*, the Finger is first to be introduced into the *Anus*; for otherwise the Intestine is in Danger of being easily perforated by the Probe, and in an improper Place. Sometimes these Sinuses wind and turn in so intricate a Manner, that 'tis impossible with the Probe, how skilfully soever directed, thoroughly to investigate the Condition of the inner and smaller Sinuosities; tho' we may perceive, by the daily copious Discharges of Sanies or Pus, when the Cavities are many or great: Wherefore it seems necessary, for the better Examination into this *Fistula*, to syringe it with warm Milk, taking Notice how much enters, by which you estimate the Capacity of the Cavities; and observe whether any of the Milk returns by way of the *Anus*: If none comes back by this Passage, we judge the Intestine to be unperforated, as, on the other hand, the contrary appears, when the Milk is return'd by the *Anus*, or the introduced Finger feels the naked Probe. We are taught, however, by Experience, that tho' the Intestine be not penetrated quite through; its external Coats may be very thin and corroded, and loosen'd or disjointed from one another by intermediate Sinuses, in which Case we can never warrant a Cure without cutting the Intestine.

Another Species of *Fistulas* is known by an Efflux of Sanies from two or more Orifices, one or more of which open into the Rectum, and the rest are outwardly conspicuous near the *Anus*. Such a *Fistula* is in some measure represented *Tab. 56. Fig. 1. C. C.* The same is more manifest, if the Head of the Probe introduced with one Hand into the *Fistula* meets with the bare Finger of the other Hand intruded into the *Anus*; or if a Clyster, Milk, or any other Liquor, injected into the *Anus*, is return'd by the external Orifice of the *Fistula*; or, as it sometimes happens, when the Excrements, Wind, or Worms, are voided the same way.

The third and last Species comprehends those *Fistulas* whose Orifice opens into the Rectum, the external Parts contiguous to the *Anus* remaining sound; represented *Tab. 56. Fig. 1. F. G.* These are usually called secret, blind, or imperfect; the former, manifest and perfect *Fistulas*. The blind, or secret, are known by an Efflux of corrupt Matter every Day from the *Anus*, especially if no Ulcer affects the external Parts, or if the Patient complains of a Hardness or painful Tumor near the *Anus*. Sometimes the internal Orifice of the *Fistula* is found to be very deeply situated in the Intestine, but, for the most part, it is conspicuous near the Sphincter of the *Anus*, or in it; as they are both represented *Tab. 56. Fig. 1.*

However it be, the affected Place ought to be very carefully searched out, which may be done by cautiously intruding the Finger, rubbed over with Oil or Butter, into the *Anus*, and, with all the Skill requisite, exploring the internal Orifice of the *Fistula*; or if this be not sufficient, a *Speculum Ani* may be used, such as is represented *Tab. 55. Fig. 15.* or any other fit for the Purpose. But sometimes this internal and troublesome Investigation is unnecessary, as when the Seat or Sinus of the *Fistula* is evident enough from the external Tumor and Hardness.

Fistulas which have a double Orifice, one of which opens into the Intestine, and the other outwardly, are called *perfect* or *complete*; the rest, which have only one Vent, *imperfect*; the French call them *incomplètes*. The last Species is subdivided into two Inferiors; for, with respect to the Situation of the Orifice, imperfect or incomplete *Fistulas* of the *Anus* are some of them *external*, some *internal*. Moreover some *Fistulas* are called *simple*, others *complicated* or *compound*.

The first Denomination comprehends those which only penetrate the softer Parts, which are the Skin, Fat, and the Intestine itself: Some of these *Fistulas* make their Progress towards either Side of the Podex; some forwards, towards the Perineum, Urethra, Bladder, or Scrotum; others backwards, towards the Os Sacrum, or Os Coccygis.

By the Name of *complicated* we understand those *Fistulas* by which the Os Coccygis, the Os Sacrum, the Os Ischii, or the Bladder, or the Urethra in Men, or the Vagina in Women, as *Mustanus* observed, are so miserably corroded, that the Passages of the Fæces and Urine are become promiscuous. Sometimes the small Sinuses of these *Fistulas* reach even into the Belly; and these are the most dangerous of all. Some *Fistulas* are small, and give but little Trouble, and are supported to a great old Age, without any remarkable Inconvenience, of which I know some Examples. Others, on the contrary, are not only attended with most intense Pains, as I have very lately seen; but with a Decay of Strength and Extenuation of Body, a small Fever, and many other Inconveniencies. Again, I knew a Man who was well while his *Fistula* was open; but when that was consolidated, was soon after seiz'd with the Gout; the *Fistula* being again opened, he recover'd his Health; and thus it happen'd several times. Some *Fistulas* have an Orifice so narrow, that it can hardly be seen, or search'd with a Probe, and only now-and-then manifests itself by a Tubercle, in which, after a very curious Search, you meet with a small Hole, which is the Outlet to the *Fistula*. Others gape with a

large Orifice. Some *Fistulas* make their Progress only by one simple and plain way; others spread themselves into many Branches, which are as so many Rivulets derived from one Fountain. Some again proceed farther, and penetrate deeper, than others. Lastly, some move direct along by the Rectum; others take their Course under the Skin obliquely, or athwart, forming a Multiplicity of very crooked Sinuses, which are extremely difficult to be investigated, and consequently not easy to be cured.

The modern Way of searching a *Fistula* of the *Anus* is much after the following manner: The Patient is laid on a Table, or a Bed, upon his Belly, with his Legs spread. Then one of the Assistants strongly distends the Buttocks from one another, that the Operator may the more conveniently intrude his Finger rubb'd with Oil or Butter into the *Anus*. For in all Searches, that are ever made, of *Fistulas* of the *Anus*, which are near the Intestine, it is, as we said before, a necessary Caution, that the Probe be not far introduc'd into the *Fistula*, before the Finger is intruded into the *Anus*; for otherwise it is to be feared, that the sound Intestine will be pierced by the Probe in an improper Place, and so render the Disorder greater, and the Cure more difficult. When the Probe is thus cautiously introduced, the Buttocks are to be let go, that they may resume their natural Posture, and not by their Sides and Angles, when distorted, hinder the Progress of the Probe. If the Buttocks are in their natural and right Posture, and the Probe, being gently introduced, and softly directed every way, can make no farther Progress, there usually the *Fistula* terminates.

The Original or Cause of this Disease is commonly an Exulceration of the Hemorrhoidal Veins, or an Abscess howsoever generated near the Intestinum Rectum, especially in the copious Fat which surrounds it. This kind of Abscesses generally arises either from a Contusion of the Podex, a Stroke, a Fall, a Wound, or an Inflammation of the Rectum, a Dysentery, difficult Childbirth, the Venereal Disease, hard Riding, and a thousand other Causes, which may injure these Parts. The Distemper is very common among the Cavalry in an Army, from their frequent and hard Riding, especially in hot Weather, as is well known to those Physicians who attend Camps; and I myself have formerly seen a Multitude of Horsemen labouring under *Fistulas* of the *Anus*. And it is not at all strange, that Abscesses of this Part, if neglected, either out of Modesty, or for any other Reason, or open'd too late, or not carefully cleansed, should degenerate into *Fistulas*. For it can scarce be otherwise; but that the corrupt Matter, which remains within, must by Degrees so severely corrode and exulcerate the Fat and adjacent Intestine, and other neighbouring Parts, and affect the *Anus*, and its Region, with Sinuses and Callosities, in so surprising a manner, that all the Remedies which can be apply'd are of no Use without cutting. An illustrious Proof of this we have in the Person of *Lewis* the Fourteenth, the late King of France, who, after he had for a long time try'd all the Remedies that could be advis'd by the most able and experienced Physicians and Surgeons in France, was forc'd at last to have recourse to the Knife for the Cure of his *Fistula*. This being the true State of the Case, a prudent Surgeon, as soon as he shall perceive, either by outward Inspection, or introducing his Finger into the *Anus*, that his Patients, labouring under an Inflammation or Abscess of that Part, have also a Collection of Pus inwardly, will think himself oblig'd to use his Knife.

The more severe a *Fistula* is, the deeper it is situated, the greater Quantity of the Fat, of the Rectum, and especially of the Sphincter, is corrupted and corroded, the larger the Sinus, and the harder the Callus that surrounds it, the longer the Disease has affected the Parts, and the weaker, the older, and the worse the Habit of the Patient, the more difficult is the Cure, inasmuch as sometimes to render it impossible and desperate. But, what is principally to be regarded, the deeper the Aperture or Orifice of the *Fistula* is seated in the Intestine, the greater is the Danger of cutting asunder the larger Blood-vessels, whence fatal Hemorrhages have been observed, which can neither be restrain'd by Ligature, nor by Compression or Styptics, for want of a harder Body to make Resistance, and consequently the less Hope there is of a Cure. And really if the Finger intruded into the *Anus* cannot reach the Orifice of the *Fistula*, because it is so deeply situated, the Section cannot be undertaken with Safety, for fear of injuring the larger Veins, and consequently all the Art of the Surgeon is of no Importance in this Case. It is not strange, therefore, that *Garengot* should advise a Surgeon in such a Case to desist from the Operation, rather than by inflicting a terrible Wound in cutting the large Veins, which are in this Part of the Intestine, to cast the Patient into the utmost Danger of his Life by an Hemorrhage. For my Part, I am so far from contradicting him, that I am rather of Opinion, that it is the Part of a prudent Surgeon to promise nothing, but to be always dubious, whatever Appearances there may be of Success in the Beginning. For oftentimes it happens, that after Section there appear not only many Sinuses to the *Fistula*, but these so deeply seated, and so much Injury is done to the adjacent Bones, to the

Bladder, Urethra, Vagina, and the Womb itself, as will render the Cure extremely difficult, if not impossible. Abscesses of the *Anus*, that often recur, are to be treated as true *Fistulas*; for they cannot be cured without cutting the Intestine, and the Sphincter of the *Anus*. In Women big with Child the Cure of a *Fistula* of the *Anus* is not to be undertaken, but we must wait till they are deliver'd, and well recover'd. For *Mauriceau* observes, that Abortion and Death have been the Consequences of such an Operation. If in these *Fistulas* there be any Corrosion in the Bladder, the Urethra, the Womb, or the adjacent Bones, the Disease is usually desperate, and admits of no Remedy. The blind or secret *Fistulas* are also commonly more difficult of Cure than those which discover themselves. On the other hand, if the *Fistula* be recent, and only external, or if it be perfect, as in *Tab. 56. Fig. 1. C C*; but the Corrosion has only affected a small Part of the Intestinum Rectum, or Sphincter, with a little of the Fat; if the Disease has not spread itself to the adjacent Parts just named; if it has not penetrated deep; if the Sinuses are not many, and their Sides are but slightly hard and callous; if there be a good Habit of Body, and the Patient young, or not past the Vigour of his Age, the Cure is, for the most part, happily accomplish'd, but yet so, that more Relief is to be expected from the Knife, than from Physic. The same Judgment is to be formed of secret and internal *Fistulas*, which have their Orifices not far distant from the Extremity of the Sphincter of the *Anus*; as in *Tab. 56. Fig. 1. F G*.

Small external *Fistulas* in some Bodies are endur'd for a long time, without any remarkable Inconvenience; and when Nature is accustomed to them, they serve instead of an Issue to evacuate noxious Humours, and preserve the Patients from Distempers to which otherwise they would have been obnoxious. I know some who have liv'd under *Fistulas* to a vigorous old Age; therefore it is better oftentimes to let them alone, than undertake their Cure; as it is in the Case of old Ulcers. When the Rectum is so much corroded by an Exulceration from an external *Fistula*, or an Abscess, that, upon Examination by the Finger in the *Anus*, and the Probe in the *Fistula*, it is found to be very thin, there is no curing the Distemper, without cutting open the Intestine in that Place, together with the Sphincter, tho' the Intestine be not perforated by the Ulcer. But when the Intestine by the same Method of Trial is found to be substantial and thick, the Ulcer may often be cured without wounding or perforating the Part. So a recent *Fistula* combin'd with the Lues Venerea, or owing its Rise to it, is often cured by Mercurial Remedies without cutting.

Hitherto we have treated of the Nature and Properties of *Fistulas*. Now as to their Cure, we think it not improper, in the first place, to speak of perfect or complete *Fistulas*, and of the rest in their Order. For when we have proposed such Ways and Means as are proper for the Cure of complete *Fistulas*, it cannot be doubted but the Method to be taken with other *Fistulas* will be the more readily understood. In order to the Cure of a complete *Fistula*, the following Directions are to be observed. When the Circumstances of the Patient, as well as of the Distemper, are such as we before declar'd were necessary to give us Hopes of a Cure, the first Business of the Physician is to prepare his Patient for the Operation. Therefore it will be convenient, some Days before, to give a Purge; and, if the Strength will permit, to take away some Blood. But if the Patient be weak, these things are to be omitted, and Corroboratives are rather to be used, a strict Regimen of Diet, and such as is most convenient for the Condition of the Person affected, being, as far as is possible, all the while observed, and proper Medicines being taken to correct the Blood, and render it mild. And that the Surgeon may not be incommoded in the Section by the Excrements, nor the first Bandage be too soon taken off, it seems necessary some Hours before the Operation to evacuate the Belly by a Clyster; and immediately before the Section, let the Patient make Water, that the distended Bladder may not be in Danger of being injur'd. As to the Posture of the Patient, it must be such as before prescrib'd, that is, he must lie on his Belly. The Antients, as appears from *Paulus Aegineta*, placed the Patient on his Back, with his Thighs spread; but the most modern *French Surgeons*, as *Garengot* informs us, think him in the best Posture for this Operation, when he lies on his Side, after the manner of those who take Clysters in Bed, near the Edge of the Bed, with his Breech exposed, and his Knees drawn up. But tho' the Section may be sometimes well enough performed in this Situation, yet I have known Cases where, on account of the peculiar Constitution of the *Fistula*, the Operation succeeded best in the former Posture.

The Patient being placed, as shall be thought most convenient, the next thing is to perform the Section with some fit Instrument, of which there are many invented for this Purpose. In antient Times they used a peculiar sort of Knife, almost like a Hook, in the Cure of these Diseases. This they called by a *Greek Term Syringotomus*, from *Syrinx*, a *Fistula*. Some of the most common Kinds of these are represented *Tab. 56.*

Fig. 4, 5, 6, 7. where the Letters A B represent the sharp or cutting Part; B C, the obtuse and smooth Part, or Style, which ought to be flexible; and D D, the obtuse and convex Back. Tho' these Instruments are rejected by some as useless, I have learn'd by Experience, that what is necessary to be done in these Cases, may very often, especially when the *Fistulas* are of no great Depth, be most commodiously perform'd by them. They are to be taken, greater or less, according to the Depth of the *Fistula*, and are used in the following manner: Introduce the Head C of your Syringotomus into the external *Fistula*, and with the Fore-finger of the other Hand, first anointed with Oil, and then intruded into the Rectum, direct it thro' the internal Orifice of the Sinus, and along the Intestine, till it appears out at the *Anus*. Then taking hold of both Ends, whatsoever is between the two Orifices of the *Fistula* must be cut; in which Section the Sphincter of the *Anus*, in Persons otherwise sound, is always cut with Safety. Many have imagin'd, with *Albucasis*, and others of the Antients, that a Section of the Sphincter of the *Anus* must be followed with an involuntary Efflux of the Fœces, and therefore directed it to be avoided: But Experience has shewn, that it may be cut, not only once, but several times, if it be necessary, in Patients who are sound in other respects, without doing any Mischief. But if this Disorder be consequent upon this Method of Cure, it is to be rather ascribed to some extraordinary Corruption and Destruction of the Sphincter by an Ulcer or Erosion. But where the internal *Fistula* lies so deep, that the Head of the Syringotomus, which passes through it, will, with Difficulty, be made to appear at the *Anus*, the Finger in the *Anus* is to be more busily, but warily employ'd in bending and directing it till it comes out at the *Anus*, when the Surgeon is to make a Section as before. But as the upper Part of the Orifice of the *Fistula* in the Intestine is generally callous, and is not cut in this Way of Cure; and yet if it be not cut, this Part of the Callus does not coalesce with the rest, but easily gives Occasion to a new Disorder; the adjacent Part of the Intestine is to be perforated with the Head of the Syringotomus, two or three Lines above the Orifice of the *Fistula*, and so be cut together with it; or, if this be not done, then soon after the Incision, or, if the Blood be an Obstacle, some Day after it, the callous Part must have an Incision made in it with the Scissars, or be quite cut off.

But it is here to be observ'd, that some Physicians are of Opinion, that the falcated Instrument with a blunt Point, represented *Tab. 26. Fig. 3.* or any other like Instrument, are far more commodious than the Syringotomus above-mentioned, for cutting a *Fistula* in the *Anus*, because the Handle is of considerable Advantage to the Surgeon in the Operation. I am indeed so far of their Opinion, from my own Experience, and that of others, that I dare pronounce it to be most handy and useful in *Fistulas* which have no great Depth; for, to say no more, I have myself, on several Occasions, used this Knife with good Success. The *French Surgeons*, that they might accomplish in the best manner possible the Cure of their King's *Fistula*, made use of some such Knife, but furnish'd with a Head or Knob at the Point, which, however, is not necessary; which, from the Person in whose Case it was us'd, acquir'd the Name of the *Royal Bistory*. However, I should not care to apply my own above-mentioned, or that Royal Incision-knife of theirs, to all *Fistulas* indiscriminately; for they are not the most convenient for those which are somewhat deeply seated. The celebrated *Bassius* therefore, Professor of Surgery at *Hall*, did very well in giving us, in his Dissertation of a *Fistula* of the *Anus*, a Description of an Incision-knife, with a very long flexible Silver-Head, of which some make *Le Maire*, the Head-surgeon of *Straßburg*, to be the Inventor (see *Tab. 56. Fig. 8.*).

Here the Break or Head C being introduc'd into the *Fistula*, in the same manner as before directed, and made to pass thro' its Sinus and the *Anus*, the intermediate Parts, between the internal and external Orifices of the *Fistula*, may sometimes with far more Convenience be cut, than by the Instruments before-mention'd. For the same Purpose may we use the Syringotomus, (*Tab. 56. Fig. 3.*) which *Garengot* has describ'd, but delineated only in part, and which is used in the same manner as the other Syringotomi, but, by means of the Strap E E added to it, may with more Firmness be held, and the Section may the more easily be made. But I found the Inconvenience of its enormous long Beak C D, and took care to have another made, with a Beak no longer than what reached to F, by which I perform'd the Operation with more Convenience.

Some, instead of a Syringotomus and Incision-knife, introduce a flexible Silver Probe, Wire, or Style, into the external Orifice of the *Fistula*, which, after passing through the internal Orifice in the Intestine, they so bend and direct with the Fore-finger in the *Anus*, that Part of it comes out from thence (see *Tab. 56. Fig. 1. D D*). Then taking hold of the two Ends H H, of the Silver Wire, they gently draw the Flesh comprehended betwixt C C B E, and with an Incision-knife, principally a falcated one, or a convenient Pair of Scissars, divide it. This way of Operation, tho' it be very antient, and

and described by *Paulus Aegineta*, seems to *Garengot* extremely convenient, and so much the more to be preferred to others, as it prevents a Return of the Disease. For my part, I have a great Esteem for this very antient Method; but what Argument should induce this Author to think it a more effectual way to prevent the Return of the Distemper than any other, I do not as yet clearly comprehend.

Others use a flexible Probe with a Groove (see *Tab. 22. M.*, or *Tab. 56. Fig. 2.*). This is introduced into the external Orifice of the *Fistula*, and with all possible Exactness directed to the Intestinum Rectum, and reflected back through the *Anus*; after which, with a Knife, or a convenient Pair of Scissars, they cut the Flesh upon the Groove. Some modern Surgeons prefer this way of Operation to all the rest, in the Cure of those *Fistulas*, which are very deeply seated in the Intestine; but why it should be preferable to the former, I am at a Loss to conceive. But in whatever Method it be performed, it certainly requires a great deal of Skill and Caution, lest by cutting the larger Branches of the Vessels of the Rectum, as it sometimes happens in very deep *Fistulas*, we excite a dangerous or fatal Hemorrhage. To proceed, the Wound being thus inflicted, the Blood must be first carefully wiped away; which done, the Part must be very curiously search'd, and inspected whether there be any Sinus, or Callus, or corrupted Fibres remaining. For if you find any Sinus, the Probe or Finger must be nicely introduc'd, and the incumbent Flesh divided with the Scissars or Knife, that the corrupted Parts may the more accurately be view'd and absterged. We are not always allow'd to accomplish the Operation at the first Essay, because of the Moroseness, Debility, or Pusillanimity of the Patient. For pusillanimous or morose Patients can by no Reasons be persuaded to admit of a farther Search and Section the first Time, as I know by Experience; and the Infirm, or such as have lost much Blood, are sometimes unable to bear them, so that we must necessarily proceed to the Dressing. Whatever internal Remains there may be of a Callus, or vitiated Fibres, must with the like Instrument, if it may safely be done, be partly cut off, partly scarify'd, or receive frequent Incisions from the Knife or Scissars. The Consequence of this will be a quick and plentiful Suppuration, and all unnatural Hardnesses, with whatever is putrid and corrupt, will with far greater Convenience be extirpated by cathartic and mundificative Applications. In the mean while, to speak my own Sentiments freely, the Wound is much more happily, as well as speedily, mundify'd and conglutinated, if the corrupted and hardened Fat be first entirely cut away by the Knife or Scissars.

When I resided at *Bremen*, where I had Patients under Cure for the Stone, *Rungius*, a Surgeon of that Place, communicated to me another Method of curing these *Fistulas*, with some peculiar Instruments, which he had invented for that Purpose, and which I never found described elsewhere. He makes use of three Instruments, the first of which is a peculiar Sort of Probe with a Groove, (*Tab. 56. Fig. 9.*) represented in a Side View, by the Letters (A. B.) and made either of Iron or Silver, with a Handle, (C. D.) which at (E) is bent outwards in such a manner, that the Probe and Handle there form an obtuse Angle. The Groove of the Probe is shewn in a direct View (*Fig. 10.*). Another Instrument is a Canal, about a Finger's Breadth in Diameter, made also either of Iron or Silver, (*Fig. 11. A. B.*) with a like Handle, and forming with it an obtuse Angle at (B), but bent a contrary way to the other, as there shewn. The Groove of this is represented in a direct View at (*Fig. 12.*). The third Instrument is a strait Knife, long, narrow, and sharp (*Fig. 13.*). When we have occasion to use these Instruments, suppose there be a *Fistula* in the Left Side of the *Anus*, as in (*Fig. 1. C. C.*), the Instrument, or Pipe, (*Fig. 11. A. B.*) first dipped in warm Water, and then anointed with Oil, is gently introduced into the Intestinum Rectum, and its Handle (D) held firm and steady by an Assistant. The Surgeon takes the grooved Probe (*Fig. 9.*) dipped and anointed like the other, and introduces it through the external Orifice of the *Fistula*, and carries it the whole Length of the same to its external Orifice (C. C.) in an oblique Direction; so that the Point (A) falls upon the Hollow, or Bottom of the Pipe, (*Fig. 11.*) and there firmly fixes itself, as may be known partly by the Touch, partly by Hearing, and partly by introducing the Finger into the *Anus*. These things being rightly managed, the Surgeon takes the Handle of the Probe in his Left Hand, and with the Knife (*Fig. 13.*) cuts upon the Groove of the Probe through the *Fistula* (C. C.) as far as the Pipe (*Fig. 11.*), by which means he lays open the *Fistula* from the interior Part of the Intestine, to the exterior, or *Anus*. The *Fistula* being cut after this manner, as to its Mundification, Dressings, and whatever else is to be done in order to cure it; the same general Method is to be pursued, as is specify'd below. This Method seems to be suited to *Fistulas* of considerable Depth, because the Top of a Syringotomus, or a flexible Probe, cannot without great Difficulty, and Laceration of the Intestine, and sometimes, in the deeper Sort of *Fistulas*, not at

all, be inflected so as to return by the *Anus*. But the greatest Care is to be taken, that the Knife does not go out of the Canal, because the Rectum and the adjacent Parts might receive considerable Injury thereby; to avoid which, the Canal (*Fig. 11.*) is made so large. If the *Fistula* were in the Right Side of the *Anus*, the Instruments must have been applied in a contrary way, as Reason itself directs. There have been, I confess, others in former Times, who in cutting these *Fistulas* have introduced a strait Tube into the *Anus*, and afterwards, by means of a strait or hooked Knife, have opened the Sinus; and I remember, that *Ravius* in his Chirurgical Demonstrations recommends this Method of Cure. But those Instruments of *Rungius*, by their inflected Shape, render it easier for the Surgeon to direct his Knife, and consequently to avoid cutting any thing besides the Sinus of the *Fistula*; wherefore I am of Opinion, that they deserve to be preferred to any thing of that Kind known before.

If the *Fistula*, or Abscess, be only external, and recent, and seated betwixt the Fat and Skin, the Intestine and Sphincter of the *Anus* being no ways affected, the Cure is to be managed as follows: First of all, the *Fistula*, if it be not large enough, but, as it often happens, very narrow, is to be gradually enlarged by a prepared Sponge, a Piece of Gentian-root, or any other thing that is subject to swell. After this, it is to be cleansed by corroding Medicines, and then conglutinated by the general Method of treating *Fistulas*. Sometimes it is better to use the Knife immediately, and, as *Paulus Aegineta* advised, to divide the incumbent Skin by a simple Section, or to do the same when the *Fistula* cannot be sufficiently dilated by swelling Tents, and to enlarge the Incision, till the Place be laid open as it ought, and the Callus at the same time removed. After this, the *Fistula*, at the first Dressing, is to be stuffed with Lint, that it may be dilated; and if more Sinuses of the *Fistula* offer themselves to View at the first Dressing, that they may be cut. If any thing of a Callus, or of hardened or corrupted Parts, be found in the succeeding Dressings, it is to be all cut away with the Knife, or the Scissars, or to be gradually eaten off with Corrosives, particularly red precipitate Mercury. *Monnierius* asserts Ointment of the Apostles to be the most effectual and convenient Remedy in this Case. The vitiated Parts being thus extirpated, a digestive Ointment, mixed with Oil of Eggs, is to be apply'd to the Place, and a very accurate Bandage to be made upon it. In short, if no more secret Sinuses are to be discovered, if the Sanies thickens to a Pus, if new, firm, and sound Flesh increases, if the thin Matter decreases, and begins to alter its Colour and Smell for a better, there seems nothing wanting to make a perfect Cure, besides dressing the Part every Day with a vulnerary Balsam, Lime-water, Spirit of Wine, or dry Lint. Sometimes, as I said before, and as I have seen it, instead of an Aperture to an external *Fistula*, a small Tubercle shews itself, which, if narrowly examined, will be found to have a very small Perforation, which serves for an Outlet to the Sinus, and is more or less difficult to be discovered. In this Case, before all things I cut off the Tubercle with the Scissars, by which means the Duct or Sinus of the *Fistula* is soon discovered, in order to its enlarging, cutting, and curing, as before specify'd.

If the external *Fistula* has penetrated so deep as to affect the Sphincter of the *Anus*, or the Rectum, or, at least, has so much corroded the adjacent Parts, as to leave the Rectum very thin; we can scarce hope to make a perfect Cure, without perforating and cutting the Intestine and Sphincter, as we before advised. This Operation is performed in the best manner, by placing the Patient in the most convenient Posture; and then, after the Finger is inserted into the *Anus*, introducing a Syringotomus, especially one furnished with a Head, (see *Tab. 56. Fig. 5.*) or a Needle, (*Fig. 2.*) or a Stylus, or a Probe, not too blunt, through the external Orifice of the *Fistula* to the Bottom of it, towards the Intestinum Rectum, and perforating it where the Fore-finger meets with the Head of the Probe; but the Instrument must be so warily directed, as not to hurt any other Part of the Intestine; much less the Bladder. The Intestine being perforated, the thing to be done is, to direct and bend the introduced Instrument in so skilful a manner, that it may come out through the *Anus*, and so this imperfect *Fistula* may be cut according to the Rules before prescribed for the cutting of perfect *Fistulas*, whereby it becomes itself a perfect *Fistula*. When the *Fistula* lies near the *Anus*, but the Sinus under the Skin has not its Course so much towards the Rectum, as towards the Peninxum, or one Side of the *Anus*, the most convenient way seems to be, to cut it quite open with the Knife, or Scissars, and to mundify and heal the Wound, as before directed. In the last Place it is to be remarked, that, in cutting these *Fistulas*, especially if they lie deeper than ordinary, and the Operation cannot commodiously be performed by the Instruments mentioned, the Canal (*Tab. 56. Fig. 11.*) or one like it, may be introduced into the *Anus* after the manner above described, and the whole Sinus laid open by means of the Knife (*Fig. 13.*).

Internal;

Internal, secret, or blind Fistulas, usually make a third Species of this Disease. In these, since they appear not outwardly, but lie covered and concealed, the Method of Cure must certainly be difficult, without the Help of a Knife, in making a Wound or Perforation, that may lay open the hidden Sinuses. The most proper Place for the Incision is what is distinguished by some Tumor, Hardness, Pain, or Redness, especially if the Finger by Compression feels a subjacent Sinus, with a Collection of corrupt Matter, as in Abscesses. These things being well examined, and the Patient placed in a right Posture, as above, and firmly held by the Assistants, either an Incision is to be made in the Tumor perceived by the Fingers at the Side of the *Anus*, till we come to the Sinus; or, if we would act more cautiously, the affected Part with the Tumor within contained is, by Help of the Finger introduced into the *Anus*, to be forcibly thrust outwards; and then with a large Lancet, or a Knife fit for the Purpose, to be perforated as shall be thought necessary. For by this means a blind and imperfect *Fistula* is changed into a perfect or complete one, and so the Cure is rendered more commodious. The Wound thus made is afterwards to be enlarged with the Knife, either upon the Finger, or a grooved Probe; and, when large enough, is to be stuffed with Lint, on which must be laid Bolsters, and the Whole must be secured with a proper Bandage for the first time. When the Bandage is taken off, the Wound, if there be Occasion, is still more enlarged; and after a skilful Investigation of every Sinus, and the corrupted Parts within, the Intestine is also cut asunder, and the same Method of Cure pursued, as is above prescribed for complete *Fistulas*.

If there are none of the before-mentioned Signs, or, at least, such as are thought insufficient, but the introduced Finger, with or without the Assistance of a Speculum Ani, (*Tab. 55. Fig. 15.*) perceives a *Fistula* in the Intestinum Rectum, the Cure may be thus conducted: First of all, let a pretty big Silver Wire, or flexible Silver Style, (*Tab. 56. Fig. 14.*) bent one or two Inches, be intruded into the *Anus*, by a Finger of the Left Hand, in such a manner, that the bent Part (A) may by Degrees be introduced into the inwardly seated *Fistula* (*Fig. 1. G*) found, if need be, by Help of the Speculum Ani. This done, let the Right Hand, take hold of the Wire, or Style, by the other Extremity (B), and pull it, till the Head (A) manifests itself to the Sight or Touch, by a Tubercle excited near the *Anus* at the Letter (F). Then the Silver Wire is held with the Hand near the Extremity (B), and the Part of the Skin near the *Anus*, which was somewhat raised by drawing the Head (A) of the Wire, is dexterously cut with a Knife, till that Head appears in the Wound. Moreover, laying hold of the Part (A) now appearing out of the *Fistula*, this Wire is to be more bent, as at (D D, *Fig. 1.*), that by it the interjacent Parts may be drawn outwards, and cut asunder. But perhaps it would not be amiss, in these Sorts of blind *Fistulas*, which do not lie deep, but near the *Anus*, instead of this Silver Style, or Wire, before described, to make use of some kind or other of Syringotomus, (*Tab. 56. Fig. 3, 4, 5, 6, 7.*) that is well bent for the Discovery and cutting of them.

But in whatever manner the Incision is made, and cleansed of all Hardnesses and Impurities, the following things are to be done in order to a perfect Cure: First, the whole Wound is to be filled up, as exactly as possible, with Lint, and twisted Rags, that the Sinus of the *Fistula* may be the more commodiously enlarged and deterged. If the Hæmorrhage be excessive, let the Lint which is at first apply'd, contain some Powder, or Liquor, proper to stop the Flux. So when the *Fistula* lies deeper than ordinary, let the twisted Rags, which are pressed down to the Bottom of the Sinus, be always tied with some strong Thread, or small Cord, lest, in renewing the Bandage, any of the Lint should be left within. Let triple Bolsters be laid upon Plenty of Lint, the first or undermost narrow, but long and thick; the second a little broader; and the third, or uppermost, almost square, as in the falling down of the *Anus*. Every thing lying in just Order and Smoothness, a T Bandage, made of Linen or Cotton, is to come over all and bind them together with due Firmness and Neatness. Then let the Patient be put to Bed; and if there be a Redundance of Blood, or there was but little lost during the Operation, let him be blooded in the Arm, for fear of an Inflammation. Be not too forward in taking off the first Dressings till the second or third Day, unless some Necessity of going to Stool requires it; but when there is only a Desire, as is very often the Case, it is better to abstain a while than immediately to unloose the Bandage. But whenever the Patient feels himself under a real Necessity, it is convenient to take off the Bandage, as well for the more commodious exonerating the Belly, as to preserve the Bandage clean from the Fæces; and if any of these in going to Stool should happen to get into the *Fistula*, they must be very carefully wiped away, either with a Sponge moistened with warm Wine, or with dry Linen Rags. That the Lips of the Wound may not too soon come together, but may always be kept duly open, let the Wound be often well stuffed with fresh Lint. If any thing of a Callus, or any hard or corrupted

Particles, should be found left in the succeeding Dressings, the Ulcer is first to be well searched to the Bottom, and then the Lint is to be spread with a digestive Ointment, mixed with a little red Precipitate, or *Ægyptiacum*; and this is to be done every Day, till you find the vitiated Parts are quite extirpated from the red and sound Flesh. But observe, that for the first fourteen Days after the Operation, the utmost Caution is to be used, that no Sinus of the *Fistula* be left unsearched; nor must we, without good Reasons, forbear to use our Instruments in the Abscission, or laying open of those infected Parts, which the Moroseness or Weakness of the Patient prevented us from doing in the first Operation. That a Sinus or two of the *Fistula* have not been thoroughly searched and opened, may be known partly by the Sight, partly by introducing the Probe, but principally by the Plenty of the Matter issuing from thence, and the Colour, Smell, and Consistence of the same remaining unaltered. For as soon as the Wound looks pretty clean, and the *Fistula* begins to heal, the Matter grows less and less fetid. In this Case, it will be proper to promote the Growth of Flesh by Incarnatives and Balsamics, and at last, to perfect the Agglutination with dry Lint. The Diet under all these Cases must be temperate, sparing, and of Fluids; nor must the Patient, especially in the Beginning, be indulged the Use of solid Food, but only Broths, lest the frequent Desire of going to Stool should as often occasion the unloosening of the Bandage, which would be very troublesome to the Surgeon, and a very great Hinderance to Conglutination.

Fistulas complicated with a Caries, or with an Ulcer of the Bladder or Urethra, are very difficult, and generally impossible to be cured, as we said before. However, when the Os Ischii, or Os Coccygis, are affected with a Caries, not only the Ulcer is to be dilated, that we may have free Access to the Part, but proper Topics are to be used to take off the Caries. I have found the Essence of Round Birthwort most effectual for this Purpose. Nor must we neglect the Use of internal Mercurial Remedies, and Decoctions of the Woods, to purge and free the Blood from the Scurvy and Lues Venerea, which are often joined with this Disease, till the foul Orifice be cleansed, and the Bottom again covered with sound Flesh, and the Ulcer at last conglutinated by the same Remedies as simple Ulcers are treated with.

Fistulas complicated with an Ulcer of the Bladder or Urethra, are still worse than the others, and seldom admit of a Cure; yet if the external Ulcer be diligently cleansed, and plied with Balsamics, in Conjunction with the Use of the internal Medicines above-mentioned, the Defects in these Parts, if not quite desperate, if the Patient be healthy and robust in other respects, are now-and-then restored.

I am not ignorant, that there is a Multiplicity of Methods for curing a *Fistula* of the *Anus*, proposed by the Antients, as *Hippocrates*, *Celsus*, *Paulus Ægineta*, *Albucasis*, &c. such as by Ligature, hot Irons, and Corrosives, which I have on purpose omitted, because they are so far from being preferable to what I have mentioned, that upon Comparison they will be found not so convenient and proper. One thing however I must not pass over in Silence, which is, that when the Sphincter of the *Anus* is corroded, destroyed, or debilitated by some adjacent *Fistula*, the Patient, for the most part, labours under a Difficulty of retaining of the Fæces. But in Persons of a strong Constitution, and where the Sphincter is not considerably corroded, it may be cut asunder twice or thrice, or even oftener, if there be Occasion, without much Inconvenience, or Danger of the before-mentioned Infirmary. Sometimes the Age of the Patient, Imbecillity, the Severity of the Distemper, especially when the *Fistula* is very deeply seated, prevent the Operation from being undertaken. We must then endeavour to mitigate the Disease and the Pain by cleansing Injections, and Applications of lenient and balsamic Medicines. In short, the more to be pitied the Condition is of those who are forced to undergo the Operation for a severe *Fistula*, the more ridiculous is the Folly of some Frenchmen, who, though they felt nothing of a *Fistula* in the *Anus*, yet, that they might have the Reputation of going through the same Disease, and Way of Cure, with their King *Lewis* the XIVth, glorying in Misfortunes, and making an Ostentation of Misery, were earnest with the Surgeons to have the Operation of cutting for the *Fistula* performed upon them, as we are informed by *Dionis*, a very skilful French Surgeon, who, at the same time, very gravely censures this most absurd Passion in his Countrymen.

Since the right Management of a bad *Fistula* of the *Anus* is one of the most difficult Works belonging to a Surgeon, it will certainly be worth our while to propose some Cautions, that are of singular Use for the rectifying and better performing the Operation.

First then a severe *Fistula* ought to be cut in such a manner, that the external Wound may be always wider than the Bottom of the Sinus of the *Fistula*; for by so doing, this as well as other *Fistulas* are more thoroughly cleansed, and easier to be healed. For this Purpose it may even sometimes be necessary to make two Incisions across the affected Part, and then with

the Knife, or Scissars, to cut out whatever you find hard or corrupted, especially at the Bottom of the *Fistula*; for except this be done, the *Fistula* cannot be well cured, and easily returns. This may sometimes be more conveniently and safely performed, by taking up the vitiated Parts with a Hook, or Forceps, and so cutting them off.

2. To avoid injuring the Intestine in dilating the *Fistula* with the Knife, it ought to be directed with its Edge, not towards the Intestine, but outwardly towards the Os Iſchii.

3. If the external Orifice of the *Fistula* be not situated near the *Anus*, but in the Middle of the Buttocks, so that the Sinus is next to the Skin, and proceeds by Degrees towards the Rectum, a grooved Probe is to be introduced into the Bottom of the *Fistula*, upon which the incumbent Skin is to be dexterously cut with the Knife, or Scissars. Then the Wound is to be well stuffed and dilated with Lint, and the next Day the Nature of the *Fistula* is to be thoroughly examined; the rest of the Proceedings are to be regulated according to the Directions given before.

4. If the Intestine be exulcerated and perforated, as it commonly is in complete *Fistulas*, the Style or Head of the Probe, or Syringotomus, is to be thrust into the Intestine rather two Lines above, than through the internal Orifice of the *Fistula*, that the hard and callous Parts within it may the more commodiously be cut out. But when the Instrument passes through the internal Orifice of the *Fistula*, it will be necessary, after cutting through the Intestine and Sphincter, to cut off with the Scissars the hardened Part of the Intestine, that is next above the *Fistula*, to the Breadth of two Lines, or of a Straw.

5. If at the same time you should happen to perforate a Vessel, which discharges Plenty of Blood, your best way is to pass under it a crooked Needle and Thread, and so to tie up its Extremity. But if this cannot be effected, let a Bolster, squeezed out of some styptic Liquor, be applied to the divided Vein, and closely compressed with the Finger for half an Hour, till a Crust be induced; then filling up the Wound with Lint hard twisted, lay upon them some pretty thick Bolsters, and secure the Whole with a firm Bandage; let the Patient also observe to keep himself at Rest, and let an Attendant be ordered strongly to compress the Bandage with his Hand for some time, because sometimes it has been observed, that when the bleeding Vein has not been sufficiently compressed, the Blood has not flowed out through the Bandage and the *Anus*, but taken its Course into the Intestines, and killed the Patient.

6. When the Bandage is made, if the Patient some Hours after feels a Pain in making Urine, he must be exhorted to bear it with Patience, since it usually goes off in a short time.

7. If the *Fistula* of the *Anus* be complicated with the Lues Venerea, there is no easy nor safe Management of the *Fistula*, without first curing the other Distemper; but when this is extirpated, the *Fistula* often heals without Section.

8. *Arnoldus* invented and recommended a particular Bandage for a *Fistula* of the *Anus*, which *Garengot* has carefully described, and given the Preference to it before all others, by many Degrees. See a Description of it under the Word FASCIA.

9. Lastly, when the Wound begins to heal by Degrees, *Garengot* advises us to intrude into the *Anus* a Tent of Lint of a Finger's Bigness, and covered with Pompholyx, for the better drying of the Wound as it heals. But this is often unnecessary; for I commonly find dry Lint, when the Ulcer is well cleaned, and filled with Fleth, sufficient for this Purpose. *Heister*, P. 2. Sect. 5. Cap. 169.

It must be remark'd, that the Cure of a *Fistula* in the *Anus* is not always to be attempted; for in Bodies of a very bad Habit, an entire Interception of the habitual Discharge made by the *Fistula* would be attended with very ill Consequences, and precipitate the Patient into a Consumption, or some other Distemper more fatal than the original Disorder, of which I have seen Instances. This is the general Doctrine; but I can form no Idea of any Humours so inveterately riveted in the Constitution, but that a proper Regimen, and Medicines judiciously apply'd, together with other succedaneous Evacuations, may so far subdue, as to render the healing up a *Fistula* in the *Anus* in due time, curable, without any Prejudice.

Of an ABSCESS of the ANUS.

Since the Original of a *Fistula* of the *Anus* seems, for the most part, to be an Abscess near the *Anus*, when we come to know the Nature and Way of treating this Abscess, we shall clearly comprehend the Properties of this Sort of *Fistulas*, with the Method how to preserve ourselves from them, and to cure them. Therefore we cannot but think it worth while to bestow some Remarks upon an Abscess of the *Anus*.

The Beginning of this Abscess is twofold; for it either attacks the Patient on a sudden, or comes on him slowly and insensibly. The former is like a Boil in the Beginning, but soon after increases very fast, and in a very short time excites a Variety of violent Symptoms, and especially Pains.

At first a sort of sharp Tubercle, scarce so big as a Bean, or Hasle-nut, with a remarkable Hardness, appears. About this Hardness, which uses to lie deep near the *Anus*, a Redness is commonly perceived. Sometimes the outward Skin has the Marks of an Erysipelas, or Ignis Sacæ, while it is red without a Tubercle, but with so severe an Inflammation, that, unless it be speedily digested, in little more than four-and-twenty Hours, it turns to an Abscess, and is often attended with such excessive Pains, as to induce a Fever with Thirst, want of Sleep, Nausea, extreme Weakness, and other bad Symptoms.

The other Kind of Abscess, which is of slow Progress, is by some denominated a *Fistula* from the very Beginning, and is known, as other Abscesses, by the Pain and Tumor, but tends more slowly to Suppuration.

But in whatever manner the Abscess is generated, certain it is, that the corrupt Matter, after Suppuration, prepares itself by Degrees a Way to be discharged, and at last either perforates the Skin near the *Anus*, or the Intestine. Before this can be effected, the adjacent Fat is more or less corroded, and converted into Sanies, by the pent up acrimonious Matter, whence are formed a Variety of Sinuses, sometimes single, small, and direct, at other times large, crooked, and deep; and at last, penetrating through the external Skin, or Intestine, sooner or later, according to the different Nature or Quality of the Matter collected within; so that it is no Wonder, that *Fistulas* generated of Abscesses are some of them more severe than others.

For the Cure of an Abscess of this Kind, in the Beginning, Digestives, in the Form of a Fomentation, or Cataplasm, may be apply'd; but because the Disease is seldom cured by such means, and more Dependence is to be had on manual Operation than Medicines, recourse is to be had, in Season, to the Knife, and the following Method is to be observed: First, the Patient is to be placed in the same Position as we directed for the Operation under a *Fistula* of the *Anus*; then let the Surgeon, by pressing with his Finger near the *Anus*, or introducing it into it, very carefully search the vitiated Part, and thoroughly explore the Bottom of the Sinus of the corrupt Matter, though no outward Sign of a Suppuration as yet appears; but if only a Hardness or Tumor be perceived, the Matter is to be brought to some Degree of Ripeness, before the Instrument is used.

As in every Abscess Suppuration is to be promoted and accelerated by the Application of some emollient Cataplasm, such as that prepared of Crums of Bread with Milk and Saffron, or by a Plaister of Diachylum with the Gums; so a very necessary Caution is to be observed, which is, that the Cataplasm, or Plaister, be not left too long upon the affected Part, which may cause the Suppuration to proceed farther than it ought into the inward Parts, by which means the circumjacent Bodies being wasted and consumed, the Disease may be rendered desperate, or at least more exasperated and dangerous. Therefore we ought not to wait till the contained Matter shews some external Sign of Maturation; but the Cataplasm is to be removed after every two or three Hours, and, the Skin being wiped, we are to examine with a Finger of each Hand, one introduced into the *Anus*, and the other press'd on the external Parts, whether by Compression between the Fingers any corrupt or mature Matter can be discover'd. No Credit therefore is to be given to those who determine, that it is only proper to open an Abscess, when the malignant Matter is plainly perceived to be perfectly matured; for in such a State it would destroy the adjacent Parts.

As soon as there is any Sign of a Collection of corrupted Matter within the Tubercle, by means of the Finger introduced into the *Anus*, is to be pushed outwards towards the Skin, on the Side of the *Anus*. Then with the Incision-knife, or Lancet, let an Incision be made through the Middle of the Tubercle quite to the Receptacle of the Matter, and, raising a little the Instrument, let the Sanies, which is commonly mix'd with Blood, run into a Vessel placed underneath, and let the external Parts be gently press'd on all Sides, in order to force out the remaining Matter.

The Matter being evacuated in a Quantity sufficient to demonstrate, that the Abscess is perforated, let the Knife, or Lancet, be drawn out in such a manner as to cut the tumid Parts above the Abscess in a strait Line, and so make the Wound a little larger. This done, thrust in a Finger to the Bottom, in order to distend the Wound, and explore its Cavity, or Sinus; then above or near the Finger, cautiously introduce the Knife, or Scissars, and, carrying it near the *Anus* lengthwise, dilate the Wound to a sufficient Largeness; and, lastly, that there may be the freer Access to the Root of the Evil, the Part affected, if necessary, must have transverse Incisions made in it, and whatever shall be found within preternaturally corrupted and hard, must be cut out, in the same manner as directed for *Fistulas*.

In order to a right Treatment of this Wound, it will be necessary, according to *Garengot*, to observe the following Cautions: First of all, let the Wound be filled up, as exactly as possible, with three or four large Tents of Lint, each with a Thread

Thread or String ty'd to it, which must be distinguished from each other, either by their Places on the external Surface of the Wound, or by their Colour, lest, when we come to unloose and change the Dressings, we should happen to pull out the lower Tents before the superior, and so excite a pernicious Hæmorrhage. Over these Tents must be laid plenty of Dossils of Lint, and by drawing a little, as *Garengeot* advises, the Thread of the lowest Tent the Dossils, are united in close Conjunction; then placing several narrow Bolsters in such Order, that the upper Bolster may be always wider than the next under it, over all must be brought a proper Bandage, such as is described for a Fistula under the Article FASCIA. But, to speak my Mind freely, I do not see the Necessity of such a Multitude of Tents with their Strings in a simple Abscess, nor of so troublesome and operose a Dressing. For my part, I take care to have this sort of Abscesses, as well as others, well filled up with plenty of twisted Lint; and then applying Bolsters, make the Bandage in the most simple manner with the common Fillet. In the following Dressings I do not pull out the Lint by Force, but apply to the Ulcer a digestive Ointment, and a Plaister of Diachylum, and wait till a Suppuration coming on, they fall off of themselves; and by this Method there is no great Danger of an Hæmorrhage. After this, I deterge the Abscess, as I do other Abscesses, and at last heal it with Balsamics.

If any considerable Vein happens to be cut in the Operation, it seems necessary either to tie the Vein, or, if this cannot be done, to apply a small Bolster squeezed out of some styptic Liquor, and to compress the same with the Fingers for a while till the Blood is stopped. The Wound afterwards is to be more filled with twisted Lint, more and thicker Bolsters are to be laid on, and an Assistant is to be appointed to attend the Patient, that with his Hand he may compress that Part of the Bandage which is just over the bleeding Vessel. As for Conglutination of the Wound, though *Garengeot* has said nothing about it, I perform it exactly by the same Methods as in other Abscesses, and *Fistulas* of the *Anus*. Oftentimes these Abscesses are maintain'd by a Venereal Cause, and Funguses and Calluses arise in them, so that they cannot be healed.

To conclude, it seems strange, that *Garengeot*, who, like us, divided *Fistulas* of the *Anus* into *perfect* and *imperfect*, and gave the Characteristics of each, should yet, in treating of the Cure, pass over in Silence the blind and imperfect *Fistulas*, though these require a singular, and, I may say, a more artificial Management than the others, as, I think, appears in the preceding Chapter. Neither has *Garengeot* said a Word about the Method of treating complicated *Fistulas* of the *Anus*, though they are not so scarce and rare to be found, as to deserve to be passed over in Silence. *Heister*, P. 2. *Secl.* 5. *Cap.* 169.

Mr. Sharp's Observations on the FISTULA in ANO are as follows:

If the Surgeon has the first Management of the Abscess, and there appears an external Inflammation upon one Side of the Buttock only, after having waited for the proper Maturity, let him with a Knife make an Incision the whole Length of it, and, in all Probability, even though the Bladder be affected, the Largeness of the Wound, and the proper Application of Dossils lightly pressed in, will prevent the Putrefaction of the Intestine, and make the Cavity fill up like Imposthumations of other Parts.

If the Sinus is continued to the other Buttock almost surrounding the Intestine, the whole Course of it must be dilated in like manner, since, in such spongy Cavities, a Generation of Flesh cannot be procured but by large Openings; whence also if the Skin is very thin, lying loose and flabby over the Sinus, it is absolutely necessary to cut it quite away, or the Patient will be apt to sink under the Discharge, which, in the Circumstance here described, is sometimes excessive. By this Method, which cannot be too much recommended, it is amazing how happy the Event is likely to be; whereas from neglecting it, and trusting only to a narrow Opening, if the Discharge does not corrupt the Gut, at least the Matter, by being confined, corrodes the Gut, and, insinuating itself about it, forms many other Channells, which, running in various Directions, often baffle an Operator, and have been the Cause of a Fistula being so generally esteemed very difficult of Cure.

Here I have considered the Imposthumation as possessing a great Part of the Buttock; but it more frequently happens, that the Matter points with a small Extent of Inflammation on the Skin, and the Direction of the Sinus is even with the Gut: In this Case, having made a Puncture, you may with a Probe learn if it has penetrated into the Intestine by passing your Finger up it, and feeling the Probe introduced through the Wound into its Cavity, though, for the most part, it may be known by a Discharge of Matter from the *Anus*. When this is the State of the Fistula, there is no Hesitation to be made, but immediately putting one Blade of the Scissars up the Gut, and the other up the Wound, snip the whole Length of it.

This Process is as advisable, when the Intestine is not perforated, if the Sinus is narrow, and runs upon, or very near

it; for if the Abscess be tented, which is the only way of dressing it, while the external Orifice is small, as I have here supposed, it will almost certainly grow callous; so that the surest Means of Cure will be opening the Gut; that proper Applications may be laid to the Bottom of the Wound. However it should be well attended to, that some Sinuses pretty near the Intestine neither run into, nor upon it; in which Case they must be opened, according to the Course of their Penetration. There are abundance of Instances where the Intestine is so much ulcerated as to give free Issue to the Matter of the Abscess by the *Anus*; but, I believe, there are none where there is not by the Thinness and Discoloration of the Skin, or an Induration to be perceived through the Skin; some Mark of its Direction, which, if discovered, may be opened into with a Lancet, and then it becomes the same Case as if the Matter had fairly pointed.

If the Sinuses into and about the Gut are not complicated with an Induration, and you can follow their Course, the mere opening with Scissars, or a Knife guided on a Director, will sometimes suffice; but it is generally safer to cut the Piece of Flesh surrounded with these Incisions quite away, and, when it is callous, absolutely necessary, or the Callosities must be wasted afterwards by escharotic Medicines, which is a tedious and cruel Method of Cure.

When the Fistula is of long standing, and we have Choice of Time for opening it, a Dose of Rhubarb the Day before the Operation will be very convenient; as it not only will empty the Bowels, but also prove an Astringent for a while, and prevent the Mischief of removing the Dressings in order to go to Stool.

It sometimes happens, that the Orifices are so small, as not to admit the Entrance of the Scissars, in which Case Spongetents must be employ'd for their Dilatation.

In performing these Operations on the *Anus*, I do not think any Instrument so handy as the Knife and Scissars; almost all the others, that have been invented to facilitate the Work, are not only difficult to manage, but more painful to the Patient: Nor do I caution against cutting the whole Length of the Sphincter, Experience having shewn it may be done with little Danger of an Incontinence of Excrement; and, in Fact, the Muscle is so short, that it must generally be done in Dilatations of the Intestine.

The worst Species of Fistula is, that communicating with the Bladder, where the Prostate Gland is primarily concerned. This generally takes its Rise from a former Gonorrhœa, and appears externally first in the Perinæum, and afterwards increasing more towards the *Anus*, bursts out in various Orifices through the Skin, which soon becomes callous and rotten; and the Urine, passing partly thro' these Orifices, will often excite as much Pain, and of the same Kind, as a Stone in the Bladder.

Having met with none of these Instances, that I could not trace from a Clap, I have been induced, in the Trial of Cure, to practise Salivating, which assists very much in healing the Wound after the Operation. The Manner of opening this Fistula is by cutting out the callous Skin and Eminences, down as deep as the *Accelerator Urinæ*, and somewhat deeper between that Muscle and the *Erector Penis*, if the Indurations lie there. The Operation is severe, but very well rewards the Pain. It is not to be expected however, if there are many Sinuses into the Bladder, that they will all certainly be healed; but they will be reduced to one or two, almost all the Urine come by the Urethra, and the Pain be quite removed, of which Success I have had two or three remarkable Instances under my Care. See HÆMORRHOIDES.

CASE I. from Le Dran.

Of a blind internal Fistula in ANO.

Though all *Fistulas in Ano* begin by smaller or larger Abscesses, formed in the Fat covering the Rectum, yet they differ in various respects.

Authors mention blind internal *Fistulas in Ano*; but some have not described the proper Operation in that Case, and others are not sufficiently instructive in an Affair of so great an Importance. This Observation may serve as a Rule, at least, in Cases nearly parallel to this.

On the 13th of February 1726. a Man was received into the Hospital, who had evacuated Matter by the *Anus* for the Space of eighteen Months, more or less, according to the Distance of Time between his Stools. He could not inform me how it began, having never felt any remarkable Pain (It is not astonishing, that a small Abscess should be formed in the Fat near the Rectum, without creating much Pain, the Pus being capable of extending itself without meeting any Resistance). In examining the Distemper, I found an Hardness on the Left Side, within an Inch of the *Anus*, which seemed to be three Fingers Breadth deep; the Buttock appeared sound, and there was no Alteration in the *Cuticula*, or *Panniculus Adiposus*.

When I had prepared the Patient by two copious Bleedings, as he was robust, and purged him once, I performed the Operation.

Having

A N U

Having placed him with his Belly against the Side of the Bed, his Feet upon the Ground, his Legs and Thighs asunder, and there held fast by two Assistant Surgeons, I thrust an Imposthume Lancet into the Hardness which I had felt with my Finger, and thus made a complete Fistula of a blind one: Then withdrawing the Lancet, I introduced a Probe in its Place with my Left Hand, and passed it as far as the Callosity; in the Midst whereof was a Cavity, round which I could move my Probe: Then I introduced the Index of my Right Hand into the *Anus*, and discovered the Sinus that passed from the Callosity into the Rectum.

That I might leave no Source of a Fistula behind, I pierced the Intestine with my Probe a little above the *Fistula*, and, drawing it out by the *Anus*, finished the Operation in the usual manner, cutting off, or destroying the Callosities.

The Patient left the Hospital in the Beginning of *April*, perfectly cured.

REMARK.

The most preferable Method is, to pierce the Intestine above the callous Perforation; for want whereof you run a Hazard of leaving a Part of the Callosity, which may retard the Cure, or even render the Operation ineffectual.

CASE II. from Le Dran.

In the Month of *April* 1725, the King having done me the Honour to nominate me Surgeon Major of the Hospital of *La Charité*, I saw a Man there, upon whom the Operation for a *Fistula in Ano* had been performed three Weeks before. The Wound seemed to be in good Condition, and lessened every Day, inasmuch that the Cicatrix seemed almost formed. Nevertheless, examining it with Attention, I observed a little fanious Pus to proceed from a small Sinus in the Wound near the Cicatrix. Startled at this, I passed my Probe into the Hole, and found a Sinus along the Intestinum Rectum, four Fingers Breadth deep, which terminated in a Cavity surrounded with Callosities, and the Intestine was denuded the whole Length of the Sinus. I began the Operation again, performing it in the usual manner, by dividing the Intestine in the whole Extent, where it was bare. I destroyed the Callosity as much as I possibly could; and to become Master of the Bottom of the Wound, I made an Incision into the Buttock, taking off the Angles. This furnished little Blood for that Instant; but an Hæmorrhage succeeded six Hours after. I went immediately, and, removing the Dressings, placed a small Compress dipped in styptic Water upon the Vessel that furnished the Blood, which I held with my Finger near half an Hour, that the Styptic might produce its Effect. The Hæmorrhage being stopped, I supported the Compress with a threaded Dossil, and that by many others, and secured the Whole with Compresses, and a proper Bandage. I did not remove the Dressing for two Days, and then the Patient was dressed according to Art, and recovered in six Weeks. I was informed, that he bled five times in the same manner after the first Operation.

REMARKS.

There are two essential Precautions in the Cure of Fistulas. When the Operation is performed, all the Callosities must be effectually destroyed, especially those at the Bottom, because it will be too late to consume them some Days after, upon account of the external Lips approaching.

I think I ought to make a short Remark in this Place, in favour of young Students in Surgery. You must take care in the Dressing not to rub or irritate the Edge of the divided Intestine, in placing the first Dossil. For which Reason, at each Dressing, especially during the first ten or twelve Days, you must introduce your Finger to the Intestine, fixing the Edge with it; then passing the Dossil, with your Forceps, between your Finger and the sound Buttock, till it reaches the Intestine itself, withdraw your Finger, and fix the Dossil in its Place, so that half may be in the Wound, and half in the Rectum. The Neglect of this last Precaution is enough to prevent the Cure, even when the Operation has been well performed.

With regard to the Hæmorrhage, which either accompanies or follows the Operation, many Methods are proposed to stop it. I have practised all, and find none more certain, or less painful, than what I used to the Patient, who is the Subject of this Observation.

CASE III.

Of a VENEREAL FISTULA in ANO.

The Suppuration of Venereal Tumors is different from those not proceeding from the same Cause; and the Symptoms attending them are, generally, not so active; because the Venereal Virus is more disposed to fix, than to ferment those Fluids wherewith it is confounded.

A N U

On the 27th of *April* 1725, a Servant came to me to the Hospital, who had a considerable Abscess on the Left Side of the *Anus*, which was not accompanied with Symptoms in proportion to its Magnitude. We know that large Abscesses, at the Beginning, are very troublesome to Patients by their excessive Pain, Tension, and Fever; Symptoms which subsist, and even increase more and more, till the Pus is formed.

When the Patient was sent to the Hospital, the Pus was already formed, and the Skin like Dough, wherein the Impression of my Finger remained; and it was with Difficulty that the Fluctuation was to be felt.

I opened it, and found the Rectum denuded more than three Fingers Breadth above the Verge of the *Anus*, I cut through all that Portion of the Intestine which was denuded, and cut away all the Skin that was altered and separated from the adipous Substance.

The Wound proceeded very happily, and the Lips approached, and in all Appearance a certain Cure was to be expected, when, in fifteen or twenty Days, an hard Fungus appeared at the Bottom of the Wound, which rising in the Form of a Crown, seemed to be carcinomatous. I took it off with my Bistorty, but in a few Days it pushed out again; and then I began to interrogate the Patient, and, by the Description he gave me of the Venereal Infections he had before, I knew it to be the Lues. Sudorific Pilsans and Æthiops Mineral were administered in vain; the Fungus visibly returned as I consumed it; therefore I advised him to a Salivation.

He went from the Hospital to a proper Place, where he was salivated; and when he came from thence, only a small Portion of the Wound remained to be cicatrized.

CASE IV.

Of a FISTULOUS and VENEREAL ABSCESS.

In the Month of *September* 1725, a Patient was sent to *La Charité*, who had a gangrenous Abscess in *Ano*, which began in the same manner as that mentioned in the preceding Observation. I interrogated him as to his manner of Life; but he was discreet, and confess'd nothing that could give me the least Reason to think his Case Venereal; therefore, after he was prepared, according to Custom, I performed the Operation.

In twelve Days the Lips of the Wound grew callous, and a Fungus rose at the Bottom. To discover the Truth of what he had concealed from me, I thought I could deceive him in my Turn; and told him, that those Symptoms were certain Signs of the Lues Venerea, and that he could not be cured without taking proper Remedies to subdue the Cause of his Disease, and the Use of proper Dressings at the same time. He imagined that he should stay at the Hospital to pass through this Course, and confess'd, that he had two Chancres and a Gonorrhœa two Months before. Then I told him, that he could not stay in the Hospital; and by my Advice he went to the *Petits Maisons*, where he was salivated, and perfectly cured.

REMARKS.

Abscesses formed near the *Anus*, and that break off themselves, degenerate into Fistulas in time, and occasion Callosities: The same thing would have happened to those two, of whom I have been speaking, had I not performed the Operations that seemed necessary.

If then old Fistulas, not Venereal, are callous, as well as those that are, the Surgeon ought first to examine his Patient, that he may take his Measures accordingly.

If it be a simple Fistula, the Operation may be performed; but when you know it to be Venereal, I think it most prudent to begin by treating the Patient for the Lues. Some of the last Kind, that were recent, have been known to be cured with all the other Venereal Symptoms, and have had no farther Occasion for an Operation.

If by a methodical Course the Fistula does not heal, the Operation must be afterwards performed.

CASE V.

Of a complete FISTULA in ANO, caused by an extraneous Body in the Rectum, communicated by Mr. D'Estendau, Surgeon, at the Hague.

In the Month of *December* 1728, I was called to a Gentleman of fifty Years, to heal him of an external *Fistula in Ano*, with which he had been afflicted for eight or nine Months. He was emaciated, and become almost hectic, partly from the Pain he endured, and partly from a slow Fever that never ceased; so that his Life was not long expected.

When I had probed and carefully examined it, I judged there was no Time to lose before the Operation was performed, especially, because this *Fistula*, whose external Orifice was two Inches from the *Anus* on the Right Side, could not make farther Progress, without rendering the Operation impracticable, since the Fistula already pierced the Sphincter as far as I could reach,

reach, with my Finger. I prepared my Patient immediately, and then performed the Operation, in Presence of a Doctor of Physic, and Professor of Anatomy at the *Hague*.

When I thought the Operation was finished, I thrust my Finger into the Wound, to examine whether I had sufficiently open'd the Sinuses, and scarified the Sides of the Fistula, and was much surpris'd to feel an extraneous Body at the Bottom of the Wound, which was hard, pointed, and wedged in it. This oblig'd me to make an Incision, in order to disengage it, without which it could not be extracted; and I then drew a Scale of Bone, pointed at each End like a Lancet, two Fingers-breadth long, and a little broader and thicker than the Blade of a Penknife. It seem'd by its Hardness and Appearance to be the Scale of a Beef-bone. I inquired of the Patient, whether he remembered to have swallowed that Bone, who answer'd in the Negative; but he remember'd very well, that some time before the Manifestation of the *Fistula*, he felt a Pain on a sudden like a Stab with a Dagger near the Rectum, and thought he should have fainted away by the Excess of it. It was at this Time, without Doubt, that the Bone pierc'd the Intestine, prick'd the neighbouring Parts, caus'd an Inflammation, and at last an Abscess, which degenerated into a *Fistula*.

I dress'd the Patient, and afterwards prescribed him proper Medicines, by which Means he recover'd the 30th of January 1729, which was the fiftieth Day after the Operation. *Le Dran*.

It is proper to take Notice, with respect to the *Anus*, that many Substances of an extraordinary Nature are discharg'd by this Emissary. Thus calculous Concretions form'd in the biliary Ducts and Cystis, sometimes pass this Way; and we have an Instance in the Philosophical Transactions of a great Number of Stones, one of which weigh'd upwards of two Ounces, which, after a great deal of Pain, came away by the *Anus*. But the Passage of the *Fœtus* by the *Anus* is, of all others, so extraordinary a Case, that I must not omit the following Account communicated by Mr. *Giffard* to the Royal Society.

I was sent for, about the Middle of August last, to a Woman, who then judg'd herself to be between three and four Months gone with Child: She had all the Symptoms preceding a Miscarriage, and, upon touching, I found the *Os Tincæ* somewhat dilated and spread, from whence I concluded a Miscarriage would ensue, and therefore order'd what I thought proper to promote it; but I was sometime after inform'd by her Husband, that altho' she before believ'd, that she had miscarry'd, yet, that she now thought herself quick, as feeling somewhat to move within her Belly, agreeable to what she had perceiv'd after former Quickenings. Thus it pass'd on for about six or seven Weeks; in which Time she grew much bigger, and the Motion more perceptible; so that there remain'd no Doubt of her being with Child. About the third of October, she was seiz'd with violent Pains in her Belly and Back; which daily increasing, her Sister, by her Desire, came to me on the sixth, when I went to her, and found her labouring under very great Pains, and other Complaints like those preceding a Miscarriage or Delivery: But, to be better satisfy'd, and to strengthen my Opinion, I pass'd up two Fingers into the *Vagina*, to examine, by the Touch, whether the *Os Tincæ* began to open and spread. I there felt a large and unusual Fulness and Tension, which I judg'd to be the Body of the *Uterus* sunk low into the *Vagina*, and much distending it, and extending backwards, and pressing against the *Rectum*, so that the Excrements could not readily pass, neither could she, from its Pressure upon the Neck of the Bladder, freely make Water. I could not find the *Os Tincæ*, altho' I very carefully examin'd all about with the Ends of my Fingers; wherefore I then judg'd, that the *Fundus Uteri* must have receded from its natural Position, and be bent backwards towards the *Rectum*: In which Opinion I was more strengthen'd, from the Fulness I before observ'd, stretching backwards; and therefore concluded, that the *Os Tincæ* must be very forward: Wherefore I endeavour'd to pass my Fingers between the *Os Pubis*, and the Fulness which press'd against the upper Edge of the said Bone. This, with some Difficulty, I effected, and, at length, about two or three Inches above the said Bone, I felt the *Os Tincæ* with the Ends of my Fingers. The Cause of this Situation will more clearly appear in the Pursuit of this Account: I order'd her anodyne and quieting Medicines to relieve her Pains, which she was oblig'd to take every twelve Hours, with proper Cordials to support Nature, and sometimes Clysters. Thus Matters continu'd to the 20th of the said Month, only that for some Days before, a Water, tinged with Blood, came away, as she imagin'd, thro' the *Anus*, and which she believ'd proceeding from the Piles, with which she was sometimes troubled.

On the 20th, her Husband came to me, about Six of the Clock in the Evening, telling me that the Midwife had brought away a *Fœtus*, but could not complete her Business; whereupon I immediately went to the Midwife, who, upon my coming, told me, that a *Fœtus* was protruded thro' the *Anus*; and to confirm it, desired me to examine; which I did immediately, and found the *Funis Umbilicalis* hanging out about two or three Inches beyond the *Anus*, and passing up thro' the

same. I therefore pass'd my two Fore-fingers by the String into the *Anus*, when I found, about three Inches up, an Opening, as I then judg'd, into the *Uterus*, wide enough to admit the Ends of three or four Fingers, and the *Funis Umbilicalis* passing into it; from hence I was assur'd, that the *Fœtus* came out that way. I endeavour'd, with my Fingers pass'd into the Opening, to bring away the *Placenta*; but as it was very rotten, it tore away between my Fingers, so that I was forced to bring it in small Pieces, and was at last oblig'd to leave a large Part of it. The *Septum*, or Partition between the *Anus* and *Vagina*, was entirely whole, and no Perforation through it. From these Appearances I then concluded, that a Mortification must have begun in the *Uterus*, and so from its Contiguity be communicated to the *Rectum*; so that Nature, endeavouring to expel what was contained, and forcing it against this Part already mortified, and consequently ready to give way and separate upon any Pressure made against it, produced this Opening, and the Protrusion of the *Fœtus* thro' it into the *Rectum*, and so on thro' the *Anus*.

There was a large Discharge of grumous Blood, and other Substances, thro' the *Anus*, which continued coming away until the 26th of the aforesaid Month, when the Woman died about Three of the Clock in the Afternoon.

I should have observ'd, that there was a Fulness and Hardness very perceptible, to be felt outwardly on the Fore-part of the Belly, some Distance below the Navel, from the Time that the *Fœtus* came away, to her Death, which, upon opening the Body, I was well assur'd, was the *Uterus* forced upwards and forwards by a *Sacculus*, which being large and distended, fill'd up the *Pelvis*, and by its Bulk press'd the *Uterus* forwards. The *Fœtus* was perfect in all its Parts, but much wasted and shrunk, from its being some time dead, and consequently putrified.

Upon Dissection, the *Vagina*, *Uterus*, *Ligamenta Rotunda*, Left Ovary, Fallopian Tube, and *Ligamentum Latum* on that Side, together with the Hypogastric and Spermatic Vessels on the same Side, were found in a natural State. The Fallopian Tube on the Right Side we trac'd from the *Fundus Uteri* almost to the *Morus Diaboli*, where it was confusedly united with, and open'd into the *Sacculus* hereafter to be described. The Ovary on this Side, with the *Ligamentum Latum*, was dilated into a large *Sacculus*, of an irregular Form, extending itself behind the *Uterus* (to the posterior Parts of which it adher'd); and passing on towards the Left, was connect'd to that Part of the Colon that terminates in the *Rectum*. In this *Sacculus* we found great Part of the *Placenta*, and the Remains of lacerated Membranes, besides the Aperture of the Fallopian Tube mention'd before, and another about four Inches in Diameter into the Middle of the *Rectum*; that Part of the Ureter on the Right Side, which lies between the Ovary and the Kidneys, was dilated, and so was that Part of the *Rectum* between the Aperture into it, and the End of the Colon; both which were caus'd from the Contents of these Canals being obstructed in their Passage. *Phil. Trans. Abr. Vol. 8.*

ANUS, in Botany, signifies the posterior Opening of a Monopetalous Flower. This Name was originally us'd by Mr. *Vaillant*.

ANXIETAS, Anxiety, Restlessness. See *ALYSMOS*.

ANYADEL, an eternal Spring, the new World, the future Paradise. *Ruland*.

ANYDRIA, ἀνύδρεια, from *α*, Neg. and ὕδωρ, Water. In *Hippocrates* it signifies a dry Season: Thus, *Εν καύματι ἀνύδρεια*, *Lib. 2. Sect. 1. Epid. 4.* "In burning hot and dry Weather." Such a Season is said to be *Anydron*; as *Lib. 2. Epid. Sect. 3.* τὸ ἐὰρ καὶ τὸ θερινὸν πᾶν ἀνύδρον. "The Spring and Summer were extremely dry;" and *Aphorism. 14. Lib. 3.* Βόρεον καὶ ἀνύδρον. "Attended with Northerly Winds, and dry Season."

ANYDRON, a Species of *Sclanum*. *Blancard*.

ANYPERBLETOS, ἀνυπερβλήτος, from *α*, Neg. and ὑπερβάλλω, to conquer, insuperable: Thus, *Ἀνυπερβλήτος γὰρ ἡ φύσις τοῦ βοείου κρέως, καὶ ἡ τῆς τυχεύου καλῆς καλαπιδίας* "For the Beef is of an insuperable Nature, and not to be digested by an ordinary Stomach." *Hippoc. de Rat. Vita. in Morb. Acut.*

ANYPEUTHYNA, ἀνυπεύθυνα, from *α*, Negative, and εὐθύνομαι, obnoxious. Things for which we are not accountable. The *Anypeuthyna*, in Medicine, are Events that cannot be charged on the Physician, nor render him accountable for them. *Hippocrates*, ἄρρατα, speaking of ignorant and upstart Physicians, says, *Καταχλιδῶσι καλαμεμεληκότες τὰ τέχνης ἀνυπεύθυνα, ἐφ' οἷς ἂν ἰητὴς ἀγαθὸς ἀμάρτυς ἡμῶν τε καὶ ἰατρῶν* "They live voluptuously, never troubling themselves about the *Anypeuthyna* of the Art, in which a good Physician, who deserves the Name of an Artist, shews his greatest Skill." In this Place *Anypeuthyna* seems to import those things which are out of the Limits of Reason, and cannot be accounted for.

ANYSTOS, ἀνυστος, from ἀνύσσω, to perfect. Ready, expert. *Hippocrates*, περὶ ἰατρικῆς, requires, as a Qualification in Physicians, that they be ἀνυστοι περὶ λόγου, "of prompt Elocution."

AOCHLESIA, ἀοχλησία, from α, Neg. and ὀχλῶ, to disturb. A Calmness, or Quietness.

AOCNIA, ἀοκνία, from α, Neg. and ὀκνεῖν, slow, lazy. Diligence, or Alacrity. To undergo Labour with Alacrity, and eat without Satiety, are reckon'd by *Hippocrates*, *Lib. de Epid. Lib. 6. Sect. 4. T. 20.* two great Preservatives of Health.

AONCON, ἀονκον, from α, Neg. and ὄγκω, a Tumor. Not tumid. *Hippocrates*, πρὸς φύσιν ἀνθρώπου, advises, for the Cure of Epidemic Diseases, τὸ δὲ σῶμα ὅρην ὅπως ἔσται ἀογκότατον καὶ ἀδυσχεστόν. "To take care, that the Body be very low in Flesh, and much debilitated." Some understand by ἀογκότατον σῶμα, a Body of the most solid Constitution, and least exposed to the Injuries of the Air, not of a fluxile humid Substance, but dense and compact, and so less liable to external Impressions. Not bloated.

AORGESIA, ἀοργησία, from α, Neg. and ὀργή, Anger. An Absence of Anger. Mildness of Temper.

AORNOS, ἀορνός, from α, Neg. and ὄρνις, a Bird. Spoken of Places void of Birds, on account of malignant Exhalations, as formerly the Lake *Avernus* in *Campania*. *Castellus*.

AORTA, ἀορτή, the great Artery proceeding from the left Ventricle of the Heart, from which all the other Arteries either mediately or immediately proceed, and by which the whole Mass of Blood is convey'd to all Parts of the Body. See **ARTERIA**.

The Aorta is subject to many Disorders, some of which have been taken Notice of under the Article **ANEURYSMA**; and the following Cases will give some Light into the Nature of others, which it is necessary to know, in order to distinguish them, and make a proper Prognostic, for they are always incurable.

Mr. *Littre* having open'd the Body of a Woman who died suddenly in the Street, and who had, till the very Moment of her Death, been vigorous, found, besides other things, the Coats which form the Trunk of the Aorta ossify'd in several Places, its interior Part full of Ulcers and fungous Excrecences, but yet without any Inflammation: The Sigmoid Valves were likewise become hard and callous.

This State of the Aorta, besides other concurring Causes, may have contributed very considerably to the sudden Death of the Patient; for the Arteries are all along in their Course furnished with fleshy Fibres, which, by their Action and Spring, continue to the Blood that Momentum or Impulse, which it at first received from the Heart; for 'tis plain, that the contractile Force of the Heart, considering its Weakness, could not, without this continued Impulse, throw the Blood so far, and that too in Canals so winding and so small; but 'tis in a particular Manner impossible, that, without this Impulse of the Arteries, the Contraction of the Heart should propel the Blood with such a Degree of Force, as to make it enter the imperceptible Orifices of the distant Veins. Thus the Arteries, and all their Ramifications, are, as it were, so many CONTINUED HEARTS, seconding and promoting the Action of the chief and principal one. Now 'tis plain, that in this Woman the Ossification and Consumption of a Part of the Substance of the Trunk of the Aorta, must have absolutely taken away its Spring, and consequently deprived the Heart of that Assistance, without which it could not carry on the Circulation of the Blood.

Mr. *Merry* says, that having open'd a Man who died suddenly, he found his Aorta so dilated, that it had begun to separate itself from the Base of the Heart, in which Case, the Circulation of the Blood must have necessarily had an immediate Stop put to it. *Hist. de l'Acad. 1710.*

Mr. *Morand* the younger, upon opening the Body of a Merchant in *Paris*, who died suddenly, after having been for some time subject to Palpitations of the Heart, was not surprised to find polypous Concretions formed in the Aorta, and in the Branches of the pulmonary Arteries and Veins; but was astonish'd with some other uncommon Circumstances; for, on the Left Side of the Heart, one of the two *Valvulae Mitrales* of the pulmonary Sack was transform'd into a kind of Cystis, the Bottom of which lay towards the Sack itself, and the Mouth towards the Ventricle of the Heart. This Cystis was the Valve itself, dilated to such a Degree as to be able to contain one's Thumb, thicken'd; and having small Bones in several Parts of it. The three Sigmoid Valves of the Aorta, in like manner, being considerably thicken'd; had each of them, in several Places, small Bones, very solid, irregularly ranged, and rising like so many Rocks. Now 'tis easy to conceive, that, of the Blood, which flow'd from the pulmonary Sack to enter the Left Ventricle, some Part must remain in this Cystis, preternaturally form'd; and that the other Part could not, without a great deal of Difficulty, make its Way thro' the Aorta, the Valves of which, being thicken'd and ossified, did not become flat, as they ought to have done, in order to perform their Functions duly. *Hist. de l'Acad. A. 1729.*

AORTA, ἀορτή. The Lobes of the Lungs, suspended on each Side. This Sense of the Word, if not the Word itself,

depends upon a Criticism of *Foesius*, on a Passage in *Hippocrates*, *Lib. 2. de Morbis*, where he reads: "Αορτὴ τὸ πνεῦμον σπασμένη ἐπὶ τὴν ἀορτὴν σπασμένη τὴν πνεύμονα." "If the Aorta are seized with Convulsions." Here all the Copies, says *Foesius*, by the grossest of Blunders, read ἀορτὴν, instead of ἀορτῶν; for there can be no Doubt, he says, but this is the Place explained by *Galen* in his *Exegesis*, as follows: "Αορτὴν τὸ ἀπὸ τῶν πνεύμων ἐκαστὸν ἑκάτερον." "Aortron is a Part of the Lungs suspended on each Side."

AOVARA, C. *Biron*. Is a Fruit as large as a Hen's Egg, which grows with many others in a Cluster, inclosed in a great Pod, fasten'd to a Species of very high and prickly Palm-tree, which grows in the *East-Indies* and in *Africa*.

When the Pod is ripe, it bursts, and lets appear the Cluster of Fruit, which, being ripe, are fleshy, and of a golden yellow Colour: The *Indians* eat them; the Flesh incloses a Stone very hard and bony, as large as a Peach-stone, having at its Superficies three Holes at the Side, and two lesser near each other. The Bark of the Stone is two Lines thick; it contains a fine white Kernel, which, being chew'd, at first hath an agreeable Taste; but, at the End, it becomes of a sharp Taste, which approaches that of some Sorts of Cheese. They extract from the Kernel a sort of Palm-oil.

The Kernel of *Aovara* is astringent, and good to stop a Looseness, being eaten. *Lemery de Drogues.*

APAGMA, ἀπάγμα, of ἀπὸ, from, and ἀγω, to draw, Abduction. See **ABDUCTIO**.

APALLAGE, ἀπαλλαγὴ, from ἀπαλλάσσω, to change. Any Alteration in general; but, in *Hippocrates*, it sometimes strictly signifies such a Change as is caused by a Deliverance from a Disease: As, for Instance, *Aph. 45. Lib. 2. Τῶν ἐπιληπτικῶν τοῖσι νέοισι ἀπαλλαγὴν, ὅτε ποιεῖται*: "Young Persons are freed from an Epilepsy, &c."

APANCHOMENOI, ἀπαγχόμενοι, strangled. The Word is used by *Hippocrates*, *Aph. 43. Lib. 2.* and is derived from ἀγχω, to strangle.

APANTESIS, ἀπάντησις, from ἀπασθάνω, to meet. A Meeting. The Word occurs in *Hippocrates*, πρὸς ἐννομήν, and is one of the Qualifications he requires in a Physician. It is taken in different Senses: *Foesius* joins it with the preceding Word ἡσυχία, and would have them to mean Affability, and easiness of Address; others, by ἀπάντησις, understand Reprehension, and a Severity in censuring and reproving the Faults of others; and some think *Hippocrates* intends by it that Qualification which puts a Physician upon his Guard against Errors, and upon teaching every Person about the Patient the Duties of their Place, and what ought to be done, or omitted, from time to time.

APANTHISMUS, ἀπανθισμός, a very fine, and scarce perceptible Line, properly in Painting; to which *Galen*, *de Ven. & Arter. Cap. 8.* resembles the small Ramifications of the Veins, no bigger than Hairs, or the Threads of a Spider's Web, which are called *Capillary Veins*.

APANTHROPIAI, ἀπανθρωπῖαι, from ἀπὸ, from, and ἀνθρώπος, a Man. An Aversion to Company, and Love of Solitude. We find the Word in *Hippocr. Coacæ Præ.*

APANTICRY, ἀπαντικρύν. Openly, manifestly. *Hippocrates de Artic.*

APARACHYTUM VINUM, ἀπαράχυστον οἶνον, Wine not mixed with Sea-water. *Galen de Comp. Med. Sec. Gen. & Meth. Med.* Hence *Athalassus*, ἀθάλαστος, (from α Negative, and θάλασσα, the Sea) is the same as *Aparachytus*.

APARAQUA, *Hernand.* seems to be a Species of Briony growing in *Brasil*. *Raii Hist. Plant.*

APARASCEUASIA, ἀπαράσκευσιν, from α Negative, and παρᾶσκευάζω, to prepare. Unpreparedness; as when the Things necessary for Bathing are unprovided. *Hippocr. de Ratione Viæ. in Morb. acut.*

APAREGORETOS, ἀπαρηγόρητος, from α Negative, and παρηγορέω, to comfort, mitigate. What affords no Comfort or Relief. *Hippocr. πρὸς ἐννομήν.*

APARINE, Offic. Ger. 963. Emac. 1126. *Raii Hist. i. 484. Synop. 3. 225. J. B. 3. 713. Dill. Cat. Giff. 67. Hist. Oxon. 3. 331. Phyt. Brit. 9. Merc. Bot. 1. 20. Mill. Pin. 9. Aparine vulgaris, C. B. Pin. 333. Park. Theat. 567. Boerh. Ind. A. 150. Tourn. Inst. 114. Elem. Bot. 93. Rupp. Flor. Jen. 4. Buxb. 23. CLEAVERS, or GOOSE-GRASS. Dale.*

Aparine, otherwise called *Ampelocarpus*, *Omphalocarpus*, *Philanthropus*, and *Ixus*; has many slender, square, rough Branches. The Leaves lie round the Stalks in Circles, at Intervals like those of Madder. The Flowers are white, the Seed hard, white, round, and sunk in the Middle, in form of a Navel: The Herb sticks to Cloaths; and the Shepherds use it instead of a Skimmer, to take off Hairs from Milk.

The expressed Juice of the Seed, Leaves, and Stalks, drank in Wine, cures the Bites of the Phalangium [a venomous Sort of Spider] and Viper; and, instill'd into the Ears, eases the Pains thereof. The Herb, beaten up with Hog's Fat, [ἔξωγ-γιστον, render'd, by *Herm. Barbarus*, Lees of Vinegar]

and the Parts anointed therewith, discusses strumous Swellings. *Discozides, Lib. 3. Cap. 104.*

Pliny adds, that the Leaves, applied, stop the Bleeding of Wounds. *Nat. Hist. Lib. 27. Cap. 5.*

Aparine is moderately drying and deterfive, and is of fine Parts. *Oribas.*

This is an annual Plant, arising yearly from Seed, having many weak square Branches, not able to support themselves, having at every Joint eight or ten long narrow Leaves, set round about the Stalks like a Star: From among these grow out smaller Branches, with the like Leaves growing on them; and on the Tops of these come forth several Flowers, small and white, of one Leaf, divided into four Parts, each of which is succeeded by two globular rough Seeds, growing close together: The Root is small and fibrous. The whole Plant is rough, and almost prickly, sticking to the Cloaths of any that come in its Way.

This Herb goes by a great many different Names, but is most commonly known by *Aparine*, *Asparine*, or *Gratterona*. It grows almost every-where in the Fields, especially about the Roots of Bushes, and Hedges. It has many rough little Twigs, which bear Leaves, and a whitish Flower, upon which the Seeds grow in Pairs. It is an Enemy to most other Herbs that grow near it, and either lays fast hold of them with its rough Leaves and Twigs, or extirpates them entirely. Upon the Alps the Shepherds use it, in order to cleanse the Milk of any Filth that may have fallen into it. It is of a subtle Nature, opens, expels, putifies, and dries. When boiled in Water, and often drank, it removes Obstructions of the Liver and Kidneys, cures the Dysentery, and is wonderfully beneficial in a simple Gonorrhoea. Its Juice, depurated and mixed with white Wine, may, with Success, be drank in the Beginnings of Dropsies. *Sr. Th. Mayerne, L. 3. Prax. Med. Cap. 10.* If its Juice is taken in Wine, it cures the Bites of venomous Animals: Its Juice also cures Pains of the Ears, when it is made warm, and dropp'd into them. If the Herb itself is boiled with Salt, it cures Excrecences, when applied to them by way of Plaister. If reduced to Powder, it cures Ulcers and Wounds; and, according to *Pliny*, stops Hemorrhages. *Tragus* assures us, that its distilled Water cures the Jaundice and Dysentery: It is also very efficacious in Disorders of the Kidneys. It eases racking Pains of the Breast and Hypochondria. *Paul. Quadr. Botan. Class. 3. Fr. Joel, L. II. Pract. Sect. 4.* commends it against a Cardialgia in Children.

APARTES, ἀπαρτής, from the Ionic ἀπαρτίω, for ἀπαρτάω, to be suspended. Suspended, penfile. *Hippocr. περὶ ἀφθ.*

APARTHIOSIS, ἀπαρτίωσις. See ABARTICULATIO.

APARTI, APARTIS, ἀπαρτί, ἀπαρτίως, Adverbs used by *Hippocrates*, *de Rat. Vict.* in *Morb. acut.* and elsewhere; and expounded by *Galen*, *Erotian*, *Suidas*, and *Hesychius*, by ἀπαρτίσμενος ὁ ἀνεσθής; that is, wholly, exactly, exquisitely, absolutely.

APARTISIS, ἀπαρτίσις, from ἀπαρτίζω, to perfect. A compacted Body, or Frame. Thus ἀπαρτίσις τῶν νεύρων, in *Hippocr. περὶ ἀφθ.* signifies the Frame or System of the Nerves.

APATEONES, ἀπατέωνες, from ἀπάτη, Deceit, a Cheat. Impostors. *Hippocr. περὶ ἀφθ.*

APATHES, ἀπάθης, from a Negative, and πάθος, an Affection, or Passion; such as are, or seem to be, void of human Passions. Instances you have in *Pliny, Lib. 7. Cap. 19.* 'Tis reported of *Crassus*, says he, the Grandfather of him who was killed in *Parthia*, that he never laughed, and was therefore called *Agelastus*; and many were never known to weep. *Socrates*, so famous for Wisdom, always appear'd with the same Countenance, being neither more or less cheerful or sad at one time than another. This Disposition of Mind is sometimes carried to a hard and inflexible Roughness and Sternness of Nature, which extinguishes the Affections of Humanity. Persons of this obdurate Temper, were, by the Greeks, call'd *Apathes*, many of whom they had among them; and, what is strange, most of them Professors and Teachers of Wisdom; such as *Diogenes* the Cynic, *Pyrrho*, *Heraclitus*, and *Timon*, which last was arrived at such a Pitch as to hate all Mankind.

APATHIA, ἀπάθεια. An Apathy, or such an insensible Temper as is described in the preceding Article.

APECHEMA, ἀπήχημα, from ἀπὸ, and ἦχος, a Sound. Properly a Resounding, or Repercussion of a Sound; but, in a medicinal Sense, it signifies a Contrafflure. See CONTRAFISSURA.

APEIBA, *Arbor pomifera Brasiliensis fructu hispido Pomi Magnitudine, seminibus plurimis minimis.* APEIBA *Brasiliensis*, *Marcgr.*

This Fruit is of no Use to the Inhabitants; but the Wood serves to make Fishing-boats, and Rafts to pass Rivers. *Ray Hist. Plant.*

APEIROI, ἀπειροί, from a Negative, and πείρα, an Experiment. Unexperienced, unaccustomed. *Hippocr. de Ratione Vict. in Morbis acut.*

APEITHEUMENA, ἀπειθέμενα, from a Negative, and πείθω, to be persuaded, to hearken to. Things in which the

Patient will not obey the Directions of the Physician. *Hippocr. Prorrh. 1.*

APELLA, ἀπέλλα. By this Name *Galen*, calls those whose Prepuce, either thro' a Disease, Section, or Contraction, is insufficient to cover the Glans.

APELLIDES. A famous Engineer, who, with *Archimedes*, lays Claim to the Invention of a Machine for launching of Ships; the Model of which the ancient Surgeons imitated, in contriving a Machine for restoring Fractures and Luxations, which, because it was worked by three Cords, they called *Trispastrum Apellidis seu Archimedis*.

APEMPOLESIS, ἀπεμπολῆσις, from ἀπεμπολάω, to merchandise. A Trafficking or Selling. This is the proper Signification of the Word, according to *Hesychius*. In this Sense ἀναγκαῖος καθαρόν ἀπεμπολῆσις, in *Hippocrates*, περὶ εὐχρημ., must import, that, among other Qualifications he there requires in a Physician, he must be furnished with a Stock of purging Medicines, which he may sell to his Patients. Others understand ἀπεμπολῆσις, in a contrary Sense, to be an Abhorrence of selling or making Profit of his Medicines; or take it for an Aversion to Trafficking in general, as unbecoming a Physician, and betraying a Desire after Lucre. This latter Interpretation will appear the more probable, if we read the Passage, as it stands in *Edit. Fol. Gen. 1657. cum Foesii Oecon.* which is thus: "Εἰδέναι τῶν περὶ εἶον χρυσῶν ὃ ἀναγκαῖον καθαρῶν ἀπεμπολῆσις ἀδυσκιδαιμονία." A Knowledge of such purging Medicines as are useful and necessary in Life; an Aversion to gain "by Trafficking; a Mind free from Superstition."

APEN. See AMBALAM.

APENES, ἀπηνές. Harsh, unpleasant. *Hipp. de Rat. Vict. in Morb. acut.*

APENSALUS. A Vessel with a narrow Neck to hold Oil. *Rulandus.*

APEPSIA, ἀπέψια, from a Negative, and πέσσω, to digest. Indigestion.

APEPTON, ἀπέπτον. Crude, indigested. See CRUDUM.

APER. See PORCUS.

APERIENTIA. Aperitives, or aperient Medicines.

APERISTATON, ἀπερίστατον, from a Negative, and περίστασις. Affliction, Danger. An Epithet in *Galen*, for an Ulcer that is neither troublesome nor dangerous.

APERITTOS, ἀπερίττος, from a Negative, and περιττός, redundant. An Epithet of such Aliments as generate but little Excrement, as the Flesh of wild Animals, and such as live in dry Places. The opposite Quality is called *Perittomaticos*, περιττωματικός.

APERTUS, taken for *exulceratus*, as *Aperta Strumæ* in *Scribonius Largus*, *Numb. 81.* is the same with *Pliny's Strumæ exulcerata*, *Lib. 30. Cap. 5.* *Rhodus in Notis ad Scrib. Largum.*

APES, Offic. Schrod. 5. 334. *Aldrov. de Insect. 20. Jonf. de Insect. 1. Mouff. Insect. 1. Apis*, *Charlt. Exer. 36. Apis*, *Mer. Pin. 196. Apis domestica seu vulgaris abvearium*, *Raii Insect. 240. BEES.*

Hive Bees, as they are called, are too well known to want a Description. I shall leave the Oeconomy of these industrious and useful Insects to Naturalists, whose Province it is to consider it: But must remark, that Bees have furnish'd more Materials for Fables than for Medicines. Their Salts are, however, very volatile, and highly exalted; for this Reason, when dry'd, powder'd, and taken internally, they are diuretic and diaphoretic. If this Powder is mix'd in Unguents, with which the Head is anointed, it is said to cure the Alopecia, and to contribute to the Growth of Hair upon bald Places.

All the Productions of Bees are used in Medicine, as Honey, an admirable Remedy in many Disorders, and very useful in a great Number of Official Compositions. See MEL.

Wax, a very common Ingredient in Plaisters, and in the Balsam of *Lucatellus*, a very silly Composition. See CERA.

Propolis, Bee-bread. See AMBRA, and PROPOLIS.

APEUTHYSMENOS, ἀπευθυσμένος, from εὐθύς, straight. The Name of the *Intestinum Rectum*, or Strait Gut. *Goræus.*

APHACA, Offic. Ger. Emac. 1250. *Park. Theat. 1067. Raii Hist. 1. 899. Synop. 3. 320. Tourn. Inst. 399. Elem. Bot. 318. Boerh. Ind. A. 2. 45. Rupp. Flor. Jen. 211. Merc. Bot. 1. 24. Phyt. Brit. 9. Mer. Pin. 9. Lathyrus luteus annuus foliis convolvuli minoris*, *Hist. Oxon. 2. 52. Vicia lutea foliis convolvuli minoris*, *C. B. Pin. 345. Vicia quæ Pitine Anguillara*, *latâ siliqua, flore luteo*, *C. B. 2. 316. Chab. 148. YELLOW VETCHLING. Dale.*

Aphace is a small Shrub that grows in plough'd Lands, and is taller than the Lentil, and bears a thin Leaf, and larger Pods than the Lentil, which contain three or four Seeds, less than Lentils.

The Seeds have an astringent Quality, by virtue of which they stop Fluxes of the Belly and Stomach, if they are roasted, or shell'd and boil'd like Lentils. *Discozides, Lib. 2. Cap. 178.*

I do not find any other Medicinal Virtues attributed to it by the Moderns.

APHÆRESIS, ἀφαίρεσις, from ἀφαίρειν, to take away; a removing or taking away. In a general Sense it signifies a removing whatever requires it in a Medicinal way, and is opposed to *Prosthesis*, πρόσθεσις, Addition. Aphæresis, in a stricter Sense, is that Part of Surgery which takes off what is superfluous.

Ἀφαίρεσις, in *Hippocrates*, περί εὐχρη, signifies Rapaciousness; and ἀφαίρεσις τῶν ἀμαρτῶν, *Coacta Prænot.* are spontaneous Hemorrhages, according to *Foesius*.

APHANISMOS, ἀφανισμός, from ἀφανίζω, to make to disappear. An Evanescent.

Ἀφανίζομαι, is a Verb often used by *Hippocrates*, and, as explain'd by *Galen*, *Comment. 2. in Progn.* signifies to vanish, or disappear on a sudden.

APHASSOMENOS, ἀφασόμενος, from ἀφάσσω, to handle. Felt, rubbed with the Fingers, handled. *Galen. apud Hippoc. in Exeg.*

It is frequently by *Hippocrates* apply'd to the Touch of the Pudenda in Women, in order to discover Disorders of those Parts. See *Tactus*.

APHEBRIOC, Sulphur. *Rulandus*.

APHELIA, ἀφέλεια, from ἀφέλεις, simple, plain: A Simplicity in teaching and practising Physic, proper to the Sect of the Methodists. *Galen. M. M. l. 4. c. 4. Castellus*.

APHELICESTEROS, ἀφελικέστερος, of ἀπό, from, and ηλικία, Youth; one past the Flower of Age. *Hippocr. Lib. 7. Epid.*

APHEPSEMA, ἀφέψημα, from ἐψα, to boil; a Decoction. *Dioscorides*.

APHESIS, ἀφesis, from ἀφίημι, to remit, in *Hippocrates*; generally signifies the Remission or Solution of a Disease; but in *Epid. Lib. 3.* as *Galen* explains the Word, is to be taken for a Resolution of all the Parts of the Body.

APHILANTHROPIA, ἀφιανθρωπία, from α Neg. and φιλανθρωπία, the Love of Mankind; the first Degree of Melancholy, when a Person hates Society, and delights in Solitude. *Castellus*.

APHLEGMANTON, ἀφλέγματον, from α Negative, and φλέγμα, Phlegm; void of Phlegm. Ἀφλέγματον πύον, is Pus free from Phlegm; the Absence of which, *Hippocrates, Prorrh. 2.* reckons among the Marks of laudable Pus.

APHODOS, ἀφός, the Recrements of the Aliment which pass off by Stool, or the Excretion of the same. *Gal. Com. 5. in 6. Epid. &c. Hesychius. Foesius*.

APHONIA, ἀφωνία, from α Neg. and φωνή, a Voice; a Deprivation of Voice.

Hippocrates does not use to call those *Aphoni* who are deprived of Voice only; but, by way of Eminence, shews, that under this remarkable Defect, we are to include that of all spontaneous Actions. Sometimes the Patients retain their Sensation; for he says himself, Τὸς ἀφώνους αἰσθανομένους συμβαίνει γίνεσθαι, πολλοὺς δὲ ἄμω πένοντες, ὅπερ ἀποπληξίαν ὀνομάζουσι, ἀφώνους. "Though deprived of Voice, they happen'd to retain their Sensation; but oftentimes they suffer a Deprivation of both, which is called an *Apoplexy*." *Galen. Com. ad Aph. 51. Lib. 6.*

It is usual with *Hippocrates* from this one most evident Symptom, *Aphonia*, to name and signify those who are totally deprived of voluntary Motion and Sensation, and lie like Persons in an apoplectic Fit. *Idem, in Com. ad Aph. 58. Lib. 7.*

In this Place the Manner of *Hippocrates* is very observable, who, by *Aphoni*, means those who labour under a *Carus*. Now a *Carus* properly is a sudden Deprivation of Sensation and Motion, affecting the whole Body; and it is an usual thing with *Hippocrates* to call this Disorder by the Name of this single Symptom, *Aphonia*. *Idem, Com. ad Aph. 5. Lib. 5.*

Hippocrates, Lib. de Rat. Viâ. in Morb. acut. says, Τὸ δὲ ἀφώνον ἐξ αἰτίας γενέσθαι φλεβῶν ἀποπληξίας πόνον. "A Stop put to the Circulation of the Blood and Spirits causes a sudden Loss of Voice." Here *Galen* observes, that by this one common Symptom *Aphonia* are denoted the Epilepsy, Apoplexy, and Cardiacal Syncope. He adds, that an *Aphonia*, in sick Persons, is sometimes caused by a Disorder affecting the Organs of Voice or Respiration with a Resolution, or by some other Depravation of the Faculty. But *Hippocrates*, in order to make a Difference between this and the preceding *Aphonia*, adds, by way of Distinction, ἢ ὕγαινονσι συμβαίνει, "if they happen to a Person in Health." Thus far *Galen*. An *Aphonia* of this Nature proceeds from a Disorder of the Brain, a Refrigeration of the natural Heat, and total Cessation of the Locomotive Powers, when the Organs of Voice are in such a State of Resolution, that the Patient can neither cry, groan, nor utter any Sound. I chuse therefore to render ἀφώνους, deprived of Voice, (*voce defectus ac privatus*) rather than dumb, (*mutus*) since *Hippocrates*, περί σαρκῶν, and *Aristotle, Lib. 4. Hist. Anim.* attribute φωνή (Voice) to the Dumb. *Foesius*.

By the Word *Speech* we commonly understand such an Emission of articulate Sounds, as is capable of conveying the Ideas of

a Man's Mind to his Neighbour; whereas the Voice is not, properly speaking, an articulate Sound, but a certain diversified Illusion and Repercussion of the Air thrown with a kind of Force through the *Aspera Arteria*, the *Larynx*, and its Fissure called the *Glottis*, to the Cavity of the Mouth and Jaws. Thus tho' *Speech* and *Voice* are different things, yet the former cannot subsist without the latter; for when the Organs necessary for emitting Sounds, especially the *Aspera Arteria*, and its Head the *Larynx*, with their respective Cartilages, Muscles, and Nerves, or the Roof of the Mouth, are vitiated, the Power of forming Sounds, and consequently the Faculty of Speech, is destroy'd. Now *Galen* long ago prov'd by reiterated Experiments, that when one of the recurrent Nerves which are form'd by the *Par Vagus*, and the *Nervus Accessorius*, and reach to the *Larynx*, and, according to *Winslow*, to the Tongue itself, is cut, the Animal becomes only capable as it were of an half and unfinished Pronunciation; and, when both are cut, it loses at once the Power of uttering Sounds, and the Faculty of Speech; or, in other Words, becomes entirely dumb.

This Incapacity of emitting Sounds, and consequent Loss of Speech, a Case which frequently happens in Hysteric Suffocations, is by Physicians call'd *Aphonia*. But I take the Word *Aphonia* in a more restrain'd Sense, and confine it to that Incapacity of speaking or emitting articulate Sounds; which depends upon some Fault of the Tongue; in which Case Sounds may be utter'd, but the faulty Tongue cannot articulate them right, and seems, as it were, to be silenc'd by its own fruitless Struggles. There is an Affinity betwixt this Distemper and that Hesitation in speaking, which we commonly call Stammering; in which Case indeed articulate Sounds are form'd, but not distinctly enough express'd, because the Tongue is too slow, as it were, and incapable to cloathe the Ideas with Language, with the same Celerity with which they are excited in the Mind.

Now since in an Aphony the Tongue is principally in Fault, and since we consider it as the Seat of the Disorder, it will not be improper to take such a View of its Structure as we think necessary, to answer our present Purpose. The Tongue then is a Muscle of all others perhaps the most moveable, by reason of its longitudinal, transverse, perpendicular, acuminate, angular, and other variously disposed Fibres; and by means of the Mylo-stylo-hyo and Genioglossi Muscles, as well as those ascrib'd to the Os Hyoides, it can move itself most nimbly and expeditiously in all possible Directions. These Muscles now mentioned derive their *Vis Motrix*, or moving Power, from the third Branch, called the lower Maxillary Branch, of the fifth Pair of Nerves, which is almost totally employ'd in producing Motion; just as the ninth Pair seems to be destin'd for the Purposes of Taste.

If by the Volubility of the Tongue, and its Capacity of moving in all Directions, Sounds form'd by the Assistance of the Larynx are modified into certain Letters, Speech is produc'd; but the more difficult the Motion of the Tongue is, the more difficult Speech must consequently be; and when its Mobility ceases, the Faculty of Speech is destroy'd with it, tho' Sounds at the same time may be clearly enough utter'd.

Since the Motion of any given Part is either diminish'd or destroy'd by the Diminution or Interception of the nervous Fluid, which should flow into its Nerves; and since the Nerves destin'd for the Motion of the Tongue arise principally from the fifth Pair; it plainly appears, that the Seat of an Aphony is to be sought for in the said Pair, and that the Influx of the nervous Fluid into that Nerve, being more or less diminish'd, is to be assign'd as its immediate Cause. In this Opinion we shall be confirm'd, if we carefully dissect human Subjects, who, during their Lives, were *aphonous*. Thus *Bonetus [in Sepulchr. Anat. L. 1. Sect. 22. Obs. 7.]* affirms, that in a Man, whose Melancholy degenerated into Madness, and who remain'd *aphonous* to his very Death, he found the Brain very dry, and the Origin of the Nerves in the same State, but much smaller than ordinary, the Tongue in the mean time remaining unaffected; and [*Obs. 20.*] he quotes a Case from *Riverius*, of a stammering Person, in whose Brain about the Lingual Nerves a *Cystis* was found with a Hole in it, from which a Serum always drivell'd.

Whatever therefore tends to hinder the Influx of the nervous Fluid into the Nerves destin'd to the Motion of the Tongue, that very thing contributes proportionably to the bringing on an Aphony. Hence a Palsy of the Tongue, which is either antecedent or subsequent to Hemiplectic or Apoplectic Disorders, deserves our most attentive Consideration. This Disorder sometimes happens in old Men, and in languid or much weakened Constitutions. If it appears alone, 'tis generally the unwelcome Omen of an approaching Hemiplexy or Apoplexy; but if it succeed these Disorders, and is complicated with a Weakness of Memory, and a sluggish Heaviness of the mental Powers, it threatens the Return of the former Distemper. In this Case the Tongue is generally tumid, flaccid, half numb'd, less susceptible of Motion than in its natural State, its Taste impair'd; and in an Hemiplegia it is vitiated and faulty only in one Side.

That Aphony is like to terminate more happily, which proceeds from a Stagnation; or Seclusion of serous Humours compressing

Pressing the Nerves of the fifth Pair, which run to the Tongue; but it is no less afflicting to the Patient, and proves sufficiently obstinate against the Means of Cure. Aphonies of this Kind happen after the striking-in of ferous Pustles and Efflorescences, especially in moist and rainy Seasons. Thus we may read of Aphonies after restrained Sweats; after Catarrhs unskillfully treated, in *Forestus, Lib. 14. Obs. 32.* after the Small-pox, &c. These Kinds of Derivations of Serum to the Lingual Nerves may also be occasioned by external Violence, Blows, or Falls. Thus *Poterius, Cent. 2. Cap. 2.* gives an Account of an Aphony occasion'd by a Fall from an Eminence.

There also arises an Aphony from too great a Congestion of Blood in the Fauces and Tongue; but this Species of the Disorder generally uses to quit the Patient immediately, upon lessening the Quantity of Humours. An Instance of this Degree of the Disorder's being cur'd by a subsequent Hæmorrhage from the Nose, may be seen in the *Acta Academ. Natur. Curios.* This Disorder likewise ensues after letting Blood in the *Vena Ranina*, if the Operation is perform'd in plethoric Habits, without previous Venesection in the Foot. From cutting these Veins, without this necessary Caution, Experience tells us, that very terrible Inflammations of the Fauces proceed; but more especially from this Cause I have known Aphonies brought on Women whose Menstrual Discharges were defective, or who labour'd under the Hysterical Passion, the Spasms of the Lower Belly concurring to foment the Disease, and force the vital Humours to the superior Parts. Hence we frequently observe, that Girls at the Age of Puberty, or when they begin to observe the first Eruptions of their Menfes, are often subject to this Disorder. In this Case, the Distemper uses to be accompanied with a Swelling and Redness of the Face and Eyes, a turgid State of the Vessels, a vehement Pulsation of the Arteries, and a difficult Deglutition.

An Aphony proceeding from Worms lodg'd in the Cavities of the Stomach and Intestines deserves our Consideration, because it occurs pretty frequently. This Species of the Disease seizes the Patient suddenly, but ceases to rage when the Worms, its remote and secondary Cause, are dislodg'd. It is known by antecedent or concomitant Gripes of the Belly, or by the other diagnostic Symptoms of Worms. Its direct and immediate Cause is the spasmodic Contraction of the nervous Parts of the Lower Belly, by which the vital Juices are with a strong Impetus driven to the Tongue and Fauces, where they stagnate, and compress the Nerves. I myself have not only seen many Cases of this Nature, but also cur'd them with Success: Nor do we want Cases of this Kind occurring in the Practice of other Physicians; see *Act. Academ. Natur. Curios. Dec. 3. Ann. 3. Obs. 147. Vol. 2. Obs. 62.* And *Ibid. Obs. 160.* there is a Case of a periodical Aphony, which seiz'd the Patient as often as the Worms excited Gripes, and ceased as soon as these Gripes went off.

There are also other Causes, which, when they occasionally take Place, contribute very much to an Aphony, such as the wanton Abuse of spirituous Liquors, and frequent Surfeits. Thus *Hippocrates, Sect. 5. Aph. 5.* mentions an Aphony proceeding from Drunkenness: To the Causes of this Disease belong also excessive Fear and Refrigeration, especially of the inferior Parts; and all these exert their Influences the more powerfully, if they happen at a Time when any of the natural Discharges of Blood is carrying on. Nor ought I on this Occasion to forget a rainy Season, and residing in damp and marshy Places, Circumstances which contribute not a little to this Disorder, especially in phlegmatic Constitutions, and such as are subject to Catarrhs. The Prognostics of Aphonies vary, according to the respective Causes from which they proceed. That Species which owes its Origin to Worms, Hysterical Disorders, or a difficult Eruption of the Menfes, is easily cur'd; whereas that Kind of it which proceeds from a Palsy of the Tongue, either entirely frustrates the Use of all Means, or being cur'd, easily returns, and proves the direful Harbinger of a more terrible Disorder of the Brain.

The Cure.

The first Intention of Cure, in an Aphony, is to remove the Causes compressing the Lingual Nerves, and thereby hindering the Influx of the nervous Fluid into them. The second is to strengthen and corroborate the weakened Parts: But as these Causes differ very widely from one another, so he that will take the Trouble of thinking, must plainly perceive, that they call for proportionably different Methods of Treatment; and 'tis no hard Matter for any one to see, that an Aphony, produced by a Cause that lies latent and remote in the Cavity of the Cranium, must with incredible Difficulty admit of a Cure.

That Species of Aphony therefore which proceeds from a true Palsy of the Tongue, calls for a Discussion and Evacuation of the Serum, which compresses the Nerves and Brain: The Cure is therefore to be attempted by Venesection, pretty sharp Clysters, Diuretics, Sternutatories, &c. but especially nervous and balsamic Medicines are to take place, and be apply'd even ex-

ternally to the Tongue itself. For this Purpose the following are recommended:

Strong Waters of Lily of the Valley, Cowslips, Rosemary, Mother of Thyme, of Ants, Essence of Amber, and of Peruvian Balsam, Oil of Cinnamon, and of Clove-gilliflowers, and a few Drops of my *Balsamum Vita*, taken in Sugar, and kept under the Tongue. Internally also the same *Balsamum Vita*, mix'd with three Parts of the vinous Spirit of Sal Ammoniac, and two Parts of the acrid Tincture of Antimony, may be taken with great Success, twice or thrice a Day; and the Dose may be thirty Drops. Neither will it be improper to apply a gentle Vescatory to the Nape of the Neck.

If Suppressions of Sweat, or a Stop put to the usual Excretion in case of a Catarrh, have contributed to the Disorder, nothing can be used with greater Advantage and Efficacy, than Diaphoretics and Diuretics, duly and skilfully prescribed; for immediately upon the Diaphoresis being restor'd, the Faculty of Speech returns. Infusions to be drank by way of Tea, a mild Regimen, succinated Spirit of Hartshorn, acrid Tincture of Antimony, and Essence of Amber, especially if they be mixed with Balsam of Peru, or my *Balsamum Vita*, are also most sovereign and efficacious Remedies in this Case.

An Aphony sometimes seizes the Patient under a mercurial Salivation, that is, when the serous and salival Humours flow to the Tongue and Fauces in too great a Quantity. In this Case the Intention of Cure consists in making a Derivation and Evacuation of those Humours from the Head. This End is most effectually answered by diaphoretic Decoctions drank warm; by Laxatives, and especially by cephalic Pills of a pretty sharp and stimulating Quality, a proper Regimen in the mean time being enter'd into, and carefully persisted in.

In an Aphony which remains after the Shocks of an Hemiplexy or Apoplexy, and has all the Appearances of being sufficiently obstinate, I have observed remarkable Effects produced by applying to the Nape of the Neck Plaisters prepared of Turpentine, or Pitch, and the Gums Caranna and Mastich; for other Remedies, how rich and generous soever, generally come short of Expectation, and disappoint our Hopes in this Case.

If an Aphony proceeds from too great a Congestion of Blood in the Head, the whole Cure consists almost in letting Blood in proper Places, and in due Quantities. The Quantity taken from the Patient must be large, and drawn just as Circumstances require, either from the Arm, the Feet, or sometimes the Veins under the Tongue. Cupping and Scarification are also proper. The Feet must also be washed, in order to procure a Derivation of the Humours to the inferior Parts. Nitrous antispasmodic Medicines are also to be used internally, because in Cases of this Nature the Spasms of the lower Parts are generally complicated with some other Disorders. For this Reason tempering Powders, mixt with Nitre and Cinnabar, or my anodyne Liqueur, mixt with Essence of Castor, are highly serviceable in this Case.

Tho' Bleeding is a Circumstance of great Importance and Efficacy in the present Case, yet it is not to be used indiscriminately and at random; for in old Men, languid Constitutions, and Patients of phlegmatic Habits, or those whose Strength is exhausted, it does more Harm than Good; and if celebrated in a larger Quantity than is sufficient to answer the End, is so far from guarding against it, that it even excites and brings it on. Phlebotomy then should rather take place where the Pulse is quick and large, and the Face red and turgid with Blood. And even in this Case it is not to be used, till the Strictures of the lower Parts be relax'd, and mitigated by previous Clysters, Frictions, and bathing of the Feet. Plethoric People before Bleeding should carefully abstain both from the internal and external Use of the hotter, more spirituous, and nervous Medicines; because they stimulate the Humours more, and hurry on their Congestion to the Fauces.

If spasmodic Constrictions of the Fauces and Tongue have produced an Aphony, as happens in Hysterical and Hypochondriac Paroxysms, which are attended with Difficulty of Deglutition, external Paregorics are of more Service than internal Medicines: For this Purpose a little Castor, or Nutmeg, or Theriaca, or Sage, may be held under the Tongue; or a few Drops of the *Balsamum Vita*, mixt with some anodyne Liqueur, may be pour'd upon the Tongue. Besides bathing the Feet, carminative Clysters, emollient Fomentations and Baths, are highly serviceable in this Case.

Lastly, That Aphony which is produced by Worms lodged in the Cavities of the Intestines and Stomach, is easily cured by Anthelmintic Medicines, and such as relax and mitigate the Strictures of the Intestines; for when these are at an End, the Power of speaking returns, but is again frequently lost, till the Worms, the remote Cause of the Disorder, are dislodg'd: For this Reason, when the Spasms are gone, the Physician is to endeavour, by proper Remedies, to dislodge these troublesome Animals, as effectually as he possibly can.

A Girl of a flabby Habit of Body, a florid Countenance, full of Blood and Humours, and eighteen Years old, happened, after her Menfes had broken out, in a Journey she was taking, to expose herself to the Cold: Being carried home again, she was seized with a heavy Pain of her Head, and the Vessels of her Face became turgid and red. She pass'd the Night in a very uneasy manner; and in the Morning felt herself entirely depriv'd of a Power of speaking. This Disorder lasted for four Days; during which Time she had neither an Appetite for Meat, nor an Inclination for Drink. Her Sleep was disturb'd, but she had the Use of her Reason and Senses; and a Warmth was diffus'd over the Extremities of her Body. Her Physician, finding her costive, immediately prescribed a Clyster, and ordered about three Ounces of Blood to be taken from her Ankle; but her *Aphony*, notwithstanding these Means, became still stronger and stronger. Upon which I was call'd; and finding her Pulse still quick and large, I ordered a Vein to be again opened, and seven Ounces of Blood to be taken from her; and as her Pulse was as yet sufficiently strong, I prescribed her thirty Drops of a Mixture of Essence of Castor with Spirit of Sal Ammoniac, and some mineral anodyne Liqueur, to be taken every fourth Hour in Water of Lilies of the Valley. Soon after a Sweat broke out over all her Body, the Swelling of her Face abated, her Sleep became sound and undisturbed; and, by persisting in the Use of this Medicine for twenty-four Hours, her Faculty of Speech was wholly restored to her.

CASE II.

This Case is an Illustration of the former: A lean Girl, of nine Years of Age, happening to have her Body, but more especially her Feet, exposed to the Cold, in the Night-time, was seized in the Morning with a Difficulty of Speech, and a Swelling of her Tongue. Cephalic and nervous Medicines were forthwith prescrib'd, both internally and externally, but they afforded no Relief. Upon this, I, being call'd, and finding her Feet still cold, ordered them to be rubb'd and bath'd twice a Day in common Water, with a Mixture of Bran in it: But this Expedient frustrating my Hopes, I ordered Cupping and Scarification in both her Arms; some Hours after which she felt great Relief; and by washing her Head with Wine, in which Thyme, Savory, Mother of Thyme, and Marjoram, had been infused, she was cured of her *Aphony*, and restored to perfect Health.

REFLECTION on both CASES.

In both these Cases the *Aphonies* were produced by the Congestion of Blood in the Head, and this Congestion was excited by the Refrigeration of the inferior Parts of the Body: But the Danger was greater in the former than in the latter Case, because in it the Menstrual Discharge was stop'd at the same time. In the Beginnings of Disorders of this Nature, specific, cephalic, volatile and nervous Medicines do more Harm than Good, since they heat the Blood, and put it into a strong Commotion; such Remedies are rather to be prescribed as derive the Congestion from the Head, and mitigate or relax the Strictures of the inferior Parts, the principal of which are bathing of the Feet, and Venesection. If the Feet are cold, I never order bathing them till they are render'd a little warm by proper Frictions. I have often with great Success prescribed Bleeding at the Ankles for Women whose monthly Evacuations have appeared, but are afterwards obstructed; but in the younger Sort, who have as yet had no Eruption of their Menfes, Cupping and Scarification in the Arms is more proper, as also in Boys and Infants. 'Tis worth while to give this Caution, that a sufficient Quantity of Blood be taken away, since, if it is too small, it does more Harm than Good: For this Reason I judg'd it proper to repeat it in the former of the above-cited Cases. If, after all, the Vehemence of the Pulse continues, antispasmodic and gentle nervous Medicines are properly and successfully used.

CASE III.

Some time ago a Gentleman of singular Merit, and one who deserves well of our Profession, ask'd my Advice with regard to a Disorder of a very particular Nature, an Account of which must necessarily be agreeable to the Curious. A Boy of eleven Years of Age, born of honest Parents, and who had till then enjoy'd an uninterrupted State of Health, not having ever in his Lifetime been sensible of the least Defect or Faultiness in his Speech, became all of a sudden so far depriv'd of it, that he could not pronounce any one Sound articulately, except the Word *Mama*, which at the same time he utter'd with a kind of Difficulty, and with a sunk and faltering Voice. Painful spasmodic Tensions seiz'd him also in several Parts, which, drawing the whole Neck and Back into *Convulsion*, induc'd on those Parts an uncommon Torpor, and Inability to move and bend themselves as they did in their natural State.

The Physician, concluding that so terrible a Disorder must necessarily have Worms for its Cause, prescrib'd, what in other Disorders of that Nature would have proved effectual, that is, various laxative, corroborative, antispasmodic, and absorbent Medicines; and gain'd his End so far, that having by these Means procur'd a Discharge of fifteen Worms by Stool, the Patient's Appetite, together with some Degree of his Strength, returned; his Sleep became sounder, and his Belly was easy; but his terrible Impediment of Speech remain'd with him for five Weeks, without ever so much as taking a favourable Turn. I therefore, judging it proper to procure a more effectual Discharge of the Worms, prescribed the following Pills, whose Efficacy against Worms I have often found very great, and of which I prescribed him seven twice a Week; especially about the Changes of the Moon, interposing a Powder, consisting of

Fifteen Grains of the Sal Catharticum Amarum; purified Nitre, and Coral, each six Grains.

The Pills themselves were made thus:

Take Asa-foetida, the best Myrrh, Extract of Tanfy, Rhubarb, Aloes rofated, and Mercurius Dulcis, each one Dram; Extract of Saffron, six Grains: Mix, and make up, according to Art, with Essence of Castor. Twenty Pills are to be made out of each Scruple.

Lastly, That we might also afford some Assistance by external Applications, by restoring the Parts too much weakened by the Spasms, we now-and-then ordered an Epithem, made of

Four Ounces of the Aqua Anhaltina; half an Ounce of my Balsam of Life; and two Drams of Peruvian Balsam.

By the daily Use of these Medicines for some time, his Speech return'd gradually more and more to him.

REFLECTION.

Many and terrible are the Disorders brought on the nervous System by Worms, the Cause of which, I am inclined to think, consists, not so much in the Corrosion of the nervous Coats of the Intestines, as in the acrid and caustic Exhalations rising from the Bodies and Excrements of the Worms, in which they, as well as all other Insects, abound. Numberless almost are the Medicines thought proper for dislodging these Animals so hurtful to the Constitution; but excepting Mercurius Dulcis, mixt with some Purgative, such as Resin of Jalap, or Diagrydium sulphurated, I have found this Intention more safely or effectually answered by no Medicine, than by Asa-foetida, Tanfy, Garlick, Wormseed, Camphire, and Hops, which operate upon these Animals rather by their Exhalations being offensive to them, than in any other way.

CASE IV.

About a Year ago, a Boy of eight Years of Age was seized with the Small-pox, which appearing very thin, and stopping immediately after their Eruption, the Patient by that means became subject to several Disorders, and was in a particular Manner troubled with frequent Defluations of Serum, which used to bring on a Cough, Hoarseness, and Coryza. These Symptoms were indeed often allay'd by proper Remedies; but when they came at last to be accompany'd with a great Swelling and Hardness of the Belly, his Physician ordered him two Vomits, the second very soon after the first, the Effects of which were very unlucky; for these forc'd Vomitings were soon after succeeded by spontaneous ones, which being accompanied with a Diarrhoea, miserably rack'd the Patient for eight or ten Days. These Symptoms being mitigated, a sudden Dimness of Sight, and such an Immobility of Tongue, and Difficulty of Speech, seiz'd the Patient, that he could not, with all his Efforts, utter one single Word. Besides these Symptoms, a large Swelling appeared on his Head, and a vehement Trembling and Weariness seiz'd his Joints; which Symptoms increased at last to such a Degree, that his Strength becoming always weaker and weaker, he at last expired in a calm and gentle Manner.

REFLECTION.

There is hardly any Disease which leaves with Children so fatal, so various, and so lasting Symptoms as a variolous Fever, if either the Eruption or Suppuration of the Pox does not go duly on, or if the Mass of Humours is not reduced to a good State and Temper, when the Distemper is over, by a proper Regimen, and Medicines which purify the Blood. Hence it frequently occurs in the Practice of Physic, that after the Small-pox or Measles we find Diseases of the Breast arising from the Injuries sustain'd by the Lungs, Swellings and Indurations of the Abdomen, together with Fluxes arising from

the Viscera being affected; and Atrophies of the other Parts produced by scirrhus Tumors of the Meseraic Glands: But nothing is either more absurd, or unsafe, than, without any indicating Symptom, to exhibit an Emetic, by which, in our Patient, the Flux was not only increased, but also the impure Serum, being, by means of the terrible Spasms, propell'd with an Impetus to the Brain, produced, first a Palsy of the Optic, and then of the Sublingual Nerves, the Consequence of which was Death. I could not forbear laying down this Case, that People might become sensible what terrible Consequences ensue the unskilful Administration of Medicines.

CASE V.

A Man of eighty Years of Age, of a dry Habit of Body, and accustomed to let Blood at least thrice a Year, that is, in the Months February, June, and October, enjoy'd an excellent State both of Body and Mind. But one Season, which was hotter than ordinary, he, by the Advice of a certain Physician, neglected his accustomed Evacuations; upon which, being suddenly seiz'd with an apoplectic Fit, the Pulsation of his Arteries being strong, his Eyes becoming red, and his whole Body excessively hot, he lost all his Senses, and an Ability of Speech. Whilst the Patient was in this Situation, I, being call'd, first order'd a Vein to be open'd in his Arm, and emollient Clysters to be exhibited; and, without neglecting other Medicines, apply'd my *Balsamum Vitæ* to his Mouth and Nose. By these means, accompany'd with the Blessing of God, we gain'd our End so far, that the Violence of the Disease and its Symptoms abating, the Patient gradually recover'd, only the Hesitation of his Tongue remained pretty long with him, which we nevertheless happily cured, by frequently washing his Mouth with Wine, into which some Drops of my *Balsamum Vitæ* had been instill'd.

REFLECTION.

How efficacious and excellent a thing letting Blood is, both for preventing and carrying off most Diseases, to which old Men are subject, may be learnt from this Observation: And, indeed, a very good Reason may be assign'd why it should be so; for in old People, especially such as have a good Stomach, and an entire Appetite, the superfluous Blood is not so quickly consum'd as in young People, by reason of their Indolence, and want of due Exercise; and if Nature does not free herself of this Burden, 'tis necessary it should be drawn away by Art; which is most conveniently done by Venesection. His Physician then, without any good Reason, forbid his being let Blood during the Dog-days, which at that particular Season was so much the more necessary, because the too great Quantity of Blood, by having the Degree of its Expansion and Orgasm augmented, might easily stop here-and-there in the more noble Parts, and bring on very terrible Disorders. Nor is it to be doubted but in the Case now under Consideration, this gentle apoplectic Fit, with the Difficulty of Speech, were produced by such a Stagnation of the Blood in the Veins of the Head. For this Reason, the first Step I took towards the Cure, was to order Venesection in the Arm, which produc'd immediate Relief to the Patient; then I order'd emollient Clysters to be exhibited, and, for asswaging the violent Motion of the Blood, recommended some Doses of the Powder of Nitre, to be taken at proper Intervals, desiring the Patient, at the same time, to drink an Infusion by way of Tea made of the Herbs of Bawm, Betony, and Carduus Benedictus, Flowers of Sage and Rosemary; together with a few Drops of the Oil of Mace, dropp'd upon a little Sugar. From this Case we have a convincing Proof, that an Aphony is not more frequently the Concomitant of any Disease, than of an Apoplexy; since the former often remains some time, or is easily generated after the latter, if the Serum seern'd from the Blood stagnating in the Head should enter the Pores of the Brain, and, by relaxing the Roots of the Nerves, deaden or weaken the Sensation and Motion of the Parts to which the Nerves distribute themselves. *Frederic Hoffman, Med. Rational. Syst.*

CASE VI.

A Girl of twenty or twenty-two Years of Age, and of a good Constitution, after a Stop put to an intermitting Fever by the usual Remedies, was seiz'd with an Extinction of Voice, which without Interruption remained with her for a Year and an half. The Remedies used in Cases of that Nature, afforded her no Relief, only when she used a Semicupium, [See SEMICUPIMUM] she sometimes recover'd her Speech whilst she was in the Water; but her Voice was, even at that Time, very hoarse. 'Tis also very remarkable, that she could speak during the hot Fit, whenever her Fever return'd. Mr. Lemery, to whom the Case was related, prescribed such Remedies as upon physical Reasoning he judged most proper to remove it. These,

indeed, freed the Patient from some Inconveniencies, which remain'd after her Fever, but had not the least Influence upon her Extinction of Voice. Upon which, Mr. Lemery prescribed a Medicine almost by Chance, which produced very astonishing Effects. The Medicine itself was no more than some vulnerary Herbs infused by way of Tea. After she had taken it the first time, her Voice returned for half an Hour, and then was extinguish'd afresh. But by continuing the Use of this Infusion of Vulneraries either hot or cold, she gradually recover'd her Voice so far, that she only lost it towards Night, especially if she happen'd to take the fresh Air. But at last, even in that Case, the Symptom was remov'd by taking two Spoonfuls of her vulnerary Infusion, which produced so instantaneous an Effect, that she had scarce sooner taken it, than she was able to speak. It was by some thought, that in this Case, the Efficacy of Vulneraries was no greater than that of warm Water; but their Mistake was sufficiently prov'd by the best of Arguments: I mean, Fact and Experience; for the Patient frequently drank warm Water, without receiving the least Advantage from it. Decoctions of Herbs abounding with Acids, and even Coffee, Chocolate, Sallads, crude Fruits, Fish, Soup Maigre, and too great an Interval between her Meals, deprived her of her Voice; whereas Fleashes, Milk and Wine, produced no such Effect. She always carries about with her a Bottle of her vulnerary Infusion, and for that Reason uses, in a jocose manner, to say, *That she has her Voice in her Pocket. Hist. de l'Acad. 1700.*

CASE VII.

A Girl of twenty-four Years of Age has, ever since she was Sixteen, been afflicted with a Loss of Speech, during her monthly Evacuations, which generally last for two or three Days, on which occasion she makes frequent use of a Pisan of the Gramen Caninum, (see AGROSTIS) and wild Poppy. This Liquor moistens her Breast, which indeed calls aloud for a Relief of that Kind, but does not restore her Voice, which only seems of its own accord to return when her Menfes are over. At the very Time she was under these Discharges, she happen'd to have her Arm broken, and to meet with a severe Affliction. These two Accidents put a Stop to her usual Evacuations, and brought on violent Suffocations and Vapours. These Symptoms were removed by repeated Venesections in the Arms and Legs, by Emetics, and some other Medicines; but at the same time she was seiz'd with a continued Depression of Voice, and that to such a Degree, that she could scarce be heard when People apply'd their Ears as near as possible to her Lips; and if she spoke but a very little, even in that faint and languid manner, she was so fatigued, that she was oblig'd to give it over. She felt a considerable Weight about the Region of her Stomach, and could not perform the least Motion without almost an entire Loss of Respiration. Her monthly Evacuations were at this time pretty regular, but all her other Disorders were redoubled: Add to this, that she look'd tolerably well, her Appetite was keen, and all her other Functions duly carry'd on. In this Condition she remain'd for three Months, in spite of all the Medicines that could possibly be thought of for her Relief. At last, Mr. Lemery, calling to mind a Disorder of the like Nature cur'd by his late Father, by means of Vulneraries taken in an Infusion, order'd the same for the Patient, of which when she had taken one Draught, her Voice not only return'd, but was as strong and vigorous as it had been before the Approach of her Distemper. Her Oppression, together with the Difficulty attending her several Actions and Motions, was entirely removed. But a still more surprising Circumstance accompany'd this sudden Cure; for all of a sudden she felt the Weight about the Region of her Stomach fall down to her Navel, where it remain'd. But as she soon after chang'd the Place of her Residence, Mr. Lemery saw her no more, and consequently could trace the History of her Disorder no farther. *Hist. de l'Acad. 1719.*

APHORETOS, ἀφορητός, from ἀφείρω, to bear. Intolerable. *Hippoc. μετὰ νεύσεως*. In the same Sense may ἀφορητὴ νόσος, *Lib. 1. μετὰ γυναικ.* be taken as ἀφορητός, and as oppos'd to εὐφορητός.

APHORISMUS, ἀφορισμός, from ἀφορίζω, to separate, distinguish. An Aphorism. It is defined by *Galen, Com. 1. in Aph. 1.* to be a Sentence comprehending all the Properties of a thing in very few Words.

APHORME, ἀφορμή, of ἀφω, from, and ὁρμή, a Motive. An Occasion, or external manifest Cause, of any Event. *Galen, Cam. 3. in Lib. 6. Epid.* says, "That Hippocrates, and almost all the Antients, used to call Aphorme the Matter of any thing that was the original Motive to any consequent Action, whether it were Money, or any other outward Possession, or Faculty, or Place, or Faith, or Practice, or Reason, or, in short, whatever it might be." Hippocrates calls Aphorme whatever gave Occasion or Rise to a Disease by a sort of Metaphor; for Aphorme, in almost all other Authors, has relation to human Actions, and their Motives. *Foetus.*

APHRAINON,

APHRAINON, ἀφραϊνον, from α, Neg. and φραϊνω, 'to be wife. One who has lost the Use of Reason. *Erotian. apud Hippoc.*

APHRODES, ἀφροδης, from ἀφρος, Froth. Spumous, or frothy. The Word is apply'd by *Hippocrates* to the Blood, and to the Excrements.

APHRODISIA, APHRODISIASMUS, ἀφροδισια, ἀφροδισιασμός, from ἀφροδισια, Venus. Venereal Commerce. *Hippoc. Aph. 30. Sect. 6. Castellan.*

APHRODISIA, in *Johns.* and *Rulandus*, is the Venereal Age, or Age of Puberty.

APHRODISIASTICON CLIDION. A Troche so call'd by *Galen*, and recommended for spitting of Blood, the Colic, Dysentery, and Fluxes of the Stomach. It is thus prepared :

Take of the Flowers of the Pomgranate-tree, *Egyptian* Thorn, Balaustines, Juice of Hypocistis, Acacia; each six Drams fifteen Grains; Boxthorn, Rhubarb, Opium, each four Drams ten Grains; Myrrh, two Drams five Grains. Infuse them in Myrtle Wine, or in the Decoction of Roses, or of Myrtle-berries. *P. Aeginet. Lib. 7. Cap. 12.*

APHRODISIUS MORBUS. The same as *Lues Venerea*. *Blancard.*

APHRODITARIUM, ἀφροδιταριον. The Name of a Powder, recommended by *P. Aegineta* for hollow Ulcers, which is composed of equal Parts of Frankincense, Squama *Aëris*, Rhodarium, (see *RHOEDARIUM*) Amylum, and Cerus. *P. Aeginet. Lib. 4. Cap. 40. and Lib. 7. Cap. 13.*

APHROGALA, ἀφρογαλα, from ἀφρος, Froth, and γαλα, Milk.

Neither *Galen*, nor any other Writer on the *Materia Medica*, has told us what it is; but it seems to signify the Froth of Milk, or that concreted Part of the Milk on the Top, which looks like Froth, or that rich and fat Substance, which may also be called *Epipagus*, ἐπιπαγός, (Cream) and which *Nicander*, in *Theriac*, advises to be drank against the Poison of the *Ixias*. Others say, that by *Aphrogala* is to be understood Milk stirred till it turns all to Froth. *Pliny* says, "That many of the barbarous Nations, not knowing, or else despising, that useful Food Cheese, had a Method of condensing their Milk into a gratefully acid Substance, and into a fat Butter, which was the Spume or Froth of Milk." *Lib. 11. Cap. 41.* By these Words we are to understand the *Oxygala* and *Aphrogala*, which latter was an excellent Remedy against a hot Dis-temperature of the Stomach, and a wholesome Aliment, in great Repute among the *Romans*, who used to cool it with Snow, as *Galen* tell us, *Meth. Med. Lib. 7. Cap. 4.* It seems to be like what we call Syllabub.

APHRON. The Name of a wild kind of Poppy, *Pliny, Lib. 20. Cap. 19.* Also the Name of a Cephalic Plaster, described by *Aetius, Tetrab. 4. Serm. 3. Cap. 13.*

APHRONITRUM, APHROLITRUM, ἀφρονίτρον, ἀφρολίτρον, from ἀφρος, Spume, and λίτρον, or, in the *Attic* Dialect, λίτρον, Nitre, Spume of Nitre. See *NITRUM*.

APHROS, ἀφρος, Spume or Froth.

APHROSELENOS, ἀφροσεληνος, from σεληνη, the Moon. A precious Stone, otherwise called *Selenites*, from its representing the Moon as it were in a Glass. *Gorrazus.*

APHROSYNE, from ἀφρων, silly. Folly, Dotage. *Castellan.*

APHTHÆ, ἀφθας. Superficial small Ulcers in the Mouth.

Hippocrates, Aph. 24. Lib. 7. informs us, That new-born Children, and those which are young, are much subject to *Aphthæ*. This *Celsus* translating calls *Serpentia Oris Ulcera*, Spreading Ulcers of the Mouth. *Lib. 2. Cap. 1.*

But it appears by many Passages in *Hippocrates*, that *Aphthæ* are not confined to the Stomach; for this Author mentions *Aphthæ* of the *Pudenda* of Women with Child, and of the *Aspera Arteria*.

Celsus, Lib. 6. Cap. 11. says, that those Ulcers of the Mouth are most dangerous, which the *Greeks* call *Aphthæ*, but in Children especially, to whom they frequently prove fatal; but in Adults, they are not attended with so much Danger. These Ulcers begin at the Gums, and spread to the Palate, and over the whole Mouth, and descend even to the Uvula and Fauces; in which Case, it is not easy for the Child to recover. It is yet worse, if the Infant is yet at the Breast, because it is difficult to prescribe proper Remedies for it. What is principally to be done is, to make the Nurse exercise herself by frequent walking, and use such Motions as move the superior Parts; besides these, she must be put into a Bath, and be directed, whilst in it, to pour warm Water on her Breasts: Mean time she must live on mild Aliments, and such as are not very subject to corrupt: Her Drink must be Water, if the Child is feverish; if not, it may be diluted Wine; and, if costive, she must be purged. If her Mouth abounds with Phlegm, she should vomit. The Ulcers must be anointed with Honey, to which that sort of Rhus which is called *Syriac*, (see *Rhus*) and bitter Nuts, (see *Nux*) must be added; or with a Com-

position of dry'd Rose-leaves, Pine-kernels, and Mint, made up with Honey; or with the Medicine made of Mulberries, the Juice of which must be boil'd to the Consistence of Honey, and with it Saffron, Myrrh, Wine, and Honey, must be mix'd. Mean time, nothing must be given, which is capable of furnishing Matter for Humours. If the Child has sufficient Strength, Gargarisms must be us'd of the same Nature as the Remedies above-mentioned. But if milder Remedies are ineffectual, such Applications are to be made use of, as by their caustic Qualities induce a Crust upon the Ulcers; of this sort are Scissile Alum, Chalcitis, or Vitriol. Hunger and Abstinence, in the greatest Degree that can be supported, are also useful. The Aliment should be of a mild Nature. Sometimes, in order to deterge the Ulcers, Cheese is properly enough apply'd in Honey.

Aretæus confines the Word *Aphthæ* to malignant Ulcers of the Tonsils, which are treated of under the Article *TONSILLÆ*, which see.

Oribasius, as *Celsus* has done, distinguishes *Aphthæ* from other inflammatory Ulcers of the Mouth, in the manner following:

When there is an Inflammation of the Mouth, when the Patient is of a plethoric Habit, or his Body full of corrupt Humours, then we have recourse to Venesection and Purgatives, prescribe Clysters, and injoin Temperance, both with regard to Eating and Drinking. If none of these Things avail, we have immediate recourse to Topics, and first of all endeavour to subdue the Distemper by astringent and cooling Medicines; such as the *Diamoron*, with the Addition of *Omphacium*, or Rose-buds; or dry'd Rose-leaves, Balaustines, Pomgranate-peels, unripe Galls, Alum, Frankincense, purging Thistle, and a Decoction of Myrtle, and Scissile Alum. Then the *Confectio Mororum*, in which Saffron and Myrrh have been put, is sufficient to concoct and ripen the Matter of the Inflammation; and when it is so, Digestives must be used. For which Purpose we use *Aphronitrum*, Nitre, and Sulphur Vivum, which is of all other Medicines the most powerful. We also sometimes mix with it Sapa, and sometimes Mulsam, in which Origanum, Hyssop, Pennyroyal, Thyme, Savory, or Catmint, have been boil'd: For Medicines of a moderate Quality were invented, in order to be mix'd with others which have a direct Influence on the Disorder, as Necessity shall require. But in the Height of Inflammations of the Mouth, Medicines are rarely to be used; but the Mouth is only to be wash'd and gargariz'd with such Things as allay the Vehemence of the Inflammation, such as a Decoction of Figs, a Decoction of Bran, or Oil of the Mastich-tree made warm in a double Vessel. But the Medicine itself, which, because of its Influence on the Mouth, is call'd *Stomatic*, may in the Height of the Inflammation be used for washing the Mouth, if it is only mix'd up with sufficiently diluted Mulsam, and warm new Wine boil'd to two Thirds, and with warm Water, if none of these can be had. All these I have mention'd, that the Patient might have Choice of Medicines accommodated to his Case. But, in general, all Ulcers of the Mouth, which are flaccid, require highly drying Medicines, such as Recrements of Copper, both with and without Honey or Mulsam. The Troches of *Musa*, the Juice of Rhus and *Omphacium*, are also of Service in this Case. But milder Ulcers of the Mouth may be cur'd with the Medicines appropriated to *Aphthæ*, such as the *Diamoron*, or a Preparation of Bramble-berries. But when Ulcers of the Mouth are very moist, and lie pretty near the Bone, there is Danger of their mortifying. In this Case, therefore, the strongest and most powerful Medicines are necessary; for which Purpose, we reduce one of the fore-mention'd Troches to a Powder, and apply it dry to the Part affected; for upon account of the Humours, and Warmth of the Parts contain'd in the Mouth, a Putrefaction is soon brought on. For this Reason we are for the most part oblig'd to use the most forcible Medicines in Ulcers of this kind, such as may induce a Crust as effectually as the actual Caustery. But those Ulcerations which arise on the internal Surface of the Mouth, are call'd *Aphthæ*, and are principally incident to Children. Moderate Astringents are generally us'd for the Cure: Sometimes also they grow inveterate, and in Process of Time become of difficult Cure, when they bring on a Putrefaction, or that Species of Ulcer by the *Greeks* call'd *νομα*, from their spreading and consuming Nature. To such Children therefore, as can eat, 'tis proper in this Case to give Lentils with a little Bread, Marrow of Veal, or of a Stag, and a small Portion of Quinces, or other Astringents, such as Pears, Fruit of the Service-tree, or Medlars; and if the *Aphthæ* are inflam'd, Lettice must be put into their Victuals. But if the Child cannot yet eat, these Things must be given to its Nurse. It will also be proper to anoint the Children themselves. If the *Aphthæ* are reddish in the Beginning, let such Medicines as are moderately cooling and astringent, be apply'd to them; then we are to use such Things as digest without Pain. If they are yellowish, Medicines of the same, but a more cooling Nature; if they are whitish, and full of Phlegm, absterging Medicines are necessary; if black, strong Digestives.

stives. But in Adults, and those, the Parts of whose Body are of a harder Contexture, *Misy*, with a little astringent Wine, is sufficient. If the Ulcer is sordid, the *Misy* is to be mix'd with Mulsam. But in those *Aphthæ* which require stronger Medicines than the *Misy*, these may properly enough be levigated with Wine and Mulsam; for these are efficacious Ingredients: But of the middling Kind, especially in the Beginnings of these Disorders, are Omphacium with Mulsam, and Rhus with the same. In very young Children, the Flower of Roses, or even dry'd Roses themselves, are sufficient. *Oribasius de Loc. Affect. Curat. L. 4. Cap. 68.*

Children are subject to a Species of Ulcer, which they call *Æthæ*, which is sometimes whitish, sometimes reddish, and sometimes black. This Ulcer resembles a Crust, and is of a very fatal and deadly Nature. In this Case, Iris, with Honey, is of Service; as also its dry Powder, blown upon the Part affected. Rose-leaves, likewise powder'd Rose-flowers, Saffron, a little Myrrh, Galls, Frankincense, *Indian Bark*, (*ελαιός τε κιβάρης*) taken either with or without Honey. After these the Patient is to use Hydromel, and the Juice of sweet Pomgranate. *Paul. Ægineta, Lib. 1. Cap. 10.*

The Causes of the *Aphthæ* are, by *Actuarius*, said to be either when the Milk of the Nurse is too scanty, or when the Child itself cannot sufficiently concoct and digest it. The Method of Cure proposed by him, is much the same with that laid down by *Oribasius*, from whom he only differs in a few trifling Circumstances, not of Weight enough to lay a Foundation for pronouncing the Cure of the one different from that of the other. *Actuar. Lib. 6. Col. 318.*

Those Pustules, accompanied with some Degree of Inflammation, which appear in the Mouth, the Fauces, and Œsophagus of Children, are, by Physicians, call'd *Aphthæ*; and are indeed nothing else than small Ulcers, not exceeding the Bulk of a Millet or Hemp-seed: These, notwithstanding their Smallness, sometimes become so fiery and painful, as not only to excite uneasy Sensations, and loud Shrieks, in the tender Patient, but also render Suction of the Milk, and even Deglutition itself, difficult and uneasy.

These Pustules of the Mouth differ in Degrees; for some of them are without Pain, of a red or yellow Colour, and only dispersed here-and-there on the Surface of the Gums, the Tongue, and Cheeks, and are therefore to be judged of a mild and benign Nature; whereas others are of a livid or blackish Colour, very painful, and so extended to the Uvula, Fauces, and Œsophagus, that the whole Surface of the Mouth often appears to be one continued Exulceration; and indeed these are, for the most part, of such a malignant Nature, as to consume and eat the subjacent Flesh to the very Bones.

The Matter exciting the *Aphthæ* is of a highly acrimonious, penetrating, and caustic Quality. This Matter being originally lodged in the Blood, and, by means of the Glands themselves, secreted in the glandular Covering of the Fauces, corrodes, inflames, and exulcerates the tender Flesh of the Mouth and Palate: Hence arise *Aphthæ*, and all the various Train of Symptoms, with which they may possibly happen to be complicated.

But among the more remote and less immediate Causes which concur to the Generation of so virulent a Matter, we may, above all others, reckon, first, the Milk either of Mothers or Nurses, corrupted by an improper Regimen, by a Complication of Diseases, or the violent Sallies of turbulent and uneasy Passions; and secondly, this same Milk, coagulated in the Stomachs of the sucking Children themselves, and render'd impure and corrosive by an Admixture of the Bile; for when such a Milk passes into the Blood, it cannot, in the very Nature of the Thing, fail to communicate a certain acrimonious Taint to its whole Mass, and lay a pretty sure Foundation not only for *Aphthæ*, but also for several other Disorders.

As this is the Case, we have no Reason to be surpris'd, that *Aphthæ* of various Kinds should generally either accompany or succeed those Diseases, which draw their Origin from an Impurity of the Blood, as is generally the Case in acute and malignant Fevers, Coughs, choleric Diarrhoeas, Asthmas, difficult and painful Teething, and others of a like Nature; for, in Fevers, the Blood is, by reason of its excessive Heat, for the most part, deprived of its mild and gelatinous Part, and very easily acquires a saline and sulphureous Quality; but in the other Distempers mentioned, a certain sharp and vellicating Matter is in the Fault; and not only excites Coughs, Diarrhoeas, and Asthmas, but is also subject to produce *Aphthæ*.

Other external Causes also frequently concur to the Production of *Aphthæ*; and especially a Neglect of keeping the Tongue and Fauces clean; the pernicious and preposterous Method of curing Fevers, and other Diseases, by hot Medicines; and exposing the Bodies of Children, when over-heated, to a cold Air; which, by checking Transpiration, has an almost unavoidable Tendency to accumulate and hoard up saline and sulphureous Sordes in the Mass of Humours. Nor ought we, on this Occasion, to exclude other Causes which have an immediate and direct Influence on the lax Compages of the Fauces; such

as Crums of Bread, or Sugar, wrapt up in a Piece of Linen Cloth, in form of a Tent; as also a Piece of Bread dipp'd in Ale, and given to Children to be suck'd. This Practice is not only followed by the lower Class of our own Countrywomen, but *Lentilius* also, *Ephemerid. German. Dec. 3. Anno 3. Appendice, Obs. 94.* has taken Notice of its prevailing in a particular Manner in *Swabia*, and censur'd it with all the Bitterness it justly deserves; for, partly by the strong Attrition of these Substances, and partly by the Change induced on the natural State of the Saliva, the tender Cuticula of the Mouth is too violently acted upon, and Pustulæ are excited: But this Species of *Aphthæ*, unless an internal Acrimony of Humours concurs, is not only soon and easily cured, but has also given Occasion to Physicians to attribute *Aphthæ* either to an internal or an external Cause.

Those *Aphthæ* which lie at considerable Distances from each other, on the Surface of the Mouth, are free from Pain, and of a red or yellow Colour, yield more easily to the Force of Medicines, than such as possess the whole Fauces, are of a blackish Colour, exulcerate deeply, and diffuse a foetid and disagreeable Smell. Neither is there so much Danger in those *Aphthæ* which proceed from an external Cause, as in those which arise from one that is internal, and draw their Origin from a depraved and corrupted State of the Juices; such as those which symptomatically accompany acute Fevers, and some other violent Distempers. Among the worst Kind of *Aphthæ*, we may justly reckon those attended with great Inflammation, a Difficulty of Breathing and Deglutition; which, in malignant Disorders, are generally bad Prognostics, and are, upon dissecting the Patient when dead, often found dispersed over the whole Œsophagus, to the Stomach itself.

The CURE.

The Cure of *Aphthæ* varies according to the different Natures of their productive Causes; for if a depraved or corrupted Milk, either of the Mother or Nurse, is suspected as the Cause, that Cause ought to be removed by correcting the Milk; which is most effectually done by her abstaining from saline, acrid, spirituous, and acid Substances; by her strictly guarding against the Sallies of Passion, and using such Medicines as purify the Blood, and reduce it to a due Crasis: Of this Kind are the Decoctions of temperate, diaphoretic, absorbent, and gently purgative Roots and Herbs.

If, on the other hand, the *Fomes* of the Distemper is originally lodged in the Child itself, it is to be frequently purged, at proper Intervals, with due Doses of Syrup of Manna, or Sucroly with Rhubarb; and ply'd with such Medicines as prevent a Coagulation of the Milk, and correct its acrid *Dyscrasy*. Such Things, as, I have already said, had a Tendency to produce the *Aphthæ*, are at the same time to be carefully avoided and guarded against. Then, for correcting the Acrimony of the Humours, Decoctions of Oats, mixed with Sugar-candy and Oil of sweet Almonds, must be used. Decoctions of Turneps, or common Carrot, must also be prescrib'd for the Patient's ordinary Drink.

It is likewise proper to allay the corroding Acrimony of the *Aphthæ* by external Applications; for this Purpose we prescribe Linctuses, prepared of Diamoron, Juice of Pomgranate, and Honey; as also Juice of Turneps, incorporated with the Yolks of Eggs and Sugar; or Cream, mixed with Syrup of white Poppies, the Yolk of an Egg, and a little Nitre, applied either with the Fingers wrapp'd in a Piece of Linen Cloth, or with a Sponge. The Yolk of an Egg also, incorporated with Rose-water and Sugar-candy, as also a Mucilage of Quince-seed, mixed with Honey and a little Saffron, afford a very considerable Relief, if rubb'd on the Pustules. But I would not advise such Gargarisms as are usually prescrib'd for washing the Mouth, to be used for little Children, since they are entirely unqualified for doing what is requisite on an Occasion of that Nature.

Those *Aphthæ* which accompany acute or other Disorders, are never to be cured till that particular Distemper, whose concomitant Symptom they are, is either allay'd, or thoroughly subdued and eradicated. Now, in acute Cases, the Workings and Efforts of Nature ought by no means to be disturb'd by Purgatives; since the End is better answer'd by gentle Diaphoretics, and temperating Emulsions, prepared of the Four cold Seeds and a small Quantity of Poppy-seeds. *Hoffman. Medic. Rational. Systemat. Vol. 3.*

Riverius recommends Narcotics in the Cure of the worst and most dangerous *Aphthæ*; because they not only ease Pain, but prevent a Fluxion of Humours to the Parts affected. "Thus, says he, I myself snatch'd a Boy, of four Years of Age, from the very Jaws of Death, by giving him one Grain of *Laudanum*, when his Tongue and Mouth were full of deep Ulcers, accompanied with such a Degree of Inflammation, that he could neither swallow Broths, nor endure the Application of Topics; when the Afflux of acrid Humours to his Mouth was so great, that they continually dri- vell'd from it in large Quantities; and when he pass'd the
"Days

"Days and Nights in an uninterrupted Course of Agony and Shrieks." *River: Praxis Med.*

A certain Woman was afflicted with very painful and obstinate *Aphthæ*, which would neither yield to Venesections, repeated Purges, cooling Juleps, nor anointing with the Spirit of Sulphur: She pass'd the Nights without Sleep, and could not eat without the greatest Difficulty, because her Mouth was full of little Ulcers. However, upon taking three Grains of Laudanum, for three Nights successively, the acrid Defluxion on the Mouth was stopp'd, and the *Aphthæ* cured in a few Days. *Riverii Observat. Cent. 3.*

This Author gives an Instance of *Aphthæ* being produced in the Stomach by a rash and unwary Use of Lemon-juice.

From BOERHAAVE.

Aphthæ are frequent in acute Diseases, attended with Inflammations of some of the Viscera. These are small, round, superficial Ulcers, on the Inside of the Mouth; which, upon an accurate Examination, appear to be Exulcerations of the Extremities of the excretory Ducts of those Glands which separate the salivary Humour, and convey it to the Mouth: Now when this Fluid is, by any Cause, render'd too thick and viscid, it stops up the Extremities of these Canals, which, upon this, exulcerate.

Every Part, therefore, into which such excretory Ducts discharge themselves in a natural State, are subject to *Aphthæ*; as the Lips, Gums, internal Parts of the Cheeks, Tongue, Palate, Fauces, Tonsils, Uvula, Throat, Stomach, and small Intestines.

It is said, that the large Intestines, tho' rarely, are infested with these small Exulcerations; and that they are propagated thro' the whole Intestinal Tube.

The Northern People, who inhabit marshy Places, are most subject to *Aphthæ* in a hot and rainy Season; and Infants and old People are, in general, most affected with them. But in Countries which are warm or mountainous, or where the Air is habitually serene and dry, they are scarcely known. See *ÆGYPTIA ULCERA*.

Aphthæ, in the Mouth, are usually preceded by a continual putrid Fever; or an Intermittent, degenerated into a continual Fever, which began with a Diarrhoea, or Dysentery; a considerable and perpetual Nausea, Vomiting, Loss of Appetite, and great Anxieties about the Præcordia, frequently returning; by great Weakness, or any considerable Evacuation of the Humours; by Stupor and Heaviness; by unequal, but perpetual, and not very violent Drowsiness; and by perpetual Complaints of a Sensation of Heaviness and Pain about the Stomach: And it is remarkable, that those preceded by great Evacuations of the Humours are very dangerous.

Sometimes, in the Beginning, a solitary Pustule will appear in different Parts of the Mouth; as upon the Tongue, in the Angles of the Lips, in the Fauces, or elsewhere, without any Certainty as to the Part on which they first are visible; and these are generally of a mild Nature. But sometimes they appear first at the lower Part of the Fauces, and a white, thick Crust, shining like new Bacon, which adheres firmly to the Parts, and ascends slowly, seems, as it were, to proceed from the Oesophagus: These are usually a very bad Sort, and generally fatal. But the worst Sort, and of which the Patient very seldom recovers, are those which cover the whole Mouth, as far as the Extremities of the Lips, with a hard, firm, thick, and tenacious kind of Crust. The two last Species should seem to have their Origin in the Stomach, and thence to ascend into the Mouth.

The Malignancy of *Aphthæ* may be estimated by their Colour. Thus those which are white and pellucid, and almost of the Colour of Pearls, are the least malignant; those which are white, but opaque by reason of their Thickness, are more so; but not so bad as those which are brown, yellow, or livid: The black are, of all others, the worst.

When these *Aphthæ*, or *Aphthosæ* Crusts, have adher'd some time to the Parts affected, they begin to separate, and be loosen'd from the subjacent Part, and to fall off, so that all the affected Parts are, by Degrees, and successively, freed from them: But this Separation is effected in some Kinds sooner, in others later. And hence also we may judge of the Degrees of Malignity; for the sooner the Separation happens, the less is the Danger.

Sometimes these, when fallen off, are immediately succeeded by fresh *Aphthæ*; but sometimes this Succession happens more slowly, and sometimes not at all: Sometimes also the succeeding *Aphthæ* are as thick, or more so, than the first; and hence also the Danger may be estimated; for the sooner they are renew'd, and the thicker, the greater is the Malignity.

From considering what has been premised, we may readily form an Idea of the Seat, Nature, Cause, and Symptoms of *Aphthæ*, and of their different Sorts; and hence also their Effects may be understood.

Thus, if such an *Aphthosæ* Crust, as is above describ'd, covers the whole Superficies of the Parts mention'd, all Sensation, which should be communicated to the Nerves, is intercepted, and the Patient loses his Taste. Besides this, the Egress of the

VOL. I.

Fluids, by these obstructed Emiffaries, is utterly prevented; the Consequences of which are, a Driness of the Parts; a Dilatation of the subjacent Vessels, a Putrefaction of the Fluids, stagnating under the *Aphthosæ* Crust, and an Inflammation of the Parts themselves in which they stagnate.

Hence also the Orifices of the absorbent Vessels are obstructed in such a manner, that no fresh Chyle, Fluids, or Medicines, can enter them; and this produces all those Disorders which may proceed from a Deficiency of Nourishment, and, in the End, Death.

When these Crusts fall off, there is an increased Flux of Humours from the Mouths of the distended Vessels now opened; hence a large Discharge of Saliva, or a Diarrhoea, which are good Symptoms, if the *Aphthosæ* Crusts are not renew'd; but bad, if they are.

Upon the Falling-off of the Crusts, a great Pain succeeds of the Parts underneath, which are now inflamed and exposed: These often discharge Blood, whence bloody Saliva, and a bloody Dysentery.

If what has been said is applied to the Stomach, the excretory Ducts of the Liver, Pancreas, and of the other Glands which open into the Intestines, we may form an Idea of an infinite Number of Disorders arising from this Distemper; inasmuch that a farther Detail of the Prognostics will be superfluous.

If these ulcerous Crusts are very slow of Separation, thick, broad, and compact, the subjacent Flesh, being, as it were, suffocated, inflames, suppurates, or even mortifies; the Consequences of which are malignant Ulcers, which sometimes affect the *Os Palati*, and its *Periosteum*: Hence we may judge of their Effects in the Stomach and Intestines.

THE CURE.

1. The Impulse of the vital Fluids, upon the Parts affected, is to be gently excited; and so conducted, that, by a proper Supply of Fluids, the ulcerous Crusts may be loosen'd, separated, and fall off: This is effected by drinking great Quantities of warm, diluting, resolving, and absterging Liquids. And because, in some bad Cases, the Orifices of the Lacteals are so obturated as not easily to admit the Liquids thus taken, Fomentations, Vapours, and Baths, are of singular Use. The very best Aliment is Bread boil'd in Water, and then mixed with Wine and Honey.

Take of sweet Almonds blanch'd, two Ounces; of Pistachio-nut Kernels, one Ounce; of the Four greater and lesser cold Seeds bruised, each three Drams; of excocticated Oats, three Ounces: Boil these in a sufficient Quantity of Water that two Pints of the Liquor may at last remain, in a close Vessel for an Hour; and then add, of Liquorice-root, an Ounce, and let them boil together a little: Then let the boiled Ingredients be thoroughly bruised in the Decoction; and of this let the Patient drink frequently; and with this let him wash his Mouth: Or,

Take of the Roots of Carrots, Skirrets, China, Sarsaparilla, and Turneps, each four Ounces; of whole Barley, an Ounce: Let these Ingredients be well bruised, and boiled in Water; and, to thirty Ounces of the express'd Liquor, add, of Syrup of Marsh-mallows, an Ounce. Let this be used as the preceding.

Take of the Roots of Turneps unpar'd, a sufficient Quantity; let them be grated or rasped, and let the Juice be press'd out; and, whilst it is boiling, let it be despumated; then, to sixteen Ounces of this Juice, add the Yolks of two Eggs; and of Syrup of Violets, two Ounces. Let the Patient take half an Ounce every half Hour.

The most proper Aliments, besides those mention'd before, are Decoctions of the farinaceous Vegetables.

2. The Crust must be disposed to separate soon and easily; which is effected by Fomentations, Gargarisms, and Clysters: These must consist of warm, relaxing, emollient, and detergent Liquors, which moisten the Parts by adhering to them a sufficient time, and which resist Putrefaction. Thus,

Take of the Leaves of Mallows, Brank-ursine, Marsh-mallows, Pellitory of the Wall, Mullein, Mercury, Lady's-mantle, each two Ounces; of the Roots of Marsh-mallows, an Ounce; of the Roots of Turneps, ten Ounces: To three Pints of the Decoction, made with Water, and express'd, add the Yolks of four Eggs; and Honey of Roses, two Ounces. With this let the Mouth be perpetually washed; or gargled.

Make a Cataplasm of the *Residuum*, to be applied externally to the Region of the Fauces.

Let Clysters also of this Decoction be administer'd.

3. As soon as the Crust is fallen off, it will be proper to use anodyne and demulcent Remedies, and such as contribute to strengthen the relax'd Parts. Thus,

Take of Syrup of white Poppies, two Ounces; of Cream, two Ounces; the Yolks of two Eggs; of Rose-water, two Ounces: Let a little of this be held continually in the Mouth. Or,

Take of the Jelly of Hartshorn, or of Flesh, made very thick, and cut into Slices, a sufficient Quantity: Let one of these Slices be perpetually dissolving on the Tongue, and so gradually swallow'd.

These two Medicines act agreeably upon the excoriated Parts; and the following contributes to strengthen them.

Take of the Decoction of the fresh Leaves of Agrimony, seven Ounces; of Honey of Roses, an Ounce. Let this be applied perpetually to the affected Parts.

4. As soon as the Fever is abated, a Sediment appears in the Urine, and the Pulse begins to be free, corroborating Medicines are to be directed. Thus,

Take of the Root of the sharp-pointed Dock, an Ounce; of the Peruvian Bark, and that of Tamarisk, each six Drams; of the Leaves of Agrimony, one Handful: Boil these Ingredients in a sufficient Quantity of Water, and to a Pint and an half of the Decoction add, of the Syrup of Kermes, an Ounce. Of this let the Patient take half an Ounce every Hour. This corroborates the relax'd Vessels of the Intestines.

Sydenham advises in those *Aphthæ* which happen at the End of Fevers, together with Hiccoughs, to give an Elestuary of an Ounce of the Bark, made up with the Syrup of red Poppies, or in the Form of Pills. Of this he directs the Patient to take one twelfth Part every four Hours, drinking after it a Draught of Whey; and he says, it is the most effectual Remedy he has met with, provided the Virtues of the Remedy are not impair'd by continually confining the Patient to his Bed.

5. At the End of the Distemper, some corroborating Purge should be administer'd. Thus,

Take of Rhubarb a Dram and a half; yellow Myrobalans, with the Nuclei, an Ounce and a half: Boil in a sufficient Quantity of Water for three Ounces of the strain'd Decoction; to which add, of Syrup of Succory with Rhubarb twelve Drams. Make a purging Potion.

From the preceding History and Cure of *Aphthæ*, many obscure practical Problems may be explained.

Thus, if a Reason should be required, Why, in a Fever, attended with a Diarrhœa or Dysentery, *Aphthæ* frequently appear at the End of the Distemper?

It may be answer'd, Because the most fluid Parts of the Secretions are carried off, and only the most viscid remain in the excretory Vessels of the Glands.

Why does this happen principally to Children and old People?

Because in Children the *Vires Vita* are languid; in old People the Juices are subject to Viscidities.

Why are those particularly subject to these *Aphthæ*, who, in the Beginning of the Fever, have been treated with Medicines, Aliment, or a Regimen, which are heating or astringent?

Because Astringents brace up the Orifices of the excretory Ducts; and a hot Treatment draws off the thinner Parts of the Fluids.

Why does a Purge, administer'd in the Beginning of such Distempers, prevent *Aphthæ*?

Because by this means those Viscidities which stick in the Ducts, and cause *Aphthæ* afterwards, are carried off.

Why does a troublesome and fatal Hiccough frequently accompany the worst Species of *Aphthæ*?

Because, in this Case, the Stomach is cover'd with an *Aphthæ* Crust, which falling off, the Extremities of the Nerves are left bare, and are consequently easily irritated to Convulsions, and liable to Inflammation and Gangrene.

Why are *Aphthæ* in the Mouth joined, by Hippocrates, with loose Bellies, and Prostration of Appetite?

Because when the internal Coat of the Stomach is cover'd with *Aphthæ*, there must be a Loss of Appetite, or a Chylose Diarrhœa, because the Chyle cannot enter the Lacteals; the Stomach is seldom affected with these *Aphthæ*, but the Intestines are so likewise.

Why does an *Aphthæ* Covering of the Stomach produce a Lientery?

Because no proper diluting Humour can be secreted in the Stomach, and therefore no Digestion can be performed, and the Aliment must go out of the Stomach as it enter'd.

Why are black *Aphthæ* esteem'd fatal?

Because they tend to a Gangrene.

Why do *Aphthæ* in the Mouths of pregnant Women preface a Miscarriage?

First, because they are Evidences of a considerable Viscidity, and perhaps Acrimony, of the Juices; and secondly, because they prevent a due Supply of Chyle from entering the Lacteals; both which are Hindrances to the Nourishment of the Fœtus.

Why are *Aphthæ* frequent in Putrefactions of the Lungs, Liver, or other principal Viscera?

Because the putrid Matter convey'd from the Abscess of these Viscera to the Blood, and thence to the Glands, impress upon the several Secretions an acrimonious Taint; hence the Extremities of the excretory Ducts are corroded.

In a Consumption nothing is a more certain Preface of Death than these *Aphthæ*.

Why does a Tumor, Heat, Suffocation, and a Quinsy, sometimes succeed a Refrigeration of *Aphthæ*?

Because by contracting the *Aphthæ* and subjacent Parts, the *Aphthæ* are prevented from falling off, and the Vessels underneath are obstructed; hence the Parts swell, and are inflamed: And hence we may account for Deliria, Anxieties, Want of Rest, and cold Sweats, which frequently ensue, and prove fatal.

Nothing is more dangerous than to let cold Air, or cold Drinks of any Kind, be applied to these *Aphthæ*: Some have died suddenly, who have held cold Water in their Mouths, when they have had *Aphthæ* there.

Upon the Whole, it may be laid down as a Rule, that *Aphthæ* which are pellucid, white, thin, disseminated, soft, which easily separate without Renovation, and which are superficial, are of a good Sort.

On the contrary, those which are very white and opaque, yellow, brown, or black, which are in great Quantities, thick, cohering, hard, tenacious, corroding, and which perpetually repullulate, are extremely bad.

Dr. Harris, in his Chirurgical Dissertations, disapproves very much the Use of Spirit of Vitriol, Oil of Sulphur, or burnt Alum, in *Aphthæ*; for he says, these corrosive Applications will incline them to turn cancerous. Instead of these, he advises a Decoction of Elm-bark with the Leaves of Sanicle, for a Gargarism. In this he agrees with Boerhaave.

Dionis, however, recommends Honey of Roses acidulated with Oil of Vitriol, as a proper Mixture to touch malignant *Aphthæ* with in Children. And Sydenham, in the Case of a young Gentleman with *Aphthæ*, consequent to the Iliac Passion, tells us, he used successfully the following Gargarism:

Take of Verjuice, half a Pint; Syrup of Raspberries, an Ounce; mix, and make a Gargarism.

And indeed the general Directions we meet with in Authors, with respect to *Aphthæ*, are, to apply Remedies somewhat corrosive; but I have taken the less Notice of these, because both Reason and Experience are on the Side of the contrary Method recommended by Boerhaave and Harris.

There are some Empirical Remedies for *Aphthæ*; but none seems so very extraordinary as that which consists in anointing the Crown of the Head with the best Oil of Bays, which is said to cure effectually the *Aphthæ* of Children. This I had from a Physician of Veracity, who assured me he had frequently been a Witness of its salutary Effects.

APHTHARTOS, ἀφθάρτος, from a Negative, and φθάρω, to corrupt. Incorruptible. Castells.

APHYA, ΑΡΥΑ, ἀρύα, a small Fish. Hence ἀρυάδης χεῖμα, in Hippocrat. περὶ γυναικ. Lib. 2. signifies a pale whitish Colour, like that of the Fish *Apua*, proceeding from a great Hæmorrhage. Galen in Exeg. See ΑΡΥΑ.

APHYLLANTHES, ἀφυλλανθής, from a Negat. φύλλον, a Leaf, and ἄνθος, a Flower. It seems to signify an apetalous Flower.

APHYLLANTES ANGUILLARÆ, a sort of Daisy. Raii Hist. Plant. See BELLIS.

APHYLLANTES MONSPEL. See CARYOPHYLLUS.

APHYSOS, ἀφυσός, ἀφυσός, from a Negative, and φυσάω, or φυσάω, to blow. Void of Flatulency, so ἀφυσός διαίτα, Galen, Lib. 1. Cap. 6. τῶν κατὰ τὸν. is a Diet that generates no Inflation.

APHYTACORES, a sort of Trees, reported in Pliny, Lib. 31. Cap. 2. to produce Amber.

APIASTRUM. See MELISSA.

APICES, [of Apex, a Top, or Point] those little Knobs that grow on the Stamina in the Middle of the Flower. They are commonly of a dark-purplish Colour, and have been discovered, by the Help of Microscopes, to be, as it were, a sort of Seed-vessels, containing in them small globular or oval Particles, of various Colours, and exquisitely formed. They are by some supposed to be a kind of Male Sperm, which, falling down into the Flower, fecundates and ripens the Seed. Miller's Dictionary.

APIITES, Perry, a sort of Wine made of the Juice of Pears. *Raii Hist. Plant.* See **APITES**.

APINEL. This Root grows in some of the *American* Islands; and is by the native Savages called *Yabacani*; but by us *Apinel-root*, from the Name of a Captain of Horse, who served there for some time, and first made the *Europeans* acquainted with it.

It is so efficacious against Serpents, that in order to destroy them, nothing more is necessary than to thrust a Piece of it into their Mouths upon the Point of a Rod. If a Person chews it, and besmears his Hands and Feet with it, Serpents not only shun and fly from him, but, what is more surprising, he may catch them without any Danger, and do with them whatever he has a mind. 'Tis also observed, that these noxious and poisonous Animals will never enter a Chamber in which a Piece of this Root is kept. These Facts are attested by Mr. *De Hauverive*. This Root, so useful for the Preservation of Mankind, would also be beneficial for their Propagation, if that stood in need of forced Aids; which People in this Case are not much inclined to use, since the End is sufficiently answered by Infants. *Histoir. de l'Acad. R. A. 1724.*

APIOS, Offic. J. B. 3. 666. *Raii Hist.* 1. 870. *Apios vera*, Ger. 407. Emac. 504. *Apios sive Ischias*, Chab. 533. *Apios sive Tithymalus tuberosus*, Park. Theat. 195. *Tithymalus tuberosus pyriformis radice*, C. B. Pin. 292. Tourn. Inst. 87. *Hist. Oxon.* 3. 342. **ROUND KNOBBED-ROOTED SPURGE**.

APIOS, otherwise called *Ischias*, Mountain or Wood *Chamaebalanos*, and by some *Linozostis*, shoots forth two or three reedy, slender, red Stalks, which rise but little above the Ground. The Leaves are like those of Rue, only more oblong and narrower. It bears a small Seed, and its Root, which resembles that of Asphodel, is shaped much like a Pear, but rounder, and full of Juice. The Bark is black on the Outside, but white within.

The upper Part of the Root, taken, expels Phlegm and Bile by Vomiting, the lower Part by Stool; but the Whole, taken together, purges both upwards and downwards. If you desire to extract the Juice, cut the Roots in Pieces, and put them into a Vessel of Water; stir them about, and take off the Liquor that swims a-top with a Feather, and dry it. Fifteen Grains of this, drank, will both vomit and purge. *Dioscorides, Lib. 4. Cap. 177.*

Pliny says, the Root is like an Onion, but larger; and the Pith of it is white, but the Bark black. They dig it in the Spring, bruise it, and put it into an earthen Vessel, and throwing away what swims a-top, the rest of the Juice purges upwards and downwards, taken to the Quantity of fifteen Grains in Hydromel. The Measure of One-eighth of a Pint is a Dose for hydropical Patients. The Powder of the dry'd Root is also given in a Potion. *Lib. 26. Cap. 8.*

It is a Species of Spurge, or a Plant which sends forth many small and low Stalks, slender, round, and reddish, lying often upon the Ground; the Leaves are small, short, resembling those of wild Rue, but less. The Flowers grow at the Extremity of the Stalks; they are small, form'd in the Shape of a Cup, cut into many Divisions, and of a pale-yellow Colour. When this Flower falls off, it is succeeded by a triangular Fruit, which divides itself into three Apartments, each of which incloses one oblong Seed; the Root is tuberosus, and of the Figure of a Pear, more slender at the Bottom than at the Top, black on the Outside, and white within, full of a great deal of Milk. It is remarkable, that when the Root is large and well grown, the Plant is small; but when the Root is small, the Plant is larger. It grows in hot Countries, and in mountainous Places. It contains a great deal of Essential Salt and Oil, mix'd with a large Quantity of Phlegm and Earth.

The Root of this Plant works by Vomit, and by Stool, with Violence. They pretend, that the superior Part works upwards, and the inferior downwards; but both the Parts of the Root have the same Virtues. *Lemery de Drogues.*

APIOS, a Pear-tree. *Oribasius, Aetius*. See **PYRUS**.

APIS. See **APES**.

APITES, **APITES VINUM**, ἀπίτης, ἀπίτης δίνω, from ἀπίς, the Pear-tree, Perry, Wine of Pears. It is thus prepared:

Take the Pears, which must not be very ripe, and cut them in Pieces, as you would Turneps, taking out the Seeds; then put the Weight of eleven or twelve Pounds of them into ten Gallons and a Quarter of Must, and let it macerate for thirty Days; after which strain it off, and set it aside for Use.

It is thus otherwise prepared:

Cut and pound the Pears, and having pressed out the Juice, with every twelve Pints thereof, mix one Pint of Honey, and set it aside.

After the same Manner are prepared Wines of Carobs, Medlars, and Services. All these Kinds are astringent, have a grateful Sourness, and are good for the Stomach, and restrain inward Fluxes. *Dioscorides, Lib. 5. Cap. 32.*

APIUM. Smallage.

The Garden Smallage is an Herb effectual for the same Purposes as Coriander, and, made into a Cataplasim with Bread, or fine Flour, is also good for Inflammations of the Eyes. It comforts a hot Stomach, and represses the Breasts when turgid with grumous Milk; it provokes Urine, whether it be eaten boiled or raw. The Decoction of the Herb and the Roots resists Poison, and excites Vomiting, but binds the Belly. The Seed is a more powerful Diuretic and Alexipharmic; relieves those who have swallowed Litharge, and is a good Carminative. It is an useful Ingredient in anodyne and theriacal Remedies, and in such as are prescribed against Coughs. *Dioscorides, Lib. 3. Cap. 74.*

The Heleofelinum, or Marsh Smallage, that grows in watry Places, is larger than the Garden Kind, and useful for the same Purposes. *Idem, Cap. 75.*

The Oreofelinum (Mountain Parsley) shoots up from a slender Root a single Stalk a Span high, which spreads into little Branches and Heads like Hemlock, but much slenderer, and bearing an oblong, slender, acrid, and fragrant Seed, like that of Cumin; it grows on rocky and hilly Places.

The Seed and Root, drank in Wine, provoke Urine and the Menfes. It is mixed in Antidotes with other Ingredients of diuretic and heating Qualities. But we must take care not to mistake the Oreofelinum for the Petroselinum, or what grows on Rocks; for the Petroselinum is another thing. *Idem, Cap. 76.*

The Apium which they call Petroselinum, grows in Macedonia, on craggy Places, having a Seed like Bishop's-weed, but more scented, acrid, and aromatic, being a Diuretic, and Emmenagogue. It is good for the Gripes and Wind in the Stomach and Colon, and for Pains in the Side, Kidneys and Bladder, being taken in a Potion. It is mixed with other Diuretics in Antidotes. *Dioscorides, Lib. 3. Cap. 77.*

Hippofelinum is by some called *Grielum*, by others *Agriofelinum*, by others *Smyrnum*, though the proper *Smyrnum* be another thing. It is larger and whiter than the Garden Apium, with a tall, hollow, tender Stalk, distinguished, as it were, by Lines. The Leaves are larger, inclining to a Scarlet; the Tops of the Branches are like those of Rosemary, and laden with Flowers, which form themselves into an Umbella. The Seed is black; oblong, solid, acrimonious, and aromatic. The Root is sweet-scented, white, and of a grateful Taste, not thick in Body. It grows in shady Places, and by the Sides of Marshes, and is eaten like Smallage and other Greens. The Root is eaten either raw or boiled, and the Leaves and Stalks dressed either alone or with Fish; they are also pickled raw.

The Seed, drank in *Mulsim*, provokes the Menfes; and, used either in a Potion or Litus, warms those who shiver with Cold, and helps the Strangury. The Root works the same Effects. *Dioscorides, Lib. 3. Cap. 78.*

Apium is an Herb mightily in Request; its Branches, in great Quantities, swim in our Soops, and have a peculiar Gratefulness in Pickles. Besides, if it be made into a *Litus* with Honey, and the Eyes anointed therewith, so that they may be now-and-then fomented with the warm Decoction of the same, it gives wonderful Relief in Defluxions, and also in Rheums on other Parts, if it be bruised and apply'd alone, or with Bread, or Polenta. Fishes, when sick in Ponds, are recovered with green *Apium*. But among the Knowing, there is nothing dug out of the Earth, that has been the Subject of a greater Variety of Opinions. It has a Distinction of Sexes. *Chrysippus* tells us, that the Female has crisper Leaves and hard, with a thick Stalk, and a hot acrimonious Taste. *Dionysius* says it is blacker, has a short Root, and breeds Worms. Both these Authors agree in making it forbidden, and altogether unlawful to be eaten, as being appropriated to funeral Feasts, and also hurtful to the Sight. The Stalk of the Female, they say, breeds Worms, for which Reason those who eat of it, of either Sex, become barren; and that Children, suckled by Women who eat it, become affected with the Falling Sickness. The Male Kind, they grant, is more innocent, and therefore it is not condemn'd with the other forbidden Plants.

The Leaves, apply'd, mollify the Hardness of the Breasts; and, boiled in Water, make it more grateful to the Taste. The Juice, especially of the Root, drank in Wine, mitigates Pains of the Loins; the same, instilled, helps Thickness of Hearing. The Seed provokes Urine and the Menfes, and brings away the Secundines. The Decoction of the Seed takes away the Marks of Blows, if the Parts be fomented therewith. Made into a *Litus* with the White of an Egg, or the Decoction of it in Water being drank, it cures Disorders of the Kidneys. Bruised in cold Water, it heals Ulcers of the Mouth. The Seed, drank in Wine, or the Root in old Wine, breaks the Stone in the Bladder; it is also given in White Wine to those who are affected with the Jaundice.

Olusatrum, otherwise called *Hippofelinum*, is good against the Poison of Scorpions; the Seed, drank, cures the Gripes; and the Decoction thereof in *Mulsam*, being drank, relieves under a Difficulty of Urine. The Root, boiled in Wine, expels the Stone, and mitigates the Pains of the Sides and Loins; being drank, and the Parts anointed with the same, it cures the Bite of a mad Dog. The Juice, drank, warms those who shiver with Cold.

Some make a fourth Kind, called *Oreofelinum*, which is an upright Plant, a Span high, and has a Seed like Camin, which is effectual in provoking Urine and the Menfes. The *Heleoselinum* has a particular Virtue against Spiders; and Women take the *Oreofelinum* in Wine, as an Emmenagogue. *Pliny, Lib. 20. Cap. 11.*

Another Kind grows on Rocks, and is by some called *Petroselinum*. It has a peculiar Efficacy in an Abscess, if to two Spoonfuls of the Juice you add One-eighth of a Pint of Juice of Horehound, and three times that Quantity of warm Water. Some add *Buselinum*, which differs from the Garden Kind in the Shortness of its Stalk, and the reddish Colour of its Root; but has the same Virtues, and is a powerful Remedy against the Bites of Serpents, either drank, or used as a Litus. *Idem, Cap. 12.*

Apium is of all Garden Herbs the slowest in shooting out of the Ground, not appearing before the fortieth Day when quickest, but generally not before the fiftieth Day. *Idem, Lib. 19. Cap. 7.* It is sown after the Vernal Equinox, the Seed being first a little bruised in a Mortar, which, they fancy, makes it the more crisped, as well as when, after sowing, it is pressed down with a Roller, or the Feet. It has a peculiar Property of changing its Colour. In *Achaia* it has the Honour to crown the Conquerors in the sacred Nemean Games. *Idem, Lib. 19. Cap. 8.*

This is the Account given of the different Sorts of *Apium* by the Antients. But *Miller* enumerates thirteen Species.

Dale mentions six Sorts of *Apium* used in Medicine. The first is the

APIUM ET ELEOSELINUM, Offic. *Apium vulgare sive palustre*, Mer. Pin. 9. Park. Theat. 296. *Apium vulgare ingratius*, J. B. 3. 100. *Apium palustre Heleoselinum*, Chab. 396. *Apium palustre sive Officinarium*, Raii Hist. 1. 447. Synop. 3. 214. *Apium Officinarium sive Paludarium*, Merc. Bot. 1. 20. Phyt. Brit. 9. *Apium palustre*, & *Apium Officinarium*, C. B. Pin. 154. Tourn. Inst. 305. Elem. Bot. 254. Boerh. Ind. A. 58. Hist. Oxon. 3. 293. Rupp. Flor. Jen. 229. *Apium palustre Paludarium dictum*, Mor. Umb. 21. *Eleoselinum*, seu *Paludarium*, Ger. 862. Emac. 1014. SMALLAGE.

The Roots of Smallage are about a Finger thick, wrinkled, and sinking deep in the Earth, of a white Colour, from which spring many winged Leaves, somewhat resembling Parsley, but are larger, of a yellower Colour, each single Leaf being somewhat three-square; the Stalks grow to be two or three Foot high, smooth-channelled, and somewhat angular, and very much branched; at the Division of the Branches, come forth Umbels of small yellowish Flowers, followed by Seed less than Parsley-seed, paler and hotter. The whole Plant is of a strong ungrateful Savour. It grows in marshy watry Places, flowering and ripening Seed in the Summer.

The Roots, Leaves, and Seed, are used.

The Roots are diuretic, and very good for the Stoppage of Urine, the Stone and Gravel, and open Obstructions of the Liver and Spleen; and help the Dropsy and Jaundice, and remove Female Obstructions. The Leaves are of the same Nature, and are one of the Herbs which are eaten in the Spring, to sweeten and purify the Blood, and cure the Scurvy; the Seed is hot and carminative, and is one of the Four lesser hot Seeds, as the Root is one of the Five opening Roots. *Miller Bot. Off.*

Cordus justly observed, that the *Apium sativum*, which is our *Celeri*, did not differ from the Smallage, any otherwise than by Culture. This Plant is bitter, acrid, and aromatic. It contains a great deal of oily volatile Salt, from which the Sal Ammoniac is not quite disengaged, but dissolved in a great deal of Phlegm, and united with a great deal of Earth. By the Chymical Analysis, it yields, beside several acid Liquors, a great deal of Sulphur and Earth, a pretty deal of an urinous Spirit, and a little concreted volatile Salt. Thus it is no Wonder, that this Plant should be Aperitive, Diuretic, Febrifugous, and Vulnerary. Six Ounces of the Juice of its Leaves, mixed with two Ounces of the *Peruvian Bark*, is a certain Cure for a Quartan Ague, and wheresoever there are Obstructions in the lower Belly. In the Scurvy, the Juice of Smallage is no less efficacious than that of Scurvy-grass, to strengthen the Gums, and cleanse the Ulcers of the Mouth. Cancerous, and other Ulcers may be bathed also with it. The Root is made use of in Aperitive Puffs, Decoctions, Apozems, and Syrups. To draw the Milk, boil equal Parts of the Leaves of Smallage and Mint in Whey; strain it, and sprinkle it with Smallage-seeds powdered. *Martyn's Tournefort.*

Bartholomæus Zorn, in his *Botanologia*, says, that it grows naturally in moist, marshy, and shady Places. It is also planted in Gardens, where it is known under the Name of *Sallary*. Both the Seeds and Roots are used, especially in Obstructions of the Liver and Spleen; they warm, dry, purify, and attenuate; they occasion a Discharge of the Urine and Gravel, provoke the Menstrual Evacuations of Women, and carry off Fevers, Jaundice, and Dropsies; but they are very improper for such as are subject to the Falling Sickness, by reason of some particular Quality, as *Simeon Sethi* informs us. If Women with Child use them, they bring forth Monsters; and the Children which suck of them, contract the Falling Sickness, if we may believe *Pliny*. Its Root, hung about the Arm, by way of Amulet, removes Tooth-achs. *Melch. Scbitz. Disp. de Dentibus*, 4. 186. The Herb itself, and its Root attenuate and dissolve the Milk coagulated in the Breasts of Women, and dissipate its superfluous Quantity. For this Purpose some add to it Mint, Coriander, and Cummin. The expressed Juice of this Herb, mixed with Honey of Roses, is said to be an excellent Deterger of Wounds and Ulcers. See *Franc. Valeriola, Obs. 1. Lib. 15*. Some Surgeons order it to be mixed with Medicines designed for dressing Cancers, and other malignant Ulcers.

The only Shop Composition which takes its Name from *Apium*, is the

MUNDIFICATIVUM EX APIO.

The cleansing Ointment with SMALLAGE.

Take of the Juice of Smallage, one Pint; of Honey, nine Ounces; of Wheat-flower, three Ounces. Boil them till they grow thick together, of the Consistence of an Ointment, *S. A.*

This hath pass'd through all the College Dispensatories exactly the same; but I have never known it prescribed or made. *Quincy's London Dispensatory.*

The second Species of *Apium*, mention'd by *Dale*, is the PETROSELINUM VULGARE, Offic. Park. Theat. 922. *Petroselinum*, Ejusd. Parad. 491. *Apium hortense*, Ger. 861. Emac. 1013. Raii Hist. 1448. *Apium hortense*, seu *Petroselinum vulgare*, C. B. Pin. 153. Tourn. Inst. 305. Elem. Bot. 254. Boerh. Ind. A. 58. Rupp. Flor. Jen. 229. Hist. Oxon. 3. 292. *Apium hortense multis, quod vulgè Petroselinum palatum*, J. B. 3. 97. *Apium, Selinum, Petroselinum*, Chab. 396. *Apium sativum vel hortense, vulgatus latifolium planum*, Mor. Umb. 22. PARSLEY.

The Root of this is one of the Five opening Roots.

Of this sort of *Apium* there are a great many Species. They are all esteem'd opening, attenuating, diuretic, and useful for Obstructions of the Liver and Spleen; help the Jaundice, provoke Urine; and are of Service against the Stone, Gravel, and Strangury. *Miller. Bot. Off.*

A distill'd Water of *Parsley*, which partakes of the Virtues of the Plant, is directed by the College to be kept in the Shops.

The third *Apium*, taken Notice of by *Dale*, is the

APIUM PYRENAICUM THAPSIAE FACIE, Tourn. Inst. 305. Boerh. Ind. A. 58. *Seseli Pyrenaicum Thapsia folio*, Pluk. Almag. 244. Raii Hist. 2. 1808. *Seseli Pyrenaicum Thapsia facie*, D. Fagon. Schol. Bot. 161. Parad. Bat. 229. *Selinum Pyrenaicum, lobis foliorum acutioribus*, Vaill. MOUNTAIN PARSLEY, or THE SECOND BASTARD TURBITH.

It grows on the *Pyrenean Mountains*, and the Root is in Use, which serves the *Spaniards* instead of the Root of Turbith, as *Chomelinus* affirms; but it is of a noxious Quality. *Dale.*

The fourth is the

BUNIAM, Offic. *Bunium Dalechampii*, J. B. 3. 20. Chab. 385. *Daucus Petroselini vel Coriandri folio*, C. B. Pin. 150. *Daucus Petroselini vel Coriandri folio*, seu *Bunium Dalechampii*, Park. Theat. 900. Raii Hist. 1. 449. *Saxifraga montana minor Petroselini vel Coriandri folio*, Hist. Oxon. 3. 274. WILD PARSLEY.

It grows in stony and rugged Places, and flowers in the Summer. The Herb is used, and is diuretic, heating, and brings away the After-birth: It is good for the Spleen, Kidneys, and Bladder. *Dale.*

The fifth is the

PETROSELINUM MACEDONICUM, Offic. *Petroselinum Macedonicum verum*, Ger. 864. Emac. 1016. *Petroselinum Macedonicum quibusdam*, Park. Theat. 924. *Apium Macedonicum*, C. B. Pin. 154. Tourn. Inst. 305. Elem. Bot. 254. Raii Hist. 1. 463. Hist. Oxon. 3. 293. Boerh. Ind. A. 59. *Apium sive Petroselinum Macedonicum multis*, J. B. 3. 102. Chab. 397. *Apium semine villosa seu incano, Macedonicum*, Mor. Umb. 21. *Daucus Macedonicus Apii folio*, Herm. Flor. 2. 17. MACEDONIAN PARSLEY.

It is cultivated in the Gardens of the Curious, and flowers in July. The Seeds are small, hairy, striated, of a very dark Green, of an acrid and aromatic Taste, and of a fragrant Smell.

It is principally used as a Diuretic and Emmenagogue, and sometimes as a Remedy against Diseases caused by Witchcraft. *Schroder.* Some conceited Preparers of Medicines have been so ill advised, as to reject this Simple in the Composition of the *Theriaca*, &c. as *Volckamerus* observes, and in its stead to substitute the *Smyrniolum perfoliatum Creticum*, or *Olus atrum* [*Alexanders*], which will by no means answer the Purpose. *Flor. Nor. 325. Dale.*

The sixth is the

SELINUM MONTANUM, Offic. *Selinum sive Apium peregrinum*, Park. Theat. 928. *Apium peregrinum*, foliis subrotundis, C. B. Prod. 31. Pin. 154. Hist. Oxon. 3. 293. *Apium semine villoso incano*, peregrinum primum *Clusii*, Mor. Umb. 21. *Vifnaga minor quorundam*, *Selinum peregrinum Clusii*, semine hirsuto, J. B. 3. 94. *Daucus tertius Dioscoridis*, Raii Hist. 1. 462. *Daucus peregrinus*, foliis subrotundis pinnatis, Herm. Flor. 2. 17. **STONE PARSLEY.**

It is sometimes found in the Gardens of Botanists. The Seed is used, and is supposed to have the same Virtues as the former. *Dale.*

Bartholomæus Zorn mentions a Sort of *Apium*, under the Name of

Apium sylvestre, *Alfnicium dictum*, Officin. *Apium sylvestre*, Dod. *Thyselinum quorundam*, planta lacteo succo turgens, locis humidis proveniens, J. B. *Thyselinum Plinii*, Lob. *Olsenichium*, Cord. Thal. *Olsnitium*, Tab. *Apium sylvestre lacteo succo turgens*, C. B. *Meum Silesiacum palustre*, Schwenckf. *Daucus palustris*, Gesn. H. *Cuminum alnorum*, Al.

Dale, amongst other Synonyma, calls it *ORLNIZIUM*, Offic. Germ.

This Plant is very little known in our Shops; but is much in Vogue amongst the Germans.

This Herb grows in moist and shady Places, and especially near the Roots of Alder-trees. In Pharmacy its Root is principally in Use, which, if gather'd in the Spring, smells pretty strong, and is of a sharppish bitter Taste. It opens the Pores, dissolves, attenuates, and expels malignant Humours by Sweat. It carries off Pains in the Stomach and Belly, clears the Breast of Distinctions, eases Coughs, occasions a Discharge of Gravel, and resists the Plague, contagious Fevers, and other virulent Disorders. It is also successfully used against the Bites of poisonous Animals. See *Leon Thurneisser Histor. Planta. Cap. 14. Casp. Schwenckfelt. Descript. Thermar. Hirschbergens. Ed. Gorlic. 1607. Mich. Crugner. Chym. Garten. Baw. C. 27. Matth. Flacc. Tr. German. de Peste, P. 2. C. 13. Ed. Witt. 1566. A. 2. Rivin. Dissert. de Lipsiens. Pest. Ed. 1680. Thomas Reines. Traët. German. de Pest. p. 72. Edit. Altenb. 1681.* The Root has by some been taken for the true *Meum* of the Antients. *Bartholomæi Zorn Botanologia.*

APLESTIA, ἀπλεσία, from a Negative, and πλέω, to fill. Insatiableness. A Vice opposed to ἀνάρπεια, Contentment in the present State. *Galen. de Dign. & Cur. an. Morb. C. 9.*

APLEUROS, ἀπλευρῶς, from a Negative, and πλευρῶν, a Rib. Wanting Ribs. *Galen. Lib. 4. de Hippocr. & Plat. Decr. C. 4.*

APLYTOS, ἀπλῆς, from a Negative, and πλύνω, to wash. Unwashed, an Epithet of Wool, which is otherwise call'd, in Latin, *Lana succida*, and by *Hippocrates* ἐρίον ἀπλυτόν.

APNEUSTI, ἀπνευσί, from a Negative, and πνεύω, to breathe. Without fetching Breath: Κελευε ἀπνευσί τῷτο πιέν. "Order him to drink it off at one Draught, or without fetching Breath." *Hippocrates de Intern. Affect.*

APNOEA, ἀπνοία, a Defect of Respiration. "Απνευ ἀναπνοή, "a Respiration without Breath," is spoken by *Heraclides* in *Galen, Lib. 1. de Diffic. Spir.* of a Respiration in those who are refrigerated, which is so small, rare, and slow, that it seems to be in a manner extinct, and is such an ἀπνοία as happens in a Strangulation of the Uterus, the Apoplexy, and Lethargy, being a Consequence of a Resolution of the Organs of Respiration.

Diogenes Laertius informs us, that *Empedocles*, the most celebrated of all the Disciples of *Pythagoras*, acquired an uncommon Share of Reputation for curing a Woman who was taken for dead; when, according to that Philosopher, she only labour'd under a Strangulation of the Matrix. He gave the Name ἀπνοῦς, which implies without Respiration, to this Disorder; and maintained, that a Patient might live thirty Days under it.

Heraclides of Pontus, a Philosopher who studied some time under *Aristotle*, and then under *Speusippus* the Disciple of *Plato*, wrote, among other Things, a Treatise περὶ τῆ ἀπνῆς, or concerning the Distemper in which the Patient is deprived of Respiration, in which he also asserted, that the Disorder might continue for thirty Days, during which time the Patient remained without Respiration, and appear'd dead, without any Danger of the Body's corrupting.

APOBÆNON, ἀποβαίνων, from ἀποβαίω, to happen. An Event.

APOBAMMA, ἀπόβαμμα, from ἀποβάπτω, to tincture slightly. The same as *Embamma*, a slight Tincture, and commonly applied to Liquor in which Gold Coins, or red-hot Irons, have been quench'd. *Castellus.*

APOBRASMA, ἀπόβρασμα, from ἀποβράσσω, to ejaculate, or eject in Estuation, *Hipp. de Natura Pueri.* The Bran of Wheat; or, according to others, the Froth of the Sea. *Foefius. Castellus.*

APOBREGMA, ἀπόβρεγμα, from ἀποβρέχω, to dilute. A Dilution.

APOCAPNISMUS, ἀποκαπνισμός, from ἀποκαπνίζω, to suffumigate. A Suffumigation. See **SUFFUMENTUM**.

APOCARTEREON, ἀποκαρτερέων, in *Hippocrates de Rat. Vict. in Morb. acut.* is one that starves himself to Death: "Αποκαρτερῶν ἐαυτὸν λιμῶ ἢ ἀγχόνῃ τῷ βίῃ ἐξάγειν." "Αποκαρτερῶν is to force one's self out of Life by Famine or Strangling." *Suidas. Foefius.*

APOCATASTASIS, ἀποκατάστασις, from ἀποκαθίστημι, to restore. A Restitution, Amendment, Subsiding, Cessation. In these various Significations the Verb is used by *Hippocrates* in many Places of his Works; and in *Arctæus, Lib. 1. Cap. 10. τὸν ἐξ παθῶν*, the Word ἀποκατάστασις imports an intire Restitution to the former sound State.

APOCATHARSIS, ἀποκαθάρισις, from ἀποκαθαίρω, to cleanse or purge. An Expurgation. "Αποκαθαίρειν, or ἀποκαθαίρεν, are used by *Hippocrates* to express the Evacuation of Pus from the Breast by Spitting. "Αποκαθάροις χολαίς, in *Thucydides, Lib. 2.* are those bilious Vomitings and Purgations, which affected the Patients in the memorable Plague of *Athens*.

APOCENOSIS, ἀποκένωσις. The same as **ABEVACUATIO**, which see.

APOCERUGMA, ἀποκηρύγμα, from ἀποκηρύσσω, to declare publicly. A Declaration. "Αποκηρύγματα, in *Hippocrates*, are such Declarations or Indications as are thought proper to be made to the Patient.

APOCHOREON, ἀποχωρέων, from ἀποχωρέω, to secede. Excrement in general, or whatever is discharged from the Body by Stool or Urine.

APOCHREMPSIS, ἀπόχρημψις. A Hacking up of Spit; as *Apochremma*, ἀπόχρημμα, is the Matter or Spit thus evacuated. *Hippocr. Coac. & de Locis in Homine.*

APOCHYLISMA, ἀποχύλισμα. The Juice of Vegetables extracted and inspissated, answering to the officinal Word *Rob. Castellus.*

APOCHYMA, ἀπόχυμα, is that Kind of *Zopissa* which is made of the Resin and Wax that are scraped from Ships. So *Aetius* understands it; but some will have it to be the Resin of the Pitch-tree. *Oribasius* prepares it in the following manner:

Take of dry Pitch, one Pound; Tar and Wax, each four Ounces; Resin of the Pine-tree, six Ounces. After they are all melted and strained, they are thrown into a Pail full of Sea-water, or common Water, and worked with the Hands after the Manner of Troches. It is of a very mollifying Quality. See **ZOPISSA**.

APOCLASMA, ἀποκλάσμα. The same as **APAGMA**, or **ABDUCTIO**, which see. It is also called ἀποκεκαυλισμένον, that is, when a Bone is broken καυλῶν, as the *Greeks* say, or after the Manner of a Stalk (καυλός), near the Joint.

APOCLEISIS, ἀποκλείσις, from ἀποκλείω, to exclude. An Exclusion; but, in many Places of *Hippocrates*, the Verb whence it derives its Signification, is used to express a Loathing and Aversion to Food.

APOCOPE, ἀποκοπή, from ἀποκόπτω, to cut off. Abscission. See **ABSCISSIO**.

APOCRISIS, ἀποκρίσις, in *Hippocrates*, is the same as *Ecrrisis*, ἐκκρίσις. Whatever excrementitious or redundant Matter is discharged out of the Body. In *Lib. περὶ ἐνπνίων*, ἀποκρίσις signifies a secreted Matter, that is the Cause and Support of a Disease. In the same Treatise it often signifies a Secretion of the Food, and Distribution of the Aliment. "Αποκρίσις νοσέει, in the same Author, is a pestiferous Vapour, Exhalation, or unwholesome Quality impress'd on the Air.

APOCRUSTICON, ἀποκρουστικόν, from ἀποκρέω, to repel. An Epithet for a Remedy of a repelling and astringent Quality. *Gal. Lib. 11. Meth. Med. 15.*

APOCYESIS, ἀποκύσις, from ἀποκύω, to bring forth Young. A Birth. *Gal. Lib. 1. de Caus. Morb. Cap. 7.*

APOCYNON, called also *Cynanchon*, *Pardalianches*, *Cynomeron*, and *Cynocrambe*, is a Shrub with long flexible Branches, that are difficult to be broken: The Leaves resemble those of Ivy, but are softer, and sharper pointed, strongly scented, somewhat viscid, and full of a Honey-like Juice. The Fruit runs out, like a Bean-cod, a Finger in Length, of a capsular Form, containing small, hard, black Seeds.

The Leaves, mix'd with Meal, and made up into Loaves, kill Dogs, Wolves, Foxes, or Panthers, that eat of them, and immediately affect their Hips with a Palsy. *Dioscorides, Lib. 4. Cap. 81.*

The Seed, drank in Water, cures the Pleurisy, and all manner of Pains in the Side. *Pliny, Lib. 24. Cap. 11.*

Dale takes Notice of two Sorts of the APOCYNUM. The first is the

APOCYNON SYRIACUM, Offic. Mont. 37. *Apocynum Egyptianum, lactescens filiquâ Asclepiadis, C. B. Pin. 303. Apocynum erectum incanum latifolium Egyptianum, floribus croceis, Par. Bat. 27. Tourn. Inst. 91. Apocynum erectum majus latifolium Egyptianum, flore luteo spicato, Breyn. Prod. 2. 14. Pluk. Almag. 34. Hist. Oxon. 3. 609. Apocynum Egyptianum floribus, spicatis, Elem. Bot. 78. Apocynum Syriacum Clusii, Raii Hist. 2. 1088. Beidelsar offar, Alpin, Egypt. 85. Beidelsar Alpini sive Apocynum Syriacum, J. B. 2. 136. Apocynum Syriacum & Egyptianum, Beidelsar Alexandrinum Alpini, Chab. 119. Offar, Hon. Belli Epist. ad Clusium, 306. DOGS-BANE.*

I find no Virtues attributed to this Plant, except those taken Notice of from *Dioscorides* and *Pliny*, which are transcribed by *Galen*, and all succeeding Authors.

The second is the

PSEUDO-IPECACUANNA FUSCA, Offic. *Apocynum erectum, folio oblongo flore umbellato, petalis reflexis, coccineo, Cat. Jam. 89. Hist. 1. 206. Tab. 129. Raii Hist. 3. 537. Apocynum Curassavicum, fibrosa radice, floribus Aurantiis, Chamaenerii foliis angustioribus, Herm. Parad. Bat. Prod. 213. Parad. Bat. 36. Pluk. Phytog. 76. 6. Almag. 36. Apocynum erectum, Salicis latiori folio, umbellatum, floribus Aurantiis, Ejusd. Phytog. 138. Almag. 36. Apocynum Novæ Angliæ subhirsutum, radice tuberosa, floribus Aurantiis, Herm. Cat. Hort. Lugd. Bat. 646. Apocynum Canadense angustifolium, flore Aurantio, Mor. Hort. Bles. 232. Apocynum erectum minus latifolium Americanum, flore umbellato Aurantio, petalis reflexis, radice tuberosa, Breyn. Prod. 2. 15. BASTARD IPECACUANNA.*

It is imported from America by the Name of IPECACUANNA. The Root is of a dusky Colour, and has a poisonous Quality. Dale.

Boerhaave enumerates twenty-two Species of the APOCYNUM; but I know of nothing remarkable with respect to their Virtues.

Mr. *Sarrasin*, however, in the History of the Royal Academy of Sciences for 1730. says, that the APOCYNUM MAJUS SYRIACUM RECTUM furnishes the Inhabitants of Canada with a Juice, of which they make Sugar: He says, they also gather the Dew, which is found in the Bottom of the Flowers.

Dr. *Harris*, in his Dissertations, informs us, that the Apocynum, a Root very like the Ipecacuanha, is imported to us from Jamaica, Porto-Bello, and Virginia: This works excessively both by Vomit and Stool, even so as to exhaust all the Strength.

This cannot be distinguish'd from the true Ipecacuanha in Powder, but may in the Root; for the Filament, or Fibre, that runs thro' the Medullium of the Ipecacuanha, is of a whitish or ash Colour, but that of the Apocynum is yellow.

I believe this Observation is perfectly just. I remember, some Years ago, I directed half a Dram of Ipecacuanha for a Farmer in the Country, at the Request of a near Relation of my own, to whom he was Tenant. It happen'd, by some Accident or other, that the Person for whom it was prescribed did not take it; but some few Weeks after, the Gentleman who desir'd me to direct it, took it himself; the Consequence of which was, that he vomited excessively, and thin watery Stools came from him insensibly for several Days. This made me think he had taken Apocynum, instead of Ipecacuanha.

APOCYRTUMENA, αποκυρτώμενα, from αποκυρτίζομαι, to be turned archwise. Decreasing in manner of a Cone. Αποκυρτώμενα εἰς ἕξ διὰ σπινθήρα. "Suppurations gathering to a sharp Head." *Hippocr. in Progn.*

APODACRYTICA, αποδακρυτικά, from ἀπὸ, signifying negatively, and δάκρυ, a Tear. Medicines first exciting, and after evacuating, the superfluous Moisture of the Eyes, suppressing Tears, and drying the Eyes; or, in one Word, Delacrymatives; for in this Sense is Delacrymare taken by *Pliny* and *Columella*. We meet with a List of Remedies of this Sort in *Actius, Tetrab. 1. Serm. 3. Cap. 138.* Among which are Celandine, Germander, Centaury, Onions, Pimpernel, Hellebore, &c.

APODEIXIS, αποδείξις, from αποδείκνυμι, to demonstrate. Demonstration.

APODES, αποδες, from a Neg. and ποὺς, a Foot. A kind of Birds which have very short Feet: They are also call'd κύπελλα, Cypseli. *Aristot. Lib. 9. Animal. Cap. 30.* These Birds are like Swallows, and are very much upon the Wing on account of their Feet. They build in Rocks, and fly all over the Seas; nor is there any Ship that sails never so far from Land, but finds itself within the Reach of these Apodes, which fly about it. Other Kinds fit or stand; these never rest themselves but in their Nest, where they hang or lie. They differ as much in their Economy, especially as to Food. *Pliny, Cap. 39. Lib. 10.*

Apodes, boiled in Wine, are a Remedy for the Gripes. *Idem, Lib. 30. Cap. 7.*

APODYTERIUM, αποδυτήριον, from αποδυόμαι, to undeclothe: A private Room before the Entrance into the Baths, where they who went to bathe put off their Cloaths: It is also called Conisterium, and Spoliarium. *Castellus.*

APCEUM, ἀποιον, from a Negative, and πῖος, of some Quality. Void of all sensible Qualities, inspid, without Astringency, Acrimony, or any remarkable Property; such as among humid Substances, Water ought to be; and, among dry ones, Amylum. *Galen* judges inspid Aliments to be more nourishing than the acrimonious and bitter. *Galen. de Al. Fac. Lib. 2. Cap. 64.*

APOGALACTISMUS, απογαλακτισμός, of ἀπὸ, from, and γαλακτίζω, to suckle, from γάλα, Milk. A Weaning. See ABLACTATIO.

APOGLAUCOSIS, απογλαύκωσις. See GLAUCOMA.

APOGONA, ἀπόγονα. Vital, likely to live. Ἦσαν ἑδὲν ἕω τὴν τεταγμένην χεῖρα, ἐκείνοι τὰ τιμώμενα ἀπόγονα γίνεσθαι. "Those Women who meet with no Disaster within the Term, are delivered of strong or lively Children." *Hippocr. Lib. 2. Epid. In this Place, and also in Lib. 6. Epid. Sect. 8. Aph. 6.* ἀπόγονα signifies the same as γόνιμα, or γονά, in *Lib. περὶ σαρκῶν*

APOLEPSIS, ἀπόληψις, from ἀπολαμβάνομαι, to be suppress'd, retain'd, &c. An Interception, Suppression, or Retention. Thus ἀπολήψεις οὐραν; in *Hippocr. Prorrh.* is a Suppression or Retention of Urine; and in *Coac. Praenot. ἀπόληψις καίλης*, a Costiveness. Again, in the same Author, we often meet with ἀπολήψεις φλεβῶν, as in *Lib. de Rat. Viſt. in Morb. acut.* that is, a Stagnation from a too great Oppletion of the Veins. There are also ἀπολήψεις πνευμάτων ἀπὸ τὰς φλέβας, which *Galen* explains as follows: Πνευμάτων ἀπολήψεις ἀπὸ τὰς φλέβας εἰκός ἐστιν ἐπὶ τῆς ἀσθενείας λέγεσθαι. φλέβας γὰρ ἐκάλουν οἱ παλαιοὶ τὰς ἀρτηρίας ἀπολήψεις δὲ πνευμάτων τὰς διὰ καλακίσεις τε καὶ ἰσχυρίας δύνασθαι λέγειν. "It is probable, that by these ἀπολήψεις (Interceptions) of the Spirits in the Veins, he means a Cessation of the Pulse; for the Antients call'd the Arteries by the Name of Veins: These Apoplepsies of the Spirits, then, may be called their sinking into Rest and Inactivity." Such an Apoplepsis of the Spirits attends a Catalepsis, Apoplexy, and Epilepsy, when the Brain being refrigerated, and the Blood in a Stagnation, the Course of the Spirits is intercepted by the congealed Blood. Again, in the same Book, melancholy Persons are said to be affected with ἀπολήψεις πνευμάτων διὰ φλεβῶν, which is thus explain'd by *Galen*: Πνευμάτων διὰ ἀπολήψιν εἰ μὲν τῶν κατ' ἀσθενείας λέγει, τί ἄλλο ἢ ἀσθενεία γένοιτ' ἂν τὸ πάθος; εἰ δὲ τῶν κατὰ τὸν πλεῖμονα, πάλιν ἐπ' αὐτὰ τὴν καλυμένην ἀποσιαν ἀνιήσεται. "If by an Apoplepsis of the Spirits he means those in the Arteries, what can be the Consequence but a Cessation of the Pulse? But if he speaks it of the Spirits in the Lungs, he seems to give another Hint, tho' but obscurely, at what we call an Apnoea."

There is also an ἀπόληψις φλεβῶν in a quite different Sense, and means no more than the Tying or Compressing of a Vein or Artery, in order to prevent or stop an Hemorrhage: This Method is recommended by *Hippocr. Lib. 6. Epid. Sect. 7. Aph. 3.* And ἀπόληψις νεφρῶν, in the same Author, signifies the Preventing the Course of a Distemper, by putting a Stop to the Humours which caused it. *Epid. Lib. 2.*

ABOLEXIS, ἀπόληξις, from ἀπολύω, to cease or end. A decaying Time of Age, in *Hippocr. παρὰ γεν.* and is there opposed to ἀκμή ηλικίας, "the Flower of Age."

APOLINOSIS, ἀπολίνωσις, from λίνον, Flax. So *P. Aegineta* calls the Method of curing a Fistula by raw Flax. See OMOLINON.

APOLLINARIS, Herba. The same as HYOSCYAMUS, which see.

APOLYSIS, ἀπόλυσις, from ἀπολύω, to release. A Solution, or Release, which is diversify'd according to the Subject; as, for Instance, it signifies, in *Hippocrates*, the Exclusion of the Foetus, *Lib. 5. Epid. of the Secundines, Lib. 2. Prorrh.* the Solution of a Disease, *Coac. Praenot.* and also the Unloosing of a Bandage. *De Fraſt.*

APOLYSIA, ἀπολύσια. *Erotian*, on *Hippocrates*, says it is either a Resolution of the Limbs, or the Relaxation of a Bandage.

APOMAGMA, ἀπομάγμα, from ἀπομάζω, to absterge. Any thing proper to be used as an Instrument for absterging excrementitious Matter or Sordes, as a Linen Handkerchief for the Eyes, and a Sponge for Wounds.

APOMATHEMA, ἀπομάθημα, from ἀπὸ, Negative, and μαθάνω, to learn. In *Hippocrates, Lib. de Fraſt.* it signifies an Oblivion of what has been learned.

APOMELI, ἀπόμελι. A sweet Drink made of Honeycombs, diluted and boiled in Water. The Manner of preparing it is thus described by *Actius, Tetrab. 2. Serm. 1. Cap. 137.*

Take white Honeycombs, full of pellucid Honey, which press out with your Hands, and mix with the best Spring Water;

Water: If your Honey be thick, take four Parts of Water for one of Honey; if liquid, let the Water be to the Honey as three to one. If the Combs be pretty dry, cut them in small Pieces, and work them with your Hands in the Water first measur'd; after which press and strain off the Liquor, and by measuring it you will know what Quantity of Honey to add. Then put the Liquor into a new Earthen Pot, in which Water has been boiled before, in order to take off its earthy Quality, and boil it over a clear Fire, still skimming off the Spume or Wax as it arises. When no more ascends to the Top, and about a seventh or eighth Part of the Whole is boiled away, remove it from the Fire, and let it cool. After it is perfectly cold, the next Day skim off what swims on the Top, and pour the rest into new Earthen Vessels, in order to be set aside in your Wine-cellar.

Galen, Com. 3. in Hippocr. περί αγμῶν, observes, that *Apomeli* was called by *Hippocrates*, and many others, *ὀξύγλυκος* or *ὀξύγλυκός* (*Oxyglycy* or *Oxyglycēs*); and that some made it of Honey and Vinegar, others of Honeycombs and Vinegar boiled together: For he makes two Distinctions; one sort, he says, is sweet, another more upon the Acid; and this latter is made either of Honey and Vinegar, or Honeycombs and Vinegar. We, says *Galen*, make it of Honeycombs, putting Vinegar to the Honey, and boil them till their Qualities are united, and the Force of the Vinegar is broken.

Apomeli is endu'd with an incisive and absterfivè Virtue: It purges Bile downward, provokes Urine, and prepares putrid Fevers for a Solution. It is however an Enemy to hot and dry Constitutions; and is hurtful in hot Distempers, and Inflammations of the Præcordia; and rather increases than allays Thirst. It is given after Meals; for it does Harm upon a full Stomach. *Aetius, Cap. prædicto.*

APOMYLENAS, ἀπομυλῖνας. *Galen. in Exeg. Voc. Hippocr.* explains this Term, by *προβαλὼν τὰ χεῖλη συνημμένως*, "thrusting out the Lips compress'd together."

APOMYLLENE, ἀπομυλλήνη. *Erotian, on Hippocrates*, says, *Τὸτο γινέται ὅταν διασπορῇ ἢ διῶν σπᾶσμα περὶ τὸν γένον μετὰ παρέσεως ὀχῆς; μάλιστα δὲ ἐκ πληγῆς*. "An *Apomyllene* happens when there is a Distortion, and, as it were, a Con-vulsion, with a Relaxation of the Cheek, or Parts adjacent, principally occasioned by a Blow."

APONENOEMENOS, ἀπονενομένος, from ἀπονοῶ, to be negligent or averse. An Adverb importing an utter Aversion to a thing. *Hippocr. Epid. Lib. 3. Egr. 2. Περὶ τὰ γεύματα ἀπονενομένος εἶχεν*. "The Patient nauseated all manner of Food."

APONEUROSIS, ἀπνεύρωσις, from ἀπὸ and νῆρον, a Nerve. The Extremity of a Muscle, called by *Hippocrates* *τῖνον*, a Tendon, or Chord.

APOPALLESIS, **APOPALSIS**, ἀποπάλλωσις, ἀπόπασις, from ἀποπάλλω, to throw off, in an hasty manner. An Expulsion, or Extrusion, as when the Fœtus is expell'd by Abortion. *Hipp. περί γυναικ.*

AOPATOI, ἀόπατοι, is a Word often used by *Hippocrates*, and is explain'd in *Erotian* by ἀποδύσεις, which signifies as well the Places of Easement, as the Fœces. So *Suidas* explains ἀόπατοι by ἀποδοί. See *APHODOS*.

AOPHLEGMATISMUS, ἀποφλεγματισμός, of ἀπὸ, from, and φλέγμα, Phlegm. A Medicine contriv'd for drawing Phlegm from the Mouth, and thence evacuating it by Spitting; for which Purpose it is held in the Mouth. Such Medicines, by their hot pungent Quality, stimulate the Fibres, and make them compress the Glands, whereby their Contents are faster thrown out into the Mouth, and so a Drain is promoted of such watery pituitous Humours, from all Parts of the Head, as have any Consent therewith. In Comas, Lethargies, Epilepsies, Palsies, and, in short, in all Disorders from a moist Temperament of the Brain, these Remedies are to be used with good Success.

As to the Form and Consistence of *Apophlegmatisms*, they are various. *Morellus* distinguishes them into liquid and dry; to which *Gobius* adds a third, that is, soft, or in the Form of an Electuary. And to these a fourth may be added, which consists of Fumes or Vapours.

Liquid *Apophlegmatisms* are made of Decoctions, Infusions, express'd Juices, and officinal Liquors; and these either mixed together, or alone.

Those which are solid usually consist of Gums, as Mastic; acrid Roots, as Pellitory of Spain, or Horse-radish; Leaves, as those of Tobacco; Salts, as Nitre, Sal Gemmæ, or Alum; and Fruits, as Pepper. These are sometimes used alone, and without any Preparation; and sometimes mix'd and made into the Form of Powders, Balls, and Troches, which last are ordered to be held under the Tongue, and to be suffer'd to dissolve gradually. The Powders are directed sometimes to be taken naked into the Mouth, and sometimes to be ty'd up in a Rag, and so to be chew'd.

Electuaries are form'd of such Ingredients powder'd, and made up with some Fluid, proper to give them a Consistence.

Vapours are convey'd to the Mouth by means of a Funnel, or otherwise, from Decoctions of stimulating Ingredients. And Fumes are received from dry Ingredients burnt, either in the same Manner, or by means of a Pipe, as in smoking Tobacco either mix'd or unmix'd.

Upon this Occasion I must not omit giving the Form of a medicated Tobacco, of which that so much advertis'd under the Name of the Cephalic and Oppthalmic Tobacco, is an humble Imitation:

Take of the Flowers of Rosemary, Betony, Eyebright, each two Handfuls; of Aloës-wood, Sassafras, yellow Amber, Clove-bark, Storax Calamita, each an Ounce; of the external Peel or Husk of Pistachio-nuts, an Ounce and an half; of the Cortex Elaterii, half an Ounce: Let all these Ingredients be powder'd, and mix'd together. Mix four Ounces of these Ingredients with a Pound of Tobacco, to be smok'd in the common manner.

If all these Drugs are faithfully put in, the Smoke is of an exceeding fine Smell. As I was acquainted with the good Effects of this, long before I knew any thing of Medicine, I have had many Opportunities of making myself acquainted with its real Efficacy, and know it to be capable of affording singular Relief in Dimness of Sight, and habitual Disorders of the Head proceeding from a Redundance of tenacious Lymph, provided it is duly persifted in. And it must be confess'd, that this Mixture has perform'd something little less than a Miracle; in making Tobacco agreeable, and of some real Use.

As to *Apophlegmatisms*, the Choice of the Ingredients and Forms must be directed by the several Circumstances relative to the Disease, the Patient, and the Intentions of the Physician.

Thus in Paralytic and Lethargic Cases, when a Patient cannot chew a Solid, nor manage a Liquid properly in his Mouth, a soft Form, as that of an Electuary, is best adapted to the Case; because it dissolves gradually, and produces the intended Effect, without that Care of the Person who uses it, which is requisite in other Forms. In these Disorders also the Fumes of Narcotic Ingredients are highly prejudicial.

But with respect to *Apophlegmatisms*, as well as every thing else relative to Medicine, Circumstances are so various and complicated, that much must be left to the Discretion and Judgment of a Physician, whose Reason and Experience will furnish him with a Sagacity sufficient to enable him to make a proper Choice of Ingredients and Forms suited to particular Cases which occur. It were to be wish'd, that universal Rules could be laid down in Medicine, and Maxims which admit of no Exception, because this would render Abilities and Learning less necessary, which, according to the ordinary Course of human Nature, cannot possibly fall to the Share of every one whose Duty it is to attend the Sick.

Tho' *Apophlegmatisms* in the ordinary Acceptation are confin'd to things taken at the Mouth, yet whatever by a Stimulus affects the Glands of the Mouth, Fauces, and those of the Membrana Pituitaria describ'd by *Schneider*, so as to increase the Discharge of pituitous Humours, may properly enough be call'd *Apophlegmatisms*; thus Snuffs of all Sorts are a Species of *Apophlegmatisms*.

A very effectual *Apophlegmatism*, under the Name of *Pila Masticatoria*, or spitting Balls, is thus prepared:

Take Mastic, three Ounces; Pellitory of Spain, Stavesacre, each two Drams; Angelica-root, half a Dram; Cubebs, Nutmegs, each one Dram; Euphorbium, half a Scruple; Wax enough to make them into little Balls or Pellets: If the Euphorbium be thought too hot, it may be left out. *Quincy's Dispensatory.*

APOPHRADES, ἀποφράδες, from the Singular ἀποφράς, unfortunate, unlucky; an Epithet apply'd to those Days in which an acute Distemper comes to a fatal Crisis, or to no Crisis at all. *Castellus.*

APOPHTHORA, ἀποφθορά, from ἀποφθίω, which is from the Original φθίω, to corrupt. An Abortion. The Word is used by *Hippocrates*, and also ἀπίσθαμα, (*Apophtharma*) a Medicine to procure Abortion, *Lib. 5. and 7. Epid.* See *ABORTUS*.

AOPHYAS, ἀοφυάς, of ἀπὸ, from, and φύω, to grow. An Appendix; any thing that grows to, or proceeds from another, as Boughs and Branches. Thus ἀποφυάδες *Lib. περί ἀσείων φύσ.* are the Ramifications of the Veins.

AOPHYSIS, ἀπίφυσις. See the Etymology under the preceding Word. The Process or Protruberance of a Bone; or that kind of Eminence of a Bone which is continuous, and makes one Piece with it, and is called by the Greek Term *Apophysis*, which signifies an Excrescence, because it grows or shoots out immediately from the Bone itself; such are the sharp Eminences of the Lower Jaw, &c. *Winflow.*

APOPIESMA, ἀποπνιγμα, from ἀποπνίζω, to compress. An Expression of Humours by Compress in the binding up of Wounds or Fractures. *Hippocr. περί ἀγνυόν.*

APOPLECTA. A Name for the internal Jugular Vein, which ascends by the Side of the *Aspera Arteria*. *Castellus.*

APOPLECTICA, Medicines against the Apoplexy. *Blancard.* They are so called instead of *Antapoplectica*. *Castellus.*

APOPLECTICÆ VENÆ. The same as **JUGULARES VENÆ**, which see.

APOPLEXIA, ἀποπληξία, from ἀποπλύνω, to strike, or knock down. An Apoplexy. This by the *Latin* Writers is called *Attonitus Morbus*. *Celsus* and *Caelius Aurelianus* inform us, that the most antient Medicinal Writers gave this Name to that Species of Palsy which succeeds what we call a true *Apoplexy*.

Any Disorder which instantaneously deprives a Man of Life, who a few Minutes before was, or at least seem'd to be, in perfect Health, may, according to the Derivation of the Word, be properly enough called an *Apoplexy*; but it would be more methodical to confine the Word *Apoplexy* to such sudden Disorders caused by Affections of the Brain.

OBSERVATION I.

A certain Envoy from *Florence* to the *French King* was suddenly seiz'd with an *Apoplexy*, which put a speedy Period to his Life, though, just before, he appeared to be in an entire and confirmed State of Health.

Upon opening his Body, I found his Heart turgid; and when I cut it open, it discharged three or four Pounds of Blood. The Orifice of the great Artery was at the same time dilated to such a preternatural Size, that it would have admitted a Person's Arm. *Andreas Laurentius in Controversiis Anatom.*

From this Case *Maebius* concludes, that *Apoplexies* draw their Origins rather from the Obstructions of the Arteries, than those of the Nerves.

From this Case also *Bartholine* concludes, that the Causes of *Apoplexies* are not always to be look'd for in the Brain, since they sometimes proceed from the Blood being intercepted in the obstructed Vessels of the Heart. *Boneti Sepulch. Anatom.*

OBSERVATION II.

A certain Student had the Misfortune to be wounded with the Point of a Sword near his Nose, and immediately below the Orbit of the Left Eye. Soon after, he was depriv'd both of his Speech and Reason, and seiz'd with an *Apoplexy* and *Stertor*, which quickly put an End to his Life. Upon opening the Cranium, I found the Wound not only passing thro' the Orbit of the Eye, and the *Os Cribrosum* near the *Crista Galla*, but also affecting the Right Ventricle of the Brain; from which I extracted a Portion of black, grumous, and fibrous Blood, as long and thick as my middle Finger. The Base of the Brain, and the Region of the Cerebellum, were fill'd with extravasated Blood; and the whole Substance of the Brain itself appear'd of a ruddy Colour, as if it had been inflam'd. *Jac. Wepferus Exercit. de Apoplexia.*

OBSERVATION III.

A certain Gentlewoman of Distinction, having for a considerable Number of Years been subject to spasmodic Disorders, began at last to flatter herself with the Hopes of a perfect Recovery. She complain'd in the mean time of a violent Pain and Heaviness in her Head; soon after which she was seiz'd with a violent convulsive Fit, which terminated in an *Apoplexy*, which soon put an End to her Life. Upon raising her Scull, the Vessels running thro' the Meninges and Brain appear'd distended and stretch'd with Blood; whereas in dissecting the other Parts of her Body, scarce any Blood at all appear'd. Upon removing the thicker Membrane, thro' the other slender and pellucid one we observed a limpid Water filling the several Meanders of the Brain, and, as it were, overflowing the Whole of its Substance. *Bonet.*

OBSERVATION IV.

A Man of seventy Years of Age, happening to fall from a considerable Height, received a large Wound in his Scull. Next Day he recovered a little; but on the fourth Day died of an unexpected *Apoplexy*, after spitting up some purulent Matter. When we were examining the internal Parts of his Head, we first found the Ventricles of his Brain fill'd with a great deal of a certain Humour: Next we found a large Fragment of the *Os Cuneiforme* separated from the rest, and bearing upon the adjacent Parts, in the most remote Recesses of which there was a great deal of coagulated Blood lodg'd. But the *Apoplexy* proceeded partly from the Obstruction of the Processes of the *Medulla Spinalis*, which are the true Origins of the Nerves, and partly from the Angustation of the *Rete Mirabile*, which is formed by the intermixed Concourse of the Jugular Veins, and the carotid and cervical Arteries. These noble Parts being obstructed, the Patient must of course have been deprived of Sensation, Motion, and Life, according to the Maxim of *Celsus*, *S. 2. Servari non*

potest cui Basis Cerebri percussa est: No Art can save him, the Base of whose Brain is wounded.

OBSERVATION V.

A certain Butler, happening to take Flowers of Antimony from a Mountebank, fell into an *Apoplexy*, during which he had such a violent Ptyalism, that six full Measures of frothy Phlegm were discharged from his Mouth and Ears.

Upon opening his Body, when dead, we found his Lungs, the whole Region of his Breast, his Stomach, and his Head, full of the same kind of frothy Phlegm. *Bonet.*

OBSERVATION VI.

In dissecting the Body of one who lately died of an *Apoplexy* in the Left Ventricle of the Heart, I observed a Portion of Fat ascending into the *Arteria Venosa*, where, after blocking up its Orifice, it branch'd itself out in two Horns like the *Pythagorean* Letter Y. *Bonet.*

OBSERVATION VII.

A certain Priest, towards the End of the Consecration, became wonderfully foolish, and soon after died *Apoplectic*. Upon dissecting his Head, some round whitish Bladders, full of a phlegmatic Humour, were found upon the Corpus Callosum, which were taken for the immediate Cause of so fatal a Disorder. *Bonet.*

OBSERVATION VIII.

A Woman of *Leyden* had an external Tumor on the Right Side of her Forehead, which being taken off by the Hand of a skilful Surgeon, three Days pass'd without any Suspicion of a more terrible Disorder appearing; however, on the fourth Day, she was suddenly seiz'd with an *Apoplexy*, which prov'd mortal, as the learned *Walæus* had prognosticated, from Instances of a like Nature; because in such Tumors of the Head the Pericranium is hurt; and when the internal Membranes adhering to the Brain are dilated, the Brain itself falls down, and compresses the Ventricles. *Bonetus* from *T. Bartholine*.

OBSERVATION IX.

A certain old Clergyman of an untainted moral Character, of a corpulent Make, and a short wry Neck, having been long valetudinary, and leading a sedentary Life, contracted a violent scorbutic Cacoehymia; being also afflicted with a Difficulty of Breathing, an heavy Pain in his Head, and an unusual Torpor; he could scarce undergo any Labour or Fatigue, besides going between his Chamber and the Chapel every Day: Accordingly one Morning, when he had gone into the Chapel a little before Prayers began, and fallen upon his Knees, he was suddenly struck with an *Apoplexy*, and becoming speechless and senseless, fell prostrate on the Ground. But being forthwith taken up, and his Cloaths taken off, he was put into a warm Bed. Upon which, I myself, and other Physicians, being called, we found him not only deprived of Sensation, Pulse, and Respiration, but his whole Body was even cold and stiff; nor could we by the most diligent Application of any Medicines whatever restore him, either to Life or Warmth. Hence we suspected, that by the very first Shock of the Distemper, the Pulsation of the Heart was stopp'd, and the Motion of the Blood suppress'd.

Next Day we opened the dead Body, which by that time was become considerably stiff, not in the least doubting but a Distemper which had proved so suddenly mortal, would leave some remarkable Traces in the Brain. But neither in it, nor in any other Part within the Cranium, were the least Traces of this violent Distemper to be observed; for the Vessels running through the Meninges were only filled with a due Quantity of Blood, without any Inflammation or Extravasation. The Brain, the Cerebellum, and Medulla Oblongata, together with all their Processes and Protuberances, appeared every-where found and well-coloured, both externally and internally. There was no Effusion either of Blood or Serum in their Pores or Ducts: Neither was there any Coacervation of Matter found in the large Ventricles: Besides, the *Plexus Choroides*, both within the Brain, and behind the Cerebellum, did not in the least appear faulty; so that the morbid Matter, as fine and subtle as the Animal Spirits themselves, which it had affected, was entirely unobservable; and we could only argue for its being actually there from the Effects it produced. But lest the morbid Matter should be lodged somewhere else, after having taken an accurate View of the several Parts of the Brain, we descended to the Thorax, where we found the Lungs discoloured, and distended with a frothy Ichor. A Circumstance which sufficiently accounted for the Difficulty of Breathing! But the Heart was found, untouch'd, and entirely free from all manner of Obstructions, or polypous Concretions. Neither in its Neighbourhood, nor in any of the adjacent Viscera, was there any Abscess or Apostematation found, by whose Contact, or foetid Exhalations, the Heart, if such a thing be possible, could be oppressed, and Respiration stopped. *Willis.*

A P O

OBSERVATION X.

I had an Opportunity of seeing a Girl who was killed by Lightning, but no Marks of Violence appeared on her Body, except two Scars all along her Back, which looked as if they had been made with a red-hot Smith's Forceps. Internally there was no apparent Disorder, except that the Extremity of one of the Lobes of her Lungs seemed to be somewhat burned. *Brassaval, Com. ad Lib. 1. Hippocrat. de Vict. in Acut.*

When in the Year 1581. the Bell-ringers of *Besançon* were ringing the Bells, in order to prevent the Effects of a Tempest, one of them, being struck with Lightning, died on the Spot. Upon inspecting his Body, no Wound was discovered, and the Skin was entire, only his Neck was a little blacken'd, and the Neck-band of his Shirt torn. Upon opening his Body, the principal Viscera, the Heart, Liver and Spleen, were found unaffected, and the smaller Intestines blasted. *Bonetus from Gilbertus.*

Beneventus affirms, that an Apoplexy may be occasioned by Lightning [*De Abd. Cap. 2.*]; and that he himself knew a Father and Son, who, being struck with Lightning at one and the same time, became Apoplectic, and were afterwards thoroughly cured; for such is the Influence of Lightning, that it can excite Commotions in the Humours of the Brain, and render People Apoplectic. Accordingly *Hildanus, Cent. 3. Obs. 26.* mentions the Case of a Servant, whose Head swelled prodigiously, and became black a little after he had been kill'd by the Lightning; hence 'tis plain, that in this Case, the Brain was very much injured. But Lightning rarely excites a true Apoplexy; since, for the most part, it either kills entirely, or produces such an Effect upon People, that, losing their Colour, and their Pulse, and Respiration being quite destroy'd, they resemble dead Persons.

OBSERVATION XI.

In a very severe Winter, when every thing was covered with Snow, a certain Gentleman of great Learning was seized with a violent Pain in the Left Side of his Head; and, afterwards complaining heavily of Pains in his Abdomen, he at last died *Apoplectic.*

Upon dissecting his lower Belly, the largest Gland of his Mesentery was found scirrhus and exulcerated. Upon opening his Cranium the Right Carotid Artery ascending within the Cranium was quite ossified, or even petrified, if I may say so, and its Cavity scarce permeable. The Right Vertebral Artery was also a Third larger than that on the opposite Side. *Bonet.*

OBSERVATION XII.

A certain dull Fellow had the Misfortune to be seiz'd with an Apoplexy, which proved mortal to him. Upon searching for the Causes of his Disorder, we found his Brain flaccid. The Meninges were overflowed with a mucous and viscid Humour; and even the third Sinus itself, with its adherent Vessels, were filled with the same Liquor. The Ventricles of the Brain were also filled with it. In the Left Ventricle of the Heart, there was a Polypus formed by a viscid Matter, and the Spinal Marrow was moistened by a Lymphatic Fluid. *Bonet.*

OBSERVATION XIII.

A Man of fifty-six Years of Age happened to be seized with an Apoplexy: the whole Right Side of his Body was within six Hours after convulsed and contracted; but more especially the Hand and Foot on that Side. The whole Left Side of his Body, in the mean time, became paralytic; he could not speak, but a great deal of viscid Spittle flowed from his Mouth. On the second Day, he felt a kind of Concussion about his Breast, and died as if he had been suffocated.

Upon opening the Cranium, we found the Substance of the Brain found and entire: But the Right Ventricle was full of an extravasated Blood, which was black, purulent, and streaked with different Colours. The Bottom of this Ventricle was also corroded, and, as it were, excavated. Nothing uncommon was found in the Left Ventricle, the Lungs were black and flaccid, and a Polypus was found in the Right Ventricle of the Heart.

The Wife of the Deceased informed us, that, for many Years past, he had been subject to a Vertigo; that many Days before his Death, he had complained of a heavy Pain of his Head; and that, the very Day before the Apoplexy seized him, a Discharge of Blood was made from his Nostrils. *Bonetus from Baglivi.*

Thus we see many Causes, and those very different from each other, may induce an Apoplexy. And, indeed, whatever is capable of putting a sudden and entire Stop to the Circulation of the Blood, may have this Effect. Thus a Palsy of the Heart, of the Lungs, or of the Muscular Coats of the principal Arteries, may be readily conceived to put an effectual Stop to the Circulation, and consequently to cause an Apoplexy. The same Effect may be produced by an Over-fulness of the

A P O

Vessels; for where there is no void Space to move in, no Motion can be carried on. Polypose Concretions in the Heart, or its Auricles, in the large Arteries, or Veins, especially the Jugulars, in the Sinuses of the Brain; particularly in or near the *Torcular Herophili*, or in the large Vessels of the Meninges; sudden Ruptures of any of the large Vessels near the Heart, or of smaller in the Meninges; in the Substance of the Brain, or its Ventricles, whether Sanguiferous, or Lymphatic; a general Viscidity of the Juices; or Languor of the vital Powers; a Congestion of Humours of any sort; in, or very near, the Brain; Wounds, Blows, any Compressure of the Brain, or whatever is capable of preventing the Influx of the Nervous Fluid into the Canals which convey it from the *Medulla Oblongata*, and *Spinalis*, to the different Parts of the Body; may produce this Distemper.

But the two most general Causes of an Apoplexy are, first, a Plethora, or Over-fulness of Blood, to which the younger Sort of People, who live freely, are principally subject.

Secondly, a Deficiency in the vital Powers, and a consequent Redundance of viscid and ferous Humours, which affects particularly People advanced in Years.

Sometimes Hysterical Disorders attack the Head, and cause an Apoplexy, which also terminates in an Hemiplegia, exactly resembling that kind of Apoplexy which proves fatal to some aged and corpulent Persons, and arises from an Obstruction and Compression of the Nerves, occasioned by a copious Phlegm contained in the cortical Part of the Brain. But the Apoplexy in Hysterical Women seems to proceed from a very different Cause; for it seizes them frequently after a difficult Delivery; attended with a great Loss of Blood, or proceeds from some violent Commotion of Mind. *Sydenham.*

The Gout is also frequently productive of an Apoplexy. See ARTHRITIS.

DIAGNOSTICS and PROGNOSTICS:

Caelius Aurelianus has given the Sentiments of the Antients on an Apoplexy, in the manner following:

This Disease is so called, because, upon its Approach, the Patient drops down on a sudden, as if he was struck dead by a Blow. It may be defined, *A quick and sudden Oppression, often attended with a Fever, depriving the Patient of Sensation, and seizing always instantaneously, but never slowly and gradually.* Its antecedent Causes may be esteemed the same with those of other Diseases; but the more considerable of them are, the being exposed to continual scorching Heats, or to violent Colds; frequent Indigestions, occasioned by the immoderate Use of Baths, and Excess of Venery, especially in old Men. This Distemper may also proceed from the Meninges being wounded, or in Boys from their Concussion. In some Cases therefore no Symptoms are observed previous to the Patient's dropping down; whereas in others some prognostic Symptoms precede the immediate Shock of the Distemper, such as Heaviness or Pain of the Head, Vertigo, Ringing of the Ears, Difficulty in performing accustomed Motions; Sadness of Countenance; convulsive Twitchings of the Parts, and especially of the Lips; a tremulous and scarce articulate Voice, Interruption of Speech, without any apparent Reason; Forgetfulness of what the Patient had but very lately spoken; Fulness of Countenance, and a Difficulty in discharging the Excrements. But these are also generally antecedent Symptoms in such as are threatened with an Epilepsy or Madness. The first Approach of the Distemper is attended with Loss of Speech, and Depravation of the Senses, by reason of the sudden Shock, perfect Inability of Motion in all the Members of the Body, and Distortion of the Countenance, and, in some, Retraction and Immobility of the Eye-lids, and a Gaping of the Mouth; a full and labouring Pulse, a cold Torpor of the Joints, short Respiration, a livid or leaden-coloured Countenance, and an involuntary Discharge of Tears. As the Distemper grows worse, and seems to threaten the Patient with immediate Death, the Countenance is so distorted, that it appears longer than ordinary, the Præcordia become prominent, a cold Torpor seizes the whole Body, the Lungs during Respiration, make a Noise cold Sweats break out on the superior Parts of the Body, the Eye-brows also and Eye-lids are drawn upwards, and fixed immovably in that Position. But if the Distemper abates, and takes a favourable Turn, the Torpor quits the Body, the Coldness forsakes it, and the natural Heat returns. Some Parts also will be twitched with desultory Spasms, even in those who before were entirely free from them. The Humour secreted from the Fauces is swallowed, though with much Difficulty, nor is it hindered from being so by the Cause which formerly prevented its passing that way. The Patient also, if prick'd, or call'd upon, moves his Eye-lids, and shuts his Lips, as a Sign; that he feels the Puncture, or hears the Person who calls him; and it holds universally, that some die the first Day the Distemper seizes them; others survive its Approach for two or three Days; and others escape with their Lives; some of whom recover immediately, whilst others are affected with a Palsy in one or more Parts of their Body. Some are also racked with uneasy Com-

motions of Mind, to such a pitch, that they seem to have lost their Reason, to be sad and drowsy, and, if any one awake them out of their Sleep, they speak something incoherent and foreign to the Purpose. Now this Disorder is the Result of *Stricture*, or *Tension*, and is of the quick, vehement, and acute Kind. Old Men are most subject to it, and it generally makes its Approaches in the Winter-season, and towards the End of the Autumn. It is by some also styl'd *Paraplexy*. The Head suffers principally in this Distemper, as we may easily conclude from its antecedent Symptoms, and the Violence done to the Body. The Cure is difficult even in Men of strong and robust Constitutions; and those who are weakly and tender yield more easily to its Violence, and that for this additional Reason, that they are not able to bear the stronger and more powerful Means of Relief. Hence we plainly find, that the Cure of this Disease is more difficult in Women than in Men, and in old Men and Boys, than in People who are in the Flower of their Age, in consumptive Persons, than in those who are blest with a firm and strong Habit of Body. It is also more difficultly cured in those who have gone through a Course of Sickness, than in those who have never laboured under any Distemper. The Winter-season also contributes to the Difficulty of the Cure, not only because the Cold condenses and braces up Bodies, but because it is incompatible with some Means of Cure and Recovery, such as Riding, or taking free Air in an open Coach. A Lethargy, Epilepsy, Hysteric Suffocations, according to some, the Palsy, that Species of Disorder which the Greeks call'd *Carus* and *Syncope*, all bear a Resemblance to, and border upon, an Apoplexy. There is nevertheless a Difference betwixt an Apoplexy and a Lethargy, since every Lethargy happens either after, or is accompany'd with a Fever, produces a low Pulse, and does not always deprive the Patient of his Senses: Whereas an Apoplexy seizes without a Fever, renders the Pulse small and quick, and causes the Patient to drop down suddenly as if he was struck dead; add to this, that an Apoplexy sometimes proceeds from a Wound of the Membrane of the Brain, whereas a Lethargy never does (*This is a Mistake*). An Apoplexy is likewise different from an Epilepsy; since Epileptic Patients are affected with Convulsions of the whole Body, and foam at the Mouth, none of which Symptoms are ever observ'd in Apoplectic Cases. After the Fit also, Epileptic Patients arise, for the most part, with their Constitutions sound, whereas Apoplectic Patients come not off without a Palsy of the Parts. An Apoplexy is always accounted a Disease of the quick and acute Kind, whereas an Epilepsy is most frequently found to partake of a slow and chronical Nature. The Disease of which we are treating, differs also from Hysteric Suffocations; for these latter are not preceded by Pains of the Head, and in the Paroxysm the Matrix is found convulsed, and heaving upwards; but this never happens in Apoplectic Cases. Besides, Apoplectic Women do not remember any thing that happen'd after the Fit is over, whereas those who labour under Hysteric Suffocations can both remember and tell what Degree of Pain they suffered during the Paroxysm. Hysteric Suffocations are also found to be slow and chronical, but an Apoplexy never. An Apoplexy is also different from a Palsy, though these two Diseases were confounded by many of the Antients, among whom were *Hippocrates*, *Diocles*, *Praxagoras*, *Asclepiades*, *Demetrius*, and some others besides; for they called those People Apoplectic, whose whole Bodies were paralytic, and those Paraplectic, who were paralytic in some particular Parts of their Bodies. But *Themison* properly calls a Palsy of the Head, with the Operations of the Mind weakened, an Apoplexy; but the same Disorder in other Parts of the Body, with the Faculties of the Mind impaired, he calls only Palsy. But there is no Occasion for wrangling about Circumstances, on which the Method of Cure does not depend. We must only consider, that an Apoplexy is esteem'd a Disease of the quick and acute Kind, and a Palsy a Disorder of a slow and chronical Nature. The *Carus* also, and *Catalepsis*, are rank'd among the Diseases of which the Patients recover, and they never elevate the *Præcordia*, nor create such a Difficulty of Recovery as the Apoplexy does. *Cælius Aurelianus*, *Acut. Lib. 3. Cap. 5.*

Altho' the *Morbus Attonitus*, by the Greeks call'd ἀποπληξία, sometimes seizes the Patient without any previous remarkable Symptoms, 'tis nevertheless, for the most part, ushered in by a sudden and acute Pain of the Head, a Vertigo, a Dimness of Sight, a Grinding of the Teeth during Sleep, and a Coldness of the whole Body, but especially of the extreme Parts. Then the Patient, like one thunder-struck, drops down, sometimes with Shrieks; immediately after, the Eyes are shut, and a Stertor ensues; the Difficulty of Breathing is so great, as to occasion a Danger of Suffocation, and the Breast ceases to heave, just as if it was bound fast with Cords: Sense and Motion are entirely lost, and the only remaining Hope of Life consists in Respiration being preserved. And, indeed, the Nature and Danger of the Disorder bear a direct Proportion to the Difficulty or easiness with which Respiration is perform'd; for which Reason, we conclude the Disorder fatal, when the Respiration is either intermittent, or carried on with great Difficulty. But the

Case is less dangerous when the Patient's Respiration is pretty easy, and when the Liquors he drinks are not again discharg'd by the Nose, but freely descend to the Stomach. The Cure of this Distemper, when violent, is altogether impossible; and even when slight, very difficult; and indeed, this latter Degree of the Disorder frequently terminates in a Paralysis of one or other of the Sides, and that generally within the first four Days; after which, if the Disease continues, it proves fatal. Yet the Distemper often affects some in so gentle a manner, as only to distort their Mouths, and deprive them of Motion, without any Foaming at the Mouth, Stertor, or Palsy, in which Case they may be recovered by the Use of proper Remedies. This Disease is generally most incident to Men between forty and sixty Years of Age, especially if they have the Misfortune to be of a too cold Constitution, to be frequently afflicted with heavy Pains of the Head, Drowsiness, and Dimness of Sight, or if they have short and narrow Necks, live entirely idle, or are addicted to Drinking and Gluttony. But a young Man, or even one who is moderately advanced in Years, or in Reality any one whatever, is not, during the Summer-season, subject to this Disorder, unless very considerable Causes concur; in which Case, Death is generally the Result. The Winter, on the other hand, paves a more direct Road to this Disorder, especially when cold Winds blow, or black Clouds hover in the Air. Hæmorrhoidal Discharges are of good Presage in this Disorder; but Coldness and Insensibility are hurtful. Sweats also arising from Difficulty of Respiration are mortal. People in this Disorder often appear dead, when they are really alive, but more especially Women, and Men of cold Constitutions. However, the Truth of the Matter may fully be discovered, by applying a light Feather to the Mouth and Nose, or by placing a small Vessel full of Water on the Breast, to which if any Motion is communicated, the Patient is still alive; but if they remain entirely unmoved, he is dead. *Hippocrates's* Observation seems to be just, That a sudden Pain of the Head, accompany'd with Loss of Voice and Stertor, destroys the Patient within seven Days; but that he may be preserved, if a Fever happens before the End of that Time. *Lemmii Opusc. Aureum.*

The most fatal and terrible of all Apoplexies is that which proceeds from an Effusion of Blood in the Brain, from its Vessels being burst without any external Violence, and which suddenly stops and extinguishes the vital and animal Functions.

That such an Hæmorrhage of the Brain really exists, and that the Rupture of the Vessels is its immediate Cause, is sufficiently plain from the Dissection of Subjects that have died of this Disorder. Upon such Occasions, we plainly find an Effusion of Blood, sometimes between the Cranium and the Dura Mater, sometimes between the Dura and the Pia Mater, but more frequently between the Pia Mater and the Brain, but most frequently of all, in the Windings of the Brain itself, and the Medullium of its Ventricles. This Effusion happens also sometimes in its Basis, sometimes in a small, and sometimes in a pretty large Quantity. From dissecting Subjects of this kind, 'tis also plain, that the Blood-vessels, running thro' the Membranes and cortical Substance of the Brain, are sometimes found turgid, and, as it were, aneurysmatic, with liquid, and sometimes coagulated Blood: They are also found on some Occasions to be actually burst. The Histories of the Dissections of Subjects who have died of Apoplexies, written by the learned *Wepfer*, may be consulted for Satisfaction in this Point.

The Part then originally affected is the Brain, which is very much disposed to, and susceptible of, this Stagnation of the Blood, and the Hæmorrhage consequent upon it. For a very large Quantity, and at the least, according to *Malpighi*, a third Part of all that Blood which is thrown from the Left Ventricle of the Heart thro' the whole Body, is carry'd to it by means of four pretty large Arteries; besides, these arterial Vessels, which convey the Blood to the Brain, are very winding in the Whole of their Course, but especially in the *Pia Mater*. But the most considerable Circumstance of all is, that after these very Arteries have enter'd the Cranium, they lay aside their exterior tendinous Coat, the principal Instrument of their contractive Motion, become much smaller than those in any other Parts of the Body, and almost resemble Veins; not to mention, that these Vessels become at last so very small, that the Transition of the Blood from them, into their corresponding Veins, cannot possibly be observ'd. All these Circumstances concur to make us perceive, why the Blood in these Parts must circulate slowly, stop easily, not enter the Veins quickly and readily, but, being accumulated by continual Recruits of fresh Blood, distend and enlarge the Capacities of the several Canals, and lay a Foundation for many subsequent Evils.

From such a Disposition and State of Things as this, the Transition is easy to a Rupture of the Vessels, and an Effusion of their Contents, where those Causes concur, which occasion a Congestion of the Blood to the Head in too great a Quantity, or with an undue Impetus, produce its Stagnation there, and strongly prevent its free Return thro' the Veins; for by these means it happens, that the Vessels not only become turgid

with

with Blood, but, being too much distended with the continual Arrival of more, burst, and pour forth the Blood contain'd in them. This principally happens in the small Vessels of the Pia Mater, and those of the cortical Substance of the Brain, as well as those which form the Plexus Choroides, as is evident from the Dissection of Carcases.

By an Effusion of Blood in the Brain, the Secretion and Distribution thro' the Nerves of that most subtle Fluid, which conveys Motion, Strength, and Sensation to the several Parts, is not only hinder'd, but the Motion of the whole Blood circulating thro' the Brain is disturb'd and intercepted, by which means the animal and vital Functions languish apace, and are at last quite extinguish'd. That Matters stand thus, is sufficiently attested by the direful Symptoms accompanying this Hæmorrhage, and by which, as by so many diagnostic Signs, it may be distinguish'd from every other Disorder; for those who are seiz'd with it fall suddenly to the Ground, become void of all Thought and Reflection, and are depriv'd of all Sensation and Motion; all their Members become languid and flaccid, their Tongues swell, their Eye-lids are retracted and immovable, and their Mouths remain wide open; their Deglutition is destroy'd, and their Excrements and Urine are often involuntarily discharg'd: And all these Symptoms plainly shew, that the Functions of the Brain are impair'd and injur'd, and that the Strength and Vigour of the Muscles is consequently become weak and languid.

The other Phenomena observ'd in Cases of this Nature are to be ascrib'd to the difficult and intercepted Passage of the Blood thro' the interior Vessels of the Head. Thus the Cheeks are cover'd with a red and florid Colour; the Face swells; its Vessels, especially those running thro' the Temples, become so turgid, that sometimes breaking, they pour out Blood into the Mouth, Nostrils, and Ears, especially after the Death of the Patient. And that when Putrefaction comes on, the Head is distended to an incredible Size, which is justly to be ascrib'd to the Blood's not being allow'd a free Course thro' the internal Carotids, and on that account making an Effort on the external ones; that the Eyes are distended, become prominent, stiff like Glass, and pour out Tears in great Abundance, are Phenomena that may be accounted for from the Lymph being secern'd in great Plenty from the stagnating Blood. That the Palpitation of the Heart is strong; that the Pulsation of the Arteries is at first great, and afterwards languid and slow; that the Breathing is difficult, and accompany'd with a Stertor; these are to be imputed to the Load of Blood oppressing the Lungs, and their having by that means their equal reciprocal Motions destroy'd, and becoming incapable of receiving and expelling the Air as they should do. In fine, that Vomiting and Convulsions, accompany'd with Grinding of the Teeth, happen, is to be accounted for from nothing else than the Blood lodg'd in the Vessels of the Dura Mater, and exciting Spasms in it.

Now as every Hæmorrhage presupposes such a Congestion of Blood as is sufficient to produce a Rupture in the Parts where it happens; so 'tis certain, that this must be the Case with Hæmorrhages of the Brain. This is plainly prov'd, by the Nature of all the antecedent Symptoms; the principal of which are, a dull and heavy Pain of the Head, especially of its hinder Part, accompany'd with a Vertigo, like that which attends a Fit of Drunkenness, an unequal formicating Pulse, the Sight sometimes obscur'd, and sometimes flashing or sparkling; watering and swell'd Eyes; Noise and Ringing of the Ears; a certain Heaviness of Memory and Genius; profound Sleep, attended with the Incubus, and troublesome Dreams; a Turgidness of the Jugular Veins, and a preternatural Redness of the Face.

But farther, as in order to bring a Congestion of Blood upon any Part, besides the Abundance of the Blood itself, a strong Propulsion of it by the Spasms of some other Part, and a certain Weakness and Debility in the Part, admitting the Congestion, are necessary; so we have no Reason to doubt, but these Causes concur to bring on that Congestion which happens in the Vessels of the Brain: For Reason informs us, and Experience confirms to us, that all the antecedent and procatartick Causes of this Disease may be reduc'd to these now mentioned.

To begin then with the too great Quantity of Blood; it is entirely owing to it, that Hæmorrhages of the Brain happen most frequently to People arriv'd at Maturity, and, according to *Hippocrates*, *Aph. 57. Sect. 6.* from the fortieth to the sixtieth Year of one's Age, when the Growth or Increase of the Body being at an End, the Juices are not only treasur'd up in the Vessels in a greater Quantity than they should be, but also become thicker. Hence it also happens, that such as are of what we commonly call sanguine Constitutions, as also fat People, and those who lead a delicate, idle, and sedentary Life, or indulge themselves too much in Sleep, are very subject to these fatal Hæmorrhages. That this Misfortune also happens to those, who either thro' a Diminution of their spontaneous Hæmorrhages, or an Omission of their long-accustom'd, artificial Eva-

cuations of Blood, have acquir'd and treasur'd up, as it were, too great a Quantity of it, is abundantly plain from the Observations of Physicians. That this Disorder arises from accumulat'd Evacuation of Blood being neglected, may be seen in *Acta Medica Vratisl. 1702.* That it may proceed from an Hæmorrhage of the Nose being suppress'd; is plain from *Hildanus, Cent. 3. Observat. 2.* That a Retention of the Hæmorrhoids has brought it on, may be found in the Writings of *Hippocrates*, *Amatus*, and *Zacutus Lusitanus*. For this Effect also, *Lancisi de Mortib. Subit.* ought, above all others, to be consulted. The Writings of *Fontanus*, and the *Acta Nat. Curios.* are full of Instances of this Distemper's arising from the *Menses* and *Lochia* being suppress'd. And *Hildanus, Cent. 3. Observat. 12.* gives us an Instance of its being produced by the *Menses* being discharged at the Mouth and Nose, instead of the natural Way.

But a Redundance of Blood will contribute more readily and more effectually to the bringing on this Disorder, if another Cause, that is, Spasms in some of the external Parts remote from the Head, should happen to act in Conjunction with it; for this latter Cause operates in so terrible a manner, as not only to stop the Progress of the Blood, by bracing up the Fibres, and constricting the Vessels of the Part affected, but also propels the Blood in such a manner, that it rushes to some other Parts with an Impetus, fills their Vessels, distends, and at last bursts them. But the Hardness and Largeness of the Pulse, which plainly bespeak a Stricture of the Nervous Coats of the Arteries, evidently shew, that Spasms accompany almost every Hæmorrhage, as well as this of which we are treating. The preceding Coldness of the Extremities, as also that sort of tingling Sensation which some feel in their Limbs, is likewise a collateral Proof of this Truth. For this Reason also we have just Reason to think, as, indeed, Experience testifies, that Hæmorrhages of this Kind are often incident to those who have been long subject to Spasms, especially of the Abdomen, that is, those who have been afflicted with Colic Pains, especially the spasmodic Kind, Hypochondriac Disorders, Pains from the Stone in the Bladder or Gall-bladder, or a long continu'd Series of Costiveness.

From what has been said, we may also farther conclude, that every thing which has a Tendency to excite Spasms, is to be rank'd among the Causes which produce this Distemper. The Effects of the Passions of the Mind are very remarkable, with regard to this Particular, especially of Anger and Dread, which act immediately upon the nervous Parts, and, by bringing anomalous spasmodic Motions upon them, render the Circulation of the Blood irregular, and frequently produce this Disorder, as amongst the Writings of many others may be seen in those of *Hildanus*, *Schenckius*, and *Foresius*. The same Effect may be produced by the Heat of Venereal Rage, which destroying the due Equilibrium of the several Motions, the Blood has in some been put into such an unnatural Commotion, that they have died Apoplectic, and, as it were, thunder-struck, in the very Time of their fatal Embraces. For farther Satisfaction in this Particular, the Reader may consult *Henric. ab Heers, Observat. 18.* and *Bartholin.* (See VENUS).

A violent Commotion of the Body, as well as of the Mind, contributes also very much to produce a Congestion of Blood in the Head; and among other Instances of this Kind, I myself knew a violent Cough excited by a small Piece of Bread getting into the Aspera Arteria, which brought on an Hæmorrhage of the Brain, and prov'd the Patient's Death.

When that acrid, corrupt, and almost poisonous Matter, for wise and salutary Purposes, secreted from the common Mass of vital Juices, in order to be propell'd to the Surface of the Body, either retreats inwardly of its own Accord, or is repell'd by external Injuries, it is of great Force, and has a direct Tendency to bring on this Disorder; because, by entering the internal nervous Membranes, it excites terrible spasmodic Strictures, by which the Blood is driven with an Impetus to the Head, and treasur'd up there. Thus *Wesfer* informs us, that this Disorder has proceeded from the closing up of running Ulcers and Fontanels; and in the *Ephemerides Naturæ Curiosorum* we have Instances of its proceeding from the Suppression of a Coryza, Sweatings of the Feet, Catarrhus Discharges, and from the striking in of the Itch. It also proceeds from repelling the gouty Humour.

Astringents unseasonably and imprudently apply'd, especially in large Hæmorrhages, produce almost the same fatal Effects on the internal nervous Parts: Of this we have observed a remarkable Instance, describ'd at length by the famous *Schultraius*, in a Dissertation deliver'd at *Altorf*, concerning a Man who died of an *Apoplexy*; brought on by a rash Suppression of the Hæmorrhoids.

Among the Causes of this Disorder, we may justly reckon the Air itself; the unwholesome and preternatural State and Constitution of which is, by *Lommius*, *Bagliivi*, and *Lancisi*, affirm'd to have made this Disease epidemical. But what most of all contributes to the Production of this Disorder is Cold, which, by contracting the cutaneous Fibres, and bracing up the

the Vessels which lie near the Surface of the Body, forces the Humours to the internal Parts, and to the Head itself. Hence *Hippocrates*, *Seet. 3. Aph. 23.* reckon'd an Apoplexy among the Number of those Diseases which rage in the Winter-season. And *Piso* observ'd, that about the Winter Solstice, when the North Wind, which compresses Bodies very strongly, and consequently raises the Mercury in the Barometer, began to blow of a sudden, *Apoplexies* us'd to seize People who were inclin'd to them. A sudden Change of Air contributes also very much to excite this Distemper. We certainly very often observe, that when a cold Northerly Wind suddenly succeeds a long, cold, and moist Intemperature of the Air, when the Winds have blown long from the West; or also when a cold and constricting State of the Atmosphere suddenly succeeds a warm and moist State of the Air, People very readily fall into this Disorder, provided their Constitution dispose them to it. Upon this also is built that Observation of *Amatus Lusitanus*, *Cent. 1. Curat. 36.* in which he gives us an Account of an Apoplexy arising from the Body's being expos'd to the cold Air, immediately after coming out of a hot Bath.

Among the principal Causes of this Disorder we may justly reckon the Weakness of the Vessels and Membranes of the Brain, or a Diminution of their contractile Power; for without this Imbecillity, neither the Abundance, nor the too quick Arrival, of the Blood can produce this Disorder; but where it is found, the Membranes protrude the Blood with too little Force, the Vessels yield to it, the Circulation becomes slow, a Stagnation ensues, then an Infarction, and then a Rupture. This Weakness is sometimes natural, and deriv'd down to Children from their Parents. Hence it is, that this Distemper proves fatal to whole Families, Examples of which may be found in *Hoeferus*, *Forestus*, and *Sennertus*. This Imbecillity is also adventitious, as is the Case with old Men, in whom the Strength of every Part decays, and consequently of the Head; for which reason they are, *ceteris paribus*, more subject to this Distemper than young People.

Among the Causes depriving the Vessels and Membranes of the Brain of their due Tone, the principal are, Gluttony, Intemperance, and drinking to Excess of hop'd Ales, Wine, especially if impregnated with the Fume of Sulphur, and Brandy; for such is the Nature of these Liquors, that they agitate and expand the Blood, and at the same time, by that very means, distend the Vessels thro' which it flows: When this happens to be the Case with the Brain, the Distention continues, the contractile Force of its Vessels and Membranes is impair'd, and a Way pav'd for a Stagnation. From these Circumstances *Henricus ab Heer* justly accounts for this Disease being so incident to the Inhabitants of the Northern Climates; and *Lancisi* observ'd, that, generally, no habitually sober Persons were subject to it. The same is the Case with such Substances as induce a Stupor on the Head, such as Opiates, Wormwood, Hops, Tobacco, Saffron, Live-coals, the Steams of Must and Ale, by which, whilst the Juices are rarefy'd, and the Canals preternaturally distended, the Circulation becomes slow, and is retarded.

A cachectic Habit of Body, accompany'd with a heavy Pain of the Head, in which the Medullary and Nervous Fibres of the Brain are render'd flaccid, too lubricous, and depriv'd of their contractile and oscillatory Forces, contributes very much to the bringing on this Disorder. That this State and Disposition of the Brain contribute very effectually, not only to an *Hemiplegia*, but also to a strong and sanguine *Apoplexy*, we know from many Instances. We have also found, Asthmatic People subject to this Disorder, especially, when their Distemper was fed and nourish'd by polypose Coagulations lodg'd in the Ventricles of the Heart, or pulmonary Vessels. It has also been often observ'd, that not only grumous, but polypose Masses lodg'd in the Sinuses of the Brain, especially the longitudinal Sinus, and in the internal Jugulars, have produced a fatal Effusion of Blood in the Brain.

That *Apoplexy* which proceeds from an Effusion of Blood in the Brain, is accurately to be distinguish'd from that milder Species produc'd by an Extravasation of the Serum, which is follow'd by an *Hemiplegia*, and a Palsy of the whole Side; in which Case Life is indeed preserv'd, but at the same time render'd very miserable. This Disorder happens when the Blood is carry'd to the Head with too great Force, and in too great a Quantity, but does not burst the Vessels; only, in consequence of its long Stagnation, the Serum passes thro' the Pores of the Vessels, and falling down to the Basis of the Brain, or the Sides of the Medulla Spinalis, and pressing upon it, not only hinders the Secretion of the subtle active Fluid, but also intercepts its Influx into the Nerves, and by that means deprives one or other of the Sides of all Sensation and Motion. We must not forget to take notice of the remarkable Difference betwixt sleepy Indispositions, and that now describ'd; for the former seize the Patient by Degrees, and not all on a sudden; neither do they destroy Sensation and Motion, except under the immediate Paroxysm, and by reason of the Profoundness of the Sleep.

That Observation laid down by *Hippocrates* in his Apho-

risms, *Seet. 2: Aph. 32.* corresponds very well to Truth, and what we find from Experience: That more violent *Apoplexies*, such as those proceeding from an Effusion of Blood in the Brain, are absolutely incurable; but that the milder Species, proceeding from a Stagnation of the Blood, and an Extravasation of the Serum, admit of a Cure, though with Difficulty: For, unless the Patient is relieved, and the Symptoms remit within twenty-four Hours after Blood has been taken away, and other proper Means used, all Hopes of Recovery are lost, and, according to *Caelius Aurelianus*, the third Day at the longest puts an End to the Patient's Life. This fatal Event is the more to be dreaded and look'd for, if the Disease seizes old Men of plethoric Habits, whose Strength is impair'd, and whose Brains are weaken'd; if it happens after a Fit of Drunkenness, or violent Attention of the Mind, an Excess of Anger or Terror, or also if it succeeds and follows immediately another Disease. But we are to conclude, that Death will very soon be the Fate of the Patient, if the Stertor and Difficulty of Breathing increase more and more, if the Heart beats violently, and the Pulsation of the Arteries is great, hard, and unequal; if, when the Patient recovers a little, his Mind is nevertheless unhing'd, as it were, and disorder'd; if convulsive Motions of one of the Sides, and of the Breast itself, appear; if a cold Sweat break out in Drops, especially on the superior Parts of the Body; if the Breath itself is cold; and, lastly, if the Urine and Excrements come away spontaneously.

Celsus advises to bleed *Apoplectic* Patients (*Attonitos*), to exhibit white Hellebore, or to purge them. Then Frictions are to be applied; mild Aliments, which are not in the least fat, and some which are acrid, are to be used. The Patient must utterly abstain from Wine. *Lib. 3. Cap. 26.*

Arctaeus distinguishes a true *Apoplexy* from Distempers which are nearly related to it, in this manner:

An *Apoplexy*, *Paraplegy*, *Paresis* [*πάρεσις*], and *Palsy*, belong all to one Kind, as including a Defect of Motion, or Sensation, or both, and sometimes a Loss of Reason, or some one or other of the Senses. But an *Apoplexy* affects the whole Body, and is a *Palsy* [*παράλυσις*] of the Senses, Reason, and locomotive Faculty; wherefore a strong *Apoplexy* is incapable of a Solution, and a weak one will hardly admit of it. A *Paraplegy* is a *Paresis* of Motion and Sensation, but limited to a Part, as the Hand or Leg; and the *Palsy*, universally speaking, is a *Paresis* only of Motion and Action. If there be only a Defect of Sensation, which rarely happens, it is rather call'd *Anaesthesia* than *Paresis*. *Hippocrates* by saying, that a Leg is *apoplectic*, means, that it is like a dead Member, unserviceable and incurable; for a strong *Apoplexy* is to the whole System, what a *Paraplegy* is to the Leg. There is a proper *Paresis* of the Bladder under an involuntary Retention or Discharge of the Urine. A Distortion of the Eye-lids, Cheeks, Maxillary Muscles, and Chin, by a Convulsion, is called a *Spasmus Cynicus* [*κυνικός σπασμός*]. A Resolution of the Knees with a short Stupefaction of the Senses, a Fainting, and Falling down, we call a *Lipothymy* [*λεπθυμία*]. *Arctaeus* *περὶ ἀσθενῶν καὶ συμ-χεσίων παθῶν*, *Lib. 1. Cap. 7.*

The CURE.

The above-quoted Author is more distinct, with respect to the Cure of an *Apoplexy*, than any of the Antients; for which Reason, I shall give his entire Chapter.

A strong *Apoplexy* is mortal on all Accounts, especially to old Persons, who are most subject to this Disorder; for there is no Hope, that they should survive, because they are at once oppress'd with the Weight of the Distemper, and the Infirmities of old Age. If the Patient be young, and the *Apoplexy* weak, the Cure indeed is not easy, but however ought to be attempted.

The most obvious Remedy, as it is best suited to the Greatness of the Disorder, is Phlebotomy, if it be exercised in a due Measure. But the Quantity of Blood which ought to be taken away is hard to be determined, since, if you take but a little more than the Case requires, you destroy the Patient; for this little Excess is sufficient to keep them alive, being the Fuel of Life, and Matter of Nutriment to the Body. If, on the other hand, you bleed less than is requisite, you make use of a very good Remedy to little Purpose; for the Cause still remains. However, it is better to offend in this Extreme; for if the Patient seems to want it, and some favourable Symptoms appear, the Vein may again be open'd; and the most proper one for this Purpose is the Vein on the Inside of the Cubit, which in the Left Arm is disposed to bleed freely.

In a small *Apoplexy* it is to be considered, whether the Resolution affects the Parts on the Right or the Left Side; and the Blood, in short, must be drawn from the sound Parts, as best disposed to bleed, and fittest to make a Derivation from the Parts affected. If an *Apoplexy* seizes a Person without a manifest Cause, we are to proceed by these Directions in letting of Blood; but if it happens from a Blow, a Fall, or a Pressure, we are not to consider, but with all possible Speed to open a Vein, which has been to some a Remedy sufficient of itself, and the only Means of Life and Recovery.

If Phlebotomy be thought improper, because of the great Coldness, Torpor, and Insensibility, with which the Patient is oppressed, a Clyster is to be administer'd, which, by evacuating the loaded Intestines, (for this Disorder is the usual Effect of a Crapula) may cause a Revulsion of the Humours from the Head. The Clyster should be acrimonious, and a Purger of Phlegm and Choler; and have not only Nitre, but half a Dram of Euphorbium for an Ingredient in the usual Quantity of a Clyster, with the Pulp of Colocynth, or a Decoction of the Tops of Centaury in Oil or Water. The following is a very good Preparation:

Honey in the usual Quantity, Rue boiled in Oil, and Refin of Turpentine, with Salt instead of Nitre, and a Decoction of Hyssop.

If the Patient be a little roused by this Method, have a Fever come upon him; or recover his Senses; if his Pulse beats well, or good Signs appear in his Face, there is room for Hope, and we may proceed with more Confidence. When the Strength is somewhat recover'd, you are to administer the Purge call'd *Hiera* to the Patient fasting, in its full Dose, if the Strength will permit; if not, half of it, in Hydromel. After this, let him be gently carry'd in a Chair in a reclining Posture, often resting to avoid Weariness. If his Belly be loose, let it so remain; if otherwise, let him drink about a quarter of a Pint of Water or Hydromel. If a Nausea comes upon him after purging, by no means try to remove it; for the stretching of the Body tends to awaken and blow up the Sparks of Life, and the Vomiting of Phlegm carries off the Cause of the Disease. The *Hiera* is a Medicine that purges the Brain, Nerves, and Senses; and thus I have said enough of Evacuations in the Beginning.

As to the rest, the Patient must be wrapt in Wool, and be washed all over with Oleum Sicyonium, or old Oleum Gleucinum, either of them alone, or both mixed together. And it will be the best way to melt a little Wax, to thicken the Oils, and to increase their Strength with an Addition of Nitre and Pepper, first pounded and sifted. Castor is a noble Remedy against Paralytic Disorders, if it be mixed with the before-mentioned Oils, and anointed upon the Parts; but it is much more effectual, if drank in Hydromel, in the Quantity of half a Dram; and we are to judge from the Age and Disposition of the Patient, whether it be proper for him to take it in a Course of several Days together. Ointments are better than Embrocations, as being more tolerable as well as effectual; for they do not run about, and stain the Bedcloaths, and it would be inconvenient for the Patient in this Case to have the Cloaths stick to his Body; whereas Ointments are melted and absorbed by the Heat, and are serviceable also on account of their continual Adhesion, when Embrocations run off. The Ingredients of Ointment may be such as I have named already; and besides these,

Castor, Refin of Turpentine, Euphorbium, the greater Centaury [*αυανθισ*], Pellitory of Spain, of each an equal Quantity; of Pepper, and Galbanum, each half as much, with triple the Quantity of Egyptian Nitre; to which add as much Wax as will make it into the due Consistence of an Ointment.

Cataplasms are to be apply'd to the hard and distended Parts; these may consist of

Linseed, Fenugreek, Barley-meal, Honey, Oil, in which Rue or Dill have been boiled, the Root of Marshmallows cut in Pieces, and boiled in Hydromel, till it becomes of a wax-like Thickness; and let these Cataplasms be of an agreeable and soft Consistence.

If the Patients then have little or nothing of a Fever, these are the Remedies that are to be try'd, without regarding their Heat.

If there be an acute Fever, which appears more formidable than the other Distemper, and threatens the Life of the Patient, both Diet and Medicine, and all other Parts of the Management, are to be suited thereto. The Aliment therefore must be very thin and slender, and easy of Concoction, and the proper Seasons for eating are now to be more regarded; no Sustainance is to be taken before the Paroxysms during the whole Course of the Cure, and all our Intentions are to be directed to the Removal of the Fever.

If the Disease be protracted, and the Head in fault, a Cupping Glass must be apply'd to the back Part of the Head, and the Place must be well scarify'd; for this gives more Relief than Phlebotomy, without any Diminution of the Strength: But first of all let another Cupping Glass be apply'd between the Shoulder-blades, without Scarification, in order to make a Revulsion from that Cupping Glass on the Head.

Sometimes a Palsy affects the Oesophagus, which is the Part that can be the only Means of Relief to the Patient, as being the common Passage for Food and Medicine: And the Sick is in Danger, not only of Famine and Atrophy, but of a Cough, Difficulty of Breathing, and Suffocation; for whatever liquid

VOL. I.

Aliment you put into his Mouth slides into the Aspera Arteria; neither the Tonsils doing their Office by descending to depress the Food, nor the Epiglottis, which is in the Nature of a Lid or Cover to the Aspera Arteria, subsiding into its proper Place. It will be necessary therefore, by means of a long Spoon introduced into the Oesophagus beyond the Aspera Arteria, to convey some Hydromel, or Cremor of Ptisan, into the Stomach; and so supply the Defect of Deglutination. If the Patient lie at the Point of Death, and his Neck, together with his Breath, seem to be condensed and closed up, we are to treat the Neck; and the Parts under the Chin, with heating Ointments and Fomentations. They who apply a Cupping Glass under the Chin, in order to open a Passage to the Stomach, act unskillfully, and to no Purpose; for there is no Need of a Dilatation, but of a Compression of the Parts, in order to Deglutition. But a Cupping Glass dilates the Oesophagus, and by a Retraction, and holding the Parts at a Distance from one another, is an Enemy to spontaneous Deglutition: But this Part ought rather to be left at Liberty, that it may the better protrude the Aliment forwards into the Stomach. Besides what has been observed, a Cupping Glass fills the Trachea so as to endanger Suffocation; and if you should apply one to different Parts of the Throat, it would be of no Service; for the Multitude of Muscles, Nerves, Tendons, and Veins, are interpos'd betwixt the Oesophagus and the Glottis.

Sometimes the Bladder, and its neighbouring Part the Rectum, become Paralytic, so as to be incapable of discharging their Contents; whence they remain always full, and the Bladder in particular swells to an enormous Size. Sometimes a Palsy affects these Parts in such a manner, that they can retain nothing, but all runs from them as if they were dead. In this Case it is not safe to search the Bladder with a Catheter, for fear of causing a Sphacelus in that Part; or of throwing the Patient into Convulsions. The best way is to wash the Intestines with moderate Clysters of Cremor of Ptisan; but the only Remedy to be depended upon in all Palsies, whether general, or of some particular Part, is an Infusion in Oil. *Arctaeus regi* βεζαν. βζ. παθ. Lib. 1. Cap. 4.

From COELIUS AURELIANUS.

The Cure of the Apoplexy has been insisted on by none of the principal Physicians among the Antients; for they generally thought, that it was to be ascrib'd to a Palsy. *Hippocrates* alone [*Aphor. 42. Sect. 2.*] says, That it is impossible to cure a violent Apoplexy, and not easy to cure a gentle one. The Abettors also of other Sects in this Case fomented the Head with Vinegar and Oil, and the other Parts of the Body with Wine and Oil, covering up the Patient with undress'd Wool. They likewise carefully embrocated the Head with a Mixture of Ivy, Mother of Thyme, and Hog's Fennel; the acrimonious and astringent Qualities of which ought in this Case to be avoided. A Method of Cure therefore adapted to the Nature of the Distemper is to be used. The Patient is to be lodg'd in a Place moderately light and warm. The Joints are to be gently rubb'd; and the Middle of the Head and Neck are to be cover'd with clean Wool. Warm Fomentations of sweet Oil are also to be used, and the Face is to be covered with a Sponge wrung out of warm Water. Warm Water is to be drank; and Mulsim is to be gradually swallow'd. Phlebotomy is also to be used; nor is it necessary to wait [*ad diatrioton*] till the third Day before that Operation be performed; since it may properly enough be done when the Paroxysm is least violent, or about Break of Day, when the Coldness and Torpor of the Body seem to be succeeded by a gentle Warmth: For those who have hurried on to Phlebotomy before this favourable Concurrence of Circumstances appeared, have unawares performed the Operation in the Height of the Paroxysm, or, performing it at the time the Patients were expiring, could possibly be of no Service to them; since at that Time the weakened Body is incapable of sending forth any Blood, tho' the Vein appears to be open'd. Abstinence is also to be used for the first three Days; then hot Ointments are to be apply'd, and Vaporations by means of Sponges wrung out of warm Liquors; forbile Aliment is proper, or Bread infused in warm Water, or Mulsim. If the Patient is not costive, a common Clyster is to be injected; and Cupping Glasses, with Scarification, are to be apply'd at the Time already directed, that is, in those Intervals when the Disease rages least, to the Back of the Head, and whole Spine. Vaporations, with Sponges, and laxative Cataplasms, are to be used. Then the whole Head is to be shav'd, and Cupping Glasses are to be apply'd to several Parts of it; and till the Distemper abates, the Patient is only to be nourish'd every other Day; but if his Strength is much spent, he may be fed daily. When the Disease declines, Cerecloths are to be used, and the Body is to be immerfed and bathed in Oil, or in warm Water and Oil. Then Variety of Food becomes proper, sometimes Pot-herbs, sometimes Fish, and sometimes Fowl. The Bath must also now be used; a few Apples may be eaten, and Wine may be allow'd. But too immoderate and excessive an Use of the above-mentioned things is to be avoided, by reason of the Dan-

ger of the Distemper, and the Difficulty of its Cure. *Cælius Aurelianus, Acut. Morb. L. 3. C. 5.*

From PHILUMENUS.

Those who are seized with an Apoplexy must be plentifully anointed with thin Oil. The Head is also to be anointed with Oil of Roses, in which Cows-parfnip has been boiled; and Mulsam is to be infill'd into the Mouth. Perfumes are likewise to be used, such as Castor, Opopanax, or Galbanum. The Patient's Mouth is also forcibly to be opened, and the Finger, or a Feather, dipt in Oil, introduced into it, in order to remove any superfluous Matter that may happen to be lodg'd in it. The Anus also is to be anointed with such Substances as have a Tendency to draw forth, and dispel Flatulences. If the Violence of the Distemper is not abated by these means, we must then have recourse to acrid Clysters, with which Brine and Honey have been mixed. After these several Steps have been taken, a Vein must be open'd. Upon which we must again betake ourselves to stimulating Medicines. *Oribas. Lib. Octav.*

Galen's Method of Cure is much the same with that of *Philumenus* mention'd by *Oribasius*, only it is a little fuller, and more circumstantial; for he orders Attempts to be made to procure a Discharge of the injected Clysters by Friction of the Belly, and Region of the Loins. He also orders the Vein to be opened in the Right Arm; and the Patient's Pulse, the Colour of his Face, and his Respiration, to be carefully adverted to during the Evacuation of Blood; and if no bad Consequence ensues, he orders Phlebotomy to be repeated; and the Patient is to be excited by foetid Smells, and by frequently calling to him. If any Part is remarkably weakened by the Violence of the Distemper, he orders a Bolster of Wool, impregnated with *Sicyonian*, or any other rich old Oil, to be apply'd to it.

In Cases where Blood cannot be procured, the Patient's Throat is to be tickled, in order to bring on a Vomiting; his Anus is to be anointed with such Substances as draw out Flatulences, and severe Cuppings are to be apply'd to the Region of his Loins for some time, and then to the Pubes and Lower Belly. When none of these Means succeed, he orders *Hiera* to be pour'd into the Mouth, or injected by way of Clyster. If the Distemper is complicated with a Fever, which he says sometimes comes on the first or second Day, and is an hopeful Symptom, the Fever is not to be neglected; but if any noxious Matter remains in the Intestines, it is to be evacuated, if lodg'd near the Anus, with Clysters; if otherwise, with Purgatives, and especially with the *Hiera* of *Archigenes*. After the Patient is thus purg'd, Cuppings, with Scarification, are to be used on the Patient's Præcordia and Head; and, if any Pain is felt lower, Scarification is there also to be used, especially in Women about the Region of the Uterus. The Evacuations by Stool and Urine must be kept free and easy, and the Patient must be fed daily, but sparingly, with such Foods as are light, warm, and cleansing. The Food in this Case may for the most Part be edulcorated with Honey. *Actius, Tetrabib. 2. Serm. 2. C. 27.*

The Cure of an Apoplexy, propos'd by *Paulus Ægineta*, agrees with these already mentioned, in the most material Circumstances. Only he is for anointing the Body with Oil impregnated with Sulphur, and the Head with Oil of Chamomile or Dill, in which Cow-parfnip or Calamint have been boiled. He also orders Sternutories and Apophlegmatisms, or Decoction of Thyme or Origanum in Vinegar, in order to promote a Discharge of Phlegm from the Mouth. If the Patient is depriv'd of Speech, and if his Strength will permit, he uses Cuppings, with Scarification, on the Back of the Head, and also on the Præcordia, if possible. Then the Patient is to have recourse to Gestation in a Chair, a Sedan, or Hanging Bed; and after the fourteenth Day to proceed to other Gestations, and use for Aliment old *APOMELI*, with Crums of Bread, or *Alica*. After this he orders a little *Hiera* to be given. After the twenty-first Day he orders the Use of the Bath; and Wine mix'd with warm Water to be drank. The Patients ought also, according to him, to live on the Sea Coast if possible. *Paulus Ægineta, Lib. 3. Cap. 18.*

Father *Malbranch* gives an Account of a Man who was cur'd of an Apoplexy by a great many Clysters of Coffee. And Mr. *Chaplain*, Physician of *Montpelier*, cured another who labour'd under the same Disorder, by giving him a Grain of Laudanum. *Hist. de l'Acad. R. 1702.*

Those who are seiz'd with a phlegmatic Apoplexy, grow pale, and fall into a profound Drowsiness. Their Pulse is small, they are reliev'd by emetic and purgative Medicines, and become worse after Bleeding. Hence we may infer, that some viscid Substance, of a weak Impetus, and sufficiently thick, produces these kinds of Apoplexies. In a sanguine Apoplexy, on the other hand, the Patient's Face becomes red; the Blood-vessels of the Head become very turgid. The Drowsiness is not very great, nor the Pulse so remarkably weak. He is also reliev'd by Venesection, and his Symptoms are generally heighten'd by emetic and purgative Medicines. From these Symptoms we

may easily conclude, that Apoplexies of this Kind arise from an Obstruction of the Course of the Blood and Spirits in the Brain and circumjacent Vessels. *Baglivi.*

Agreeable to this Observation of *Baglivi* is that of Dr. *John Drummond*, in the *Medical Essays*: Suppose two Persons seized with an Apoplexy; one is a full-bodied vigorous young Man, after a Debauch; the other is an old feeble Person, long subject to Catarrhs: I presume Bleeding very plentifully must be the principal thing depended on for the Cure of the first; and that this Method would very effectually destroy the other, who must be treated with every thing that stimulates.

Dr. *Calderwood* (in his new Method of curing the Apoplexy) condemns the common Method of letting Blood from any Vein, giving Emetics, or sharp Clysters, and applying Blisters: But insists much on the Advantage of Arteriotomy; and recommends Cordials in the Cure of the Apoplexy.

'Tis a Circumstance not to be forgot, that some Physicians assert their having learnt from Experience, that People, when so violently seiz'd with Apoplexies, as that no Medicines can possibly rouse them, have sometimes had that Effect very quickly produced upon them by the Application of Causteries to the Body: But they are not all of the same Mind, with regard to the particular Part to which the Application should be made; for *Scultetus* (*Obs. 34.*) has directed the Application of a red-hot Iron to the back Part of the Head; whereas to others, especially *Zacutus Lusitanus*, and *Riverius*, the Space between the first and second Vertebrae of the Neck seems a Place much more commodious and proper for that Purpose. Some recommend the Place where the sagittal and coronal Sutures meet, whilst others entirely disapprove of that Practice. And, indeed, *Mistichelli*, an Italian Author, in a Book publish'd in his Mother-tongue, concerning the Apoplexy, asserts, That in order to rouse and recover from that Disorder, the actual Caustery is apply'd so successfully to no Parts of the Body, as to the Soles of the Feet. And the particular Method of burning them, on Occasions of this Nature, he endeavours to represent in Figures. See Tab. 33. Fig. 11. Where the Places burnt are represented by the Letters A A, and the Caustery itself by the Letter B; but it may be of any other Form as well as Quadrangular. I myself try'd this new Method on a Man who was Apoplectic, but I could not rouse him by it, and he soon after died. *Heister.*

Since this Disorder attacks so suddenly, and is attended with so imminent Danger, timely Assistance is to be called in, whilst there as yet remain any Hopes of Safety. The Patient is to be laid in a light and temperate Place in such a Posture, as that his Neck may neither recline too much, nor yet be quite erect; and his Feet are, above all things, to be kept warm with Feathers or Cloths. As for the Cure itself, the several Steps of it are to be indicated by the Causes; and, because the Chief of these are the antecedent Efflux of the Blood, which abounded too much in the Vessels of the Brain, the preternatural Congestion, and the Vis Motrix, or moving Force, of the Vessels and Membranes of the Brain, being weakened, the Cure is to be directed by, and have a relation to, these Causes; so that the chief Intentions of Cure are to divert the Motion and Impetus of the Blood from the Head, and to restore Strength to the debilitated and weakened Parts, that the Blood which does not now circulate, may again be put in Motion.

For answering the former of these Intentions, Bleeding in the very Beginning of the Disorder has, in all Ages, been looked upon as a Circumstance of the greatest Moment and Efficacy, and must, in the very Nature of the thing, be a choice and excellent Remedy. *Dodonaus*, as well as *Nymanus*, deservedly reckoned it the first and principal Step to be taken in the Cure, in his *Observat. Medic. Cap. 8. Exercit. Pract. p. 385.* where he gives an Account of a Woman of seventy-two Years of Age being cured of an Apoplexy by Bleeding. Besides, that Nature herself points out this Step, is plain from that Observation of *Lancisi*, in which he gives us an Account of a Man of almost seventy Years of Age being cured of the antecedent Symptoms of an Apoplexy by a Discharge of twelve Pounds of Blood from his Nose.

But in what Shape Blood is to be let, is not by all agreed upon. Some are of Opinion, that in this Case, Arteriotomy, or the opening of an Artery, is preferable to all other Methods of letting Blood; but the strongest Abettor of this Practice is *Catherwood*, who, in a small Book, written in English, endeavours to establish it by Arguments drawn from Reason and Experience. Some German Physicians have given their Suffrage in behalf of this Practice; and, among the rest, *Loew*, of *Erlsfeld*, in his *Medic. Pract.* Nor indeed, does the Advice seem improper; 'tis only to be lamented, that the Unskillfulness of Surgeons, and the Novelty of the Thing, should hinder the Practice from becoming universal. Many recommend Venesection, but differ in their Sentiments with regard to the Place, where the Vein is to be opened. Some order opening the Veins of the Arms, others those of the Forehead. Some those of the Nostrils, and others those under the Tongue. *Morgagni* recommends opening the Occipital Veins, *Anat. 6.*

p. 108. because these Veins pass within the Cranium, and have a Communication with both the lateral Sinuses. For this Reason, when they are opened, the Blood, which they were to convey into the Sinuses, is taken away; hence the Quantity of Blood, which passes through these Sinuses, is lessened, and its Motion increased, to the great Relief and Advantage of the Patient. But because the Trunks of these Veins lie very deep, and are sometimes found divided into many small Ramifications, he is of Opinion, that Cuppings, and frequent deep Incisions, are preferable. In this manner *Zacutus Lusitanus* [*Med. Princ. Hist. Lib. 1. Hist. 33.*] affirms, that he cured two Apoplectic Patients. But the generality of Physicians, and those the most skilful, as *Severinus*, *Lancisi*, and *Freind*, recommend opening the Jugular Veins, because, lying very near the Brain, the taking away some of their Contents must afford Space and Liberty for the Blood, impacted and congested in the Brain, to flow with the greater Ease and Freedom.

In letting Blood, these Cautions are to be observed: Let it be done as soon as possible, before the small Arteries are so dilated as to lose their Tone, or the Brain be inundated with the Effusion of Blood. Let the Orifice be sufficiently large, that the Blood may flow out quickly, and in a large Stream, because a slow Efflux is attended with no Advantage. Let the Vein be opened as near to the Part affected as is possible, the Arm for Instance, or the Jugulars: The Quantity of Blood to be taken is to be determined by the Fulness of the Vessels, the State of the Pulse, and the Strength of the Patient; though it ought always to be very large. If the Body is plethoric, if the Constitution is sanguine, or if the Disorder takes its Rise from a Stoppage of some habitual Evacuation of Blood, let Phlebotomy be ordered again and again, since *Dionis* assures us, that the opening a Vein seven different times, has, in this Case, produced happy Effects. But 'tis first to be done in the Foot, then in the Arm or Neck, left by first opening a Vein in the superior Parts, a greater Afflux of Blood should be invited to the Head from the inferior Parts, and the Circumference of the Body.

For diverting the Afflux of Blood from the Head, besides Venesection, those Medicines are also efficacious, which purge pretty strongly. I do not mean those drastic and herculean Cathartics, which contain something of a poisonous Quality; but those harmless and innocent ones, which only stimulate the nervous Coats of the Intestines to a proper Degree of Motion, such as *Sal Gemmæ*, *Seltz Salt*, and *Sal Ammoniac*. A pretty large Dose of these is to be put into Clysters; and such Powders are to be added as are proper for discussing Flatulencies, and corroborating the Tone of the Intestines. Of which Kind are the Powders of Rue, Sage, Marjoram, Savory, Thyme, Mother of Thyme, Flowers of Lavender, Lilly of the Valley, *Roman Chamomile*, the Seeds also of Caraway and Dill, together with expressed Oils, and Oils of Rue, Chamomile, and Bays. The Clysters, thus prepared, are to be injected often, but not in great Quantities, lest they should not be retain'd; they are also to be thrown in with a Syringe, that they may penetrate the deeper, and reach the farther.

But such Medicines as strengthen the weakened nervous Parts, and stimulate them into a proper Motion, and by that means promote and further the Discussion of the stagnant Humours, are to be used both internally and externally. The external Applications of greatest Efficacy are, volatile, urinous Substances; mixed with Cephalics, the principal of which, in a liquid Form, is Spirit of *Sal Ammoniac* prepared with quick Lime, and impregnated with Oil of Rue, Marjoram, or Lavender; and, in a dry Form, dry volatile *Sal Ammoniac* sprinkled with the same Oils. These Medicines, either applied to the Nose in such a manner as their Effluvia may strike the Olfactory Nerves, or put into the Nostrils themselves on the Point of a Feather, or even blown up into them by means of a Quill, prove an excellent Stimulus, and rouse very effectually. For the same End, and with the same Intention, such Substances as excite a certain Sense of Pain, are generally applied to such Parts of the Body as are of a more exquisite Sensation, especially the Soles of the Feet; by which means the whole System of the nervous Parts is stimulated into a due and proper Contraction. This Intention is answered by pretty hard Frictions with rough Cloths, or the Flesh-brush, and by the Application of Nettles to the Parts. The Efficacy of Vescicatories, in this Case, is also very great, as also that of actual Cauterics, a new Method of using which has been described by *Dominicus Mistichelli*, in a Treatise written in the Italian Language; and the Author's Method of Application is approved of by *Lancisi*.

But if the Power of Deglutition either remains with the Patient, or is restored after it is lost, spirituous and volatile Medicines are not to be prescribed internally; for these put the already raging Blood into a greater Commotion, and rarefy it more, and are upon that Account deservedly condemned in Cases of this Nature, by *Pitcairn de Circul. Sangu.* But such Medicines are to be prescribed as are of an analeptic, rousing, and discutient Quality; among which, the best and most approved are, fixed Diaphoretics with Cinnabar, Amber, and Nitre;

and these may be either exhibited in form of a Powder, with some proper Water as a Vehicle, or, which is still better, they may be reduced to the Form of a Potion. In the Course of my Practice indeed, I make more frequent Use, and more cordially approve, of this Mixture:

Take of the Water of Lillies of the Valley with Wine, and of distilled Vinegar, each two Ounces; of succinated Spirit of Hartshorn, one Dram; of Diaphoretic Antimony, Cinnabar, and Crabs-eyes, each half a Dram; Syrup of Orange-peel, two Drams; mix all together: To this we sometimes add a very small Quantity of Emetic Tartar, to give a gentle Stimulus to the small nervous Fibres of the Stomach, which have an Intercourse and Communication with all the rest. Yet Care must be taken not to exhibit it in such a Quantity as to procure a Vomit.

But because an Hæmorrhage of the Brain is not only very dangerous in itself, but also very subject to recur after it is cured, 'tis the Business of the Physician to employ all his Care and Skill both to carry off the Paroxysm, and to prevent its Return. Now *Caspar Hoffman*, [*Lib. 3. Instit. Med.*] with *Martianus* and *Ballonius*, rightly concluded, that all Apoplectic Patients were plethoric; therefore the Physician's chief Care must be to lessen the redundant Blood. For this Purpose letting Blood is proper at all Seasons, but especially about the *Æquinoxes*, when the Blood and Humours generally use to be in a preternatural Commotion, and Nature exerts her utmost Efforts to eliminate and throw out of the Body whatever is superfluous and prejudicial. For this very Reason, according to the Testimony of *Hippocrates*, the hæmorrhoidal Flux is in this Case salutary, and attended with happy Consequences, especially in those who have before had Discharges of that Kind. But first to procure, and then duly to promote, an hæmorrhoidal Discharge, are Circumstances that call for a great deal of Skill, Art, and Caution. For obtaining such a thing, besides Frictions of the Anus, and the Use of proper Fomentations, I think the Application of Leeches very proper; to which may be advantageously join'd a balsamic Elixir of corrected Aloes, Saffron, Myrrh, and Amber, prepared not with a spirituous, but with an aqueous lixivial Menstruum. The *Balsamic Pills*, if cautiously given, are very proper in this Case. But such Medicines as provoke an hæmorrhoidal Discharge, ought by no means to be administered, if the Patient is not disposed to Discharges of that Nature; they are only to be used when the Discharge begins to discover itself, or to flow too slowly; in other Cases they do more Harm than the Plethora itself, under which the Patient labours.

For preventing the Access of this Disorder, the due Excretion of the Fæces is of uncommon Efficacy; for 'tis almost a general Maxim in Practice, *That a Man cannot readily labour under Diseases of the Head, provided his Belly perform its Office duly.* This Discharge of the Excrements is by no means, however, to be procured by Medicines of too strong and drastic a Quality; since these, by operating too violently upon the nervous Coats of the Intestines, excite Spasms in them, and induce an unequal Circulation of the Blood. This End is rather to be obtained by Medicines, that are mild, gentle, and friendly to the Constitution; among which, the most proper and efficacious are, Preparations of Rhubarb with abstergent Salts; as also the *Pilula Polychrestæ*, and Clysters.

Those Waters and Balsams which are called *Apoplectic*, and by some highly extolled as proper, not only to be taken internally, but also applied externally, by way of Uction, to the Temples, Nostrils, and Nape of the Neck, are, in my Opinion very hurtful both as a Cure, and a Preservative against this Disease, in Cases where an Hæmorrhage of the Brain is dreaded, in plethoric sanguine Habits of Body, and in Persons in the Flower of their Age. The Testimony of *Dodonæus* [*Stirp. Historia, Lib. 6.*] is of considerable Weight in this Point: *When, says he, there is too great a Quantity of Humours, especially if mixed with the Blood, the Use of this Medicine, that is, distill'd Lavender-water, is not safe; neither is that Composition safe, which consists of distilled Wine, in which Herbs, Flowers, Seeds, and Spices of this Nature have been macerated, and which are rashly and indiscriminately prescribed by most People; since by the Use of those hot Medicines, which stuff the Head, the Disease is increased, and the Patient exposed to a more imminent Danger.* Far safer are Infusions by way of Tea, prepared of common Water and Cephalic Herbs, especially Baum, Betony, Sage, and the lesser Cardamums, which, being frequently supped, not only preserve an equal Motion in the Blood; but also refresh and comfort the Brain and Nerves.

But the Recovery and Safety of the Patient are justly to be despaired of, unless a cautious and moderate Regimen, with regard to the Non-naturals, is carefully observed. But for Prevention, in Cases of this Nature, Rest and Abstinence are of wonderful Efficacy, since, according to *Celsus*, very terrible Disorders may, by their means, not only be prevented, but cured. For this Reason, immoderate Eating, and Variety of

Dishes,

Diffes, are to be avoided; sweet and palatable Wines; all intoxicating Liquors, and severe Exercises of the Body, are also to be abstained from, especially after Meals: He who dreads this Disorder, should not go to Bed immediately after Supper; neither should he lie with his Head too low. If the Constitution is such, as to favour the Generation of this Disorder, the Body is not to be exposed to its Influences, but the Feet are carefully to be defended from the Cold, and sometimes immersed and washed in warm Water; and the Patient is to remain in a Chamber moderately warm. Gentle Motion is also to be used, the Mind is to be kept calm and serene, and Sleep is neither to be too long, nor too short. In a word, all those things are to be carefully avoided and abstained from, which we have above rank'd among the procatactic Causes of this Disorder.

CASE I.

An illustrious Count, almost fifty Years of Age, and full of Blood and Juices, was some Years ago afflicted pretty often with a milder Species of Palsy, accompanied with a Difficulty of Speech. For the Cure of these Disorders he went to the *Caroline Baths*, which lay contiguous to his Estate, and used them both internally and externally. But as he did this without the Advice of his Physician, and had neglected to prepare his Body for it by proper Evacuations, such as letting Blood, and purging; it happened, that having gone into a Bath, which was as yet too warm, he was suddenly deprived of all Senses, both internal and external. Immediately upon this Accident, he breathed quick, his Breast heaved with a sort of convulsive Motion, his Arteries beat strongly with a certain kind of Hardness, and his Face became prodigiously red. A Vein was opened, and a Sternutatory apply'd to his Nostrils; by which means a more terrible convulsive Concussion of his Breast, together with a violent Stertor, were brought on. His whole Left Side became destitute of all Sensation and Motion; but the Hand of his Left Arm, being convulsed, shook continually. His Reason utterly left him, and, within five Hours, he died; and after his Death, a large Quantity of Blood, and bloody Serum, flow'd from his Nostrils for the Space of twenty-four Hours, or more.

REFLECTION.

If any of the Mineral Waters, used by way of Bath, require Prudence and Circumspection in their Use, the *Caroline* certainly do; for these are of such a Quality as strongly to contract the Surface of the Body, and drive the Blood and Humours to the internal Parts, by that earthy, calcareous, and even chalybeate Principle, with which they abound. And this is the very Reason why they so speedily carry off oedematous Swellings of the Feet, and bring on, if the Body is subject to Spasms, and the Vessels turgid with Blood, violent Pains, vehement Palpitations of the Heart, acute Pains of the Head, Loss of Strength, Weakness of the Joints, and even continued and intermitting Fevers. We need not therefore wonder, if in this illustrious Person, whose Mass of Blood was already too large, and whose Humours were even thus disposed to stagnate in the Brain, the Blood was, by a rash and inconsiderate Use of the *Caroline Waters*, driven with an Impetus to the Head, and both its internal and external Vessels burst; a Circumstance which could not fail to cause the immediate Death of the Patient. This is plainly proved by that large and copious Effusion of a bloody Matter from his Nostrils, which always sufficiently discover a previous Hemorrhage in the Brain. And since his Stertor and Difficulty of Breathing increased upon the Application of Sternutatories; this should teach Physicians to be wary and circumspect in applying such things as promote Sneezing in sanguine Apoplexies, and that too even after the impetuous Motion of the Blood to the Head is allay'd, lest the Blood should rush with too great Violence to the stimulated Parts, and hasten the Death of the Patient.

CASE II.

A Gentlewoman of fifty Years of Age, of a sanguine, but at the same time of a very delicate and tender Constitution, had always had her monthly Evacuations in a very plentiful and copious manner. But about the forty-ninth Year of her Age, this Discharge happening according to the Course of Nature to stop, she began to complain much of an Uneasiness and Straightness about her Præcordia, an Inflation in the Left Side of her Abdomen, a painful and flaccid State of her Joints, a vertiginous and heavy Pain of her Head, and unsound and interrupted Sleep, tho' her Countenance all the while remained very florid and ruddy. The Winter at last approaching, all these Symptoms were so heightened, that she was reduced to a Necessity of calling a Physician, who, in order to discuss her Flatulencies, prescribed her *Volatile oily Salts*, and *Carminative Essences*. He likewise ordered her a purging Powder, consisting of half a Scruple of Resin of Jalap; and six Grains of vitriolated

Tartar. With which after she had purged six times, and that not without terrible Gripes, she was next Night seized with an *Apoplectic Fit*, but her Pulse remained in its ordinary State, and her Breathing was free. For her Relief, a Vein was forthwith opened, and an acrid Clyster injected, by which means she was indeed recovered from her *Apoplexy*; but an *Aphony*, and a great Weakness of her Head, still remained with her. Her Physician, in order at once to carry off these Symptoms, and the Remains of her other Distemper, ordered her a purging Powder of twelve Grains of Resin of Jalap, and ten Grains of vitriolated Tartar, to be taken in Water of Lillies of the Valley as a Vehicle. But scarce an Hour after the taking of this, the *Apoplexy* return'd, and kill'd the miserable Patient.

REFLECTION.

Women of sanguine Constitutions are, upon the Cessation of their monthly Evacuations, very much inclined to an *Apoplexy*, and therefore stand greatly in Need of Venesections, lest, by the Concurrence of other Causes, the Disposition should break forth into the Distemper itself; and, indeed, if any thing is effectual for making it do so, it is undoubtedly the Use of the stronger Purgatives, and such Medicines as excite Gripes. Among which we may, for its many fatal Effects, justly reckon that pernicious Medicine *Resin of Jalap* exhibited in Powder; for, when taken into the Stomach, it easily runs together, and adhering to the Folds of the nervous Coat of the Intestines, it quickly excites Spasms, and painful Tensions, by which the Blood is forced to the superior Parts; and produces the most fatal Effects. Hence 'tis plain, that the Physician committed an egregious Blunder, since upon the Approach of a gentle *Apoplexy*, which remitted, he repeated this Purgative in so large a Dose, as not only to bring on a Relapse, but even Death. And though the Intention of drawing the noxious Humours to the inferior Parts does not at all seem inconsistent with a rational Practice, yet it ought to be done by mild Laxatives, or even Clysters, and not by such Medicines as induce sensible Spasms on the Intestines, which may be discovered by the Gripes, and by that means force the Blood to the Head in such a Quantity, that it bursts the Vessels, and produces present Death.

CASE III.

A certain Divine of a great Character, not quite fifty Years old, of a florid and sanguine Constitution, and who had always enjoyed a sound and vigorous State of Health; by means of a certain Accident, which hurt his Character and Reputation, fell into a violent Perturbation of Mind, accompanied with Sadness, and the most uneasy Sensations. Being thus disturbed, and sleeping very little, he thought proper to cheer his Mind, and dispel his Melancholy, by a pretty liberal Use of Wine, which indeed he loved too much before. In Process of Time he lost his Appetite for Food, and his Digestion being very bad, he was troubled with continual Eructations without any Discharge of Flatulencies from his Belly, which was costive; his Strength began to be impaired, he was seized with a terrible Pain and Straightness about his Præcordia; and, mournful and distracting Thoughts unhinging his Mind, at last, he suddenly and unexpectedly fell down with the total Loss of his Senses, his Pulse and Respiration remaining at the same time entire. But about two Hours, after proper Remedies being applied, his Strength returned in some measure, and he came to himself; but began to complain terribly of a Weakness in his Knees, a Torpor and Languor of his Right Side, and a Loss of Memory. Of his own Accord he went to the *Caroline Baths*, not only with a View to carry off his hypochondriac Disorder, but also to banish from his Mind all melancholy and perplexing Thoughts by the Journey and Conversation. As I was in the Place, he earnestly asked my Advice, and I ordered him to drink moderately of that temperate Spring, commonly called *Muhlen-Brumen*, which he used with great Success for about twenty Days. But in his Return home, when he was passing through a noted Town, being invited to a splendid Entertainment by his Friends, he indulged his Palate, and drank too much Wine: And going home in the cold Night Air, he began to complain of an Uneasiness and Difficulty of Breathing; upon which he took some diaphoretic Powders, by the Use of which, a red Purple Fever began to appear almost over all his Body. But, complaining of an insupportable Pain of his Head, his Physician judged Venesection in the Foot proper; and, taking my Advice about the Propriety of this Step, I declared myself against it, for fear of striking the Purple Fever back to the internal Parts. But the Physician insisting much on the bad Consequences that might attend the Neglect of Venesection, it was accordingly performed in the Foot, and a sufficient Quantity of Blood taken away. Soon after, the Uneasiness about his Præcordia increased, the Extremities of his Body became cold, and, the Purple Fever disappearing, a violent *Apoplectic Fit* unexpectedly ensued, accompanied with the Loss of all his Senses, Stertor, a strong and unequal Pulse, and a red and

and tumid Countenance; by the Violence of which Disorder this learned and ingenious Clergyman was; in eight Hours time, convey'd into another World.

REFLECTION.

There are many Circumstances in this Case, the Observation of which may be of Use for directing a Man in the pathologic and therapeutic Parts of Physic: And, first, we may observe, that in a Man of a sanguine Constitution, when to long and excessive Sorrow, a bad Regimen, and especially the immoderate Use of Wine, are joined, the nervous System may be so weaken'd, as to induce hypochondriac Symptoms of such a Nature, as would not have otherwise, in all Probability, seiz'd a Constitution of that Kind. It is also to be observed, that by a long-continued, perplexing, and uneasy State of Mind, accompany'd with Sorrow, the Brain and nervous System may be so weaken'd, as to become disposed and subject to *apoplectic* Fits. Besides, in the Case now under our Consideration, the first Fit was slightest and most gentle, since it proceeded only from the Blood being forced to the Head from the lower Belly, by means of the Spasms there excited, and might have been soon carried off by Venesection; which would have resolved the Blood stagnating in the Vessels of the Brain: But because no Indisposition is more apt to recur than an *Apoplexy*, especially if it is not averted and guarded against by a due Regimen, and proper Medicines, hence it happen'd, that a due Regimen not being observed, after the Use of the *Caroline* Baths, which are indeed excellent in hypochondriacal Cases, but very improper in Disorders of the Head, a more violent Fit ensued, which, in the present Case, proved fatal to the Patient; which was undoubtedly owing to the large Quantity of Blood taken away, by which means the Matter of the Purple Fever being struck into the internal Parts with great Violence, excited such Spasms as forced the Blood impetuously to the Head, and at last broke its Vessels internally. *Hoffman; Vol. 2:*

CASE IV. From C. Pifo.

One *Claud Dionis*, a Citizen and Taylor of *Pont-à-mousson* in *Lorraine*, a Man of a slender Make, black Hair, and, like the Generality of City-tradesmen, accusom'd to Idleness and high Feeding, happen'd in the Year 1603. after a Debauch of Wine, to drop down suddenly, and lose all Sense and Motion: He at that very time became speechless; but his Respiration, tho' it continued with him, was nevertheless unequal, disorder'd, and intermitting, tho' not high, and accompanied with Stertor. After he had thus remain'd speechless for four Days, and was concluded *Apoplectic* by every one who saw him, he at last recover'd on the fourth Day; rather, I suppose, by the peculiar Interposition of Heaven, than by the Influence of Medicines, which, in Cases of this Nature, either cannot be exhibited at all, or, if exhibited, generally produce no Effect, on account of the Oppression under which the sensitive Faculties labour. But tho' the Patient recover'd thus far, the morbid Matter was nevertheless, by a salutary Translation, deposited not only on the Middle of the Spine, by which Accident the Trunk of his Body became paralytic, but also on those Branches of the Seventh Pair of Nerves which run to the Tongue, by which means a Stammering in his Speech still remain'd. His Palsy was, by proper Care and Warmth, so far remov'd, that a few Months after he was able to go abroad, and stand at the Church-doors, in order to receive the Charity of tender-hearted Christians: But about a Year and a half after, when this miserable Creature had lost the Use of his Limbs, and betaken himself to his Bed, he was soon cut off by a Fever, the particular Nature of which I know not.

CASE V. From C. Pifo.

In the Year 1603. about the Beginning of September, a certain Citizen and industrious Tradesman of *Pont-à-mousson*, happening to return drunk from a neighbouring Town, dropp'd down in the Middle of his Journey, lost all Sense and Motion, and lay prostrate on the Ground for three Days: However, being found on the third Day, and carried home, he indeed recover'd his Senses, but at the same time lost the Power of moving the middle Part of his Body, and his Right Side; nor is the Use of these Parts as yet restor'd to him, tho' four Years are now elapsed since that Symptom appear'd; besides, he hesitates in his Speech, and walks with Difficulty. 'Tis also to be observed, that, in this Patient, the paralytic Parts were always moist with Sweat.

CASE VI.

I remember, that about ten Years ago, on the Confines of the Bishoprick of *Metz*, a Lady of Distinction, the Wife, if I rightly remember, of Mr. *Helmeftat*, became paralytic after an *Apoplectic* Fit; which returning some Months after, put a final Period at once to her Palsy, and her Life.

The Duchy of *Lorain* is, indeed, so very fruitful in Disorders of this Kind, that there are few of its Towns or Villages, in which the remarkable Changes of Weather, that happen du-

ring the Winter-season, do not suddenly and unexpectedly strike and cast down some of the Inhabitants in this sudden manner.

But whether the frequent Surfeits of the Inhabitants, or the damp and moist Nature of the Climate and Air, produce this Disorder separately; or, which is more probable; whether they concur, and join their united Forces on this Occasion, are Disquisitions I shall not, at present, enter upon; neither shall I launch out into the more abstruse Theories relating to this Disorder; and its several Symptoms, since these Things have already been set in a Light sufficiently clear. I shall therefore only observe; that there are three Species of *Apoplexy*; a very strong and violent one, which instantaneously suffocates and kills the Patient; one of a milder Nature, which renders the Patient's Respiration violent, difficult, and high, and which is by some distinguish'd into two Sorts, differing rather in Degree than Nature; and one of a very slight and gentle Kind, in which the Patient breathes with some Labour and Difficulty. The first of these, or the most violent Kind of all, proceeds from a mucous Humour; either alone, or more frequently intermix'd with Serum, but in such a Proportion, that the former much exceeds the latter: The slight and gentle Kind, on the other hand, proceeds from Serum, either alone, or intermix'd with a very small Quantity of Mucus; so that the former may predominate much over the latter. The intermediate Species proceeds from a Mixture of both of these, almost in an equal Quantity: And; indeed, this Theory is confirmed by the following Observation:

CASE VII.

About the Year 1600. *Stephen Ruiffseau*, the Son of a noted Advocate, and a Youth about twelve Years of Age, about the Winter Solstice, suddenly dropp'd down without any Sense or Motion, except a convulsive one, which soon after seiz'd him, and which was immediately follow'd by a Stertor. In this Case we try'd very few Medicines, because we concluded the Patient irrecoverable: Accordingly he was suffocated by the Violence of the Distemper, about twelve Hours after it had seiz'd him; and, to the no small Surprise of all who saw him, died discharging a mere, but frothy Mucus from his Nostrils in large Quantities, and not Drop by Drop, which is the Case in old Disorders of the Lungs; so that we had no Reason to believe, that it came from his Thorax: For altho' those who labour under a *Peripneumony* may, by the Violence of the Stertor, discharge a purulent Matter from their Nostrils, yet that Matter is not frothy, nor yielded in great Plenty; but is of a pretty good Consistence, and comes away Drop by Drop: This Circumstance is, perhaps, owing to the Length and Acclivity of the Way thro' which it has to pass, and the Agitation of its Parts ceasing sooner than in the mucous Humour flowing from the Head.

I also know, that an *Apoplexy* may arise not only from Concretions of Blood in the Head, but also from the Blood being rendered too liquid: Thus, I heard of a certain Person who dropp'd down *Apoplectic*, and died on the Spot, in Consequence of his hanging his Head down, and sleeping before a Fire. And about three Years ago, I myself saw the Son of *Arnulphus Richards*, when, on the Day of Intermision in a Tertian Fever, he had exposed himself for some time to the scorching Heat of the Sun, during the Dog-days, suddenly become *Apoplectic*, and that to such a Degree, that he died the following Day. *Carol. Pifo. Observat. Select.*

From BOERHAAVE:

In an *Apoplexy* the Patient is suddenly deprived of the Exercise of all the Senses, both external and internal, and of voluntary Motion; whilst the Pulse, which is generally strong, remains, together with a laborious and deep Respiration, attended with a considerable Elevation of the Breast, with a Stertor, and the Appearance of a profound and perpetual Sleep.

A Multitude of the most accurate Observations have made it appear, that this Disorder arises from whatever Cause is capable of preventing, either totally or in part, the Influx of the nervous Fluid, secreted in the *Cerebrum*, to the Organs of Sense and voluntary Motion, and the Reflux of the same Fluid from the above-mention'd Organs to the common Senfory in the Brain; whilst the Progress, and perhaps the Return, of the Fluid, supply'd by the *Cerebellum*, to and from the Heart, and Organs of Respiration, is preserved in a Degree sufficient to support, in some measure, their Functions.

All these Causes, as observ'd and deliver'd by Authors, may, for the greater Perspicuity, be reduced to Classes; in the first of which may be reckon'd,

1. The natural Make of the Body: Thus, when the Head is naturally large, the Neck short, and, as it sometimes happens, consisting only of six Vertebrae, whereas there ought to be seven, this Structure disposes to an *Apoplexy*, as it favours the Congestion of Blood and Humours in the Head. Thus also, if the Body is corpulent and fat, the capillary Arteries in general will be subject to Compressions; and, in Consequence thereof, a greater Quantity of Blood and Humours will flow into the Vessels which convey them to the Brain. Thus also, a plethoric Habit, and a Redundance of pituitous Humours in the Blood,

lay a Foundation for the Stagnation of the Juices, and a subsequent Rupture of the Vessels in the Brain.

2. To the second Class belong all those Causes which induce such a Change in the Blood, Lymph, and nervous Fluid, as to render them incapable of circulating freely thro' their respective Vessels in the Brain. Amongst these are;

Polypous Concretions in the Carotid or Vertebral Arteries, whether form'd originally about the Heart, or within the Cranium; which are discover'd by a Palpitation of the Heart, an unequal Pulse, a Vertigo, and temporary Loss of Sight; often recurring, and which are increas'd by Motion or Heat.

An inflammatory Sickness of the Blood, which may be known by an acute continual Fever, a Phrenitis, a considerable inflammatory Pain in the Head, which have affected the Patient some time before the Attack of the *Apoplexy*: Add to these, all those Signs which evince, that the Blood, upon being prevented from circulating duly in the Vessels of the Brain, in Consequence thereof, is carry'd in greater Quantities, and with greater Force than usual, thro' the external Branches of the Carotids; whence a Redness, Fullness, and Inflammation of the Eyes, Face, and Neck, together with an involuntary Discharge of Tears.

A thick, glutinous, pituitous, and sluggish Disposition of the whole Mass of Blood; whence old People, those who are much subject to Catarrhs, whose Constitutions are cold and moist, and who are pale and leucophlegmatic, are very subject to *Apoplexies*. It is not difficult to preface an *Apoplexy* from this Cause, as it is generally preceded by an universal Listlessness, and Dulness of the Senses; Sleepiness; Inactivity, with respect to all manner of Motion; unusual Slowness of Speech; Tremors, Stertors, Incubi (*Night-mares*); Paleness, Turgidness, Humidity, and Dimness of the Eyes; frequent Discharges of pituitous Humours by Vomit; Vertigos; Shortness of Breath upon the least Motion, with a Compression of the Cartilages of the Nose. Such a State of the Blood is produced and increased by all the Causes related under the Article *LENTOR*, which see.

3. To the third Class belongs whatever compresses the Arteries themselves, or the nervous Vessels of the Brain, so as to prevent a free Circulation of their respective Fluids through them.

People who are plethoric, that is, full of Blood, and bloated with bad Humours, are much subject to this Species of *Apoplexy*; especially if extraordinary Motion or Heat increase the Velocity of the Circulation. Hence it is apparent, that the Disorder must be promoted in such Constitutions by high Feeding, and spirituous Liquors; Medicines which are acrid, and excite the Motion of the Blood, such as Cardiacs, Volatiles, and Emetics; by excessive Heat and Motion; and by Intenseness of Thought, especially if long continued, and frequently repeated, because this determines a more copious Flux of Humours towards the Brain.

All Tumors also arising within the Cranium properly belong to this Class, whether they are inflammatory, purulent, serous, pituitous, steatomatous, scirrhus, or bony, provided they compress the Arteries, or the venous Sinuses near the *Torcular Herophili*, or the medullary Origins of the Nerves, or the *Medulla* of the *Cerebrum* itself.

To this Class also belongs too great a Velocity of the Blood in the Vessels of the Head, determin'd to that Part by some Impediment to the Circulation of the Blood in the Arteries of the inferior Parts, which may arise from an infinite Number of Causes.

Hither also may be referr'd all Compressions, from whatever Cause, of the Veins without the Head, which convey the reflux Blood from the Contents of the Cranium towards the Heart: As also Effusions of Blood, Pus, Ichor, or Lymph, which press externally upon the *Dura* or *Pia Mater*.

4. To the fourth Class belong all those Causes, which, by any means, so dissolve the Texture of the Arteries, Veins, or Lympheducts belonging to the internal Part of the *Cerebrum*, as to cause an Extravasation of their respective Fluids, which then press upon and injure the Medullary Origins of the Nerves of the *Cerebrum*. Such, for Example, are an acrimonious Serum in hydropic and leucophlegmatic Cases; a Redundance of Blood in a Plethora; an atrabilarious Acrimony prevalent in melancholy, scorbutic, and arthritic Constitutions, which frequently produces an *Apoplexy*, and usually operates betwixt the fortieth and sixtieth Years of Life: Now, all these may remain latent in the Constitution for some time; but, upon being excited by adequate Causes, they frequently are productive of a sudden *Apoplexy*; which may be foreseen, by comparing the Materials subsisting in the Constitution with the Causes capable of exciting them to Action, which are principally violent Affections of the Mind, and intense Studies; to which, perhaps, imprudent and excessive Venery may be added.

5. Some Sorts of Poisons, which are suddenly deleterious, may be rank'd in the fifth Class; but these may either be reduced to the second, third, or fourth; or may be more properly said to act upon the Lungs than the Brain. Amongst these are, the Fumes of Mineral Sulphurs, of Charcoal, and that

Gas Sylvestris, or incoercible Spirit, which exhales from vegetable Juices, during Fermentation.

The Anatomical Inspection of Bodies which have died of *Apoplexies*, and the historical Observation of such Circumstances as occur in the Treatment of such Cases, furnish us with a Knowledge of these Causes; and a due Reflection upon these naturally leads us to a Distribution of them into the preceding Classes, which are admirably adapted to the Investigation of the best Methods of Cure.

See the *Observations and Histories* in this Article.

Hence it appears, that *Apoplexies* are produced by various, and those opposite, Causes; and therefore they may be properly enough distinguish'd into *sanguinous* and *pituitous*; tho' this Distinction is far from being perfect, since, besides these, there are *serous*, *atrabilarious*, *polypous*, and other Species of *Apoplexies*.

The Part affected, in a perfect *Apoplexy*, is the entire *common Sensory* in the Brain, but in a *Parapoplexy* some Parts of the *common Sensory*, which are more compress'd than the rest; whilst the *Cerebellum* and its Dependencies remain, in the Beginning of the Disorder, unaffected.

Now as the *Cerebrum* supplies the Instruments of Sensation, and voluntary Motion, with their Portions of the nervous Fluid; and as the Heart and Organs of Respiration are furnish'd from the *Cerebellum*, the Reason is obvious why the Pulse and Respiration remain, whilst the Senses and voluntary Motion are destroy'd; and why even the Pulse and Respiration increase, in proportion as Sensation and Motion decline; for it generally happens, that the nearer the Patient is to Death, the greater is the Pulse and Respiration, which is to be accounted for thus: When there is a considerable Obstruction in the *Cerebrum*, the usual Quantity of Blood cannot circulate therein; and as the same Quantity is still brought by the Carotids from the Heart, the remaining Part of that which should circulate thro' the *Cerebrum*, must now circulate thro' other Parts of the Head: Hence an Inflation and Redness of the Cheeks, and Foaming at the Mouth, caused by a greater Quantity of Fluids circulating thro' the Branches of the external Carotids; and because a greater Quantity of Blood is determin'd, by this Obstruction in the *Cerebrum*, to the Vessels of the *Cerebellum*, a greater Quantity of Spirits must be there secreted; and as these Spirits are subservient only to the vital Functions, the Pulse and Respiration must necessarily increase.

The Violence, therefore, and Danger of an *Apoplexy*, is to be estimated by the Age, Constitution, and Make of the Patient, by the Vehemence of the Symptoms, and principally by the absolute Privation of the Senses and voluntary Motion, by a strong and profound Respiration, attended with a Stertor, by Plenty of viscid Froth about the Mouth, by a slight cold Sweat, which sticks in Drops upon the Skin, by its being consequent to a former slight *Parapoplexy*, or a violent Epilepsy, or any other vehement Cause.

On the contrary, an *Apoplexy* which is moderate, and admits of a Cure, may be distinguish'd by the Slightness of the Symptoms, and the Absence of those Accidents above enumerated.

If a copious Sweat, which is equal all over the Body, dewy, warm, and which relieves the Symptoms, supervenes in a slight *Apoplexy*, it resolves the Distemper; for by this the stagnating Matter, which obstructs the Nerves destin'd for Sensation and voluntary Motion, is carry'd out of the Habit, being first attenuated by the vital Powers.

The same salutary End is accomplish'd by a plentiful Discharge of thick Urine, and for the same Reasons.

The morbid Matter is also carry'd off, and the Distemper is cured, by a large and long-continued hæmorrhoidal Discharge; and, in Women, by a Restitution of the Menstrual Flux.

The Disorder is also removed sometimes by a Diarrhoea; and a violent Fever supervening, especially in the Beginning of the Distemper, attenuates and removes the obstructing Matter, disposes it to Elimination, and by these means sometimes restores the Patient. A slight Fever, however, not sufficient for the Attenuation and Removal of the morbid Matter, is of bad Presege: But a Fever seems principally of Service in that Species of *Apoplexy* which is caused by a Viscidity of the Juices, because Attenuation is more wanted here than in the other Sorts.

When the Cause of a somewhat more severe *Apoplexy* is in some measure removed, the Distemper is changed into a Palsy of some of the muscular Parts; of one entire Side, which is call'd an *Hemiplegia*; or of all the Parts below the Neck, which is call'd a *Paraplegia*. These are said to happen during the four first Days, and seldom admit of a Cure, and always impair the Memory, Judgment, and the Power of voluntary Motion: Hence the Patients remain for ever after heavy, dull, pusillanimous, and are affected with Tremors, and frequent Vertigos.

A perfect *Apoplexy*, wherein the *Cerebrum* is much injur'd, the Fluids are corrupted, and the Cause of the Disorder is propagated to the *Cerebellum*, soon terminates in Death, and seldom exceeds the seventh Day.

And it is a Maxim laid down by Authors, that if an *Apoplexy* remains unresolv'd beyond the fourth Day, the Patient dies, unless reliev'd by a violent acute Fever, before the seventh.

An *Apoplexy* may be foreseen, first, from the natural Constitution, Frame, and Make of the Patient.

Secondly, from a Knowledge of the predisposing Causes, or Materials in the Blood and Juices, capable of producing the Disorder, when excited to Action.

Thirdly, from the Procatartic Causes, which are those which excite the predisposing Causes to Action.

All these have been already specify'd.

Fourthly, from the first Effects of these Causes, as a Tremor, Vacillation, Vertigo, temporary Loss of Sight, Stupor, unusual Sleepiness, Depravation of Memory, Ringing in the Ears, Inflation of the superior Parts, Respiration more profound than ordinary, Compression of the Pinnæ of the Nose, and a frequent Incubus.

What has been said above, will enable us to know an *Apoplexy* when it occurs, and to distinguish its different Degrees.

As to the Cure and Prevention of an *Apoplexy*, no universal Rules can be laid down; for as the predisposing and exciting Causes, together with the Parts principally affected, are various, the Method of Relief must also vary; and must be attempted before the Disorder grows inveterate, otherwise it will be difficult to do it with Success.

If, therefore, an *Apoplexy*, from a glutinous, inert, cold Cause, is foreseen from the Signs above specify'd, the Intentions must be directed, first, to avert the Pressure of the glutinous Juices from the Head.

Secondly, to attenuate the glutinous Viscidity in the Brain, and in the whole Habit.

The Pressure on the Vessels of the Brain is diminish'd,

First, by a Derivation of the Humours to other, and those opposite Parts.

Secondly, by universal Evacuations.

A Derivation of the Humours is effected by Vapours, Fomentations, and Baths, apply'd to particular Parts, to which it is intended the Humours should be invited; by Suction, with Cupping Glasses; by Sinapisms, and Vesicatories, among which Cantharides are of great Importance, as they both invite the Humours to the Part where they are apply'd, and attenuate at the same time; by Caustics, Issues, Setons, and Frictions; by Ligatures made upon the large Veins of the Feet, Legs, and Thighs. To these may be added Collutions, Gargarisms, and Masticatories, which excite a Discharge of Saliva, and Apoplegmatisms apply'd to the Mouth, Fauces, and Nose.

Boerhaave, in his *Materia Medica*, gives the following Forms:

Take of the Roots of Masterwort, Pellitory of Spain, Galangals, each an Ounce; of the Leaves of Origanum, Rue, Thyme, each an Handful; of the Flowers of Lavender and Feverfew, each an Ounce; of the Cortex Winteranus, six Drams: Boil these in a close Vessel, in a Quantity of Water sufficient for three Pints of strain'd Liquor; to which add of Spirit of Sal Ammoniac, three Ounces. Let this be used as a Collution or Gargarism.

Take of Mastich, white Wax, and Ginger, each an Ounce; and make them up into small Troches, which must be chew'd in the Mouth by way of Masticatory.

Universal Evacuations are procur'd by strong Emetics and Cathartics, exhibited in sufficient Doses; by Scarification and Bleeding; tho' the Efficacy of these is not always to be depended on.

Proper Forms of Emetics and Cathartics recommended by *Boerhaave*, are as follows:

Take of Emetic Wine, two Ounces and an half; simple Oxymel, an Ounce: Mix for a Vomit.

Take of Emetic Tartar, seven Grains; for a Dose.

Take of the express'd Juice of Horse-radish, an Ounce; simple Oxymel, two Ounces: Make a Draught.

Take of Mercurius Vitæ, two Grains: For a Dose.

Take of Diagrydium, Resin of Jalap, each ten Grains; rectify'd Spirit of Wine, two Drams: Let them be carefully rubb'd together, till the Diagrydium and Resin are dissolv'd; and then add Solutive Syrup of Roses, with Sena, six Drams: Make a purging Potion.

As to Bleeding in this Species of *Apoplexy*, some Authors advise it, others oppose it; for my own part, I think this should be determined by the Fullness of the general Habit, and Quantity of Humours to be evacuated; so that the Sagacity and

Prudence of the Physician must suggest to him Reasons for directing it, or omitting it.

After these Derivations and Evacuations, the Lentor or glutinous Viscidity of the Juices is to be attenuated and dissolv'd by Remedies adapted to that Purpose. Amongst these, a Regimen with respect to Aliment cannot be of any great Effect in curing an *Apoplexy*, because there is not sufficient Time for it to operate; but for the Prevention of one it may be of singular Use: It ought therefore to consist of both solid Foods and Liquids, which have had their natural Viscidity perfectly destroy'd by Fermentation, and which are seasoned with Salt and Aromatics; this supposes them to be of vegetable Substances, because no other will ferment, properly speaking. Salts of all Kinds are here of Service, because they stimulate the Solids, and excite the languid and almost stagnating Juices to Motion, the ready Means for their Attenuation. For the same Reasons aromatic Vegetables, and their essential or chymical Oils, are here of Importance; on which Account the *Balsamum Apoplecticum*, describ'd at the End of this Article, has been in great Esteem; but seems to have grown into Disuse thro' its frequent Misapplication; for all these stimulating Remedies are capable of producing great Mischiefs, in *Apoplexies*, from a real Extravasion, a distending Plethora, or an inflammatory State of the Blood. Broths made of Fowls may be also allow'd, because they are Destroyers of Acids, which are great Promoters of Coagulation and Viscidity.

Adding Strength to the Vessels and Viscera, increasing the Motion of the Fluids, diluting, resolving, stimulating, bilious, and saponaceous Medicines, Frictions, Heat, Baths, and Vesicatories, all contribute to the Attenuation of the glutinous Viscidity above mentioned. These are more fully treated of under the Article LENTOR, which see.

These, however, must be used with great Care and Caution; because most of them may be productive of great Evils, and increase the Disorder they are intended to cure; if apply'd at an improper Season, that is, without previous Derivation and Evacuation, or suffer'd to act with too much Violence.

External Topics to the Head, which stimulate, evacuate, or resolve, are not to be omitted. But of all Remedies, Blisters raised by Cantharides are of the greatest Service.

In case an *Apoplexy* from this Cause is already form'd, it seldom admits of a Cure. However, the Remedies above-mentioned should be try'd; and every thing that is likely to excite the Senses should be apply'd to the Nose, Mouth, and Head; the most acrid and stimulating Remedies are to be used; and Stools must be procured by acrid Clysters. *Celsus* directs white Hellebore, one of the most stimulating Medicines we are acquainted with.

Boerhaave specifies the following Forms:

Take of Tincture of Castor, and Spirit of Sal Ammoniac, each two Drams: Apply this frequently to the Nose.

Take of the sharpest Vinegar, and Tincture of Castor, each two Drams: Apply this in the same manner.

Take of the Chymical Oils of Rosemary, Tansy, Lavender, Rue, Wormwood, each four Drops; Tincture of Castor, a Dram; Nerve Ointment, an Ounce; Sal volatile oleosum, a Dram: Mix, and make a Balsam. Let the Vapour of this be received into the Nostrils; and let the Temples be rubb'd with it.

Take of the Pulp of Colocynth, half a Dram; of the Leaves of Tobacco, a Dram and an half: Boil these in a sufficient Quantity of Water for ten Ounces of strain'd Liquor; to which add of Sal Gem two Drams: Make a Clyster.

From FULLER.

Take of the Root of Pellitory of Spain, half an Ounce; of the Leaves of Rue, two Handfuls; of the Pulp of Colocynth, ty'd in a Rag, half a Dram: Boil these in a Quantity of Water sufficient for twelve Ounces of the strain'd Liquor; to which add of the Infusion of Crocus Metallorum, three Ounces; Tincture of Castor, half an Ounce; Oil of Amber, Sal Gem, each two Drams: Make a Clyster.

It must, however, be confess'd, that the Disorder is frequently increased by all these intended Remedies, the Motion of the offending Matter being augmented, and more strongly impell'd upon the affected Parts, by every thing which stimulates: Mean time the Strength would be too much impair'd by farther Evacuations. Hence appears the Reason, why, in procuring a Dissolution of the glutinous Juices, all possible Regard is to be paid to Evacuation and Revulsion. Hence also it is evident, why Bleeding, if it does not relieve, destroys the Patient.

But

But if by the Signs above mentioned it is perceiv'd, that an *Apoplexy* is threaten'd, by an inflammatory Sizziness of the Blood; by a Plethora, or Rarefaction of the Blood; or by too great a Velocity of the Blood in the Head, determined thither by any Cause whatever, immediate Recourse must be had to such Remedies, as most expeditiously evacuate, resolve, and avert the Blood from the Head.

1. Therefore let a considerable Quantity of Blood be taken from the Jugular Veins by a large Orifice; and let this be repeated as Occasion requires. By this the Patient is generally much reliev'd immediately, if the Case is such as will admit of a Cure. See ARTERIOTOMIA.

2. The next Step is to give a considerable Dose of an Antiphlogistic Purge, which must be repeated in such a manner, that an almost perpetual Diarrhoea may be excited; and if these Cathartics do not exert their Effects soon enough, their Operation must be promoted by acrid Clysters:

Antiphlogistic Purges recommended by *Boerhaave* are:

Cream of Tartar, in the Quantity of six Drams.

Crystals of Tartar, in the same Dose.

Crude Tartar, in the same Dose.

Sal Polychreston, in the Quantity of five Scruples.

Pulp of Tamarinds, in the Quantity of three Ounces.

Tamarinds, in the Quantity of four Ounces.

Rob of Elder, in the Quantity of four Ounces.

Rhubarb, in the Quantity of a Dram and an half.

Take of choice Rhubarb, a Dram; Sal Polychreston, thirty Grains; Syrup of Succory, with Rhubarb, an Ounce: Mix these well together; and then add of Elder-flower Water, two Ounces; small Cinnamon-water, two Drams. Make a purging Potion.

Take of choice Pulp of Cassia, two Ounces; Crystals of Tartar, three Drams: Mix these, and let the Patient take a Dram every quarter of an Hour, till he purges sufficiently.

Take of the Leaves of choice Sena, with the Stalks, two Drams; of the best Agaric, a Dram; of choice Tamarinds, two Ounces: Boil these for a quarter of an Hour in a close Vessel, in a sufficient Quantity of Elder-flower Water for five Ounces of the strain'd Liquor; to which add of purify'd Nitre, a Dram; solutive Syrup of Roses, with Sena, six Drams. Make a purging Potion.

Take of the Leaves of Sena, three Drams; Tamarinds, two Ounces; Agaric, three Drams: Boil for a quarter of an Hour in a Quantity of Water sufficient for one Pint of the strain'd Liquor; to which add Syrup of Succory, with Rhubarb, an Ounce. Let the Patient take an Ounce every half Hour, till it purges him.

Forms of Purges somewhat stronger, and more stimulating:

Take of Agaric, two Drams and an half; Sal Polychreston, a Scruple. Mix for a Purge.

Take of the internal Bark of Elder, or Dwarf-elder, an Ounce: Contuse this with a sufficient Quantity of Rain-water; then boil them a little, and press out four Ounces of the Liquor, which administer for a Purge.

Take of Agaric, two Drams; Leaves of Sena, three Drams; Root of Mechoacan, a Dram; Tamarinds, two Ounces: Let these Ingredients be cut and bruised, and then macerated in a sufficient Quantity of Rain-water for half an Hour; then boil gently for seven Minutes; and to nine Ounces of the strain'd Liquor, add of Sal Prunellæ, half a Dram; solutive Syrup of Roses, with Sena, nine Drams. Let the Patient take an Ounce every half Hour, till he purges briskly.

Take of the best Syriac Scammony, thirteen Grains; Diaphoretic Antimony, a Scruple; solutive Syrup of Roses, with Sena, six Drams: Let these be mix'd well together, and then add of distill'd Succory-water, half an Ounce. Make a purging Potion.

Boerhaave, however, in these Cases, recommends in a particular Manner Tamarinds, and Sena.

3. Besides these, during the whole Course of the Cure, the Patient must be kept strictly to the Use of such Medicines as refrigerate, dilute, attenuate, and excite Urine. For these diminish the Velocity and Motion of the Blood, whereas all stimulating Aromatics increase them, and consequently the Disorder.

Proper Forms for this Purpose are, according to *Boerhaave*, those which follow:

Take of the Leaves of Wood-sorrel, three Ounces; of Mallows, an Handful and an half; of Oats unhull'd, an Ounce: Boil in a sufficient Quantity of Whey to twelve Ounces; to which add the Yolks of two Eggs; Rob of Currans, an Ounce: Of this let the Patient drink frequently.

A CLYSTER.

Take of the fresh Leaves of Endive, Succory, Fumitory, Mallows, Marshmallows, each an Handful: Boil these in a sufficient Quantity of Whey for ten Ounces of the strained Liquor. Let this be administer'd twice or three times a Day.

4. Mean time perpetual and strong Revulsions must be made by the Means specify'd above, till the Cure is completed.

5. With respect to Aliment, the Regimen must be extremely thin and antiphlogistic. See INFLAMMATIO.

6. All Medicines which stimulate strongly, or excite the Motion of the Blood, or Heat, must be industriously avoided; as also external Heat; and the Patient must not be suffer'd to lie in Bed, especially in a reclining or supine Posture, but must be kept erect. Narcotics are in all these Cases esteemed prejudicial.

If an *Apoplexy* from this Cause is already form'd, a Cure is seldom to be expected; the Remedies, however, above specify'd, are the only probable Means of Relief.

That Species of *Apoplexy* which is caused by Juices extravasated betwixt the Cranium and Dura Mater, or betwixt the Dura and Pia Mater, from a Wound, Contusion, Fracture, or Suppuration, is treated of under the Article CAPUT, which see.

That sort of *Apoplexy* which is caused by an Extravasation of Humours in the internal Cavities of the Brain, scarcely admits of any Cure, because it generally proves very soon fatal: But if any Relief can be obtained, it must be, first, from emptying the Vessels by copious Bleeding and Purging, which must be repeated, provided the Symptoms are alleviated by the first; for by these means Room will be made in the evacuated Veins for the Absorption of the extravasated Humours, which may possibly be impell'd into them by the vital Powers.

Secondly, from correcting at the same time the prevailing Acrimony and Viscidity of the Juices, by Remedies adapted to the particular Kinds of them.

That Species of *Apoplexy* which is caused by an Extravasation of redundant Lymph, more readily admits of a Cure, by brisk Hydragogue Purges, to which must be added Topics which dissipate or draw off a Part of the abounding Lymph, amongst which the principal are large Vesicatories, which must be kept running a considerable time: Besides these, the Regimen must be drying, and Sinapisms, Issues, and Setons, are to be made use of as Occasion requires. In this Species Bleeding is pernicious, and must therefore be omitted.

This Species of *Apoplexy* so frequently occurs, that some Authors have erroneously treated of all *Apoplexies*, as arising from an Extravasation of Lymph.

No Remedies have yet been taken Notice of by Authors, for *Apoplexies* caused by Poisons, or polypous Concretions in the large Vessels.

Apoplecticum Balsamum. Apoplectic Balm.

Take the distill'd Oil of Cinnabar, Cloves, Lavender, Lemons, Marjoram, Mint, Rice, Rosemary, Sage, Rhodium, Wormwood, of each twelve Drops; Amber, six Drops; Bitumen Judaicum, two Drams; Oil of Nutmegs by Expression, one Ounce; Balsam of Peru, a sufficient Quantity to make all together into a smooth Balm.

This warms and enlivens the Nerves, being either smell'd to, or rubbed upon the Temples, or any other convenient Parts. It does much Good also to paralytic Limbs, by rubbing them well with it. It has been in mighty Esteem and Fashion to wear in little Ivory Boxes and Cane Heads; but it has in such respects given place to more modish Contrivances. In Distempers of the Head and Nerves, it is likewise directed to be given inwardly from three to six Drops, in a Bole or Electuary. *Quincy's Dispensatory.*

APOPNIXIS, ἀποπνιξις, from ἀποπνιγω, to suffocate. Suffocation, apply'd particularly to Hystrics. These Suffocations were by the Antients thought to proceed from the Uterus.

APOPSYCHIA, ἀποψυχία, from ἀπο, signifying Privation, and ψυχή, Soul, Life. The greatest Degree of Lipothymy. See LIPOTHYMIA. *Castellus.*

APOPTOSIS, ἀποπτώσις. Erotian explains it by τῶν ἐμ-
δ' ἐμὸν ἀρσεν, "the unloosing of a Bandage;" in which Sense
it is the same as APOLYSIS.

APORIA, ἀπορία. The same as ALYSMUS, which see.
Ἀπορρητισμός, in Hippocrates, is a doubtful Disease, or such
a one as endangers the Life of the Patient.

APORRHAIDES, ἀπορρηαίδες. Purple Fishes with Prickles.
Castellus. A sort of Shell-fish.

APORRHIPSIS, ἀπορρηψις; from ἀπορρίπτω, to throw away
with Precipitation. A precipitate casting away. Ἀπορρίψις
ἐξ ἰμᾶτιον, in Hippoc. de rat. Viñ. in Morb. acut. is, "a
precipitate Throwing off the Cloaths," as it is customary for
delirious Persons in the Height of a Fever.

APORRHŒA, ἀπορρηαία, of ἀπορρέω, to flow from. A
Defluxion, or Influx; also a Contagion, Pollution, Effluvium,
Morbose Apocrisis. See APOCRISIS, CONTAGIUM, EFFLU-
VIUM. Castellus.

APORRHŒA, ἀπορρηαία, signifies a Defluxion; or Falling
off, as ἀπορρητὸν τῶν τευχῶν, is "a Falling off of the Hair."
See ALOPECIA.

APOS. A Bird thus distinguish'd:

APOS, Offic. Aldrov. Ornith. 2. 698. Bellon. des Oyse,
377. Jonf. de Avib. 84. Gefn. de Avib. 506. Apos major,
Charlt. Exer. 96. Hirundo, Apos, Raii Ornith. 214. Ejusd.
Synop. A. 72. Mer. Pin. 178. Will. Ornith. 156. THE
BLACK MARTIN, OR SWIFT.

It lives with us in England during the Summer. See APO-
DES.

These, on account of their habitual Exercise and Food,
which is of Insects, abound much with volatile Salts, and an
exalted Oil. They are said to be good for Epilepsies, for
weak Eyes, for nephritic Pains, and for the Colick.

APOSÆIS, ἀποσαΐσις, is explain'd in Galen's Exegetis, by
ἀποσβεσμός, that is, extinguish'd.

APOSCEMMA, or **APOSCEPSIS**, ἀποσκημμά, ἢ ἀπό-
σκηψις, from ἀποσκήνω, a Verb, importing, among other Sig-
nifications, to remove hastily, in order to a new Settlement.
A violent Influx and Settlement of Humours translated from
one Part to another, Galen, Lib. 2. ad Glauconem. This is
sometimes critical, and owing to the Strength of Nature, as the
same Author observes, Lib. πρὸς τὴν περὶ γυναικῶν. He calls also
by the Name of ἀποσκημμά, those excrementitious Parts of
the Body, which are deposited in the Alvus, whereby the
other Parts are reliev'd from their Load of Humours. Ἀποσκήψις,
in Hippocrates, are the same as ἀποσκημμά, or the Settlement
of Humours, and sometimes the Transmutations or Transitions
of Diseases, as Aph. 56. Lib. 6. Ἐστὰς ἀποκλίνονται αἱ ἀποσκή-
ψις, "are in Danger of, or liable to these Transmutations;"
by which Passage, which otherwise would be obscure, he hints,
that Diseases owing to Melancholy are subject to make Tran-
sitions into Apoplexies, Convulsions, Madness, and Blindness.
Ἀποσκήψις, in Hippoc. Lib. 1. de Morb. majore, as quoted by
Galen, is explained by him in Exeg. by ἀποσάσεις, that is,
Scarifications.

APOSECAPNISMUS, ἀποσκαπνισμός, from σκαπνέω,
an Ax, is a kind of Fracture of a Bone, when a Piece of it is
cut off, as a Chip from a Block with an Ax. Such a Wound
is inflicted by a Side-blow, with a light and sharp Weapon.
Castellus.

APOSCHASIS, **APOSCHASMUS**, ἀποσχασις, ἀποσχασμός,
from ἀποσχάω, to scarify. Scarification, and a slight superfi-
cial Incision in the Skin. Ἀποσχάν, and ἀποσχάσαι, in Hip-
pocrates, signify, to pierce, cut, scarify; and in Lib. 1. & 2.
de Morbis, denote Piercing, or Opening, as apply'd to a Vein;
as, Πρῶτον μὲρ τὰς φλέβας τὰς ὑπὸ τῇ γλῶσσῃ ἀποσχάν. "First
open the Veins under the Tongue." And, Τέταρτον ξυμφέρει τὴν
φλέβα ἀποσχάσαι τὴν ἐν τῇ χειρὶ, τὴν σπληνίτιν καλεομένην, ἢ τὴν
ἥπατιν. "It would be convenient for the Patient to open
the Vein in the Hand, call'd the Splenic, or Hepatic Vein."
Ἀποσχάσαι is expounded in Hesychius by φλεβοτομεῖν, and in Va-
rius also by διαχῆσαι, to dissect.

APOSIGESIS, ἀποσίγησις, from ἀποσιγέω, to be silent. A
keeping Silence. Περὶ τὰς ἀποσιγῆσας ἐνθυμηματικῶν, in Hip-
pocrates ἐπὶ ἐνθυμ. is very differently understood by Interpreters:
Some render it, "sharp and prompt in making pertinent An-
swers;" others, "grave and sententious in answering." One
understands by the Phrase, "a Mind obstinately bent upon
Silence;" another, "angry and vehement against such as hold
their Peace." Foesius takes it in the first Signification,
for "acute and prompt in answering;" in which Sense, he says,
it will best correspond with the preceding Clause, πρὸς τὰς ἀνα-
στάσεις σιγῆσιν, which he translates, "silent (that is, patient
and modest) in hearing the Objections of Opponents."

APOSITIA, ἀποσιτία, of ἀπό, from, and σιτίον, Food. The
same as ANOREXIA, which see.

APOSITICA, ἀποσιτικά, in Hippocrates are expounded in
Galen's Exegetis, by ἀποσιτίας καὶ ἀποφύγιος ποιήσιν, "such
Things as cause a Loathing and Aversion to Food."

AOSPASMATA, ἀποσπασμάτα, of ἀποσπᾶω, to draw off,
or separate. A Name by which Galen, Lib. de Constit. Art.
calls those Solutions of Continuity; which are in the organical
Parts. In the Beginning of Lib. 4. Meth. Med. he calls the
violent Solution of Continuity in the Ligaments ἀποσπασμα,
as he does that in the Vessels and Muscles by the Name of
ῥήγμα and θλάσμα. In his Comment. 3. in Lib. κατ' ἰνσρ. he
tells us, That Hippocrates calls by the Name of ἀποσπασμάτα,
the rending asunder those Parts which serve to unite and knit
together the Bones.

AOSPHACELISIS, ἀοσφακέλισις; from σφακέλω, a Mor-
tification; in Hippocrates, is a Sideration or Mortification of
the Flesh in Wounds or Fractures, which is caused by too tight
a Bandage.

AOSPHAGE, ἀοσφαγή, from ἀποσφάγω, to slaughter as
a Victim. Butchering, cutting the Throat. Hippoc. ἐπὶ δεχ.
ἰνσρ. According to Pollux, σφαγή is the Throat, καὶ τὸ κοίλον
ἐν μεσασὶ αἱ κλάδες, "and the Cavity between the Clavicles."
Foesius.

AOSPHAGMA, ἀοσφαγμα, is expounded by Galen,
ἐν τρυγῶδες παρὲνθιμα, "the feculent Straining," which is
also called ἀοσφαγμα. Aposphagma also, according to Pliny
and Athenæus, signifies the Blood that flows into the Vessel set
under the Throat of a slaughter'd Beast, which was reserv'd for
the Preparation of several Sorts of Food.

AOSPHINXIS, ἀοσφινγίσις, from ἀποσφίγω, of σφίγω, to
strain or streighten. A Streightening; the Word is used by
Hippocrates, in several Places, to express the Constriction or
Streightening of a Fillet in Bandage.

AOSPONGISMUS, ἀοσπογγισμός, is the using of a
Sponge, either dry, or dipt in Water; for the deterring of
Filth, easing of Pain, taking off Itching, refreshing the Spi-
rits, &c. Castellus.

APOSTAGMA, **APOSTALAGMA**, ἀποστάγμα, ἀποστά-
λαγμα, from ἀποσάω, and ἀποσάλλω, to distil. That sweet
Liquor which distils from the Grapes before they are trodden;
it is also, on account of its singular Sweetness, called γλεῦκος;
and by some Protropum. Castellus.

APOSTASIS, ἀποστάσις, from ἀφίστημι, to abscede. An Ab-
cess. See ABCESSUS.

Besides this common Acceptation of the Word, there are
other Significations of it to be met with in Hippocrates, where-
of two are most remarkable; one is, ἀποστάσις κατ' ἐξουον, ἢ
κατ' ἐκκρίσιν, "an Apostasis by Efflux, or Excretion," when
the Distemper leaves the Patient, and passes off by some such
Way, as by an Outlet. The second is call'd an ἀποστάσις κατ'
ἀπόθεσιν, "an Apostasis by Settlement," when the morbid
Matter by its own Weight falls upon a Part, and there lodges
and settles. Thus, Galen, Com. 8. in Lib. 6. Epid. Πολλὰς
ἀποστάσεις εὐεργετὸν αὐτὸν ἐν ἐπὶ μόνων ὄψι κατ' ἀπόθεσιν, ἀλλὰ
κατὰ τὴν ἐκκρίσιν εὐνομεῖται. "We often find him applying
the Term Apostasis, not only to Things deposited in any
Part, but to those which are discharged by Excretion."

Hippocrates also uses ἀποστάσις for the Transition of one Dis-
ease into another; as Lib. 1. Epid. Ἐστὶ δ' οἷς ἐν ὀλίγοις ἐξ
ἄλλων πυρετῶν καὶ νευμάτων ἀποστάσεις ἐς τελευταίους ἐγένοντο
"Many of the other Fevers and Distempers underwent an Al-
teration, and passed into Quartans." Here Galen on the
Place expounds ἀποστάσις by μετέστας.

APOSTAXIS, ἀποστάξις, of ἀποσάω, from σάω, to distil.
A Distillation is generally used by Hippocrates to signify a Di-
stillation of Blood from the Nose; sometimes it means any Di-
stillation or Defluxion.

APOSTEMA, ἀποστήμα, from ἀφίστημι, to abscede. The
same as ABCESSUS, which see.

APOSTEMATIAI, ἀποστηματιαί. Aretæus, Lib. 1. de
Caus. & Sig. Chron. Cap. 9. calls those, who, labouring under
an inward Abscess, void Pus downward, ἀποστηματιαί, as he
names those who discharge it by Expectoration, ἐμπνοί
(Empnoi).

APOSTERIGMATA, ἀποστηρίγματα, from ἀποστηρίζω, to
support or prop. It signifies whatever Things are used for a
Stay and Support to any weak Part, without Tying or Bind-
ing, as Pillows, Bolsters, &c. to the Head, Gal. Com. 3. in
κατ' ἰνσρ. In Hippocrates, Lib. de Flat. ἀποστηρίγματα is
generally supposed to mean such Diseases as are confirmed and
deeply rooted in the Intestines.

APOSTOLORUM UNGUENTUM. The Ointment
of the Apostles. It is thus prepared:

Take of Turpentine, Rosin, Wax, Gum Ammoniacum,
each fourteen Drams; Roots of long Birthwort, Oliba-
num, Bdelium, each six Drams; Myrrh, Galbanum,
each half a Dram; Opopanax, three Drams; Verdigris,
two Drams; Litharge, nine Drams; Oil, two Pounds;
Vinegar enough to dissolve the Ammoniacum, Opopa-
nax, and Galbanum. Digest the Bdelium, Galbanum,
Ammoniacum, and Opopanax, twelve Hours in the Vi-
negar upon hot Ashes; then make them boil, and when
they

they are thoroughly melted; strain them, and, with a gentle Heat, reduce them to the Consistence of Honey, to which, whilst warm, add the Turpentine. The Litharge being supposed in the mean time to be levigated, grind it in Part of the Oil by a gentle Fire; after which, add the rest of the Oil by Degrees, in which melt the Wax, and the Rosin grossly beaten. Being remov'd from the Fire, mix therewith the Gums before prepared; then the Birthwort and Myrrh; and, lastly, the Frankincense and Verdigris reduc'd to Powder. Stir it continually with the Spatula, till it comes to the Consistence of an Ointment.

It takes its Name from the Number of its Ingredients, which answers to that of the Apostles, being Twelve, except the Oil and Vinegar. It is vulnerary.

APOSTRACOS OSTEON, ἀποστράκος ὀστὸν, from ἀστέρον, a Shell, in Hippoc. de Vuln. is a Bone dry'd to such a Degree as to become a mere Shell.

APOSTROPHE, ἀποστροφή, from ἀποστρέφω, to turn away, in P. Aeginet. Lib. 3. Cap. 37. is a Loathing and Aversion to Food.

APOSYRMA, ἀποσύρμα, from ἀποσύρω, to obtrude. The same as ABRASUM, which see.

APOTELESMA, the Effect or Event of a Disease. Caelius Aurel. Chron. Lib. 2. Cap. 12.

APOTHECA, ἀποθήκη, from ἀποτίθημι, to lay aside, or reposit, formerly signify'd a Wine-cellar, but now a Shop where Medicines are sold; also a Gally-pot. Hence,

APOTHECARIUS, A Preparer of Medicines.

APOTHERAPIA, ἀποθεραπεία, from ἀποθεράσσω, to cure, signifies in general a perfect and absolute Cure; for, in this Sense, the Verb ἀποθεραπεύειν seems to be used, Hippoc. Præcept. In Galen it sometimes signifies the End or last Part of a perfect Exercise, when a Person came to use Friction, Unction, or Bathing, to remove Lassitude; and sometimes it means a particular sort of Exercise, intermix'd with Friction, Remission of Motion, and frequent Intervals of Rest; and that Part of Medicine which teaches these, is called *Apothepaueutikê*.

APOTHERMUM, ἀποθερμῶν, an acrimonious sort of Pickle, such as is made of Mustard, Oil, and Vinegar, or of Vinegar alone, Gal. de Aten. Diet. Cap. 11. Some pretend to prove from Galen, Lib. 1. de Alim. Fac. that *Apothermum*, *Sapa*, *Siraon*, and *Hepsema*, are synonymous; but their Arguments from the Text are by no means convincing. Castell.

APOTHESIS, ἀπόθεσις, from ἀποτίθημι, to reposit, in Hippocrates, is the right and orderly repositing and placing of a Limb that is broken and bound up, in the Situation in which it ought to continue; and is the same as *THESIS*, θέσις, and often join'd with *Analepsis*, ἀνάληψις, which has the same respect to the Arm, as ἀπόθεσις to the Leg. In Lib. κατ' ἰσρίων. Ἡ ἀνάληψις, ἡ ἀπόθεσις, ἡ ἐπιθέσις, ὡς ἐν τῷ αὐτῷ ἢ διαφυλάσσειν. "The Supports, the Posture, and the Bandage, must be kept in the same State."

APOTHLIMMA, ἀποθλίμμα, from ἀποθλίβω, to squeeze, or press out, signifies the Dregs, and sometimes the expressed Juice. Gorræus.

APOTHRAUSIS, ἀποθραυσίς, from ἀποθραύω, to break off. The Removal of a Fragment or Splinter of a Bone, that is loosened from the Surface by Exfoliation or otherwise.

APOTOCOS, ἀποτόκος, from ἀποτίλλω, to bring forth Young. Abortive. Hæschius expounds ἀποτόκος by ἀπογνήσκεις γυναιμάτων, "the tender Buds of Fruits, or Fœtus of Animals." Hippocrates, Lib. de Art. ἀποτόκος γυναιμάτων χειρὶς ποίωσις, "giving Occasion to the Production of chronical Diseases."

APOTOS, ἀπότος, from a Neg. and πίνω, Drink. One that never drinks, or desires to drink. Castellus.

APOTROPÆOS, ἀποτροπῆος, from ἀποτρέπω, to avert. One of the Pagan Deities, who were called *Dii Averruncatores*, *Vejoves*; and ἀλεξίκατοι, that is, Deliverers and Defenders from all evil and hurtful Things.

Apotropaia, ἀποτρόπαια, were Sacrifices offer'd to these Deities, and sometimes signify'd Amulets against Inchantments, and so were the same as *Periapta*, περιάπτα. Hippoc. Lib. περὶ ἐκφυγίων. Ἐπὶ δὲ τοῖς ἐναντίοις τοῖς ἀπὸ τῶν ἐχθρῶν, καὶ γὰρ, καὶ ἡρώων ἀποτρόπαια γενέσθαι τὰ χαλεπὰ πάντα. "In Times of Adversity supplicate the *Dii Averruncatores*, and *Terra*, (the Earth) and the Heroes, to avert all evil and hurtful Things."

APOTYCHIA, ἀποτυχία, of the Privative ἀπό, and τύχη, Fortune. Misfortune.

APOXE, **APOXERA**, ἀπόξη, ἀπόξηρα, are understood by Galen, Com. 3. in Lib. Hippocratis κατ' ἰσρίων, to signify those Parts of the Body which are acuminate, and grow slender by Degrees towards the Top. Some for ἀπόξη read ἀπόξιν, and ἀπόξιν for ἀπόξη, and take them to be meant of those Parts, which being dry and wither'd, lessen more and more

towards their Extremity, which by that means is acuminate. *Foefius*.

APOZEMA, ἀπόζημα, from ἀπόζω, to boil. A Decoction. See *Decoctum*, where Rules are laid down for the Management of this Form of Medicines.

APOZYMOS, ἀπόζυμος, from ζύμη, Ferment. Fermented. Hippoc. in Prorrh. 2. Ἄμα δὲ καὶ τὰς γαστέρας ἀποζύμους τε καὶ ῥυπαρὰς ἀποδεδυνάσκει καὶ ῥυτίδα δέσσει. "Besides, it (the Looseness before described) makes the Belly appear as if under a Ferment, dirty and wrinkled."

APPARATUS, κάτασκευή. An Apparatus. In Surgery, it is a Collection, and regular Disposition, of all the Instruments necessary for the perfect Exercise of the Art, or for any particular Operation. The Word may also be used with respect to other Parts of Medicine, as well diætic as pharmaceutic, which require an Apparatus of the necessary Means and Instruments for attaining their Ends. The Lithotomists have their *Apparatus major* and *minor*. *Castellus*, *Blancard*.

APPENDICULA VERMIFORMIS. On one Side of the Bottom of the Cæcum lies an Appendix, resembling a small Intestine, nearly of the same Length with the Cæcum, but very slender. It is termed *Appendicula Vermiformis*, from its supposed Resemblance to an Earth-worm. Its common Diameter is not above a Quarter of an Inch. By one Extremity, it opens laterally, and a little obliquely, into the Bottom of the Cæcum, and the other Extremity is closed, being sometimes greater, and sometimes smaller, than the rest of the Appendix.

It has some Contortions like those of a Worm when it is touched, from whence comes the Epithet of *Vermicularis*, or *Vermiformis*; and it may likewise be compared to the Gills or Pendants of a Turkey-cock. Its Structure resembles nearly that of the other Intestines. The internal Coat of this Appendix is folliculous, like that of the Duodenum; and it is likewise Reticular, the Mashes being the glandular Lacunæ, which continually discharge a Fluid into its Cavity.

It has been often disputed, whether this Appendix, or the large Portion which is, as it were, the Head of the Colon, ought to be called the *Cæcum*; but the general Division of the Intestines into great and small leaves no room to doubt of its being only an Appendix in Man, whatever Reason there may be for talking differently with respect to Brutes and Birds. *Winflow's Anatomy*.

The End which is shut, is not tied to the Mesentery, but to the Right Kidney, by means of the Peritonæum. Its Use is yet unknown. Some take it for a second Stomach, others for a Receptacle of the Excrement of the Fœtus, of which it is always full, till after the Birth. Others say, it contains a Ferment, and others, the Flatulosity of the Intestines; and others, that it separates a Liquor by some Glands which are in its Cavity, which Liquor serves to harden the Excrements as they pass thro' the Colon. *Keill's Anatomy*.

APPENDIX, ἐπιφύσις, from ἐπιφύω, to grow, to or upon. The same as *EPIDYSIS*, which see.

APPENSIO, the Suspension of a broken Limb, principally of the Arm in a Scarf. *Castellus*.

APPETITUS, **APPETENTIA**, ὄρεξις, ὄρεμα, ἐπιθυμία, Appetite. In the most general Sense it means that natural Inclination which is found in all Beings towards particular things; but in the strict and common Acceptation, it signifies a Desire of Aliment, or Meat and Drink. Of this Appetite there are two Kinds, which are *Hunger* and *Thirst*.

APPETITUS CANINUS, ὄρεξις κυνῶδης. The same as *BULIMIA*, which see.

APPLICATIO, ἐφαρμογή, προσοικεῖσις, from ἐφαρίζω, to fit, and προσοικεῖω, to accommodate. Application. That Action of the Physician or Surgeon, wherein he administers, or communicates to the Body, internal or external Remedies, as by the Application of a Plaster, Clyster, &c. *Castellus*.

APPLUDA, the Chaff of Millet, Panic, and Sesamum. *Pliny*.

APPOSITIO, the same as *ADDITIO*, which see.

APPREHENSIO, **APPREHENSORIUM**, the same as *ANTILEPSIS*, which see.

APPREHENSIO is sometimes taken also for a *CATALEPSIS*, or *CATOCHÉ*, which see.

APPROPRIATIO, that Action of the natural Heat, or vital Flame, by which the Humours and Spirits are so united with the Body, and its solid Parts, as to enable them to perform their proper Functions.

Medicines are said to be *appropriated*, when they are calculated for a particular Part of the Body.

APPROXIMATIO. A Method of Cure by transplanting a Disease into an Animal or Vegetable Subject by way of immediate Contact. *Castellus*.

APRACTA, ἀπραξία, from a Neg. and πράω, to act. Unactive; an Epithet of the Pudenda in a State of Impotence. *Castellus*.

APRONIA. A Name for the *nigra Vitis*, or black Vine, otherwise called by the Name of *Bryony*, *Chironia*, and *Gynacanthé*.

neanthe. The Root thereof, bruised with a fat Fig, takes off Wrinkles, if the Patient, immediately after being anointed, walk a quarter of a Mile. *Pliny, Lib. 23. Cap. 1.* See *BRYNIA*.

APROXIS, an Herb. so called by *Pythagoras*, whose Root takes Fire at a Distance, like *Naphtha*. The same Philosopher says, that whatever Diseases happen to the human Body, in the time of the Flowering of the *Aproxis*, though cured, will be sure to give the Patient a Memorandum at the Return of the Flowering-season. The Case is the same with *Wheat*, *Hemlock*, and *Violets*. *Pliny, Lib. 24. Cap. 17.*

APSINTHATUM, ἀψινθῶν, from ἀψινθῶν, Wormwood. A sort of Drink accommodated to the Stomach, of which you have several Forms in *Astius, Tettab. 1. Serm. 3. Cap. 69, 70, 71.*

APSIRRHON, ἀψιρρῶν, from ἀψ, backwards, and ῥῶν, to flow, in *Hippocrates* is expounded by *Galen, ἐν τοῦ πτω πῶν*, "flowing backwards."

APSYCHIA, ἀψυχία, from α Negative, and ψυχή, Life. The same as *LIPOTHYMIA*.

APTISTOS, ἀπίστος, from α Negative, and πίσις, according to *Erotian*, to peel, or take off the outer coarse Rind. *Hippocrates, περὶ ἀρχαίων ἰσχυρίων*, among the Kinds of Bread reckons ἀπίστον πυρῶν, ἢ ἐπισμίνων, "Bread of Wheat cleaned, or not cleaned from the Bran."

APTYSTOS, ἀπτυστός, from α Negative, and πτύω, to spit. An Epithet of a Pleurisy, or other Distemper, in which nothing is spit out. *Αἱ ἐν τῶν πνευμάτιδων ὃ ἀπύσαι χαλεπώταται* "Dry Pleurifies, in which there is no Expectoration by Spitting, are very dangerous." *Hippocr. Coac.*

APUA, a Fish thus distinguished: *Encrasicholus*, *Offic. Aldrov. de Pisc. 214. Charlt. Pisc. 24. Rondel. de Pisc. 1. 211. Jons. de Pisc. 51. Raii Ichth. 225. Ejusd. Synop. Pisc. 107. Encrasicholus, quos alii Engraulis, alii Lycofomus appellant Rondeletii, Gesn. de Aquat. 68. Heteula, Bellon. de Aquat. 169. THE ANCHOVY.*

They are pickled with Salt, and kept in Barrels, and the whole Fish, as well as the Pickle, are in Use; the Fish pickled is apply'd like Herrings to the Soles of the Feet; and both their Pickles serve for the same Purposes. *Dale.*

You are to chuse those that are tender, fresh, white without, red within, small, plump, firm, and well tasted.

Anchovies are of an opening Nature, fortify the Stomach, and create an Appetite.

When they are used to Excess, they heat much, and make the Humours sharp and pungent.

They contain much Oil, and volatile Salt.

They agree in Winter with old phlegmatic and melancholy People, and with those who have no good Digestion: But young People of a hot and bilious Constitution ought to abstain from them, or use them very moderately.

R E M A R K S.

The Anchovy is a small Sea Fish, that is as long and as thick, very near, as one's Finger; they fish for it in several Parts near *Genoa* and *Provence*. They usually swim in Shoals, and make a close Body together; they will run to the Fire, when they see it, and the same is made use of as a Snare to catch them. But some pretend, that those taken in this manner, are softer than the others; they are pickled after their Heads are cut off, and Guts taken out, which soon corrupt.

This Fish is much used in several Parts of *Europe*; for the Excellency of its Taste, they mix it with Sauces: It helps Digestion, and fortifies the Stomach with its volatile and saline Principles, which cause a gentle and moderate Heat in that Part, and disperse and attenuate the Aliments, that are contained therein. In the mean time, if it be used to Excess, it very much rarefies the Humours by these same Principles, and so produces the ill Effects above-mentioned. *Lemery on Foods.*

APULOTICUS, ἀπυλωτικός, the same as *EPULOTICUS*, which see.

APYETOS, ἀπύητος, from α Negative, and πύς, Pus. An Epithet for an external Disease, or Tumor which is not suppurable; it is the same as ἀνεκπύητος, in *Hippocrates*, and differs from ἀπύος, which signifies Want of Pus. *Castellus.*

APYREXIA, ἀπυρεξία, from α Negative, and πυρεξία, the same as πυρετός, a Fever. The Absence of a Fever. It signifies that Interval, or Space of Time, which passes between the two Fits of an intermittent Fever; and also the total Cessation and Absence of a continual Fever.

APYROMELE, or **APYRENOMELE**, ἀπυρεμήλη, ἢ ἀπυρηνόμηλη, from α Negative, πυρην, a Nucleus, and μέλη, a Probe. A Probe without a Button, that is, a *Melotris*. *Galen. in Exeges.*

APYRON, ἀπυρον, from α Negative, and πῦρ, Fire. What never felt the Fire; in particular it is apply'd by *Dioscorides* to *Sulphur Vivum*, *Lib. 5. Cap. 124.* and also by *Celsus*, *Lib. 5. Cap. 18.* Ἀπυρον is also an Epithet bestowed on a chymical Preparation called *Ethiops*, which is performed by

means of Trifuration only, without the Help of Fire. See *ÆTHIOPS*.

APYROTIIUM, a Name for *Sulphur Vivum*. *Blanc.*

APYROTI. Carbuncles, as *Pliny* says, are so called by some, because though those Precious Stones so much resemble Fire, they yield not the least Sensation of it. *Lib. 37. Cap. 7.*

AQUA, Water. See the Article *ACIDULÆ*, and *THERMÆ*, and *Hippocrates, on Air, Waters, and Situations*, under the Article *AER*. See also *BALNEA*.

It is difficult to form a Judgment of Waters in general, because of the peculiar Nature and Qualities of Places, Air, and many other things; but, for the most part, the best Water is what is pure, sweet, participating of no manner of Quality, and soonest passes off the Hypochondria, creating no Molestation in its Passage, nor breeding Inflammations, and what is least subject to Corruption. *Dioscorides, Lib. 5. Cap. 18.*

Of SEA-WATER.

Sea-water is hot and acrimonious, hurts the Stomach, disturbs the Belly, and expels Phlegm. Used warm in a Fomentation, it is both a Drawer and a Diaphoretic, and is therefore proper in Affections of the Nerves, and for Kibes, before they are ulcerated. It is an useful Ingredient in Cataplasms of Barley Meal, and in discutitive Plaisters and Malagmata. Administered in a Clyster warm, it evacuates the Belly; and, injected hot the same way, eases the Gripes. It makes a good Fomentation for the Pfora, Itch, Tetters [ἀγχίνων], and Scurf [καυδῶν]; and for Breasts turgid with Milk; it also discusses Evidnefs from Blows, if the Place affected be fomented with the same hot. An hot Bath of Sea-water is effectual against the Bites of venomous Creatures, which are succeeded by Tremblings and Refrigerations, especially those of the Scorpion, Phalangium, and Aspid. The same relieves under an inveterate Cachexy, or Disorder of the Nerves; and the hot Vapour thereof comforts and helps those who labour under a Dropsy, Pain in the Head, and Deafness. Sea-water kept pure, without being mixed with potable Water, loses its rank Smell. Some boil it first, and then set it aside. It is also administered as a Purge, either alone, or with Oxycras, Wine, or Honey, care being taken, after its Working, to give the Patient some Broth made of Chicken or Fish, in order to temper its acrimonious and biting Quality. *Dioscorides, Lib. 5. Cap. 19.*

With respect to Waters, two things come under our present Consideration, which are, that pure simple Element, so well known, and of so universal Use in common Life; and medicinal or medicated Waters, distilled from, or impregnated with, Animal, Vegetable, or Mineral Substances, which are directed to be kept in the Shops.

Many and surprising are the Properties of Water; which have been discovered by Naturalists, to whose Province these properly belong. I shall therefore confine myself to the Properties of Waters, so far as they relate to Medicine. Perhaps it may be of some Use to specify the Salubrity and Insalubrity of those Waters we generally meet with, because as good Waters conduce to Health, those which are bad, are productive of Diseases.

It is a common Observation, familiar in the Kitchen and Laundry, that some Waters are hard, crude, and rough, and others again soft, mild, smooth, or, as it were, milky: The former whereof are properly accounted bad, and the latter good.

WATER of dissolved ICE and SNOW.

Among the crude and hard Waters, we reckon that which is obtained by the dissolving of Ice: And of this Water *Hippocrates* says very justly, "That the clear, light and sweet Part in frozen Water, is dissipated and discharged; and only the turbid and ponderous Part left behind: For, if a certain measured Quantity be set to freeze in the open Air, and the Ice be the next Day dissolved in a warm Place, and the Water be now measured again, it will be found to have lost much of its Quantity." The same Author likewise assigns a very good Reason why Snow-water is rather pernicious than advantageous to Vegetables and Animals; as Water by freezing has its Texture destroyed. For 'tis manifest, that the subtle Principle of the Water is thereby separated from the gross Part, and driven towards the Centre: Whence, in the Middle of all Ice, there appear large Bubbles, proceeding from the subtle elastic Matter being driven inwards; where, by its rarefactive Motion, it increases the Bulk of the Ice, and causes it to possess a greater Space, than when in the Form of Water; and thus occasions the bursting of such Glass or Earthen Vessels as it happens to be contained in: And this shews by what means the fine, fluid elastic Principle is separated, and only the grosser and more ponderous Part left behind: Inasmuch that Water being despoiled and corrupted by this Operation, must needs become unwholesome. But principally the Use of Snow-water is found to produce Swellings in the Glands of the Throat, as frequently happens to those who inhabit the Bottoms of Mountains,

tains, which are all the Year covered with Snow; but especially in the Women, who have generally large Tumors hanging at their Throat. And this the People who live at the Foot of the *Alps*, *Pyreneans*, &c. to their great Misfortune, experience. Those Waters therefore must be carefully avoided, which, upon a general Thaw, flow down the Sides of the Mountains into the Valleys; and thus often pollute and corrupt the Springs and Rivers.

The WATERS of MINES.

In the next place, those Waters are found to be hard, crude, and unwholesome, which are found in metallic Mines, or descend from very high Rocks; because they lick up in their Passage many rough, earthy, and astringent Particles from the Fossils, Minerals, Chalk-stones, and the harder compacted Bodies they run over; and thus become impregnated therewith; whence few can bear to drink them. And their Use, to such as are not accustomed thereto, proves very pernicious. Thus 'tis observed by *Hippocrates*, that those Waters are to be rejected as unwholesome which flow from Rocks; for this renders them hard; and those again which run near to hot Springs, Beds of Iron, Stone, Sulphur, Alum, &c. for none but crude, heating, and unwholesome Waters, that pass not well by Urine, but bind up the Belly, are to be found in such Places. And we cannot but commend the Justness of the Observation, with regard to the common Waters found near hot Springs; for such generally are crude and unwholesome, unfit for brewing, or promoting the Secretions of the Body, but rather obstruct and hinder them; and the Reason hereof seems principally owing to the chalky, rough, styptic Earth, with which the Soil about these Springs most commonly abounds.

CHALKY and STONY WATERS.

Again, those Waters are crude, heavy, and sluggish, which spring up in chalky Ground, as may appear from the Pipes or Canals through which they run; for they all along deposit an earthy, chalky Matter, that lines the Insides of these Conduits; and, when boil'd over the Fire, deposit a stony Crust on the Sides of the Vessel. In short, the stony Waters of all Kinds, running upon chalky Beds, are unwholesome, crude, and hard; as the Matter of these Beds is easily imbibed by the Waters, which renders them gross and heavy; so that when drank, they pass with Difficulty through the fine Canals of the Body; nor readily reach the Extremities of the Veins, without causing Obstructions.

STAGNANT WATERS.

Lastly, those Waters are unwholesome which collect themselves in stagnant Ponds, marshy Grounds, or are received into Reservoirs, formed on Purpose to preserve the Rain, that runs from the Tops of Houses; as also those of Springs arising in an open Champain Country, and having a muddy, unctuous, earthy, or bituminous Bottom; for all these are gross, turbid, and somewhat fetid; and, though frequently refreshed by new Rain, lose their fine, thin, and most useful Principle, by the Sun's striking continually upon them; whence they become subject to cause Obstructions in the finer Vessels, and are productive of chronical Distempers.

RAIN-WATER.

On the other hand, those Waters must be allowed good and wholesome, which are light, sweet, soft, thin, and readily pass through all the excretory Vessels of the Body. And of this Kind, in the first place, are certainly those raised by the Sun into the Atmosphere. The Cause of this is, with more Chymical Knowledge than one could expect, delivered by *Hippocrates*, in these Words: "Because the Sun raises that Part which is thinnest and lightest, leaving behind what is saline, gross and heavy, in the Sea." For, in Reality, Rain-water is Water distilled by the Sun, which not only raises from the Ocean, but likewise from all Springs and Rivers, the lightest and thinnest Parts of the Waters, makes them mount into the Atmosphere, attenuates, perfects and digests them with its Rays; and indeed enriches them with the universal, æthereal, and sulphureous Salt, or rarefied and exalted Nitre, as appears from Experiment and Observation: So that by this means, the Chymic Sun seems to prepare a most perfectly pure and wholesome Water, which will readily pass through all the finest Vessels of the Body, wash the capillary Meanders thereof, and promote its own Discharge by the Law of Circulation. Whence this naturally distilled Water is better fitted than any other for the Nutrition of Vegetables, the brewing of Drinks, the infusing of Herbs, all Family Uses, and is of itself, without farther Preparation, one of the noblest, and, when properly used, perhaps the most universal Remedy in all Nature, as we propose more fully to shew hereafter.

We are sensible of the Objections against this general Position, as to the Purity and Perfection of Rain-water. "'Tis said, that this Water soon putrefies, corrupts, and stinks, and thence must necessarily become unwholesome." But, to con-

sider the Matter chymically and closely, though the Fact here alledged were certain, yet it only demonstrates, that this Water abounds with sulphureous Particles, which is also confirmed by numerous Chymical and Philosophical Experiments.

But this Inconvenience attending Rain-water may, in great measure, be prevented, by catching it, not after it has washed the Tops of Houses, and run through foul Pipes and Conduits, but as it falls immediately from the Air, in an open Place where no Houses stand. For this, when it has stood a while to settle, cleanse and purge itself, as it will in a very few Days, may be drawn fine from its Bottom, and long preserved perfect, in pure Vessels of Earth or Glass: But if put into Vessels of Wood, especially such as are new, it thence extracts numerous, fermentable, sulphureous Parts; and accordingly runs into what is commonly called Corruption. And the Reason of this Difference is plain from Chymical Experiments; for as, by standing, the gross Sediment falls to the Bottom, that, like the Lees of Wine or Beer, contains the subtle, fermentable, sulphureous Particles, which have the Power to begin or renew an Intestine, fermentative, or corruptive Motion: When these busy Particles are once separated, whether by Standing, Filtration, or Distillation, the pure remaining Fluid must necessarily continue unaltered in its natural Texture and Constitution.

'Tis also worth observing, that the Rains which fall about the Vernal Equinox, and in the Month of *May*, when the East and South Winds blow, are of a much more subtle and spirituous Nature, and refresh and nourish all the Vegetable Kingdom, better and quicker than those which fall in other Months, when the Winds stand to different Points of the Compass: The Reason whereof seems owing to this, that in the coldest Countries, or such as are filled with dense Vapours, the Exhalations of the Earth and Waters cannot be so much ripened and refined, as in Countries where a warmer Sun raises them up, concocts, and brings them to Maturity.

SPRING-WATERS.

The next Degree of Perfection we assign to those Waters, where the Springs lie high, rise on clean earthy Hills, and run upon a gravelly Bottom, or pure hard Clay; provided they be sweet, that is, perfectly tasteless, limpid, transparent, cold in the Summer, warm in the Winter, and receive the rising Sun. For when Waters pass through such a kind of porous, spongy Earth, which is not dissolved thereby, they are thus percolated, filtered, and purified, after the manner of that common Practice in *Italy*, *Sicily*, *Holland*, and other Countries, where they pass their thick and muddy Waters through a certain spongy Stone, cut and chizzed into a kind of Mortar, so as to become a large and proper Filtre for thoroughly purifying the Water, which it transmits perfectly bright, clear, and grateful, retaining the Filth and Slime behind.

To try the Goodness of WATERS.

There are certain œconomical Observations, and Ways of proving the Goodness, Excellence, Thinness, and Virtues of Waters. It is a thing known to every one, that those Waters are soft and light, which readily take Soap, easily wash Linen, and quickly boil Peas, Pulse, &c. soft and tender; and the Waters which will not do this, are properly accounted rough, harsh, and hard. But for these Purposes, there is nothing comparable to Rain-water, which is admirably fitted for the washing of Linen, and boiling of Pulse and Herbs to the greatest Perfection. So likewise these Waters are to be esteemed good and excellent, which best serve the Purposes of Brewing, or the making of Malt Drinks; for, 'tis certain, that the Wholesomeness of Malt Liquors has a great Dependence upon the Goodness of the Waters; whence such Countries always brew the best, wholesomest, and soundest Drinks, as are supplied with the best and purest Waters. In general, hard Waters make the best Beer for keeping, and soft Water the best for Flavour; but they are subject to turn sour. And a Proof of Excellence in this Case is, when the Drink neither oppresses the Stomach, nor binds up the Belly, but passes readily by Urine. On the other hand, in those Countries where the Waters are thick, gross, and slimy, the Drinks are unwholesome, generate Wind in the Stomach and Bowels, pass sluggishly through the Canals of the Body, breed Stones, and stony Concretions, in the Viscera, rot the Teeth, relax the Gums, &c. of all which there are but too many Instances in particular Countries. Another Sign of Goodness in Waters may be taken from their feeding and producing fine wholesome Fish; and their Indisposition to freeze. For these Particulars prove a Fineness of Parts, and a temperate and wholesome Nature, in such Waters.

RIVER-WATER.

Those Waters likewise, that remain long sound and uncorrupted, may be esteemed good; as this affords some Token of their being free from Impurities, and Parts which do not properly belong to them, and of their being rather simple, pure, and full of the spirituous Principle, which preserves them from Corruption. And hence 'tis found, that if River-water, as well

well as Rain-water, be first freed from its Filth by standing; drawing off from its Bottom, or filtering through a porous Stone, and then put into proper large earthen Vessels, and preserved in a cool Vault or Cellar, it keeps much better and longer than when committed to little Vessels, and set in a warm Place. And thus the Water of the River *Tiber*, which the common People drink thick and muddy as it runs, is clarified and preserved by the Nobility of *Rome*, in large Earthen Vases, which stand in their Wine-cellars. Whence it remains perfect and uncorrupted for many Months, or even for Years.

Besides the several Signs of the Excellence of Waters, above delivered, there are abundance more, derivable from the Art of Chymistry; though these being not so well suited for general Use, we shall not enter into a Detail of them, but finish this Account with observing, that soft, subtle Waters, and particularly those of Rain, are constantly found the fittest for washing what we call the Calxes of Metals, from their Salts; whilst hard Water is very unsuitable for this Purpose.

Hoffman, in the following Dissertation, has farther explained the Natures of different Waters.

WATER considered as a MEDICINE.

How earnestly, and how universally, a Medicine capable of subduing all Disorders, of whatever Nature, has been desired, is, I presume, sufficiently known to such as have any tolerable Acquaintance with physical Subjects; and indeed, immortal Honours ought to crown the Man who should be so lucky as to discover a Medicine of this Kind, since the Recovery of the Sick, and the Safety of Mankind in general, are so nearly connected with a Discovery of this Nature. But since we have not hitherto found a Medicine capable of certainly subduing any one Species of Disorder, so we have the greater Reason to despair of finding one capable of eradicating and baffling the whole Train of Diseases to which Mankind are subject; for if we reflect, with Attention, on the Difference of Constitutions, on the numerous and often contrary Causes of Diseases, and on the Virtues of Medicines varying according to the various Constitutions of the Patients to whom they are exhibited, we shall easily see, that 'tis in vain to rack our Brains, and spend our Time, in the Pursuit of an universal Medicine.

But if there is, in Nature, a Medicine which deserves the Name of *Universal*, 'tis, in my Opinion, *common Water*: The Use of this is so common, and so necessary to us all, that without it we can neither live, nor preserve our Bodies sound and healthy; for it guards against Diseases of every Kind, protects, and defends the Body from all kind of Corruption, that may prove fatal to Life. Besides, *Water* answers all possible Intentions of Cure; so that, without it, no Disorder, whether chronic or acute, can be happily and successfully removed. For Confirmation of this Opinion, I shall not insist on the Medicinal Springs, whether hot or cold; nor attempt to prove their salutary Virtues in subduing various Disorders; but shall confine myself entirely to common Water, tho' of the best and purest Kind, the universal Use of which I at present design to recommend.

Since, then, I am to consider *Water* as an universal Medicine in preventing and curing Diseases, and since I intend to prove, that it is so, by the strongest and best chosen Topics I possibly can, I think it will not be improper to premise a few Things concerning the natural Necessity our Bodies lie under of being ruin'd or destroy'd one time or other; that, these things being known, we may be able, with the greater Accuracy, to discern what Diseases are curable, and what not. As to the natural Necessity of dying, 'tis sufficiently known, that the Duration of our Bodies, and a Prevention of that Putrefaction to which they are naturally very much dispos'd, depend entirely upon the perpetual and uninterrupted Circulation of the Blood and Humours; for so long as this Circulation is entire and unobstructed, so long we are said to be alive; but in proportion as it decreases, or is impair'd, we make gradual Advances towards *Death*. 'Tis, therefore, this Motion alone which guards the Body against Corruption, because it hinders that State of Rest, which is the Cause and Foundation of all Putrefaction, from taking place in that heterogeneous Fluid with which the Parts of all Animals in general abound.

Our Bodies would, without Doubt, enjoy an eternal Duration, if we could for ever preserve and maintain the Circulation of the Blood; but since human Weakness, and the wretched Condition of our mortal Nature, render this impossible, it is at least worth while to inquire into the Cause which may produce a Deficiency or Decrease of this Circulation, which, in my Opinion, is as follows: This vital Circulation of Humours is carried on by Organs and Ducts; the elastic Fibres of the Muscles, which are furnish'd with a successive and reciprocal Dilatation and Contraction, constitute the Organs. These Organs are Vessels, some of larger and others of lesser Diameters. When, then, at any time the Elasticity and Impulse of the Fibres are so diminish'd as not to bear a due Proportion to the Quantity of Humours to be moved, and when these Humours are not quickly and expeditiously carried thro' the small-

est Tubuli, Stagnations of the Humours must unavoidably happen in the Capillary Vessels; and hence arise Putrefactions, those fruitful Sources of Disorders and Death.

For as, in all Machines, the Elasticity and moving Forces of the component Parts are weaken'd and impair'd, by reason of the Change undergone by the Matter of which the said Machines are made, so it happens in our Bodies, that the Fibres, which alone are the Instruments of Motion, in Process of Time become thick, hard, solid, and dry: For this Reason they not only move with Difficulty, but the Pores, and minute Passages, being by that means render'd narrower, hinder the Fluids from being carried thro' their Channels in an equal and uniform Course. This is sufficiently proved by the Fleshes of old Animals, which, by reason of their Hardness and Solidity, require a stronger Heat, and longer Time, to render them soft and tender, than the Fleshes of young Animals do: Hence we may conclude, that there is not the least Doubt to be made but if the same State, the same Mobility of the Fibres and Vessels, and the same Degree of Aperture in the Pores and minute Passages, could always be maintain'd and preserv'd, Life might of course be protracted for ever, if external Causes, and foreign Degrees of Violence, did not interfere to put an End to it. That this surprising Effect may possibly be produced; either by Medicines, or a proper Regimen, is a Fact which can by no means gain the Assent of those who are ignorant of the Virtues and Qualities of natural Bodies: But 'tis not only probable, but strictly true, that many have fallen short of that Period of Life and Duration, which the natural Temperament and Constitution of their Bodies seem'd to promise, whilst they were either ignorant of, or despised those Rules, the Observation of which would, in the very Nature of the Thing, have procur'd them that Blessing; so that the greater Part of the human Species, either by exorbitant Passions, Intemperance with regard to the Non-naturals, or a criminal Neglect to distinguish between things of a salutary and a noxious Nature, unavoidably shorten their Days, and render their very Existence a Foundation for Distress, Calamity, and Misery.

Having thus explain'd the natural and internal Cause and Origin of Death, it will not be improper to assign a few Reasons why some Diseases are incurable, and of so stubborn and unrelenting a Nature, that they will not yield to the highest Skill, or the best chosen Remedies. Now that there is a certain Analogy and Proportion betwixt the Agent and the Patient, and that Effects can only be produced by their proper and adequate Causes, are Truths sufficiently evinced and explain'd, both by Reason, and the Laws of Motion: When, therefore, obstinate Obstructions of the Vessels, Indurations of the Viscera, large Effusions of Humours into the Cavities of the Ducts, and consequent Putrefactions, happen, what Physician is able to discover Medicines of such a powerful and efficacious Quality as to subdue and remove these Disorders? Who can put a seasonable Stop to the remote and internal Inflammations of the more noble Parts, and the Mortifications consequent upon them? Or, what Man is there found among all the venerable Sons of the *Healing Art*, who can, with Certainty, quell and calm the violent and preternatural Commotions of the nervous System? If I could once find the happy Man, who, by any sort of Medicines, could perform such miraculous Cures, I would not only pronounce him a second *Æsculapius*, but loudly proclaim, that he was sent from *Heaven* as a common Blessing to the *Earth*; since I am firmly persuaded, that no acute Distemper could possibly prove fatal to the Patient, who should have the good Luck to be under his Care.

We must also, on this Occasion, inquire whether there are, in Nature, Medicines peculiarly adapted and calculated for removing particular Disorders. 'Tis universally known, that some Medicines are, even in our own Days, wonderfully extoll'd as *Specifics* against certain Diseases. Thus the *Peruvian Bark* is esteem'd a Medicine of divine and irresistible Efficacy against Fevers. *Quicksilver* is wonderfully extoll'd against a virulent *Lues Venerea*. *Opium* is said to be the surest and most efficacious Asswager of all Kinds of Pain. *Steel* is call'd the sovereign Reliever of the Hypochondriac. *Sulphur* is accounted the most valuable Pectoral. *Castor* is judged to have the most happy Influence on the Nerves. Bitters are applauded as the most suitable Remedies in dropical and cachectic Cases. Nitre is given out to be of uncommon Efficacy in allaying feverish Heats. But tho' these Medicines are justly distinguish'd on account of their Virtues, and their Praises deservedly celebrated, yet any Person, who has been for a considerable time employ'd in the Practice of Physic, cannot fail to observe, that they are by no means sufficient to remove the respective Disorders to which they are appropriated: For who does not know, that almost all Distempers are nourish'd and fomented by different, and often by contrary Causes? Who is ignorant, that the same Diseases, in different Stages, appear with different Series of Symptoms; and that, according to these, there is more or less Danger in the Case? Who is not apprisd, that there are different Constitutions; and that on these the Actions of Medicines vary very remarkably? Hence it must necessarily follow, that one and the

the same Medicine must produce different, and even contrary Effects, according to the different Constitutions of the Patients to whom it is exhibited; for 'tis carefully to be adverted to, that Medicines act not only *secundum Activitatem suam*, or according to their own inherent Qualities, but also *secundum Receptivitatem*, or according to the Constitution of the Patient to whom they are exhibited; or, in other Words, the Force of Remedies is the Result of a mechanical, mutual, and reciprocal Action and Reaction of Medicines and Constitutions; so that if a Medicine acts upon the Body, the Body returns the Favour, and acts in like manner upon it. Hence we may judge, how daring and impious the Practice of those is, who, not regarding the Diversity of Constitutions, morbid Causes, and other Circumstances, in the same Disorder invariably prescribe the same Remedy, exhibited in the same Form, as blundering and unskilful Physicians do, to the great Reproach of Physic, and the unspeakable Emolument of Funeral-undertakers, Grave-diggers, and all that Class of Men who live by burying the Dead: For the Physician who duly adverts to the above-mention'd Considerations, will not readily adhere to one and the same Remedy in one and the same Disorder, unless all Cases were directly parallel.

It now remains, that I fix and ascertain the precise and determinate Sense, in which Water may be said to be an *universal Medicine*. Now I affirm, that Water is excellently suited and adapted to all Constitutions, and that at all Times and Seasons whatever; that there is not, in Nature, a more noble or efficacious Preservative against Diseases; that in acute as well as in chronical Disorders, it affords a most certain Relief; and lastly, that its Use answers all possible Intentions, as well *preservative* as *curative*: But since there is a great Difference between different Waters, we are carefully to inquire which are best calculated for answering this Medicinal Intention; for 'tis not to be deny'd, that the Nature and Properties of particular Waters differ so far as to be easily distinguish'd, even by the Taste of such as accustom themselves to drink Water. But the best Way of distinguishing them is by Chymical Trials, their Weight, and mixing them with different Substances. It must not be imagined, that Water is an homogeneous Fluid; there are numerous Experiments that manifest it to be a Mixture of different Parts. Thus all Waters contain an aerial or æthereal Principle, whereon their elastic Property seems entirely to depend; for all Waters are more or less expansive and contractive, as they contain more or less Air or Æther. This evidently appears in the Water-thermometer, where the included Liquor possesses a greater or less Space, according to the greater or less Degree of Heat it sustains: For 'tis the Nature of all Liquors to admit a great Quantity of æthereal Fluid when they are heated, and again reject it when they are cool'd; as we know by particular Experiments, made in a very severe Winter. The Quantity of Air or Æther residing in Water cannot perhaps be better determin'd than by means of the Air-pump; for the more subtile Waters, included in an exhausted Receiver, throw up numerous Bubbles, and, if somewhat heated, flow over the containing Glass; as, on the contrary, those which are grosser, and more ponderous, afford fewer Bubbles in *Vacuo*.

Waters also appear to consist of a lighter and a heavier Part; and the former, as being more moveable, easily rises first in Distillation; whilst the heavier and grosser Particles require a greater Degree of Heat to bring them over: Whence 'tis observable, that Waters lose their more subtile Parts in boiling, and leave the cruder and less useful ones behind, as is known to all those who are curious in the making of Coffee; for if the ground Berries are put into Water, that has long been boiled, the Liquor, so made, becomes less quick and pleasant to the Taste. It has also been observed, that some Waters rise much faster than others in Distillation. Waters also differ extremely in their Gravity, as appears by the Water-poise, those which abound with Earth and Salts causing the Instrument to rise higher than such as are pure: But Distillation is one of the best Ways of discovering the Purity of Waters; as not only rendering the Quantity, but also the Quality, of the Contents evident to the Senses. 'Tis surprising to see what a large Mass of earthy or stony Matter remains, upon the Distillation of some Waters. I once distill'd two Quarts of Spring-water, in a Glass Body, to Dryness, repeating the Operation ten times in the same Vessel; and by this means obtain'd a hard stony Crust at the Bottom, as thick as the Back of a Knife. Most Waters contain a chalky Earth, some an Oker, others a stony Matter, and others again a Proportion of common Salt. But the true Way of examining whether Waters are impure, or contain any foreign Matters, is by the Means of Chymical Experiments; two whereof I have singled out for my own Use, and recommend, as exactly discovering the Purity or Impurity of Waters. The first is, by dropping Oil of Tartar into them; and the second, a Solution of Silver in *Aqua-fortis*. If the Waters are pure, such as Rain-water, Water distill'd, and some Sorts of Spring-water, they manifest no Alteration upon mixing with these Liquors; but if impure and gross, they turn milky with Oil of Tartar, especially if they abound with a chalky Earth; and the Solution of

Silver turns impure Waters thick, grey-colour'd, and, if they partake of Iron, almost red.

The Effects of Waters also manifest their Nature, Subtlety, and Purity: Thus, those that are light and soft serve best for mollifying the Bones of Animals, and the Boiling of Sea-fish. The Whitstners and Bleachers find a remarkable Difference in Waters; the softer and fatter Sorts thereof serving better to wash and blanch, than such as are ponderous, hard, and take Soap with Difficulty. The Bakers find, that the more soft and subtile Waters make their Bread rise well. The Gardeners observe, that such Waters as are light, subtile, and spirituous, are much better to water their Beds with, than such as are hard. The Masons, Makers of Terrace and Figures in Plaster of Paris, find hard Water the best for their Purpose; and can scarce work with such as is soft, so as to give their Matter its due Strength and Firmness. The Chymists find a great Difference in Waters; those of Rain being best suited to wash and edulcorate their Magisteries and Metalline Powders, *viz.* the Calx of Gold, Silver, the Caput Mortuum of Vitriol, &c. as readily drinking in the Salts that hard Spring-waters will scarcely touch. We daily observe, in the domestic Operations of Brewing, Washing, the making of Tea, &c. that the more subtile and soft River-waters are better for these Purposes than Spring-water.

But for Medicinal Purposes we prefer Rain-water, as what is naturally distill'd by the Sun, and thus render'd subtile, and fitter for Solutions, Infusions, Extractions, and all internal Uses. Only this Water, being mix'd with various mineral, vegetable, and animal Exhalations, is thence render'd easily corruptible, if expos'd to the free Air, or suffer'd to stand long in Vessels of Wood. The Rain that falls in the Month of March is more durable, as not then receiving so many Effluvia. The better to fit this Water for Medicinal Use, 'tis proper to keep it in earthen Vessels, close stopp'd down: And thus if it be collected, not in Cities and Towns as it runs from the Spouts of Houses, but in the open Fields, it may be kept sound and serviceable for several Years.

Next to Rain-water, in point of Goodness, comes that of Rivers: But as Rivers proceed from the Springs situated in high and mountainous Places, and as Rains increase these Springs, which, running over vast Tracts of Land, drink up many different Matters from the Earth; hence Rivers become more turbid and impure, the larger Tracts of Land they wash in their Course. Add to this, that they take up numerous heterogeneous Parts from the Bottom they run upon, whence there often arises a considerable Difference betwixt Rain and River-water. Lastly, Rivers, being perpetually expos'd to the free Air, and the Action of the Sun, have their more subtile Parts exhaled and raised into the Atmosphere, so as to supply the Matter of Clouds and Rain.

There is likewise a great Difference between the Waters of Rivers; for those that have a swift Course, or run violently down from the Mountains, where they rise, into the lower Plains, are very different from those where the Course is slack and gentle, and which rise in lower Places. Thus the rapid Rivers usually afford a light and subtile Water, not greatly subject to Corruption; tho' somewhat improper for the feeding and nourishing of Fish, because the Rapidity of their Motion prevents the Spawn of the Fish from clinging to their Banks, so as to be there animated by the Heat of the Sun. But tho' these Rivers of swift Course do not greatly abound with Fish, yet those they produce are well-tasted and excellent: Thus the Rhine and the Rhone, which rise from the highest Mountains of the Grisons Country, are found to be much lighter than the Waters of other Rivers. And 'tis remarkable, that the Ships coming out of the River Meyne into the Rhine, draw much more Water in the latter: And hence the Waters of the Rhine and the Rhone appear, upon Hydrostatical Examination, nearly to approach the Lightness of Rain-water. And as both these Rivers are very rapid, their Waters are hence render'd less corruptible, and therefore allow'd, for internal Medicinal Use, to excel the Waters of all other Rivers. Thus we are assured, from a good Writer upon the Water of the Rhone, that "if it be kept in Wine-cellars, put up into large earthen Jars, so as there to deposit its Sediment, for some Weeks or Months before 'tis drank, it thus becomes pure and excellent; and will afterwards keep many Years, or even an Age, without spoiling or corrupting." *Jacob. Spon. in Observation. circa Aquam Rhodan. in Act. Erudit. Ann. 1683. p. 519.*

The Rivers that flow gently, differ from the former, not only on account of the immense Quantities of Fish they breed, but also because they generally run on fat and clayish Bottoms, or such as afford proper Bedding and Nutriment to Fish; whence such Rivers are not so clear and crystalline as those of a rapid Course: But then such Waters are of a softer Nature, and serve for the Purposes of Washing, Fulling, Scouring, &c. without any considerable Addition of Soap. From hence it may easily appear, that Rivers are not at all alike, or equally fit for Medicinal Use: Those to be chosen for this Purpose are clear,

clear, light, do not easily corrupt; and receive no Alteration upon the Addition of Oil of Tartar, or any metalline Solution. It must be constantly observed, that Rivers of a rapid Course are universally more wholesome than those which flow slow and gentle.

Spring-waters are also sometimes observed to differ in their Virtues; for according to the different Nature of the Soil and earthy Matters they meet with or imbibe, they receive a different Nature and Disposition; whence we seldom find Springs of a perfectly pure and light Water. The greatest Part of them leave a copious earthy Substance upon Distillation. There are but few that do not turn thick with metalline Solutions, or alkaline Salts: Some of them contain common Salt; and others a subtile, volatile Vitriol. If they hold common Salt, Oil of Tartar will discover it, by turning milky therewith: If they contain a vitriolic Principle, the Infusion of Galls, or Balaustines, will manifest it by turning black. There are others again, that contain somewhat of Iron, and thence have a styptic Taste, and let fall an Oker upon standing. 'Tis therefore the Business of Art and Industry, out of so large a Number of Springs wherewith Nature supplies us, to discover the wholesomest, which are known by their Lightness, Transparency, Purity, Durability, and the Trials above-mention'd. This Difference in Spring-waters must also be observed, that some are soft, and others hard, the latter whereof are the most durable, and indisposed to freeze; whereas the former more easily turn to Ice. They are both of them wholesome and medicinal, if properly suited to the Disease and Constitution of the Drinker or Patient.

Having thus shewn which Waters are best fitted for Medicinal Use, and how they are to be distinguish'd and examin'd, we now come directly to prove the Excellence and universal Virtue of pure Water: Our first Position is, That pure and light Waters are agreeable to the different Natures and Constitutions of all Men; for since the Circulation of the Fluids thro' the Canals, and finest Vessels, is what preserves and secures the Body from Corruption, and keeps the Blood and Juices in a thin, moveable State, Water must necessarily be appropriated to the Continuance of Life. The Fluids of the Body, serving to Nutrition and the vital Offices, and whereof the Solids also are composed, actually consist both of Solids and Liquids: That there are solid Parts contain'd in the Blood, is evident upon drying it; and that these Parts are of different Natures, some saline, others unctuous, some mucilaginous, and others earthy, appears to the Senses, by the inflammable Property they have upon Evaporation, and other Chymical Experiments. In short, they are a Number of heterogeneous Parts united into one Whole, which is very corruptible, when put into a State that fits it for Corruption; that is, a State of Warmth, Rest, and Moisture. To prevent the Fluids from thus corrupting, and consequently infecting and changing all the other Parts of the Body, it is necessary they should never stagnate or collect together, otherwise Corruption would immediately ensue: Whence these subtile, solid Particles, both unctuous and earthy, should not only be kept in perpetual Motion among themselves, but also circulate in a progressive Motion through the finest Tubes of the Body, that the solid Parts of the Blood may be divided into extremely fine Globules, by the Motion of Attrition, or Action and Reaction between the Juices and the fibrous Parts. Whence appears the Necessity of an aerial, æthereal Fluid, and elastic Principle, along with a large Quantity of an aqueous Fluid; that is, the Necessity of pure Water, to secure this indispensable Effect. And hence it is, that, upon examining the Blood taken from a Man in Health, we find, at least, two Parts of a Fluid, for one of a dry and solid Matter; for I have frequently observed twelve Ounces of Blood to contain eight Ounces of a liquid, and four of a solid Substance. Again, that the Blood contains a large Quantity of a subtile, aerial, and æthereal Principle, manifestly appears from its Bubbling in *Vacuo*, so as to run over the Edges of a cylindrical Glass, whereof it at first possessed only one half. From the Whole we infer, that nothing is more wholesome, nothing better fitted, or more necessary to preserve Life, than Water; which is so agreeable to the Nature of the human Body, and without which it can neither subsist, nor Life be long preserved.

Our next Position is, that no Remedy can more effectually secure Health, and prevent Diseases, than pure Water. If we strictly inquire into the Cause of Health, we shall find it to be an equable and free Circulation of the Juices through all the Canals of the Body, even the finest, that lead to the Excretory Ducts. For by this means it is, that what proves serviceable and fit for Nutrition, remains within, separated for Use by the proper Strainers; and what would either prove useless, corruptible, and inconvenient to the Body, is discharged. And here it deserves the utmost Attention, that the Excretions of the Body do not so directly, simply, and absolutely regard Life, as they indirectly regard Health, and the Exercise of all the Functions and Offices, inasmuch that Health, and even Life itself, may be endangered, without any Fault in the Excretions. Thus 'tis

obvious; that from violent Passions of the Mind, extreme Pain, Inflammation of the Stomach, and the swallowing of Poisons, the natural Functions of the Body are strongly disordered. Neither in the most obstinate Chronical Diseases are the Excretions so much to be regarded, as the Obstructions of the glandular Parts, the Indurations, Corruptions and Sphacelations of the Viscera, and Extravasations of the Humours: So likewise in Acute Distempers, the inflammatory Disposition of the Blood is principally to be regarded. 'Tis therefore an equable Motion of the Blood and Juices that maintains Health, promotes the Excretion of unnecessary Substances, affords a convenient Nutriment to the solid Parts, and procures to the Nerves and Fibres that most subtile Fluid, by means whereof they feel and move. But whenever this free and equable Motion is obstructed, whether by an Over-charge of Humours, their Viscosity, or by Weakness in the Spring or Tension of the moving Fibres, it becomes an immediate Occasion to Diseases, especially those we term Chronical; for from these Causes proceed Stagnations of the Juices in the larger and smaller Vessels, Obstructions in the Excretory Ducts, and Indurations in the Glandular Parts; these are soon followed by great Impurities of the Juices, causing Pains and spasmodic Disorders; and not long after, by Putrefactions, which are the Bane of Health, and the direct Opposite to Life. And thus are the true Causes of Diseases formed in the Body.

Every one who perceives the Justness of this Description, will readily grant; that a proper Fluidity of the Blood is highly necessary, to procure a free and equable Circulation; by means whereof the Vessels are kept always open, Obstructions prevented, Excretions secured, Stagnations and Impurities of the Juices hindered, and the Causes of Diseases cut off. And whether there be in Nature a better disposed Remedy for procuring this necessary Fluidity to the Blood, we leave to the Judgment of sober and experienced Physicians: To us it appears, that a pure and subtile Water exquisitely divides the solid and viscid Parts of the Blood and Juices, so as to prevent their coagulating, or coming together; at the same time that it drinks up the useless and recrementitious Matters of various Kinds, whether earthy, saline, or unctuous; and discharges them by the proper Outlets.

And hence, we conceive, proceeds the Reason why Drinkers of Water, provided it be pure and excellent, are more healthy, and longer lived, than such as drink Wine, or Malt Liquors; and why it generally gives them a better Appetite, and renders them plump and fleshy. For certainly Water is a most appropriated Menstruum to dissolve the Aliment, extract its Chyle, or nutrimental Part, and carry it through all the innermost and finest Canals of the Body. Besides this, it readily washes off and dissolves that tough viscous Slime, which lines the glandular Coats of the Stomach, and Duodenum, whereby the dissolving Juices of the Intestines, which are the immediate Instruments of Digestion, may more plentifully mix with the Food, and perform their Office. There goes a common Opinion, that the drinking of Water is pernicious to those who eat Fruit: But this is a great Mistake; for in *Spain*, *Portugal*, and *France*, Water is the common Liquor; and yet those Nations freely eat Fruit all the Summer, without any Inconvenience. Again, those who drink Water, are observed to have much sounder and whiter Teeth, than others; for Putrefaction and Corruption of the Teeth is caused by the Scurvy, a Disease prevented by the drinking of pure Water, which actually cleanses and washes the Blood, and discharges the Foulness thereof. Add to this, that the Drinkers of Water are much brisker and more alert to all the Actions both of Mind and Body, than such as use Malt Liquors, the greatest Parts whereof produce clammy, viscid, and sluggish Juices, hardly capable of passing through the exquisitely fine Vessels of the Brain and Nerves; whence ensue Indolence, and Weakness of the Body, and an Indisposition and Dulness of the Limbs, both to Sense and Motion. And as this plainly appears to be Matter of Fact, 'tis the more surprising, that the drinking of pure Water, which is so conducive to the Preservation both of Life and Health, should be so perversely, and, as it were, unnaturally nauseated by the People of our Country, whilst it is as strongly coveted and admired in other Nations. Such Malt Liquors as are thick, and highly nutrimental, lay the Foundations of many Disorders among the Inhabitants of Northern Countries, more particularly where the Use of Brandies, Spirits, and Strong Waters, prevails. It is certainly much better for all Persons of delicate Constitutions, and sedentary Lives, to accustom themselves to the drinking of the finest and purest Water, either alone, or mixed with Wine, to render it more acceptable.

Having thus considered the singular Efficacy of Water, by way of Prevention, we come next to examine what it will perform in the Cure of Diseases. Physicians divide all Distempers into Acute and Chronical. Of the Acute Kind, the principal are Fevers; which from the Structure of the Body, and the Laws of Motion, appear to be an Increase of the Blood's Velocity and Force, so as to distend both the solid, or fibrous

and fluid Parts of the Body beyond their natural Size; this Increase of Motion having a Tendency either to overcome and discharge the Cause of the Disorder, or to destroy the Machine itself. Whence there ensues either Recovery, Death, or a Depravation of some Parts of the Machine, when the Disease terminates in another. And thus Nature, which is often her own best Physician, sometimes also produces Diseases and Death. But here we must by no means confound the rational Soul with Nature, which is a Word we use to signify the Structure, Mechanism, and Contrivance of the Body, acting with certain Powers, according to certain necessary and mechanical Laws, assigned it by its Maker. A Physician therefore, in the present imperfect State of Medicine, can do no more than supply a proper Matter to this augmented Motion in continued Fevers, during the whole Time they thus regularly continue; for they have their own natural Periods, that cannot hitherto be safely stopped by Art. This increased Motion and Distention is attended with a great Heat, which violently dissipates the fluid Part of the Blood and Juices, so necessary to Life; whence the principal Intention is to supply this fluid Part, in proportion as it wastes. And as the Tendency of this increased Motion is to break through the Obstructions, that cause the Disorder, the Blood can by no means make its way, unless sufficiently thinned and diluted with a proper Fluid; but, thus assisted, it may allay the Heat and Inflammation, propel the stagnating Juices, and discharge the offending Matter that causes the Mischief. And Experience shews, that if Water be not the only thing, there is no better Remedy yet found for this kind of Fever, than a free and large Use thereof. Whence *Hippocrates*, and others, highly recommend an aqueous Ptsan for this Purpose. And accordingly, by this alone, with the Assistance of Rest, and temperate Warmth, the most violent Fevers have frequently been cured, without any other Medicine. All that the best Physicians do in these Cases, is either to bleed at the Beginning, where the Body is full; or to exhibit an Emetic, if the Distemper is seated in the first Passages; or to prescribe a Sudorific, in order to expel the offending Cause, in the most expeditious manner; but after this, through the whole Course of the Distemper, they give nothing more than cooling, moistening, and perspirative Remedies. The Caution required in the Use of Water for this Distemper, is not to give it too cold, especially near the Crisis, and when there is Reason to fear an Inflammation in the first Passages, nor when the Body is stiff and rigid, and the external Parts parched and bound up; but to wait for the Time when there appears a Disposition to sweat; for then 'tis ever proper to give Water in a large Quantity.

This is agreeable to the Advice of the best Physicians, and particularly insisted on by *Lommius*, in his excellent Discourse of Fevers.

Those called Chronical Diseases generally arise from an Obstruction of the Viscera and glandulous Parts, or a Surcharge and Foulness of the Juices, with a Stagnation thereof in the larger Vessels; all which, according to the Rules both of Reason and Experience, are therefore to be removed in order to a Cure: But to procure this Effect, there is not a more serviceable Remedy than pure Water. How eminently serviceable the Medicinal Waters, both of hot and cold Springs, are, for this Purpose, is a thing manifest by Experience. But the greater Part of their Efficacy, in this respect, is, beyond all Dispute, owing to the Quantity of pure elementary Water they contain; for it were insignificant to exhibit in these Distempers the mineral volatile Spirit, and the Salt, which such Waters contain, without that purely aqueous Part. And accordingly there are numerous Instances of pure and light Water, which, without containing any Mineral Ingredients, prove of extraordinary Efficacy in the Cure of Chronical Diseases. The Effect therefore can possibly be ascribed to nothing else, but the pure Water. Of this Kind there are numerous Springs in *Germany*, the Waters whereof, being pure and subtile, tho' plentifully abounding with Air and Æther, prove curative of most Chronical Distempers; particularly the Stone, the Gout, the Rheumatism, the Scurvy, and Weakness in the Limbs; and by procuring the requisite Fluidity to the Humours, they remedy Suppressions of the Hæmorrhoids and Menfes.

As there is therefore sufficient Reason to persuade us, that the Wholsomeness of many Springs depends upon the Goodness of their Waters, it follows, that where other pure Waters are procurable, these likewise will have the same Effects. And this also is confirmed by Experience, as may appear from the Testimonies of *Riverius*, *Oper. Lib. 4. Cap. 24. Celsus*, *Lib. 1. Cap. 15. Ballonius*, *Lib. 1. Epidem. p. 106. Sylvaticus*, *Cap. 1. Observat. 1. Martianus, Rondeletius, Avicenna*, *Lib. 1. Sect. 2. Cap. 16. p. 102.* and others, who shew, that the drinking of Water has cured Obstructions of the Menfes, the Head-ach, Ophthalmias, Colds, Rheums, Inflammations, the Gout, the Colic, &c. being used either cold or warm, as the Stomach can bear, or the weak State of the Nerves requires.

Of what singular Efficacy pure hot Water is, both by way of Preservative and Cure, appears from the Nature and Use

of Tea-drinking: For 'tis certainly a Mistake to attribute all the good Effects of Tea to the Leaves of the Plant. The principal Virtue of this Infusion is doubtless owing to the Quantity of the pure hot Water employed in the Making; whilst the Herb by its Astringency prevents the Fibres of the Body from being too much relaxed and weakened thereby. Therefore, as numerous Diseases are attended with a strong Contraction of the Fibres, all Physicians, who are well versed in Practice, will be cautious of indulging too free an Use of this astringent Ingredient in such Cases.

That Tea is an Astringent or Styptic Plant, appears by several Experiments, as particularly because, like Oak-bark, Balsamines, and other astringent Vegetables, it turns inky with a Solution of Iron, or the Chalybeate Waters. See *THEA*.

And, to speak a serviceable Truth, we have in our own Country many Plants, whose Virtues far exceed those of the *Indian Tea*: And Choice should be made of these Plants for Medicinal Use, according to the Difference of Distempers. Thus, for Example, in Diseases of the Breast, *Paul's Betony* is proper; common Betony, in Disorders of the Nerves; *Baumi* and *Penyroyal*, in Disorders of the Uterus; *Ground-ivy*, in Ulcers of the Kidneys; *Buck-bean*, in the Scurvy, &c. being severally made into Tea, with the purest Water, and drank hot. Again, common Chamomile may be advantageously used in the way of Tea, against the Colic; Parsley, in the Stone; the *Ranunculus*, in the moist Asthma. Rosemary Tea is by many recommended as excellent in nervous Diseases, viz. the Epilepsy, Palsy, and Apoplexy; and for defending the Body, and preventing the catching of Cold; especially if made with the Flowers of the Plant. But, in all Tea, 'tis a Caution of Moment, that the Water designed for the Infusion be not long boiled, but immediately poured upon the Plant as soon as it simmers strongly, in order to prevent the Loss of its more subtile Parts.

It remains, that we shew Water to be an universal Remedy, as it agrees not only with all Constitutions, but in all the Indications of Distempers. And, first, the Drinking of Water is serviceable in every Complexion. In the Sanguine, and those of a soft Habit of Body, who have but few of the finest kind of Vessels, it causes the Blood and Juices to circulate freely; which in this Constitution would otherwise flow but slowly, and so be subject to generate Obstructions in the Viscera. In bilious Habits, where the Humours are in brisk Motion, it allays the excessive Heat, which would otherwise evaporate the unctuous Parts of the Blood through the widened Tubes and Pores of the Body. It likewise proves extremely serviceable, by diluting and thinning the Viscidity of the Blood and Juices, in Persons of melancholy and phlegmatic Constitutions.

Again, Water proves agreeable to Persons of all Ages. Children are frequently subject to violent Disorders from the Viscidity and Acrimony of the Milk they feed on, in which Case, besides Absorbents, diluting aqueous Remedies are of great Service. In Youth, the Surcharge and Thickness of the nutritious Humours produce various Diseases; such as Colds, and Eruptions of the Skin, which are excellently remedied by the Use of diluting Liquors. And the same holds true of the Diseases of grown Persons, and Persons in Years; in all which the drinking of Water is serviceable. For Men of full Growth are very subject to Inflammations and Fevers, and old Men to such Disorders as proceed from Stoppages and Obstructions; in which Circumstances, there can nothing be given more proper than the finest Water, either hot or cold. We find, by daily Experience, what severe Disorders are occasion'd by Irregularity in the Menstrual and Hæmorrhoidal Flux, to reduce which to their natural Periods, and preserve them in their proper Course, I am convinced from practical Observations, that nothing is more effectual than diluting aqueous Remedies.

'Tis well known, that a Fulness of Blood and Juices brings on many Distempers; but, to prevent this Fulness, the most appropriated thing is hot Water, made into an Infusion with Herbs; which thus, by dissolving the glutinous Humours, prevents the Mass of Blood from increasing too fast. A free Use of Water is no less serviceable in purifying bad Juices; as it readily washes off their impure saline, and drossy Parts, through all the excretory Passages of the Body. Besides this, the drinking of Water promotes all the Evacuations, preserves the Belly soluble, keeps the urinary Passages open, washes and cleanses the same from the Adhesion of gravelly or stony Matter, and powerfully promotes that most healthy Discharge of insensible Perspiration. Lastly, Water is the effectual Vehicle of all other Remedies. Thus Antiscorbutics, and vegetable Medicines appropriated to cleanse the Blood, prove of little Service in correcting the Depravities of the Humours, unless by the Assistance of Water their Virtue be carried into the Juices and remote Parts of the Body, in the Form of Decoctions or Infusions. To sum up all, in whatever Cases there is a Necessity either for altering, evacuating, opening, or resolving, Water is at all times the best of Remedies.

As Water is thus extensively useful, it may be proper to observe, that they who cannot procure the purest and best Sort thereof

thereof for Medicinal Use, must serve themselves with such Rain or River-water as can be had; but if these be not obtainable in tolerable Purity, the best way is to distil them; or else, upon a slight boiling, to correct them, by the Addition of calcin'd Hardhorn. It is doubtless a singular Benefit of Nature, to have large Cities and Countries well watered with wholesome Springs, which thus bountifully supply so much better Remedies than those of the Shops. If every prudent and disinterested Physician would carefully examine into the Waters of the Place where he resides, he might thence assuredly practise more to the Satisfaction of himself, and Service of his Patients, than in the common way, by the miscellaneous Use of numberless uncertain Remedies. *F. Hoffman.*

From what has been said above, the great Uses and Advantages of drinking Water, both with respect to the Prevention and Cure of Diseases, will be sufficiently evident to every intelligent Reader. I shall now proceed to consider distill'd Waters.

Of Distilled and Medicated Waters.

The Waters ordered to be kept in the Shops are either simple, compound, or medicated. There are several ways of procuring simple Waters from Plants by Distillation, suited to the Natures of the particular Vegetables made use of. The Instruments usually employ'd in the Distillation of simple Waters, are of two Kinds, commonly call'd the hot and the cold Still. The Contrivance of the first of these is sufficiently in every one's Acquaintance, so as to want no Description; and the Reason why it hath been called the cold Still, seems to be, because no more Heat is required than to raise a Vapour, which is returned down slowly by Drops into a Receiver. The other is a Copper Vessel, worked by a strong Fire, which boils the Materials, and sends over the most volatile Parts in an hot Steam, which is condensed, and cooled in its Descent by a long spiral Pipe, contained in a Vessel of cold Water, called its Refrigeratory, from whence it falls in a continual Stream.

The first of these seems best fitted to draw off the Virtues of those Simples, which are valued for their fine Flavour when green, which is very subject to be lost in drying. Thus Baum, Meadow-sweet, damask or white Roses, and all things of the like Properties in this respect, give over much finer scented Waters this way, than by the hot Still; the Heat there required, and the Quantity of Water necessary to prevent their burning to the Still, very much injuring their natural Flavours. But when thus managed, they require no Water to be put to them, nor to be bruised, but should be committed to the Still, just as they are fresh gathered; and as much is to be drawn off as their natural Moisture will allow; the Fire required in this Case being not sufficient to cause an Empyreuma, because it is only just enough to make the Top of the Still moderately warm. Whoever hath seen what in the Shops is called a Rose-cake, may easily conceive in what Condition the Materials are left, which are thus distill'd. And as to the Damask-roses in particular, after they have been thus treated, they will give to a Decoction all their purgative Virtue, and make the Syrup ordered with them better than when managed any other way. And it is not only very remarkable concerning Materials thus to be ordered, that they are hurt by the least Mixture of Water, which makes it a Rule to gather them dry, whilst the Sun is upon them, and commit them forthwith to the Still, in order to have their Scents in Perfection; but that even bruising them destroys their fine Flavour, as any one may be easily convinced by Trial. *Boerhaave*, however, directs these Vegetables to be gather'd with the Dew upon them.

But the latter Contrivance of the hot Still seems best calculated to raise those Materials which have vigorous, strong Scents, and which will not be injured by Fire, or any Mixture of common Water with them, such as Hyssop, Pennyroyal, and the like, which from their natural Production have something hot and fiery in them. But then we are taught by common Experience, that these give over their Virtues this way much better when dried, than when green, as every one may observe in Infusion or Decoction of these things; for, when green, they make either of them more foul, and yield less Taste of the Plant, than when dried; and the Water so drawn hath the same Disadvantages.

That Diversity in the Materials coming under this Management, which requires such different Treatment, seems chiefly to consist in this: The lighter and finer scented Plants, whose natural Flavours cannot be preserved to them in drying, and which we most covet to preserve in their distill'd Waters, are best ordered by a slow Heat, without any Mixture; because by their drying, it appears, that their proper Juices are the best and only Vehicles for those Flavours. But Things, whose Scents and Medicinal Properties consist in somewhat more gross and fixed than will exhale with their natural Moistures, do better give out to common Water, by Infusion; those very Parts which we want to force from them by Distillation; and in nothing are we more obviously directed by Nature, than in this Procedure. Where we want to blend something into this Form,

that is so light and volatile, as not to subsist in open Air any longer than it is in its Growth, it is certainly best removed from the Condition Nature left it in, into an Instrument, where, as it dries, those volatile Parts can be collected and preserved. And what we call the cold Still is such an Instrument, where the drying of the Plant or Flower is only forwarded by a moderate Warmth; and all that arises from it, is saved for the Purposes of Medicine. But when what we want from a Plant is not volatile enough to rise with its natural Juice in leisurely drying, it is highly reasonable to think this way insufficient to raise it, and therefore we must have recourse to such Means as have been taken Notice of in the other Process of the hot Still. *Quincy's Praelect.*

An Example of a Water procur'd by the cold Still, from Boerhaave.

Take Rosemary, fresh gather'd, in its Perfection, with the Morning Dew upon it, and lay it lightly and unbruised upon the broad round Plate within the common cylindrical Furnace, the Plate being first made clean, and fixed at the Height of two or three Inches. Then cover the Furnace with its large conical Still-head, and apply a Glass Receiver to the Nose thereof. In the Fire-place of the Furnace put a lighted Coal, that does not smoke, and raise an equable Degree of Heat, not exceeding eighty-five Degrees on *Fahrenheit's* Thermometer; and let this Heat be kept up so long as any Liquor comes over. Then taking away the Plant, put in fresh, and proceed as before; continuing to do this successively, till a sufficient Quantity of the Water be procured. Let this distilled Liquor be kept at Rest, in a clean Glass, close stopped, for some Days, in a cold Place; whereby it will become limpid, and have the Taste and Odour of the Plant.

REMARKS.

In this Water are contained the Liquor of Dew, consisting of its own proper Parts, which are difficultly separated from the Plant, and cleave to it even in the drying. This Dew also, by sticking to the Outside, receives the liquid Parts of the Plant, which being elaborated the Day before, and exhaling in the Night, are hereby detained; so that they concrete together into one external Liquid, which is often viscid, as appears in Wax, Manna, Honey, &c. This Water also contains the Fluid which exhales from the Vessels of the Rosemary, and which principally consists of simple Water, as appears upon long standing in an open Vessel, when the Taste and Odour vanishing, leave an insipid Water behind. Another Part of this Water is that subtle, volatile Substance, which gives the Plant its peculiar Taste and Odour; for these the Senses discover in it; but the Remains of the Process scarce afford any thing thereof. This same Water seems also to contain Seeds, or other little Bodies, which in a certain time usually grows into a kind of thin, whitish Weed, suspended in the Middle of the Water; and, daily increasing or spreading itself, becomes a Mucilage, which did not appear at first.

I have kept these Waters undisturbed in separate well-closed Vessels, and observed, that in a Year's time, they began to appear thick, which Thickness gradually increased every Year, till at length the whole Liquor grew roapy or mucilaginous. Hence this Water contains the elementary Water, and presiding Spirit of the Plant; a Spirit small in Bulk, but rich in Virtue, and exhibiting the specific Smell and Taste of the Subject. This Water, therefore, in exhaling, proves a Vehicle to that Spirit which contains in a small, subtle, extremely volatile, and thence easily separable Substance, the particular Virtue of the Plant, leaving the Remainder exhausted in this respect: And hence proceeds the Medicinal Virtue of these Waters, which principally depends upon their native Spirit. For this Spirit, having a brisk Mobility in most Plants, affects the Nerves, and raises the Spirits in case of their Depression. But besides this common Principle of Action, Plants have another peculiarly appropriated to each, and of wonderful Efficacy: This, in the Language of *Paracelsus*, is called their *Appropriated Essence*.

The odoriferous Scents, both of Lavender and of Baum, agree in this, that they excite the languid Nerves; but the Smell of Lavender, besides this, has another particular Virtue, and so has Baum. From the Virtue of Plants proceed wonderful Effects in the Body, which can only be learnt from a faithful History of Plants, where their Virtues, founded upon Experience, are delivered. This peculiar Virtue has often a contrary Effect to the common. The *Indian Hyacinth* has an extremely fragrant Odour, but excites strange Spasms in Hypochondriacal Men, and Hysterical Women. Rue also diffuses a very strong Scent, which cures the Spasms occasioned by the former Odour.

We must also observe, that human Industry has discovered, that this fine Vapour of Plants is productive of those strange Effects occasioned by vegetable Concretes, as well in the way

AQU

of Evacuants, as Alteratives; because if this alone be totally separated from Medicinal or Poisonous Plants, the Remainder, tho' without almost any sensible Loss of Weight, loses all that Efficacy. Hence a Chymist should be cautious and reserved in assigning the Virtues of these Waters, and learn for some time before he pronounces with Certainty. From these Observations we may say, that these Waters will frequently cure Fainting, and prove agreeable in the way of Perfume; for nothing more directly proves more refreshing, and enlivening to the Brain and Spirits, than such a Water of Baum or Rue, each of them full of the respective Spirit of the Plants.

If the Vessel be close stopped, and set in a cool Place, the Waters will retain their Virtues for a Year; but if negligently kept, or any Crack should happen in the Glass, their extremely volatile Spirit secretly flies off, and leaves the Water yapid. Our Experiment also shews us, what it is which Plants lose by being dry'd in the Summer's Sun, viz. The Water, and the Spirit we have been describing. Hence also we know the Nature of that Fluid, which first rises from Plants in Distillation, and what that Matter properly is in Plants, which gives their peculiar Odour, that is, their presiding Spirit. Lastly, we hence learn, in some measure, what those Effluvia are, which principally, in the Summer Season, and the open Air, exhale from Vegetables; for it is highly probable, that these constant Exhalations of Plants, especially in the Day-time, have a great Agreement in their peculiar Nature with the Liquor produced in our present Process, tho' differing in this, that the Exhalation is made from Parts continually recruited by the Root; whilst in our Experiment those Parts alone are collected, which are driven off from the Plants, after being gathered, and no longer supplied with fresh Nourishment. Whence the diligent and ingenious Dr. Hales observes, in his *Vegetable Statics*, that the Distillation of the Juice received in Glass Vessels, artificially applied to recent Incisions of Plants, in the Summer Season, is of a different Kind from common Distillations.

Hence we may understand, that the various, peculiar, and often surprising Virtues of Plants, may be widely diffused thro' the Air, and carried to a vast Distance by the Winds. So that we must not presently account as Fables what we find related in the History of Plants, concerning the surprising Effects of Effluvia. The Shade of the Walnut gives the Head-ach, and makes the Body costive. The Effluvia of the Poppy procure Sleep. The Vapour of the Yew-tree is reputed mortal to those who sleep under it; and the Smell of Bean-blossoms, if long continued, disorders the Senses. The strong Action of the Sun upon Plants certainly raises Exhalations of great Efficacy, by means of the Spirits they diffuse; and the Motions of the Winds carry them to a great Distance. The dark Shades of thick Woods, where Vapours are contracted, occasion various Diseases, and often Death, to those who reside among them, as appears by melancholy Examples in *America*, which abounds with poisonous Trees. For this Spirit of Plants is a thing peculiar to each Species, absolutely inimitable, nor producible by Art: It has therefore Virtues peculiar to itself, but such as are strangely agreeable to the human Spirits. But because the Spirits of some Plants are very manifest to the Senses, whilst those of others scarce affect our Organs of Smell and Taste by any sensible Action, the Chymists have chiefly destin'd to this first Process those Plants which are remarkable for their grateful Odour. Such as those of the following short Catalogue, for Example, taken from the *European* Officials, and a few of the *Indian*.

PLANTS

Angelica,	Fennel,
Anise,	Feverfew,
Basil,	Galangal,
Baum,	The Garlicks,
Bays,	Heartwort,
The Calamints,	Hyssop,
Calamus Aromaticus,	Jessamine,
Caraway,	Lavender,
Cardamon,	Leeks,
Cassia Aromatica,	Lemons,
Catmint,	Lily of the Valley,
Celeri,	Lily-white,
Chamomile,	Lovage,
Chervil,	Mace,
Cinnamon,	Marjoram,
Citron,	Marum Syriacum,
Clary,	Masterwort,
Clove July-flowers,	Mastichina, common Ma-
Coriander,	rum,
Cresses,	The Maudlin Tanfies,
Cumin,	Melilot,
Dill,	Mint,
Dittany,	Motherwort,

AQU

Nutmeg,	Scurvy-grass,
Onions,	The Southern-woods,
Orange,	Spignel,
Origanum,	Tansy,
<i>Philadelphus Athenæi</i> , or	Tuberose,
single white Pipe-tree,	Valerian,
Polium,	Victorialis,
Roses,	Violet,
Saffron,	Walnut,
Sage,	Wild Thyme.
Savory,	

TREES.

Elder,	Rose,
Fir,	Sassafras,
Guaiacum,	Savin,
Juniper,	Storax,
Lemon,	Thuya, or Life-tree,
Lime,	Walnut.

Several of these Trees contain, in their different Parts, an aromatic, volatile Matter, which may be obtained in this first Operation; for sometimes their peculiar Virtue resides in the Root, as the camphorated Balsam in the Cinnamon-root; or in the Wood, as in the Rhodium Wood; in the Bark, as in Cinnamon; in the Catkins, as in Walnuts; and frequently in the Flowers, Leaves, and Seeds: Again, in the Waters that distil from them, as in the Walnut; in their Balsams, Gums, Tears, and Rosins, as in the Balsamic Trees. *Boerhaave's Chymistry, Vol. 2. Process 1.*

The much greater Tedioufness and Expence of working with the cold than the hot Still, makes very few care to comply with it; so that where any thing of Moment is depended upon from this particular way, great Care ought to be taken not to be deceived therein.

But to avoid the Tedioufness of the one, and the Inconveniences of the other, of these ways, there hath lately obtained a Contrivance something between both, which is by suspending in a Copper Still, conveniently filled with Water, a Pewter Body, which is to hold the Materials to be drawn off; an Head is fitted to the latter, which joins to a spiral Worm, in a Refrigeratory of cold Water, as in the common hot Still. Ingredients thus distilled, which is in *Balneo*, have a greater Heat given them than in the cold Still; and yet by the Interposition of the Water, in which the Vessel containing them is suspended, they have not the Fire so forcibly acting upon them, as in the common way of the hot Still: So that all those things which require a middle Way between the other two, are hereby well provided for, as, amongst the Simples, Mint, Angelica, Chamomile, and some others which are of a Texture between very volatile and very fixed. And amongst the Compositions, the *Aqua Lactis Alexiteria*, the softer Snail-waters, and those of similar Properties; but neither the very fine-scented Simples, nor the heavier Compounds, can be thus ordered, but to Disadvantage.

One of the greatest Advantages of this Contrivance is, that Waters so drawn come over much cooler than from the hot Still, that is, they have not so much of the Fire in them (as it is commonly termed); so that an hot spicy Water, thus ordered, shall taste as cool upon the Palate when just drawn, as in the other way it would do after it had acquired a considerable Age. But another great Benefit is likewise obtained this way, and that is, the avoiding that Foulness in the Water coming over, which arises from too great Proportions of oily Ingredients in the ordinary Distillation: For tho' a Composition be considerably overcharged with things of this Disposition, yet, by the Relaxation of Heat in this Contrivance, they are so much less forced over, that the Water will be much finer. Yet, whether a Diminution in the Quantity of Ingredients, or in the Force to raise them, is the more eligible way to avoid this Inconvenience, I will not pretend to determine; though I most incline to the latter, because, without doubt, they are the finer Parts of the Aromatics which first rise, and consequently they must be best which come over with the least Force. But this way is practicable only with those Waters which are to come over highly spirituous, because there is not here Force enough to raise the others.

In this View, if we pass over the simple Waters wherein we are directed to draw these Properties, we shall find, that both the Wormwoods, the Carduus, and the Fumitory, are in no respect fitted for this Management: As to the first, if they have any Scent that will come over, it is so much the worse; because they are to most very offensive, especially that of the common Wormwood; and all of them have their Medicinal

Medicinal Virtues only in a bitter, earthy Salt, that will not rise in the Still, and is to be come at only by Decoction. Celandine, Parsley, and Saxifrage, have nothing in them volatile to send over in Distillation, but abound with a nitrous Salt, that proves diuretic, when order'd in proper Forms; and the Plantain and Oak-buds yield only a viscid, mucilaginous Juice, which will afford nothing over the Helm but an insipid Phlegm, that will soon mother and grow ropy. The same is chargeable upon the Frogspawn, Succory, and Eyebright, which likewise give over nothing discernible in a Water; and what comes from Fennel soon grows rank, and is so ill-scented as not to be endur'd, besides its Aptness to grow ropy. From Flowers, as those of Oranges, Chamomile, Rosemary, Damask-roses, and Elder, the most fragrant Waters are procurable; but from the rest very little of Value. The Citron-peel also, among the Fruits, makes a most delightful Water; but neither Raspberries nor Walnuts send over any thing that will smell, taste, or keep. The Water from black Cherries seems, by much, the best we have in the Shops for a Vehicle; the Kernels give it an agreeable Flavour, and there is so much of a Spirit in the Juice as preserves it the Year round, when carefully distill'd, without Decay. But this we are frequently cheated in, some making it from the Stones only, which those, who express the Juice for other Purposes, sell at a cheap Rate; tho' those taken out from Brandy, where the Stone hath not been before broken, make this Water well enough; but some are not contented only with these Pieces of good Husbandry, but make it from other Kernels, and often from nothing but bitter Almonds. These Frauds are not easily discover'd, unless the substituted Materials be crouded in such Quantities, (which commonly happens from the Encouragement of their Cheapness) that they shew a Foulness which is not at all perceivable in the genuine Water.

It may indeed, in some Cases, with good Reason, be requir'd to have simple Waters under the Denomination of Coolers, or such as have no other Property than being soft Vehicles to other Things; and these are best procur'd from inodorous or soft Substances, as Plantain, Frogspawn, and the like: And certainly, a distill'd Water is more strictly and simply elementary, and more a Diluter, than any other; but it is almost impossible to keep these the Year round, which can be had only from Vegetables at certain Seasons; and therefore such as are desir'd for mere Diluters, or Coolers, may possibly be had fresher drawn, at any Season, from Substances of like Smoothness and Texture. The simple Waters, indeed, from the lighter scented Plants, as Baum, and the like, are very subject to the same Decay; but that may, in some measure, be remedy'd by sprinkling the green Herb, before it is put in the Still, with a little Spirit, which will be so far from a Prejudice to the Flavour of the Water, that it will rather help and improve it. *Quincey's Praelect. Pharm.*

Example of a distill'd Water of a fresh Plant, by the Alembic, shewn in Rosemary. From Boerhaave.

We are now to inquire into that Part of Vegetables, which, being separated by the Heat of boiling Water, flies off into the Air. The most commodious Operation for this Process, is that perform'd by a still Head, closely fitted in to the Mouth of a Vessel, so as to collect and condense the Vapour arising by a boiling Heat, and transmit it without Loss into a Receiver. We are now to collect whatever flies off from a recent Plant, by the natural Degree of the Summer's Heat, up to that of two hundred and fourteen Degrees: And for this Purpose we shall again make Choice of Rosemary, that the Operation may be duly compared with that given above upon the same Subject; tho', instead of this, any other of the sapid and odorous Plants, enumerated as fit Subjects for the preceding Process, might be here employ'd, all which contain an inflammable, oily, and a fixable saline Part, as also a saponaceous one, consisting of the two. The Plants design'd for this Operation are to be gather'd when their Leaves are at full Growth, and a little before the Flowers appear, or before the Seed comes on; because the Virtue of the Subject, expected in these Waters, is often little, after the Seed or Fruit is form'd, at which time Plants begin to languish: The Morning is best to gather them in, because the volatile Parts are then condensed by the Coldness of the Night, and kept in by the Tenacity of the Dew, not yet exhale'd by the Sun. This is understood, when the Virtue of the distill'd Water principally resides in the Leaves of Plants, as it does in Mint, Marjoram, Pennyroyal, Rue, and many more; but the Case differs, when the aromatic Virtue is only found in the Flowers, as in Roses, Lilies of the Valley, &c. in which Case we choose their flowery Parts, whilst they smell the sweetest, which should be gather'd before they are quite open'd, or begin to shed; the Morning Dew still hanging upon them. In other Plants the Seeds are to be prefer'd, as in Anise, Caraway, Cummin, &c. where the Herb and the Flower are indolent, but the whole Virtue remains in the Seed alone, where it manifests itself by its remarkable Fragrance, and aromatic Taste. We find Seeds chiefly possess'd of this Virtue when come to

perfect Maturity. We must not omit, that these desirable Properties are found only in the Roots of certain Plants, as appears in Avena, and in Orpine, whose Root smells like a Rose; and here the Roots should be gather'd, for the present Purpose, at that time when they are richest in these Virtues, which is generally at that Season of the Year just before they begin to sprout, when they are to be dug up in a Morning. If the Virtue here requir'd be contain'd in the Barks or Woods of Vegetables, then these Parts are to be chosen for the Purpose.

1. The Subject being chosen, let it be bruised, or cut, if there be Occasion, and with it fill two Thirds of a Still, leaving a third Part of it empty, without squeezing the Matter close; then pour as much fresh Rain-water upon it as will fill the Still to the same Height, that is, two Thirds, together with the Plant: Fit on the Head exactly to the Neck of the Still, so that no Vapour may pass thro' the Juncture, which the Copper-smiths can order to Perfection. Let the joining of the Nose of the Still-head to the Worm be luted with a stiff Paste, made of Linseed-meal and Water. Observe, that the Cavity of the Worm be always cleansed by passing fair boiling Water thro' it, lest otherwise the distill'd Water should be foul'd. Apply a Receiver to the Bottom of the Worm, that no Vapour may fly off in the Distillation; but that all the Liquor, being cool'd in the Worm-tub fill'd with cold Water, may be collected; which is best perform'd by keeping the Worm-tub continually supplied with cold Water.

2. Things being in this State, digest for twenty-four Hours with a moderate Degree of Heat, of 150 Degrees. Afterwards raise the Fire, so as to make the Water and the Plant boil; which may be known by a certain hissing Noise, proceeding from the breaking Bubbles of the boiling Matter; as also by the Pipe of the Still-head, or the upper End of the Worm, becoming too hot to be handled; or the Smoaking of the Water in the Worm-tub, heated by the Top of the Worm; and lastly, by the following of one Drop immediately after another, from the Nose of the Worm, so as to make an almost continued Stream. By all which Signs we know, that the requisite Heat is given; and if it be less than a gentle Degree of Ebullition, the Virtue here expected will not be rais'd: But when the Fire is too great, the Matter hastily rises into the Still-head, and fouls the Worm and the distill'd Liquor; and the Plant being also rais'd, it blocks up the Worm; for which Reason it is proper to place a Piece of fine Linen, artificially, at the End of the Still-head Pipe, that, in case of this Accident, the Plant may be kept from stopping up the Worm. But, even in this Case, if the Fire be too violent, it will throw up the Herbs into the Still-head Pipe; whence the Passage being stopp'd, the rising Vapour will forcibly blow off the Head, and throw the Liquor and Steam about, so as to do much Mischief, or even to suffocate the Operator, without a proper Caution; and the more oily, tenacious, gummy, or resinous the Subject is, and consequently the more frothy and explosive, the greater Danger there is, in case of this Accident.

3. Let the due Degree of Heat therefore be carefully observ'd, and equally kept up, so long as the Water, distilling into the Receiver, is white, thick, odorous, sapid, frothy, and turbid; for this Water should be kept carefully separated from that which will follow it: Whence the Receiver must be often chang'd, that the Operator may be certain, that nothing but this first Water comes over; for there afterwards rises a Water that is transparent, thin, and without the peculiar Taste and Odour of the Plant, but generally somewhat tartish and limpid, tho' somewhat obscur'd and foul'd by white dreggy Matter: And if the Head of the Still be not tinn'd, the Acidity of this last Water causes it to dissolve the Copper, so as to become green, nauseous, emetic, and poisonous to those who use it, especially weak Persons and young Children, as operating both upwards and downwards, with severe Gripings. If such a Misfortune should happen, it is remedied by drinking plentifully of Milk, sweeten'd with Honey, or of the common emollient Decoctions.

4. The first Water, above describ'd, principally contains the Oil and presiding Spirit of the Plant, and always somewhat saline, which in most Plants is acid, but in the more pungent Antiscorbutics a volatile Alkali; for the Fire, by boiling the Subject, dissolves its Oil, and reduces it into small Particles, which are carried upwards by the Assistance of the Water, along with those Parts of the Plant that become volatile with this Motion. And if the Vessels are exactly clos'd, all these, being united together, will be discharg'd without Loss, and without much Alteration, into the Receiver annex'd; for, if we may trust our Senses, these Waters are richly impregnated with the Odour, Taste, and particular Virtues of the volatile Parts of Plants: Hence, if the Botanist justly assigns the Virtues of any Plant, as they are contain'd in that Part which is volatile by a boiling Heat, the Chymist can present those Virtues separated from the rest. The former was attempted by Mr. Tournefort, in his Book of Plants spontaneously growing about Paris; and by Mr. Ray, in his Book of the native Plants of England. Dodonaeus has perhaps spoken too boldly, and sometimes rashly, of them all, especially in the last Edition of his Work, printed

at *Antwerp* in 1644. I have expressly observed, that the first of these distill'd Waters contains only the Virtues of the Plants, residing in that Part which is volatile with this Heat; because, in the whole mix'd Juice of the Plant, there is a certain Virtue depending upon a Mixture of this first Water, and the Liquor remaining after that is drawn off. The fresh express'd Juice of recent Mint has certainly many other distinct Properties than the distill'd Water thereof: Whence Physicians are to observe, that the Virtues of this Water, and of the native Juice, are not the same, but very different.

5. The Water of the second Running wants the volatile Part above describ'd, yet scarce brings over the more fix'd Part of the Plant, except what is somewhat acid and vapid: If, when this is come off, fresh Rain-water be pour'd upon the remaining Plant, and boil'd therewith, or strongly distill'd, there rises a more acid Water, containing very little of the particular Virtue of the Plant; almost the same kind of Acidity appearing to rise thus from them all at last. This I may venture to affirm, upon Experience, that the Virtue of destroying Worms, which the more celebrated Physicians have justly attributed to certain distill'd Waters, depends upon this, that the Acid of the Water of the last Running dissolves the Copper, and thus acquires a Virtue not its own. This Operation, however, shews, that Plants contain an acid Salt so volatile as to rise and separate from the Subject, with 215 Degrees of Heat. But Experience shews, that the Water of this second Running has scarce any other Virtue than that of cooling; as may be safely tried by using a Glass Still-head instead of a Copper one, by which means the Inconvenience of its dissolving the Copper is prevented.

6. And this is the best Method of preparing the distill'd officinal Waters, provided the two Sorts be not mix'd together, for both of them would be spoil'd by such a Mixture; they also spoil with keeping, and will seldom remain perfect a Year.

REMARKS.

We learn from the present Process,

1. What a Plant parts with by the Heat of boiling Water, that is, the Water of the preceding Process, the volatile Oil with its inherent Spirit, and a saline Acid.
2. What remains in the Still after the Separation of these three Parts; that is, the Extract, the Earth, and the Salts.
3. In what Part the Odour and Taste of a Plant reside; that is, in the Water, in the volatile Oil contained in this Water, and in the Spirit contain'd in this Oil.
4. Hence is easily known what exhales by boiling, both in Cookery and Pharmacy, and what remains behind. If Costmary, Chervil, Baum, or Smallage be boil'd in Broth, they lose their peculiar Smell and Taste, with the Virtues thereon depending, and only leave behind their common ungrateful Parts; but if cut small, and added to the Soup already prepared, and kept hot, but not boiling, in a Vessel close cover'd, so as to infuse for a while, they communicate their peculiar Virtues thereto. Cinnamon affords an extremely grateful Water, which surprisngly warms and exhilarates; but when this is all come over, there follows another that is acid and indolent, leaving an acid, austere, and cooling Decoction behind, resembling that of Oak-wood.
5. Hence it plainly appears at what time, with the same Force of Fire, quite contrary Virtues may arise from a Plant; for so long as a milky Water comes over from such Plants as are aromatic, so long the Water remains warming and attenuating; but when it comes thin and pellucid, it is acid and cooling.
6. In the last Place, we have hence the true Foundation for the conducting of Distillation; for if the Operation be stop'd as soon as ever the white Water ceases to run off, the Preparation will be valuable and perfect; but if, thro' a Desire of increasing that Quantity, more be drawn off, and so the latter acid Part be mix'd with the first Running, this spoils the Whole. We should here observe, by the way, that the distill'd Waters of inodorous Plants, which have no aromatic Sharpness, may yet leave very considerable Virtues, tho' the contrary is generally suppos'd: And again, that the native Virtues of Vegetables may thus, in some measure, be chang'd by the Boiling, from what they originally are. The Rosemary remaining in our present Process still appears green, and preserves its original Form; being only deprived of its native Smell and Taste.

The common distill'd Water by the Alembic, cohobated or return'd back upon more of the fresh Plant.

The preceding Process has shew'd, what Water and Fire may separate from a Plant in close Vessels, and what is left behind therein; but the present Process teaches a Method of opening Plants still farther, and treating them so as to obtain distill'd Waters much richer in those Virtues of the Subject, which were mention'd in the former Process.

Take the Plant and Liquor, remaining in the Still after the preceding Process, and press them strongly in a Strainer, that all the Decoction may be obtain'd, and with this mix all the Water before drawn over. Return this Mixture into the Still, and add to it as much of the same recent Subject as was employ'd before, and, if necessary, add likewise as much Water as may make up the former Proportion to the Plant: Now close the Vessels exactly, and digest the Whole, with 150 Degrees of Heat, for the Space of three Days and Nights, that the Herb, being so long steep'd in its own Liquor, may be open'd, loosen'd, and dispos'd the easier to part with its Virtues. This Digestion being so long continued, is of great Service; but if protracted too long, introduces a Change tending to Putrefaction. Let the Water now be distill'd off in the same manner as in the foregoing Process, only proceeding more cautiously, and somewhat more slowly at the first; because the Liquor in the Still being now thicker, more impregnated with the Plant, and therefore more flatulent, and apt to swell upon feeling the Fire, it easily boils over; but after about one half of the expected Water is come off, the Fire may be prudently rais'd. If the Rule before laid down be observed, and the Distillation be continued so long as the first Water, describ'd in the preceding Process, comes over, and then the Operation be immediately stopp'd, the Water so obtain'd will be whiter, thicker, more odorous, sapid, frothy, and turbid, than that of the last Process.

This Water also preserves its Virtue much longer, and contains it in greater Perfection, than that of the last Process; which shews us a way of concentrating the peculiar Virtue of Plants, so far as it resides in their volatile odorous Parts: So likewise the remaining Decoction in this Process is much stronger than in the former; and as the Operation may be repeated as often as one pleases, both the Water and the Decoction may, by several Repetitions, at length be made extremely rich; so that by this means excellent Medicines are procurable. Thus in the Year 1730. I distill'd Baum after this manner fourteen times successively, and found the Water at last had a balsamic Taste, and the perfect Fragrance of the Plant, so as to prove highly refreshing, even when barely smelt to, or tasted: And no Wonder, since the Virtue of many large Baskets of Baum was here concentrated, and brought within the Compass of a small Glass; and the Remainder also, at the Bottom of the Still, being inspissated, fill'd but another Glass, and proved grateful, austere, and strengthening; so that, by mixing the two together, the Virtues of the Plant might be thus highly concentrated, or brought into a very little room. This Process therefore does not only afford excellent Waters, but admirable Extracts also, which, when properly mix'd together, yield Medicines of such Efficacy as can scarce otherwise be imitated; for the native Virtues of Vegetables are little chang'd in this Operation, certainly less than in others; tho' it must be allow'd, that some Alteration is produced by so long a Continuation of the Boiling: But both the Odour, Taste, and Effects, demonstrate, that the Waters thus prepar'd, retain, in an high Degree, the specific Virtues of the Plant.

And hence it is certain, that the sought Medicinal Virtue of truly aromatic Vegetables resides in that Part of them which rises with the Heat of boiling Water; and that it is possible, by Art, to concentrate their Virtues, so that they should prove much more effectual than in the State they are naturally afford'd: Nor is there any Limitation; for by continuing to repeat the Operation, the Virtues of Plants may be thus exalted to any Degree the Artift should think proper; which shews the extraordinary Power of Chymistry.

Paracelsus assures us he found, by Experience, that Baum is possess'd of so great a specific Virtue, as, by insinuating into the Humours of the Body, to restore a new youthful Vigour to the Aged, and by this means perfectly to cure the Gout; and *Isaac Hollandus* avouches the same. Now, if these Authors said true, I judg'd I might, by means of the present Process, procure the united Virtues of the Plant in their utmost Strength; and, indeed, I have in myself experienced extraordinary Effects of the Water so prepar'd, by taking it upon an empty Stomach. And, certainly, it has scarce its Equal in Hypochondriacal and Hysterical Disorders, the Chlorosis, and Palpitation of the Heart, as often as these Diseases proceed rather from a Disorder of the Spirits, than any Collection of morbid Matter; tho' it is indeed expensive. I have reduced dried Mint, by three or four Cohobations, into a balsamic penetrating Liquor, which becomes an incomparable and present Remedy for strengthening a weak Stomach, and curing Vomiting proceeding from a cold viscid Phlegm lodg'd about the Mouth thereof; as also in Lienteries. The Water I have in this manner prepar'd from Lemon-peel, has, by its Fragrance, its agreeably penetrating, and highly aromatic Taste and Virtue, immediately cured Flatulencies, Deliquiums, Faintings, and irregular Motions of the Heart, tho' taken in a very small Dose. The like Water, prepar'd by repeated Cohobations from recent Wormwood, has successfully supplied the want of Bile in the Body, stimulated all the languid Vessels

Vessels that are assitant in forming the Chyle, and kill'd and expell'd Worms. The like Water, from the Leaves of Savine, has given an almost incredible Motion to the whole nervous System, so as to prove the most excellent of all Medicines, for promoting the Exclusion of the Fœtus, and the Discharge of the Menfes, and Hemorrhoids. The cohobated Water of Rue can never be sufficiently recommended for the Cure of the Falling-sickness, the Hysteric Passion, for expelling Poison, and promoting of Sweat and Perspiration. I do not here mention the Water I have made from the Berries of the Juniper-tree, and the Leaves of the Arbor Vitæ; both of them successfully curing the Dropsy, as that from Chamomile-flowers cures Tertian Agues. It were endless to pursue these Waters thro' all the Variety of Subjects. I judge it manifest upon the Whole, that this is a true and excellent Method of obtaining the Chymical distill'd Waters. Some Rules, however, are required for applying these two general Examples to all Sorts of Herbs, which may require something peculiar. These Rules are as follow:

1. Let the aromatic, balsamic, oleaginous, resinous, gummo-resinous, and strong-smelling Plants, which long retain their natural Fragrance, such as Arbor Vitæ, Baum, Bay, Hyssop, Juniper, Marjoram, Mint, Origanum, Pennyroyal, Rosemary, Sage, &c. be gently dried a little in the Shade; then digest them, with the Quantity of Water already mentioned, for twenty Hours, in a close Vessel, with 150 Degrees of Heat, and afterwards distil in the Method above deliver'd, and thus they will afford excellent Waters.

2. When Waters are to be drawn from Barks, Roots, Seeds, and Woods, that are very dense, ponderous, tough, and resinous; let them be digested for three, four, or more Weeks, with ninety-six Degrees of Heat, in Vessels perfectly closed, with a proper Quantity of Salt and Water to open and prepare them better for Distillation: A considerable Quantity of Sea-salt is here added, partly to open the Subject the more, but chiefly to prevent Putrefaction, which otherwise would certainly happen in so long a Time, and with such a Heat, as is necessary in this Case, and so destroy the Odour, Taste, and Virtues required: And thus, for Example, may Waters be prepared from Aloes, Box, Cedar, Guaiacum, Juniper, Rhodium, and the like Woods.

3. Those Plants which diffuse their Odour to some Distance from them, and thus soon lose it, should immediately be distill'd after being gather'd in a proper Season, without any previous Digestion; thus Borage, Bugloss, Jessamin, white Lilies, Lilies of the Valley, Roses, &c. are hurt by Heat, Digestion, and lying in the Air. Some Woods also are injur'd in the same manner; thus the Shavings of Sassafras, by being boiled in Water, soon lose their Virtue, Taste, and Smell.

4. The astringent, nutrimental, healing, consolidating, emollient, farinaceous, gelatinous, cooling, and styptic Virtues of Plants are never, by this means, communicated to the distill'd Waters, but are to be sought either in the whole Plant, or its most fix'd Part. Whence Pharmacy should be reliev'd from the unnecessary Trouble of preparing such Waters; and, on the other hand, Physicians are diligently to be admonish'd to seek for such Virtues in the Infusions, Decoctions, and Extracts of such Plants. Would it not be ridiculous to expect any thing nutrimental in the indolent and rapid distill'd Water of Barley, or minc'd Capon's Fleth? Can any Man expect to find the excellent Virtues of Sorrel, in hot, lax, putrid, and bilious Constitutions, from the distill'd Water of this Plant? So again it were absurd to attribute the inimitable Virtues of Plantain to its distill'd Water. Such idle and childish Trifles are therefore to be rejected in the serious Arts of Chymistry and Medicine.

The Case is far otherwise in those Plants, whose real Virtue entirely resides in that Part which is separable by a Heat not exceeding 214 Degrees; for the Waters carefully prepared from these will contain all the Virtue which is lost in their Decoctions and Extracts. The celebrated Virtues of Lavender-flowers, Lilies of the Valley, and of Rue, against that Species of the Falling-sickness which proceeds from a Disturbance in the Motion of the nervous Fluid, reside in the distill'd Water, but are absolutely wanting in the Decoctions or Extracts; so, on the other hand, the anti-epileptic Virtue of Piony remains in the Decoction, but is wanting in the Water.

6. There are some Medicinal Plants whose Virtues reside in a Part which is volatile, with the aforesaid Degree of Heat, but so, that after these are raised by Distillation, the remaining Plant, and its Decoction, continue possessed of other Virtues, of great Medicinal Efficacy. Such Decoctions, therefore, are not to be thrown away, but to be inspissated with a moderate Heat, that they may be kept uncorrupted; for, being afterwards mix'd with the distill'd Water, the Virtues of both are thus united, and afford the whole Efficacy of the Plant: And of this kind are Chamomile, Carduus Benedictus, the lesser Centaury, Germander, Ground-pine, Mugwort, Rosemary, Sage, Scordium, Wormwood, &c. This Tribe of Herbs, indeed, are exalted by Fermentation, so as to afford the better Waters; but when their Decoctions come afterwards to be inspissated,

VOL. I.

they either have less, or a different kind of Virtue from the natural.

7. Acid, bitter, austere, sweet, and flat Tastes, rarely ascend from Plants in Distillation, but commonly remain in their Extracts, tho' they ascend from Chamomile, Wormwood, and a few more; but the Colour of Plants is scarce ever rais'd by Distillation, tho' we have a blue Colour in the Distillation of Chamomile, and a green one in that of Wormwood; but these Colours are rather in the Oil than in the Waters. The saponaceous Virtue, consisting in the Union of the Salt and Oil, never rises, but remains in the Extracts; and therefore Plants endow'd with this Virtue are not to be thus distill'd.

8. The following Vegetables scarce afford any thing of Use in their distill'd Waters; that is, Barberry, Beet, common Cherries, Colewort, Currans, Elder-berries, Endive, ripe Grapes, Ladies Mantle, Lettice, the Juices of Citrons, Lemons, Oranges, Purslain, Scorzonera, Sorrel, Strawberries, and Succory. There are also very contrary Virtues in the same Plant: Thus the distill'd Water of Cinnamon, of the First Running, is deobstruent, heating, enlivening, stimulating, and good in vomiting; but that of the Second Running astringent, cooling, and nauseous; whilst the Decoction remaining in the Still is of a dark-red Colour, opaque, thick, of an austere Taste, astringent, coagulating, and strengthening.

Simple Waters are directed by the College of Physicians to be drawn

From the Leaves and Buds of

Both the Wormwoods,	Baum,
Angelica,	Mint,
Carduus Benedictus,	Parley,
Succory,	Plantain,
The greater Celandine,	Pennyroyal,
Eyebright,	Oak,
Fenil,	Rue,
Fumatory,	Saxifrage,
Hyssop,	Meadow-sweet,
Marjoram,	

From the Flowers of

Oranges,	Piony,	
Chamomile,	Rosemary,	
Beans,	White	} Roses,
Lilies of the Valley,	Red	
Elder,	Damask	
Red Poppies,	Limes.	
Cowslips,		

From the Fruits of

Citrons, the Peel,	Green Walnuts, and
Rasp-berries,	Black Cherries.

From twelve Pounds of the latter of which, bruised with the Stones, draw one Gallon.

From an Animal,

Frog's-spawn.

Quincy's London Dispensatory.

To these the Edinburgh Dispensatory adds

Mugwort and Savine.

The same Dispensatory orders the FROG-SPAWN WATER to be made thus:

Hang any Quantity of FROG-SPAWN in a Bag, so that the Water may run from it into a Vessel set underneath to receive it; and to every Pint of the Liquor, thus obtain'd, add a Dram of Roch-alum.

This is a much better Frog-spawn Water than we find order'd in other Dispensatories; the Addition of the Alum, and the manner of Preparation by Resolution, considerably increase its Virtues; whereas that obtain'd by bare Distillation gives us little more of the Spawn than its uselefs Phlegm. As it stands here, it seems design'd as a Cooler for external Uses.

The same Dispensatory very properly observes, that the Waters of those Plants which are obtainable to no good Purpose by Distillation, may be made by dissolving a proper Proportion of their essential Salt in Spring-water (or rather in distill'd Water).

The Method of making the AQUA LACTIS ALEXITERIA, Alexiterial Milk Water, is specify'd under the Article ALEXITERIA, which see.

AQUA CINNAMOMI TENUIS,

Small Cinnamon-water, is made by infusing twelve Ounces of Cinnamon in eight Pints of Water, and then distilling till the Liquor ceases to come over milky.

Another Simple-water has lately been introduced into Practice, not mention'd in any Dispensatory that I know of, under the Name of PEPPER-MINT WATER. This, I presume,

is distill'd from the MENTHA SPICIS BREVIORIBUS ET HABITIORIBUS, FOLII MENTHÆ FUSCÆ, SAPORE FERVIDO PIPERIS of Ray's *Synopsis*; MENTHA SAXIFRAGA, ANGUSTIORE FOLIO, SPICATA, SAPORE ACRI FERVIDO, of *Plukenet's Almagest*. 129. MENTHA PIPERATA ACUTA of *Petiver's Herbarium Britannicum*; Pepper-mint.

This Water is extremely hot in the Mouth, and upon the Stomach; and therefore seems proper to warm, invigorate, and discuss Flatulencies, to destroy Acidities in the Stomach and Duodenum, and prevent Coagulations consequent thereto.

Another Method of procuring a Water from Vegetables, by fermenting the Vegetable before Distillation, after the manner of Ludovicus.

The Effects of Distillation, Digestion, and Cohobation, have sufficiently shewn us the Action of the Fire, limited by the Degree of boiling Water, in Distillation and Cohobation; and of a more gentle Fire, with Water, by Digestion. We now proceed to exhibit an elegant and useful Way of obtaining Virtues of Plants very little alter'd from what they naturally are, tho' render'd more penetrating and more volatile.

1. Take recent Rosemary, cut and bruise it, if that seems necessary; put it into a large Oak Cask, leaving a Space empty at the Top, of four Inches deep; then take as much Water as would, when added, fill the Cask to the same Height, including the Plant, and mix therein about an eighth Part of Honey, if it be cold Winter Weather; or a twelfth Part, if it be warm: In the Summer the like Quantity of coarse, unrefined Sugar might, to the same Purpose, be added instead of the Honey, or half an Ounce of Yeast added for each Pint of Water will have the same Effect; but I prefer the Honey used as described: Let the proper Quantity therefore of Honey and Water be warmed and poured upon the Plant in the Cask; let the Cask stand upright, and have its wide, upper Orifice, or Bung-hole, loosely cover'd with a wooden Cover; then set it in a wooden Chest, to be kept heated by means of a live Coal bury'd under light Ashes, so that the Liquor and Plant may feel a Heat of about eighty Degrees, which is afterwards to be constantly kept up, by covering the outside with Cloths, and due Regulation of the Fire, which must therefore be greater and more carefully attended in cold Weather; but in the Heat of Summer, little or no Fire is requir'd. On the second Day a hissing Noise will begin in the Liquor, with Bubbles, Frothing, and a grateful Smell of Rosemary, the Plant now again rising to the Surface: This Motion is called *Fermentation*.
2. When this Fermentation has continu'd so long, that what was on the Top begins to subside and sink to the Bottom, the Operation is continu'd long enough for our Purpose, so that now the Vessel must be cool'd, and closely bung'd down; for if it should continue longer open in the same Warmth, the Spirit and Oil, now render'd more volatile, would fly off, and the Virtues requir'd be lost; so that the Matter should be now directly distill'd.
3. Take therefore as much of this Plant, and its fermented Liquor, as may fill Two-thirds of a Still, and work carefully from the first; for the Liquor, containing much fermenting Spirit, easily rarefies with the Fire, froths, swells, and hence becomes very subject to boil over. And as all this happens much quicker in this Distillation than in the foregoing Kinds, we ought here to work slower, especially at the first.
4. And thus there will come over first a limpid, unctuous, penetrating, odorous, sapid Liquor, all which is to be kept separate; there follows a milky, opaque, turbid Liquor, still containing something of the same Taste and Odour; and at length comes one that is thin, acid, not fragrant, and scarce having any Property of the Rosemary: There remains in the Still an Extract, indolent with respect to the Rosemary, and retaining much of the Substance of Honey. And all these Particulars hold, when the Fermentation is continued, till the Plant spontaneously falls to the Bottom of the Cask, which, with the above-mention'd Degree of Heat, usually happens in five or six Days.
5. This first Water, or rather Spirit, may be kept for several Years, in a close Vessel, without changing or growing ropy. It also excellently retains the Taste and Odour of the Plant, tho' a little alter'd; but if less Honey were added, less Heat employ'd, or the Fermentation continu'd only two or three Days; then the distill'd Water of the first Running would be white, thick, opaque, unctuous, frothy, and perfectly retain the Scent and Taste of the Plant, or much less alter'd than in the former Case; tho' the Water will not be so sharp and penetrating. After this is drawn off, a tartish, limpid, inodorous Liquor;

will rise, leaving a Remainder behind, that retains much less of the Properties of Rosemary, than in the preceding Process.

6. There is also in this Case always found some Oil in the first Water, which was not in the former Spirit. Again, if the Fermentation were to continue only for a Day, or a Day and a half, the Water that first comes over would largely abound with Oil. In other respects Matters are nearly the same in both; for it is constantly found, that the longer the Fermentation was continu'd, the less Oil appears in the distill'd Water; and therefore what runs first, is always clearer and stronger; but upon mixing with common Water, the Whole immediately becomes milky: Whence these Waters greatly differ from one another, according as they are differently prepared in the above-mention'd respects. When the Fermentation is perfectly performed, the first Water will be limpid, the second milky; and if a third be forced over by a strong boiling Heat long continu'd, it will prove acid, thin, and limpid, resembling distill'd Vinegar. The Extract in this Case will always be the less impregnated with the Virtue of the Plant employ'd, the longer the Fermentation was continued, or the more perfectly it was performed; and *vice versa*. The Oil also, which in the Distillation of the unfermented Plants floated upon the Surface of the Water, becomes so attenuated, when the Plant is perfectly fermented before Distillation, as entirely to disappear, and lie concealed; or is subtly divided in the distill'd Liquor, which may therefore be call'd Spirit, rather than Water. That this is the Case, appears from hence, that if a large Quantity of Water be added to the Spirit, it presently grows white; which shews that there was Oil conceal'd in it: And frequently little Drops of Oil, thus regenerated, will float upon the Surface of the Water.

REMARKS.

1. Hence we learn, that this Fermentation (when perfectly finish'd in the proper Time requir'd for that Purpose, with a large Proportion of Ferment, and if the whole fermented Matter be for some time contained closely bung'd down in a Cask) affords these Waters extremely limpid, hot, aromatic, odorous, sapid, and penetrating, without any Sign of their containing an Oil; and according as these Properties appear more in the Water, the native Virtues of the Plant are more changed; so that at last they can scarce be known: But when the Fermentation is perfect, each losing its proper Character, they all become nearly alike: Whence it is manifest, that the particular Virtues of Vegetables are not exalted or perfected by Fermentation, as they were in the preceding Process by repeated Cohobation; and that the Waters of the present Process, by such Cohobation, are not render'd so spirituous, as by a single Fermentation. And this seems to proceed from hence, that in the long continued and active Motion of Fermentation, the volatile presiding Spirit, now freed from the open'd Parts of the Plant, but principally from the attenuated Oil, exhales; for the Tenacity of the Oil was the chief thing that detained and locked the Spirit in the Plant. But a gentle and moderate Fermentation, which does not dissipate the Spirit, only dissolves the viscous Obstacles, admirably quickens these Waters, makes them durable, or long preserves them from Corruption, Dregginess and Ropiness; as is excellently observed by that skilful and candid Chymist, *Daniel Ludovicus*, in his Dispensatory accommodated to the present Age. And thus the Water of Carduus Benedictus, so prepared, is highly commended, where Sweating and Perspiration are required.
2. Hence the Taste and Smell of Plants, communicated to their distill'd Waters, principally depend upon their native Spirit respectively. But as this Spirit is wrapped up in a tenacious Oil, when this Oil is mixed with the Waters, it renders them the more odorous and sapid in the larger Quantity it is so mixed. This Oil is gradually thinned, made less tenacious, more spirituous, and easier to mix with Water, by Distillation, Digestion, and Cohobation in close Vessels; but thus the Spirit also becomes more volatile and diffentangled, so as easily to fly off, unless it is every way very closely confined in the Vessels during the Distillation; which being performed, highly efficacious Waters may be thus prepared. But as Fermentation requires a Length of Time, the Admission of the Air, and open Vessels, it attenuates Oils by its Motion, so as to mix them with Water, and in this Form make an inflammable Liquor; which cannot happen without a Dissipation of the native Spirit. It however renders Oils miscible with the animal Juices, and fit to enter the finest Vessels; but always destroys the peculiar Virtue of the Plant. In the mean time, it proves the Medium of conveying stimulating and grateful Virtues to the Nerves, especially those of the Nose, Mouth, Jaws, Throat, Stomach, and Intestines.

That

That nothing relating to the Distillation of Waters may be omitted, I shall add the Method of distilling *per Descensum*.

Chymists formerly called that Motion of Bodies Distillation, when, by the Assistance of Fire, the Subject to be changed, and contained in one Vessel, to which the Fire was apply'd, passes into another joined thereto, whether Solids were thus treated or Fluids; and this Operation with them differ'd in three respects: For, 1. The Fire raised the Matter perpendicularly upwards. 2. Somewhat obliquely, or laterally, as in Distillation by the Retort. And, 3. Downwards, the Fire being apply'd above; which last Species of Distillation they called *per Descensum*, which they used in the last Age for separating Quicksilver from its Ore, and which *Paracelsus* from thence transferred to Vegetables. Of this kind of Distillation we are now to give an Example.

Let there be procured a sufficiently wide and deep cylindrical Vessel, made of such Matter as will neither transmit, drink up, or foul Liquors. From the upper Rim of this Vessel cut an Inside Groove, fit to receive exactly, and sustain a round Plate struck full of Holes, which is to sink into the open Mouth of the Vessel, so far that the upper Surface of the Plate be two Inches from the Rim thereof; then place any recent, green, succulent Plant, first cut or bruised, upon the Plate, so that it may reach up to the Rim; then apply a flat Cover, which may exactly close the Mouth of the Vessel, with the Assistance of luting, to prevent any Vapours from exhaling. The whole Apparatus may be made of Iron-plate, if a large Quantity of Water is requir'd at once; otherwise, for a single Experiment, one of Earth may suffice. Let a little fine Ashes be sifted upon the Cover, and a few live Coals be placed thereon, that the moist Parts of the Plant may be resolved into Vapour, and its Juices be liquefied so as to fall into the wide Part of the Vessel below, where being condensed by the Cold, they will gradually distil and collect, if the Fire be prudently managed, and increased by Degrees. And thus the Spirit, Water, Wax, Gum, Oil, Rosin, as also the saline and saponaceous Matter of the Vegetable, which do not easily rise in the preceding Distillations, may be obtained: Care, however, must be had, not to make the Fire too large, for fear of quite burning up the Parts of the Subject; tho', indeed, a small Degree will have but little Effect; but if a violent Fire be used, all the Parts will be confounded together, the oily Matter burnt up, the Smell and Taste of the Produce become so empyreumatical, smoky, bitter, and nauseous, as to be scarce fit for internal Use, especially if the Subject were dry and unctuous. But when succulent Vegetables are employ'd, such as Rose-flowers, and prudently treated without burning, the Water so prepared will nearly resemble the natural Juices, as containing both their saponaceous Nature, and peculiar Virtues, though always a little changed by the Fire; whence the expressed Juices themselves are not only more agreeable, but more medicinal. *Paracelsus*, however, by treating Guaiacum in this manner, obtained an acid Liquor, and a sharp foetid Oil, which he recommends both for external and internal Uses; whence this Operation has been for some time practised in *Germany*, but is now almost disused, or changed for others more suitable. *Boerhaave's Chymistry*.

Spirituus and Compound Waters directed by the COLLEGE of PHYSICIANS.

For preparing these, the Herbs are to be chosen green, unless particularly ordered to the contrary: In Defect of those which are green, about a fourth Part of the dry may be substituted, and so much Spring-water is to be allowed as will prevent their burning to the Still.

AQUA ABSINTHII MINUS COMPOSITA: Or, The Lesser Composition of Wormwood Water.

Take of the Leaves of dried Wormwood, two Pounds; of the Lesser Cardamom-seeds, two Ounces; of Coriander-seeds, half a Pound. Infuse them all in four Gallons of *French Brandy*, and draw off the same Quantity by Distillation.

After the same manner, but with an Omission of these Seeds, and, for that Reason, an Augmentation of four times the Quantity of Herbs, are made Waters from the whole Plants of Angelica, Baum, Mint, Sage, &c. the Flowers of Rosemary, Seeds of Caraway, Lesser Cardamoms, Anise, Juniper-berries, Orange, Citron, and Lemon-peel, &c.

This Water differs chiefly from that of the former Dispensatory, by substituting Cardamom and Coriander-seeds in room of the Aniseeds, which makes it more cordial and grateful to the Stomach; the Aniseeds yielding too foul an Oil to suit it for such Purposes. This Water is commonly used in Stomachic Infusions, on a Supposition, that it claims a Right to such Virtues from the Wormwood; but the Water rising from it partakes not of these Qualities which belong to it in Tincture;

so that it seems only to be carminative from the Spice and Seeds now ordered in it. *Quincy*.

AQUA ABSINTHII MAGIS COMPOSITA: Or, The greater Composition of Wormwood Water.

Take of the Sea, and common Wormwood dried, each one Pound; of Sage, Mint, and Baum dried, each two Handfuls; of the Roots of Galangals, Ginger, Calamus Aromaticus, and Elecampane, of the Seeds of Sweet Fennil and Coriander, each three Drams; Cinnamon, Cloves, and Nutmegs, each two Drams; of the Lesser Cardamoms and Cubebs, each one Dram; cut and bruise the Ingredients as they require; and, after infusing them for some time in twelve Pints of *French Brandy*, draw off the same Quantity by Distillation.

This differs from that of the former Dispensatory, in rejecting Liquorice-root and Raisins, which can have no Effect in Distillation; and in allowing a greater Proportion of Spirit, and more to be drawn off; the former being too much loaded with the oily Ingredients, to admit either of its being fine to the Eye, or grateful to the Stomach. *Quincy's Disp.*

If we consider the Wormwood and Gentian Waters as Stomachics, little can be expected from them; because the Materials they are drawn from, are not suited to send any thing over by Distillation, that comes within this Intention; so that if there be any thing good in them, we are more beholden to the Spirit than the other Ingredients for it. *Quincy's Praelect. Pharmac.*

The *Aqua Absinthii*, and *Angelica magis Composita*, are sufficiently uniform in their Intentions, but have too many of the oily Seeds to allow them to come over fine, especially the latter; but neither of them is much prescribed or made. *Idem*.

AQUA ANGELICÆ MAGIS COMPOSITA: Or, The greater Composition of Angelica Water.

Take of Angelica-root, and the Leaves of Carduus, each six Ounces; of Baum and Sage, each four Ounces; of Angelica-seeds, six Ounces; and of Sweet Fennil-seeds, nine Ounces. Let the dried Herbs and Seeds be grossly bruised; and to them add of Cinnamon, two Drams; of Cloves and Mace, each one Dram and an half; of Nutmegs, and the Lesser Cardamom-seeds, each one Dram; of Cubebs, and Galangal-root, each one Dram and an half; of *Jamaica* Pepper and Saffron, each one Dram. Infuse them in two Gallons of *French Brandy*, and draw off as much by Distillation.

This hath rejected the *Species Diamoschu Dulcis*, and the *Aromaticum Rosatum*, which were in the former; one of these Compositions being wholly expunged in the present Dispensatory, and in their room are added Spices more conveniently answering the same Intentions. But in this, the Carduus avails nothing; and the Sweet Fennel-seeds are in too great a Quantity, which will make the Water foul and milky. The last Runnings of all the foregoing Waters are worth keeping separate for carminative Juleps, and such-like Intentions. *Quincy's Dispensat.*

AQUA BRYONIAE COMPOSITA: Or, Compound Bryony Water.

Take of the Juice of Bryony-roots, four Pints; of the Juice of Rue and Mugwort, each two Pints; of the Leaves of Savine, three Handfuls; Motherwort, Catmint, and Pennyroyal, each two Handfuls; of Basil and Dittany, each one Handful and an half; of fresh outer Peel of Oranges, four Ounces; of Myrrh, two Ounces; of *Russia* Castor, one Ounce; Spirit of Wine, eight Pints. Distil as usual after proper Maceration; for the longer things of this Kind infuse together, the better is the Water.

This is much prescribed in Hysterical Cases, and is very forcing upon the Uterus, which makes it given to promote Delivery, and forward the proper Cleanings afterwards; as also to open Menstrual Obstructions, and abundance of Female Complaints. It is likewise good against Convulsions in Children, and of Service in any nervous Complaint in either Sex: Its Dose is from two Drams to two Ounces, with any convenient Diluter. *Quincy's Dispensat.*

The *Aqua Bryoniae Composita* takes in some of the most efficacious of the foetid Simples, and seems admirably well contrived for the Intention of an Hysteric, so far as their Virtues are procurable this way; but they who would have it good, must expect it very foul and milky; for where it is otherwise, it hath been defrauded of its due Quantity of the best Ingredients, or their better Parts have been precipitated with Alum, or taken out by the Filre. *Quincy's Praelect. Pharmac.*

AQU

AQUA FLORUM CHAMÆMELI COMPOSITA: Or, *Compound Chamomile-flower Water.*

Take of dried Chamomile-flowers, one Pound; of the outer Peel of Oranges, two Ounces; of the Leaves of common Wormwood and Pennyroyal, each two Handfuls; of the Seeds of Anise, Cumin and Sweet Fennel, of the Berries of Bay, and Juniper, each one Ounce; infuse them in one Gallon of *French Brandy*, and draw off double that Quantity by Distillation.

This Water is a Carminative, and in that Intention may be used at Discretion. *Quincy.*

AQUA CINNAMOMI FORTIS: Or, *Strong Cinnamon Water.*

Take one Pound of Cinnamon grossly powdered, and one Gallon of *French Brandy*; draw off by Distillation ten Pints.

AQUA EPIDEMICA: Or, *Plague Water.*

Take of the Leaves of Celandine, Rosemary, Rue, Sage, *Roman* Wormwood, Dragon, Agrimony, Baum, Scordium, the Lesser Centaury, Carduus, Betony, and Mint, each two Handfuls; of dried Angelica-root, Zedoary, and Gentian, each one Ounce; of the *Virginia* Snake-root, half an Ounce; let them be infused in one Gallon of *French Brandy*, and draw off ten Pints by Distillation.

This very much differs from that of the old Dispensatory; and, besides the Addition of many new Herbs, leaves out the Masterwort, Piony, and Butterbur-roots, inasmuch that the Intention of the Medicine seems changed from an Alexipharmic into a Cardiac. It is taken from *Shipton's* Additions to the former Dispensatory; and is not, by many, so much esteemed as the former Plague Water, several Ingredients of most Efficacy there being here neglected, and many in this either useless or foreign to the Intentions. *Quincy's Dispensat.*

AQUA GENTIANÆ COMPOSITA: Or, *Compound Gentian Water.*

Take Gentian sliced, one Pound and an half; of the Leaves and Flowers of the Lesser Centaury, each four Ounces; infuse them in six Pints of *French Brandy*, and distil about half that Quantity.

This Water is frequently prescribed as a Stomachic, and is commended for a Deterger, and is said to do Service in Dropsies, the Jaundice, and any Obstructions of the Viscera; and is given from two Drams to two or three Ounces at a Dose. But, in Truth, these Ingredients give so little that will rise in Vapour, that the Spirit comes over but with a very small Alteration; so that they who are fond of the Virtues as they stand recommended in those Ingredients, must look for them in the Extract, or never put them into the Still; and that is easily made by straining and evaporating the Residuum, and is much used in the Shops, chiefly with Stomachics, and Deobstruents, when prescribed to be made in Pills. *Salmon*, in his Notes upon this Water, says, it is a Preservative in pestilential Seasons, excellent against the Rickets, helps Stitches in the Side, and provokes the Terms and After-birth; and, with equal Reason and Consistency, that wretched Scribbler might have said it cured Corns, broken Bones, and Apoplexies. *Quincy's Dispensat.*

AQUA IMPERIALIS: Or, *Imperial Water.*

Take of dried Citron Peels, of Nutmegs, Cloves, and Cinnamon, each two Ounces; Roots of Cyperus, *Florentine* Orris, and Calamus Aromaticus, each one Ounce; of Zedoary, Galangal, and Ginger, each half an Ounce; of the Tops of Lavender and Rosemary, each two Handfuls; of the Leaves of Bay, Marjoram, Baum, Mint, Sage, and Thyme, each one Handful; of the Flowers of white and red Roses, each half an Handful; Damask Rose-water, four Pints; of *French Brandy*, one Gallon; then distil off ten Pints.

This is a very good cephalic Water, and makes a very convenient Julep in any nervous Cases whatsoever; and though it is so much slighted in the present Practice, this may be said of it, which can be said of few besides in the Dispensatory, that all the Ingredients coincide in one Intention, and such as will part with their Virtues by Distillation. It may be given from two Drams to two Ounces in any convenient Vehicle; it is also a pleasant Cordial Dram alone, and very good upon any sudden Sickness of the Stomach. *Quincy's Dispensat.*

AQU

AQUA LACTIS ALEXITERIA: Or, *Alexiterial Milk Water.* See ALEXITERIA.

AQUA LIMACUM TENUIS: Or, *A small Snail Water.*

Take of the Leaves of Baum, Mint, Harts-tongue, and Ground-ivy, of the Flowers of Archangel, Mallows, and Elder, each one Handful; of Snails washed, and the White of Eggs, each four Ounces; of Nutmegs, half an Ounce; and of Cow's Milk, one Gallon; distil according to Art, either in Balneo Mariæ, or in a Sand-heat.

If this be drawn with six Pints of Cow's Milk, and two Pints of Canary, it is styled *The stronger Snail Water.*

AQUA MIRABILIS: Or, *The wonderful Water.*

Take of Cloves, Galangals, Cubebs, Mace, the Lesser Cardamoms, Nutmegs and Ginger, each one Dram; Juice of the Greater Celandine, half a Pint; *French Brandy*, two Pints and an half; and draw off the same Quantity by Distillation.

This is a pleasant and good Cordial, and greatly breaks the Wind off the Stomach, and disperses Flatulencies. *Quincy's Dispensat.*

AQUA NEPHRITICA: Or, *A Water against the Stone.*

Take of the best Flowers of White-thorn, four Pounds; of Nutmegs bruised, three Ounces; infuse them together in a close Vessel with two Gallons of generous White-wine, and draw off by Distillation twelve Pints.

This was much prescribed by the late Dr. *Radcliffe*, but was not in the former Dispensatory.

AQUA PÆONIÆ COMPOSITA: Or, *Compound Piony Water.*

Take Lily of the Valley Flowers fresh gathered, one Pound; and infuse them in two Gallons and an half of *French Brandy*; and to the same put of Lime-flowers, half a Pound; of Piony, four Ounces; of the Male Piony-root, two Ounces and an half; white Dittany, and long Birthwort, of each half an Ounce; of Mistletoe of the Oak, and Rue, each two Handfuls; of Piony-seeds husk'd, ten Drams; and of the Seeds of Rue, three Drams and an half; of *Russia* Castor, Cubebs, and Mace, each two Drams; of Cinnamon, an Ounce and an half; of Rosemary-flowers, six Pugils; of Stoechas, and Lavender-flowers, each four Pugils; of Betony, Clove, and Cowslip-flowers, each eight Pugils; of the Juice of black-Cherries, four Pints; and from the Whole draw off by Distillation four Gallons.

The present College Dispensatory hath left out some of the insignificant Ingredients that were in the former, and particularly the Squills; and avoided also the Trouble of a double Distillation, which was altogether needless. This is the same as was originally inserted by the College in their first Dispensatory, under the Title of *Aqua Antiepileptica Langii*. The Quantities also of some of the Ingredients are blameable, as three Drams and an half of Seeds of Rue, when the Whole might be taken in Substance at one Dose, without any visible Effect. It has some Ingredients in it of little or no Efficacy to the main Purpose, and others entirely unfit for this Form; of the first are the Radix Dictamni Albi, and Aristolochiæ Longæ, neither of which will send any thing considerable over the Helm. The Semina Pæoniæ, and Viscus Quercinus likewise, howsoever agreeable they may be to this Intention in other Forms, will not send out any thing of that Kind by Distillation. The Seeds will make well enough into an Emulsion when husk'd, and the Mistletoe is best reduced into a Powder; but husking the Seeds to be distill'd, were they proper for it, is a Circumstance very trifling. The Castor is in this increased in its Quantity to what it was before; but although it may be the most considerable Ingredient in the Whole for the main Intention, yet the more it sends over the Helm, the more will it deform the Water with a Milkiness, and disagreeable Scent; and therefore 'tis much better contrived into other Forms, tho' in the Quantity it now stands here, it is too little to do much Harm in this respect; so that this Water, in the main, is pleasant enough, and now obtains in common Prescription beyond any of the same Rank. *Quincy's Pract. Pharmac.*

It is an excellent Cordial, and can be exceeded by nothing in all nervous Cases, both in Children and grown Persons. It may be diluted into a Julep with Black-cherry Water, or any such Vehicle, and may be given from one Dram to three, to Children, and from half an Ounce to two Ounces to grown Persons;

Persons; and, if the Case requires it, may be repeated every six or eight Hours. But Cases of Moment are not trusted to such Helps as this alone. *Quincey's Dispensat.*

AQUA PROTHERIACALIS: Or, *A Succedaneum for the Treacle Water.*

Take of the Leaves of Scordium, Scabious, Carduus, and Goats-rue, each two Handfuls; of Citron-peel, and Orange-peel dried, each half an Ounce; Seeds of Citrons, Hartwort, and Treacle-mustard, each one Ounce; of the Flowers of Marigolds and Rosemary, each one Handful; Cinnamon, two Drams; of French Brandy, two Pints; and distil off six Pints.

The Carduus Seeds, and the Carduus Water, are in this omitted as insignificant, the rest continuing much as before. It is designed to be used as Treacle Water when that proves deficient, in a Season not fit to make it. *Quincey.*

AQUA RAPHANI COMPOSITA: Or, *Compound Horse-radish Water.*

Take of the Leaves of both Scurvy-grasses, fresh gathered in the Spring, each six Pounds; bruise them, and press out the Juice; and to it add the Juices of Brook-lime and Water-creffles, each one Pint and an half; of Horse-radish-root, two Pounds; of Arum-root, fresh, six Ounces; of Winter's-bark, and Nutmegs, each four Ounces; of Lemon-peels dried, two Ounces; of French Brandy, four Pints; and draw off by Distillation eight Pints.

In this is rejected the Briony-root, which is ordered in a large Quantity in the old College Dispensatory, but renders the Flavour of the Water nauseous, and gives no Virtues suitable to the main Intention of the Whole. The Arum-root is likewise in this increased in its Quantity, but half an Ounce, being ordered in the former, whereby the Medicine is rendered yet more pungent, and efficacious as an Antiscorbutic, or a Nephritic, both which Purposes 'tis calculated for. All the Ingredients in this Water, are of a subtle penetrating Nature, and greatly abound with volatile Salts, which, in many gross and fizy Constitutions of the Blood, do great Service by dividing it, and rendering it more fluid, which will increase the Discharges by the Kidneys, and likewise wash through any Obstructions in those Parts. In all Obstructions of the other *Viscera*, it is also an excellent Medicine, and prevails against the Jaundice, Cachexies, and Dropsies; and, in scorbutic Cases, there is nothing beyond it; as it greatly forces those minute Passages, promotes Transpiration; and cleanses the Skin, and other small Glands, which entertain gross Particles to the Detriment of their proper Offices. It may be given from half an Ounce to three or four Ounces, unless immediately after Distillation, because then it is so pungent as makes it difficult to take without much diluting. This Water ought to be drawn with the Receiver fixed close to the Worm by a Bladder, otherwise a great deal of the best Part will fly away. *Quincey's Dispensat.*

The *Aqua Raphani Composita* aims at the Intention of a Diuretic; and will, if good, be as foul and milky as the compound Bryony Water, when rightly prepared. *Quincey's Praelect. Pharmac.*

AQUA DOCTORIS STEPHANI: Or, *Doctor Stephen's Water.*

Take of Cinnamon, Ginger, Galangals, Cloves, Nutmegs, Grains of Paradise, of the Seeds of Anise, Sweet Fennel, and Caraway, each one Dram; of the Leaves of Thyme, Mother of Thyme, Mint, Sage, Pennyroyal, Rosemary, Flowers of red Roses, Chamomile, Origanum, and Lavender, each one Handful; of French Brandy, six Pints; and draw off one Gallon by Distillation.

All the Ingredients in this Water are well suited to the main Intention of a Cephalic, a Cordial, or Carminative; it is likewise somewhat Antihysterical, and therefore frequently used by the Midwives amongst their Women. It is much prescribed from two Drams to two Ounces.

AQUA THERIACALIS: Or, *Treacle Water.*

Take of the Juice of green Walnuts, four Pints; of the Juice of Rue, three Pints; of Carduus and Baum, each two Pints; of the fresh gather'd Butterbur-roots, one Pound and an half; of Burdock, one Pound; of Angelica, and Mafterwort, each half a Pound; of green Scordium, four Handfuls; of old Venice Treacle, and Mithridate, each eight Ounces; of Lemon-juice, two Pints; of French Brandy, one Gallon and an half; draw off by Distillation three Gallons and an half, and then add four Pints of distill'd Vinegar.

VOL. I.

The new Dispensatory omits the needless Circumstance in the former, of depurating the Lemon-juice before Distillation, and very prudently adds the distill'd Vinegar afterwards, instead of putting it into the Still, because with such Management it effectually answers all its Intentions, and risques less Hazard of carrying along with the Medicine any Part of the Metal with which the Alembic is made, as all Acids are subject to do. This Water is the most used of any in the Shops, though its Composition be blamed by many; for the Juices can contribute very little to its Virtues; and upon account of the proper Season to obtain them, this Water cannot be made at all times, how much soever wanted; unless, as some do, the Juices are express'd in their Season, and kept on Purpose; but then they are good for nothing; for so little as is of a volatile Nature in these Simples, will very soon be lost. The rest of the Ingredients indeed agree very well to the main Intention of an Alexipharmic and Sudorific; and the Acids contribute much to that Purpose.

The Dose of this Water is usually to grown Persons from half an Ounce to one Ounce, which is too little; for four Ounces is but a moderate Quantity to have any Reliance upon, especially to Persons who are used to high living. *Quincey's Dispensat.*

It is of great Importance in Composition to adapt the Ingredients made use of to Forms in which their Medicinal Virtues may be procured and preserved. But nothing is more idle than to study the Elegance and Beauty of Medicines, because they are not calculated to please the Eye or Palate, but to cure Distempers. Besides, all our Endeavours to render Remedies palatable are fruitless, because the very Name of a Medicine, with most People, conveys an Idea of something nauseous.

As to the Form of Spirituous Waters, they do not seem in the least calculated for the Removal of any Distemper, though they may sometimes relieve Symptoms. If what has been said under the Article ALCOHOL, with respect to Spirits procured by Fermentation, be duly considered, perhaps others will, like me, think, that spirituous Waters can seldom be taken in Quantities sufficient to do any considerable Service by the Ingredients wherewith they are impregnated, without doing a Mischief more than equivalent by their noxious Spirit.

In several of the Compound Waters mentioned above, much more is directed to be drawn off, than is put of the Spirit to the Ingredients. In these Cases therefore, the Compounder must take care to put into the Still Water sufficient to admit of the Quantities directed to be drawn off.

Because there are many of the foreign Writers in Physic, who make mention of the *Aqua Anhaltina*, and of the *Aqua Sclopetaria*, which last is usually known by the Name of *Eau d'Arquebuse*, I shall in this Place specify the Manner of their Preparation. And to these I shall add a Snail Water, somewhat different from that of the College, on account of its singular Excellence.

AQUA ANHALTINA.

Take of the best Turpentine, half a Pound; of Olibanum, one Ounce; Wood of Aloes reduced to Powder, three Drams; Grains of Mastich, Clove-gilly-flowers, or Rosemary-flowers, Nutmegs, Cubebs, or Galangals, Cinnamon, each six Drams; Saffron two Drams and an half; Fennel-seeds, and Bay-berries, each half a Dram. Reduce all to a Powder, and digest in five Pounds of Spirit of Wine for six Days, adding fifteen Grains of Musk tied up in a little Bag. Then distil in a slow *Balneum Mariae*; separate what is clear from what is turbid.

N. B. 'Tis better to put the Musk in the Beak of the Alembic.

This Water warms, dries, dissolves, strengthens the Heart, Stomach, and other Viscera; for this Reason it is thought good in Faintings and Deliquiums. But it is more frequently used externally, and said to be of great Service in Catarrhs, and Pains arising from a cold Cause, in the Wandering Gout, as 'tis call'd, in Palsies, Epilepsies, Apoplexies, Vertigos, Tremors, and Lethargies, by rubbing the affected Part well with it. *Schroderi Pharmacopœia Medico-chymica.*

AQUA SELOPETARIA, sive VULNERARIA: The *Vulnerary Water*, commonly call'd *Eau d'Arquebuse*.

Take of the Leaves and Roots of Comfrey, of the Leaves of Sage, of Mugwort, and of Bugle, each four Handfuls; of the Leaves of Betony, Sanicle, Ox-eye, of Daisy, of the greater Figwort, of Plantain, of Agrimony, Vervain, Wormwood, and Fennel, each two Handfuls; of St. John's-wort, of long Birthwort, of Orpine, of Paul's Betony, of the lesser Centaury, of Yarrow, of Tobacco, of Mouse-ear, of Mint, and of Hyssop, each one Handful: Cut all these, and bruise them sufficiently in a Mor-

tar; then put them into a large Earthen Vessel, and pour twenty Pounds of White-wine upon them. Stir the Whole with a Stick, stop the Vessel, and allow it to digest in a warm Dung-hill, or any other such Heat, for the Space of three Days. Then pour it over into a large Copper Cucurbit, whose Inside is covered with Tin; and, having adapted its Head and Refrigeratory to it, draw off the Moisture into a Receiver, by a moderate Fire, in the ordinary manner. Thus you will have the Vulnerary Water, or *Eau d'Arquebusade*, which must be preserved in a close-stopt Bottle.

It is good for Contusions, and Dislocations, and very proper for discussing Tumors; apply'd externally, it deterges Wounds, and old Ulcers. It incarns, corroborates, resists Putrefaction, stops Gangrenes, and is by some used against Vapours.

That the Nature, the Uses, and Virtues of this Water may be the better understood, I shall subjoin a short Account of the Qualities of each of its Ingredients.

As for the Water itself, its very Names are expressive of its Virtues; for the Word *Vulnerary* imports its being proper for curing Wounds. And the French Word *Arquebusade* implies its being particularly proper in Gun-shot Wounds.

1. COMFREY then, or the *greater Consoud*, is glutinous, and proper to consolidate the Lips of Wounds; hence it receives its Latin Name CONSOLIDA. It stops Hæmorrhages and Fluxes, and contains little Salt, but a great deal of Oil and Phlegm.

2. SAGE is, by way of Eminence, called *Salvia*, because in a great many Disorders it is thought to save and preserve Life. Of this Herb there are two Species, the Wild and Garden Sage; of this latter Species there are two Kinds, the large and the small. The small Kind is the best, and must be used in preparing the Vulnerary Water. It contains a great deal of Salt; and an Oil exalted into a Spirit. It has few passive Principles, and is cephalic, nervous, antihysterical, stomachic, and aperient.

3. MUGWORT contains a great deal of Salt, little Oil, and Phlegm; and is antihysterical, aperient, and vulnerary.

4. BUGLE, or *Middle Consoud*, contains a considerable Quantity of Salt and Oil, and a great many passive Principles. It is vulnerary, corroborative, and proper in Disorders of the Lungs.

5. BETONY contains an exalted Oil, and an essential or volatile Salt, but little fixed Salt, Phlegm, and Earth; and is cephalic, cordial, and vulnerary.

6. SANICLE contains a considerable Quantity of Salt and Oil, a great deal of Phlegm, and little Earth. It is astringent, consolidating, vulnerary, proper in *Hernia*, used both internally and externally.

7. OX-EYE contains a great deal of Oil and Phlegm, and a considerable Quantity of Salt. It is vulnerary, and prescrib'd for the *King's-evil*.

8. THE SMALLER DAISY, or *Bellis Minor*, contains little Salt and Earth, but a great deal of Oil and Phlegm. It is used for stopping Hæmorrhages, consolidating Wounds, discussing Tumors, and carrying off Inflammations of the Eyes.

9. *Scrophularia Major*, or the GREATER FIGWORT, contains a great deal of Salt and Oil, a considerable Quantity of Phlegm and Earth, and is apply'd for discussing scrophulous Tumors, which its Root resembles. It is also used to soften Hardnesses, to deterge Wounds, and old Ulcers.

10. PLANTAIN contains an Oil, a little Salt, but a great deal of Earth and Phlegm. Its Salt, which is acid, being mixed with its Oil, and with a great many passive Principles, is almost entirely absorb'd by them; for this Reason the Plant is only slightly deterfive, but it is astringent and refreshing, on account of its Earth and Phlegm. It is used in Fluxes of all Sorts, in Hæmorrhages, and Inflammations of the Eyes.

11. AGRIMONY, or *Eupatorium*, contains a considerable Quantity of Salt and Oil. Its active Principles are mixed with a great deal of Earth, and a little Phlegm; for which Reason it is deterfive and astringent with regard to the Forces, but aperient with regard to the Urine. It is thought good for Disorders of the Liver, and stops Fluxes.

12. VERVAIN contains a considerable Quantity of Salt and Oil, and is cephalic, vulnerary, or desiccative. It is used for Disorders of the Breast, for the Stone and Dysentery, for generating Milk in Nurses, and for the Pleurisy. It is both administered internally, and apply'd externally.

13. *Abinthium*, or WORMWOOD, contains a sulphureous Spirit, or rather an exalted Oil, in which its Smell consists. It has also great Store of Salt, but little Phlegm. It kills Worms, and corroborates the Stomach. It is vulnerary, aperient, and antihysterical.

14. *Feniculum*, or FENNEL, contains a great deal of Salt, and Oil half exalted to what we call Spirit; it also contains a considerable Quantity of Earth and Phlegm. Its Seeds, the largest and best nourish'd, come from Florence, are very much used in Medicine; they dispel Wind, and are antihysterical.

Its Root is aperient; and its Leaves are proper for deterging that Sanies which sometimes infects the Eyes, and accompanies Wounds.

15. The *Hypericum*, or ST. JOHN'S-WORT, contains a pretty large Quantity of Oil, Salt, and Earth, but little Phlegm. It is vulnerary, anti-hysterical, aperient, and nervous.

16. BIRTHWORT is called *Aristolochia*, on account of its being proper for bringing away the After-birth. There are four Species of it, the *round*, the *long*, the *small*, and that call'd the *Aristolochia Clematitis*; all of them contain a great deal of Oil and Salt, a considerable Quantity of Phlegm, but little Earth. They are vulnerary, deterfive, antihysterical, and proper to resist Gangrenes, attenuate Phlegm, and assist Respiration. The two first are apply'd externally; and the Roots of the two last are used in such Medicines as are design'd for internal Use.

17. *Telephium*, or ORPIN, contains a great deal of Phlegm and Oil, but little Salt and Earth. It is vulnerary, astringent, moistening, and consolidating. It is also proper for *Hernia*, Dysenteries, and deterging and wearing off Blemishes in the Skin.

18. *Veronica*, or PAUL'S BETONY, is of two Sorts, the Male and the Female: The Male is of two Sorts, one strait, and the other crooked, and creeping on the Ground. This last is most in Use, and must be made Choice of in preparing the vulnerary Water. All the Species of this Plant contain a great deal of Salt and Oil, and are of an inciding, attenuating, deterfive, vulnerary, and sudorific Quality; they are also proper for Ulcers of the Breast and Lungs, and for resisting Poison.

19. The *Centaurium Minus*, or LESSER CENTAURY, contains a great deal of Salt, a considerable Quantity of Oil and Earth, but little Phlegm. It is vulnerary, deterfive, drying, and aperient. It is proper for Scurvies, intermittent Fevers, Worms, Madness, Obstruction of the Menes, the Sciatica and Jaundice.

20. The *Millefolium*, or YARROW, contains a great deal of Salt and Oil, and is astringent, vulnerary, discutient, and proper to stop Fluxes, Hæmorrhages, and Gonorrhæas.

21. *Nicotiana*, or TOBACCO, is universally known to be narcotic and vulnerary. It is customary to bruise it, and apply it to Tumors, in order to discuss them, because it contains Spirits which attenuate the Matter, and open the Pores. It is also customary to infuse it in common Water for washing Tetters, and other Deformities of the Skin; but if the Water is too richly impregnated with it, it is subject to excite Vomiting. There is also a Syrup of it prepared for the Asthma. Decoctions of it are sometimes used by way of Clysters in Apoplexies, Lethargies, and uterine Suffocations. It contains a Sulphur, and a volatile Salt, so penetrating, that it is scarce sooner in the Stomach, than it stimulates its Fibres, and excites Vomiting. Its Oil is so strong an Emetic, that if a Person but holds his Nose a little above the Phial in which it is contain'd, he vomits. I myself once made a small Incision in the Skin of a Dog's Thigh; and upon putting a small Tent in it, which had been dipt in the Oil of Tobacco, the Animal was violently purged, and vomited almost immediately after.

22. The *Pilosella*, or MOUSE-EAR, contains a considerable Quantity of essential Salt and Oil, little Phlegm, but a great deal of Earth. It is astringent, vulnerary, incrassating, proper for *Hernia*, and for stopping Hæmorrhages, Dysenteries, and other Fluxes.

23. *Mentha*, or MINT, is either wild, or grows in Gardens. Both Sorts contain a great deal of exalted Oil, and volatile Salt, and but little Phlegm and Earth. Both Species corroborate the Stomach, assist Digestion, dispel Wind, cure the Colic, attenuate and dissolve Humours, and resist Gangrenes.

24. *Hyssopus*, or HYSSOP, contains a great deal of volatile Salt, and exalted Oil, and but little Phlegm and Earth. It is vulnerary, deterfive, and aperient. It is used in Disorders of the Breast and Lungs, such as the Asthma and Phtisis.

As the Vulnerary Water, or *Eau d'Arquebusade*, has so high Encomiums passed upon it by some foreign Physicians, and is at the same time so little known or heard of in our own Country, I have abridg'd Mr. Lemery's Remarks upon each of its Ingredients; that, knowing the Nature and Quality of every Simple apart, we might be the better able to form a true Estimate of the Compound resulting from their Conjunction and Preparation in the manner directed.

As in this Process most of the Plants subjected to Distillation are none of the most succulent, it is proper to add White-wine to them, since that Liquor excites a Fermentation, and serves to disengage the saline, sulphureous, and volatile Parts of the Ingredients.

Care must be taken, that the Fire be not too strong during the Distillation, lest the Matter should adhere to the Bottom of the Cucurbit, and the Water drawn off acquire, of course, an empyreumatic Smell. After half the Liquor is distill'd, it is proper to pour what remains in the Cucurbit upon a Linen Cloth, and to put it into a Press, in order to extract its Juice; after which it is to be return'd into the Cucurbit, and again subjected

AQU

subjected to Distillation. By this means the empyreumatic Smell of the Water may be prevented: But a *Balneum Vaporesum*, or a sufficiently large *Balneum Mariæ*, are still more to be trusted to in this Process.

If we dry and burn the gross Remains of these Herbs, make a Lixivium of their Ashes, draw the Salt from this Lixivium by Evaporation, and dissolve it in the distill'd Water, it will by that means become more deterfive and discutient, than it would otherwise have been. *Lemery. Cours. de Chymie.*

AQUA LIMACUM.

A Snail Water different from that of the Dispensatory.

Take a great Peck of Garden-snails, and wash them in a great deal of Beer, and make your Chimney very clean, and set a Bushel of Charcoal on Fire; and when they are thoroughly kindled, make a Hole in the Middle of the Fire, and put the Snails in, and scatter more Fire amongst them, and let them roast till they make a Noise; then take them out, and, with a Knife and coarse Cloth, pick and wipe away all the green Froth: Then break them, Shells and all, in a Stone Mortar.

Take also a Quart of Earth-worms, and scour them with Salt divers times over. Then take two Handfuls of Angelica, and lay them in the Bottom of the Still; next lay two Handfuls of Celandine; next a Quart of Rosemary-flowers; then two Handfuls of Bears-foot and Agrimony; then Fenugreek; then Turmeric; of each one Ounce: Red Dock-root, Bark of Barberry-trees, Wood-forrel, Betony, of each two Handfuls. Then lay the Snails and Worms on the Top of the Herbs; and then two Handfuls of Goose-dung; and two Handfuls of Sheep-dung. Then put in three Gallons of strong Ale, and place the Pot where you mean to set Fire under it: Let it stand all Night, or longer; in the Morning put in three Ounces of Cloves well beaten, and a small Quantity of Saffron, dry'd to Powder; then fix Ounces of Shavings of Hartshorn, which must be uppermost. Fix on the Head and Refrigeratory, and distil according to Art.

This Water is an excellent Restorative, very good when the Gout raises Flatulencies in the Stomach, and is said to be effectual in even obstinate Jaundices.

Medicated Waters from the College.

Aqua Aluminosa: ALUM WATER.

Take of red Rose and Plantain Water, each one Pint; of white Sublimate and Roch-alum, each two Drams: Let the Alum and Sublimate be rubb'd together, and be both boil'd with the Waters, in a Glass Vessel, having a narrow Neck, to the Consumption of half the Quantity; and after five Days, when the Fœces are settled, pour off the Clear for Use.

This is chiefly for external Uses, and most commonly comes under the Direction of a Surgeon, in Ulcers and cutaneous Eruptions. The Steam of the Alum-water, when boiling, is carefully to be avoided by the Operator, because it may have bad Effects from its poisonous Qualities. It was first prescrib'd by *Fallopious, Cap. 93. de Morbo Gallico.*

AQUA CALCHIS: Lime-Water.

Take one Pound of Quick-lime, and pour upon it twelve Pints of boiling Water: After the Ebullition ceases, and the Lime is settled to the Bottom, pour off the Clear for Use.

This is kept in Readiness for various Uses, both internal and external.

AQUA CAMPHORATA STYPTICA: Camphorated Styptic-Water.

Take of camphorated Vitriol, one Ounce; steep it in three Pints of Spring-water, and let it stand till the Fœces are fallen to the Bottom.

AQUA SAPPHIRINA: Sapphire-colour'd Water.

Take one Pint of Lime-water, of Sal Ammoniac one Dram and an half: Let them be dissolved together, and then stand in a Brass Basin till the Liquor becomes tinged of a Sapphire Colour.

This, by some, is greatly esteem'd for clearing the Eyes from Specks and Films, if two or three Drops be frequently instill'd into them

AQU

AQUA-FORTIS SIMPLEX: Single Aqua-fortis.

Take crude Vitriol, three Pounds; Nitre, two Pounds; beat and mix them well; Put the Mixture into an earthen Pot, call'd a long Neck; place it upon a Fire; fit it to a Receiver, which lute well with Clay, Sand, and cut Flax, wrought together: Give a Fire of the first Degree for three Hours; in that time there will come some red Fumes into the Receiver, which will again disappear; then raise the Fire to the second Degree, where keep it three Hours longer: Go on to the third and fourth, where keep it till the Receiver is free from Fumes. When all is cold, take the Receiver off carefully, and keep the Aqua-fortis for Use.

AQUA-FORTIS DUPLEX: Double Aqua-fortis.

Take Vitriol, calcin'd almost to a Redness, four Pounds; of Nitre two Pounds, both made into fine Powder, and well mix'd: Put the Mixture into an earthen long Neck, or Glass Retort luted; set it in a reverberatory Furnace; fit and lute on a Receiver to it: Kindle a Fire, and proceed exactly as in the *Aqua-fortis Simplex*.

AQUA REGIA.

Take equal Quantities of Nitre and Sal Ammoniac, and put them into a Retort, big enough to remain above two Thirds empty; place it in Sand, and raise under it a Fire of the second Degree, which keep up while any thing continues to come over.

Another AQUA REGIA.

Take of Sal Ammoniac four Ounces; put it in Powder into a Matrafs, or Glass Vessel of a good Bigness, and pour upon it sixteen Ounces of Spirit of Nitre: Place the Vessel in a warm Sand-digestion, till all the Sal Ammoniac is dissolv'd; then pour it into a Bottle, and keep it stopp'd with Wax, or a Glass Stopple.

This is honour'd with the Appellation of *Aqua Regia*, because it will dissolve Gold, the Chymists *King of Metals*; but it is of no other Use in Medicine, than as a Menstruum in some Preparations.

There are many more Prescriptions for *Aqua Regia* in Chymical Writers, all which consist of an Union of Spirit of Nitre with Spirit of Sea-salt.

AQUEDUCTUS, ὑδραγωγός, properly signifies a Pipe or Canal to convey Water; but is metaphorically applied to a Sort of bony Canal in the *Os Petrosum*, which is otherwise call'd the *Meatus Cæcus*, *Cochlearis*, and *Capreolaris*.

AQUALA. Arsenic, or Sulphur. *Johnson.*

AQUALICULUS, ἐπίσπερον, ἐρίσπερον, properly signifies that Part of the Belly which reaches from the Navel to the Pubes. It sometimes is used to express the Stomach, or intestinal Tube.

AQUARIUS. Iron. *Rulandus. Johnson.*

AQUASTER, in *Paracelsus, Lib. 1. de Vita longa, C. 3.* is a sort of Vision, which represents something to our Sight which has no real Existence, but only in Appearance.

AQUATUM, **AQUEUM**, ὑδατῆς, from ὕδωρ, Water. Watry, diluted. In *Scribonius Largus, N° 42. 26.* we meet with *Aquatior* and *Aquatissimus*. It signifies also the *Chalaxia* of an Egg.

AQUEUS HUMOR OCULI. The aqueous Humour of the Eye. See **OCULUS**.

AQUIDUCUS, ὑδραγωγός. The same as **HYDRAGOGOS**, which see. The Term **AQUIDUCUS** is found in *Cælius Aurelianus, De Traët. Passion. Lib. 3. Cap. 3.*

AQUIFOLIUM. The same as **AGRIFOLIUM**, which see.

AQUILA, *Offic. Mer. Pin. 170. Aquila fulva sive auria*, *Will. Ornith. 26. Rari Ornith. 58. Ejusd. Synop. A. 6. Chryseatos, Aldrov. Ornith. 1. 110. Charlt. Exer. 70. Jons. de Avib. 2. Aquila Germana, Gesn. de Avib. 149. Aquila Regalis, Schw. A. 214. Aigle Royal, Bellon. des Oyse, 89. THE GOLDEN EAGLE.*

The Gall and Dung are the Parts used in Medicine: The Gall, distill'd with Oil of Violets, is recommended by *Avicenna* for Pains and Ringings in the Ears; and the Dung against Abortions. *Dale.*

AQUILÆ, ἀἰσολί, are Veins so call'd first by *Philisius*, which ascend through the Temples into the Head, according to *Ruffus Ephesius*.

Aquila bears various Significations in Chymistry; it is the *Spirit of Mercury*; and Sal Armoniac passes under that Name, because of its Levity in Sublimation; and *Paracelsus* would have *Aquila* often taken for *Mercurius Præcipitatus*. It also signifies Arsenic, Sulphur, the Philosopher's Stone, &c. *Rulandus. Johnson.*

Aquila Philosophorum is the *Mercurius Metallorum*, reduced into its first Matter. *Rulandus.*

Aquila

Aquila Alba is *Mercurius Dulcis*; also the Substance which is prepar'd of Sal Armoniac and common Sublimate: Moreover; it is that spiritual and crystalline Sublimate, in the Composition of the Philosopher's Stone; whose Glue is the true Mercurial Water.

Aquila Lacrymæ is the Liquor prepar'd from the said Salt; sometimes in its fix'd, sometimes in its volatile State.

Aquila Cælestis is the Panacea, or Cure for all Diseases, prepar'd of Mercury essentiated.

Aquila Nigra is the Spirit of that venomous Cadmia call'd Cobalt, which some take to be the Matter of the Philosopher's Mercury.

Aquila Veneris consists of Crocus, made of Verdegrise in a Reverberatory, and join'd with Sal Ammoniac, seven times sublimated.

Aquila has many other Epithets bestow'd on it by these sort of Authors, as *Rubra*, *Salutifera*, *Vitriolata*, *Expansa*, *Fixa*, *Hæmatica*, *Præcipitata*, *Volans*, &c.

AQUILEGIA, Offic. *Aquilegia cærulea*, Ger. 935. Emac. 1093. Mer. Pin. 9. *Aquilegia sylvestris*, C. B. Pin. 144. Tournef. Inf. 428. Elem. Bot. 340. Dill. Cat. Giff. 82. Rupp. Flor. Jen. 131. *Aquilegia sylvestris flore simplici*, Buxb. 25. *Aquilegia flore simplici*, J. B. 3. 484. Raii Hist. 1. 706. Synop. 3. 273. *Aquilegia*, Chab. *Aquilegia vulgaris flore simplici*, Park. Theat. 1367. *Aquilegia flore cæruleo*, Merc. Bot. 2. 16. Phyt. Brit. 9. **COLUMBINES**. Dale.

The Root of this Plant is pretty thick, at the Head sending forth many long and large Fibres, which run pretty deep into the Earth. The Leaves grow upon long Foot-stalks, compos'd of a three-fold Division of as many roundish Segments, cut in, and indented about the Edges, of a bluish-green Colour: The Stalks arise to be a Foot and a half or two Foot high, somewhat hairy, slender, and of a purplish Colour, pretty much branch'd, and having several smaller Leaves set on, without Foot-stalks at each Division of the Branches. The Flowers are pendulous, of a fine blue Colour, each consisting of five plain, and five horned and hooded Petals, or Leaves, placed alternately, the Ends of the horned ones being crooked. When the Flowers are fallen, they are succeeded each by four or five longish taper Horns or Pods, set round about the Stalk, containing black shining Seed. Columbines grow wild in several Parts of England; but are not very common, and flower in May and June.

This Herb is also call'd *Leonis Officulum*; but receives the Name of *Aquilegia*, because its Leaves, not as yet fully expanded, collect and gather a great deal of Rain-water. This Herb may also justly be call'd *Theriaca*, on account of its remarkable Efficacy in curing malignant and virulent Disorders. It is well known in Flower-gardens, on account of its Flower, which resembles King's Consound, and lasts throughout the whole Summer. When its Leaves first begin to appear, it resembles the greater Celandine; and for this Reason it is also call'd *Chelidonia Sylvestris*. Its Flowers are of different Colours, some blue, some purple, some white, and some of them are indented. The blue is only used in Apothecaries Shops, where the Seed, the Flower, and the Herb, are all employ'd. It is moderately drying, opening, and healing. It purifies the Blood, and removes Obstructions of the Liver and Spleen. It dissipates the Bile, and is of singular Efficacy in curing the Jaundice. A Powder or Emulsion of its Seeds, as also its distill'd Water, are of great Service in the Jaundice; in which Case its Extract may also be used with great Success. *Hornung. Cist. Med. P. 6.* See also *Jo. Lang. Epist. Med. L. 3. C. 6. B. Tim. Epist. & Conf. Med. P. M. 461. Joh. Camerar. Hort. Med. P. 19. Jo. Johnston Syntagma, Med. Pract. L. 5. Tit. 6. C. 2. Artic. 6. Hieron. Braunschweig. Thesaur. Pauperum.* It removes the Scurvy; promotes a Discharge of Urine, and the monthly Evacuations of Women; cures a beginning Dropsy; is excellent for the Breast and Lungs; resists all kinds of Poisons; cures Wounds, and removes Pains of the Belly and Matrix. Mothers ordinarily use its Seeds for their Children, when they have the Measles or Small-pox, by tying them up in a Piece of Linen Cloth, and steeping them among Beer. *Simon Pauli (Quadr. Botan. Class. 2.)* says, that he has given half a Dram of its Seed, with the Water of *Carduus Benedictus*, to poor Peoples Children in the Small-pox, and that by its means their Lives have been preserved. For this Purpose, People ordinarily make, of this Seed, Mustard-seed, Water-creffes, and Melons, an Emulsion, with Fumitory-water, Carduus-water, Viper-grass-water, that of Columbine-flowers and Fennel. It is used with Success in malignant Disorders, and even in the Plague. It is also by some extoll'd as a Specific in the Scurvy. *Jo. Michael. Not. in Schrod. Pharm. Clusius* recommends a Quarter of an Ounce of this Seed, reduced to a Powder, and taken in Wine, in difficult and tedious Labours. It is also an excellent Remedy against a Vertigo, (*Fr. Hoffman. Meth. Med. L. 1. C. 29. Paulin. Obs. Med. Phys. 95. Cent. 3. & Obs. 64. Cent. 4.*) and against the Sciatica and Epilepsy, taken in black Cherry-water. It is also commended in hyfteric Disorders. The Seed, reduced to a Powder, may be given to costive Children. The Root,

reduced to a Powder, and applied in Form of a Plaister to the Ears, removes Pains and Noises in them; and if there are Worms in them, kills them. *Camerar. in Hort.* says, that in Spain, in order to prevent a Stone in the Kidneys, People, when they rise out of Bed, take a Piece of the Root in their Mouths, and chew it by little and little. The Flowers have a cordial Quality, and may be taken as the other cordial Flowers. Many make cordial Syrups, Conserve, and Tinctures of them. They are also good in malignant Fevers, Small-pox, and Measles. Its Syrup is excellent in Disorders of the Throat, such as the Quinsley, and in those of the Breast. It is externally used in Scurvies of the Mouth, with the Addition of a little sweet Spirit of Salt. Some also make a Vinegar of its Flowers.

AQUILENA. The *Consolida Regalis*, or Lark-spur. *Johns.*

AQUOSA URINA, is crude watry Urine.

AQUOSUS HYDROPS. See ASCITES.

AQUULA. See HYDATIS.

ARA PARVA, *Βαυὸς μικρὸς*. A little Altar. A neat way of Filleting and Bandage, which, when fix'd, represents the Corners of an Altar: It was invented by *Sostratus*, and mention'd by *Galen de Fasciis*.

ARABE, *αἰθρῆ*, in *Hippocrates*, is expounded by *Erotian* ἰσχυρὰ, Hurt or Injury.

ARABICUS LAPIS. The Arabian Stone: It is like Ivory, blemish'd with Spots.

Being levigated, and applied in a Cataplasm, it dries up the Hemorrhoids; and, when it is calcin'd, is used as a Dentifrice. *Dioscorides, Lib. 5. Cap. 149.*

The *Lapis Arabicus* is like Ivory, drying, and astringent. *Oribasius, Med. Coll. Lib. 15. P. Eginet. Lib. 7.*

ARABIS MALAGMA, *ad Strumas & Phymata*. The Arabian's Malagma for stumous Swellings, and Tubercles call'd *Phymata*.

Take of Myrrh, Sal Ammoniac, Frankincense, liquid and dry Rosin, Crocomagma, Wax, each one Dram two Grains and an half; of the Stone call'd *Pyrites*, four Drams ten Grains; to which some add of Sulphur two Drams five Grains. *Celsus, Lib. 5. Cap. 18.*

ARABICA ANTIDOTUS, *Hepatica*. The Arabian Antidote for the Liver.

Take of Myrrh, four Drams ten Grains; Costus, one Dram two Grains and an half; white Pepper, Indian Leaf, each four Drams ten Grains; bruise them, and sift them, and give them in Mulfum: With this Antidote a Decoction of Abrotanum, in Water, should be drank; or some dry'd Figs, with their Weight in Honey, be eaten. *Myresus, Sect. 1. Cap. 265.*

ARABICUM GUMMI. *Gum Arabic*. See ACACIA and GUMMI. It may be proper to observe here, that the antient Physicians, by *ἀραβικὴ*, "Gum," put indefinitely, that is, alone, without any Word to restrain its Signification, mean *Gum Arabic*.

ARABIS. The same as *DRABA*, which see.

ARACA GUAM. A Species of the Goavo-tree, according to *Piso*. See *GUAYAVA*. *Raii Hist. Plant.*

ARACA MIRL. *Pison. Margrav.* A Shrub growing plentifully in *Brasil*, and bearing ripe Fruit in *March* and *September*, which has the sweetish Taste of Musk, and somewhat of the Savour of Strawberries: This, when candy'd and preserv'd, is a pleasant Cooler, Astringent, and Strengtheners, and supplies the Place of Marmalade of Quinces, Conserve of Roses, and the like.

Of the Leaves and Buds they prepare a very good Bath for internal as well as external Affections of the Body; for they are astringent; but especially the Root, which also cures the Dysentery, and is peculiarly diuretic, and of fine Parts. *Raii Hist. Plant.*

ARACHYDNA aut **ARACOIDES**, *Honorii Belli*. J. B. *Vicia similis supra infraque Terram Fructum ferens*, C. B. *An Theophrasti Araco ὄνον*, Clus. *Arachidna Cretica*, Park.

This is one of the four leguminous Plants, mention'd by *Ray*, that bear Fruit as well above as under Ground. The other three are,

Arachis sub Terra Siliquisera Lusitanica, Park.

Arachis, ὀπύριον, Americana, Park. *Mundubi Brasiliensis*, *Marogr.*

Legumen Trifolium sub Terra Fructum edens. Mundubi de Angola, *Marogr.*

Besides these, there is describ'd in the *Memoires de l'Acad. Roy.* for 1723. another Species under the Title of

ARACHIDNOIDES AMERICANA. Or, *Arachidna Quadrifolia villosa Flore lutea*, Nov. Plant. Americ. Gen. Plum. 49. *Pistache du Tertre*, 2. 121. *Manobi*, Labat. 4-59.

All the Difference between this and the former *Arachidna* is, that this last-mention'd, as in the Synonyma, bears Cods under Ground, which hang to the Fibres of the Root.

ARACHNE,

ARACHNE, ἀράχνη, a Spider. The same as **ARANEUS**, which see.

ARACHNOIDES, ἀράχνοειδής, from ἀράχνη, a Spider; and εἶδος, a Form. The external Lamina of the Pia Mater has been, by some Anatomists, made a distinct Coat; and call'd *Membrana Arachnoides*. See **PIA MATER**.

The Tunic also of the Crystalline Humour of the Eye is call'd *Arachnoides*, or *Aranea*. Dr. Nicholls, and afterwards *Albinus*, found the Means of injecting the Vessels of this Coat, which run upon it like Rays from a Centre. But according to *Celsus*, *Rufus Ephesus*, and *Galen*, the Tunica *Arachnoides*, or *Aranea*, is that Coat which immediately invests the vitreous Humour. *Celsus*, Lib. 7. Cap. 7. says it was thus named by *Herophilus*.

ARACON, Brass. Johnson.

ARACUS, a Plant thus distinguish'd:

Aracus, *Vicia sylvestris*, Offic. *Aracus five Cracca major*, Park. Theat. 1070. Merc. Bot. 1. 20. Phyt. Brit. 10. Mer. Pin. 9. *Vicia sylvestris*, five *Cracca major*, Ger. Emac. 1227. Raii Hist. 1. 902. Synop. 3. 321. *Vicia semine rotundo nigro*, C. B. Pin. 345. *Vicia angustifolia*, Rivin. Irr. Tet. Dill. Cat. Giff. 107. Rupp. Flor. Jen. 211. *Vicia vulgaris, acutius folio*, semine parvo nigro, Tourn. Inst. 397. Boerh. Ind. A. 2. 43. *Vicia vulgaris sylvestris*, semine parvo & nigro frugum, J. B. 2. 312. *Vicia vulgaris sylvestris frugum*: Semine parvo & nigro, *Cracca quibusdam*, Chab. 146. *Vicia sylvestris*, semine nigro & variegato, folio acutius, Hist. Oxon. 2. 63. *Vicia segetum*, *Aracus*, *Cracca*, Mont. Ind. 55. **STRANGLE-TARE**, or **WILD VETCH**.

It grows in Hedges, on Banks, and among Corn. The Herb is in Use, and has the same Virtues with the other Species of the *Vicia*. Dale.

ARACYNAPPIL, *Malis Aurantiis parvis similis Fructus*, J. B. *Malis Aurantiis parvis Fructibus similis*, C. B.

This Plant is only just mention'd by Ray, without any Specification of its Virtues or Uses.

ARADOS, ἀράδος, in *Hippocrates*, signifies that Perturbation which is excited in the Stomach by concocting Meats of different Qualities, Lib. de Rat. Vict. in Morb. acut. Kai ἐρε σὺ λιν ἔχει, ἐρε ἀράδον καὶ λιν “Which (Pituita) has no Astringency, nor is subject to raise Commotions in the Stomach.” Where *Galen* expounds τὸ μὴδὲ ἀράδον ἔχειν, by μὴδὲ μίαν ἐν τῷ ἀράδῳ τὰ ἀράχνην ἐμποιοῦν, “causing no Disturbance in Concoction.” *Αράδος* also signifies any internal Perturbation caused by purging Medicines, vehement Exercises, or other Causes.

ARÆON, ἀραιόν, signifies thin, rare, flow; and is opposed to πυκνός, thick, close, frequent. Thus ἀραιὸν πνεῦμα, Lib. 1. Epid. is Breath rarely drawn, or with long Intervals of Time; as it is explain'd by *Galen* and *Erotian*. *Αραιὰ σώματα* are the rare, lax, and soft Parts of the Body, which are easily receptible of any heterogeneous Matter, such as the Humours, σπογγώδης τε καὶ ἀραιὰ, the spongy and lax Parts of the Body, as the Lungs, Spleen, and Breast. Lib. περὶ ἀρχαῖς ἰσχυρῶς.

ARÆON (rare) is properly what contains large Pores, as *Pycnum*, πυκνόν, “dense,” is what has small Pores; but by a Metaphor, Catachresis, or whatever you please to call it, they are used to signify lax and close. Thus we call the Air and Fire rare, and the Water and Earth dense, transferring the Appellations to the very Elements, which are united, consist of similar Parts by Nature, and are incapable of Pores. *Galen. de San. Tuenda*.

ARÆOSYNCRITOS, ἀραιόσυνκρητος, from ἀραιός, thin, and σπυκνῶν, to constitute or frame. A Person of a thin Constitution of Body. *Galen. de San. Tuend*.

ARÆOTICA, ἀραιώτικα, from ἀραιός, to rarefy. Things, or Medicines, which rarefy.

ARALDA. The Italian Name for the Fox-glove. See **DIGITALIS**.

ARALIA, Berry-bearing Angelica. The Characters are:

The Flower consists of many Leaves, which expand in form of a Rose, and are naked, growing on the Top of the Ovary. These Flowers are succeeded by globular Fruit, soft and succulent; and full of oblong Seeds. *Miller's Dictionary*.

Aralia is altogether like the *Araliastrum*, as to the Structure and Situation of its Flower; but its Berry consists of five Seeds placed round an Axis; and its Leaves are branch'd almost like those of Angelica; and its Stalks (which in some Species are naked, and in others have Leaves set alternately) bear each several Umbels at the Top, in the Form of a Bunch of Grapes. The Species of *Aralia* are,

1. *Aralia caule aphylo, radice repente*, D. Sarrazin. *Christophoriana Virginiana, zarzæ radicibus surculosis & fungosis, Sarsaparilla nostratibus dicta*, Pluk. Almag. 98. Tab. 238. Fig. 5. *Zarsaparilla Virginienfis nostratibus dicta; lobatis umbelliferæ foliis Americana*, Ejusd. Almag. 396.
2. *Aralia caule folioso lævi*, D. Sarrazin. *Aralia Canadensis*, Inst. Rei Herba. 300.
3. *Aralia caule folioso & hispido*, D. Sarrazin.
4. *Aralia arborefcens spinosa*, D. Vaillant. *Angelica arbore-*

scens spinosa, seu Arbor Indica, fraxini folio, cortice spinoso, Raii Hist. 2. 1798. *Christophoriana Arbor aculeata Virginienfis*, Pluk. Almag. 98. Tab. 20.

All the Species of these two Genera, except the last of each of them, are common in Canada. The Inhabitants of that Colony, and those of Virginia, call the first Species of *Aralia* by the Name of *Sarsaparilla*, because its Roots have almost the same Figure and Virtues. M. Sarrazin writes from thence, that he had a Patient who had been cured of an Anasarca, about two Years before, by the Use of a Drink made of these Roots; and assures us, that the Roots of the second Species, well boil'd, and apply'd by way of Cataplasm, are very excellent for the curing of old Ulcers; as also the Decoction of them, with which they bathe and syringe Wounds; and he does not at all doubt, but the Virtues of the third Species are the same with those of the second. *Philosoph. Transact. Abridg. Vol. 5*.

ARALIASTRUM is a Genus of Plants, whose Flower is complete, regular, polypetalous, and hermaphrodite; standing on the Ovary, which is crown'd by a Calyx cut into several Parts, and becomes a Berry, in which are, for the most part, two flat Seeds like a Semicircle, which, both together, represent a sort of Heart. The Stalk, which is single, ends in an Umbel; of which each Ray bears but one Flower. Above the middle of the Stalk come out several Pedicles, (as on that of the Anemone) on the Extremity of which grow several Leaves like Rays, or like an open Hand. The Species of this Genus are,

1. *Araliastrum quinquefolii folio, majus*, *Ninzing vocatum*, D. Sarrazin. *Gin-seng*, Des Lettres edifiantes & curieuses, tom. 10.

2. *Araliastrum quinquefolii folio, minus*, D. Sarrazin. *Plantula Marilandica, foliis in summo caule ternis, quorum unumquodque quinquefariam dividitur, circa margines serratis*, No. 36. Raii Hist. 3. 658.

3. *Araliastrum fragrarie folio, minus*, D. Vaillant. *Nasturtium Marianum, Anemones sylvaticæ foliis, emneaphyllon, floribus exiguis*, Pluk. Mantiff. 135. Tab. 435. Fig. 7. *Philosoph. Transact. Abridg. Vol. 5*.

ARANEA, ἀράχνη. The same as **ARANEUS**, which see.

ARANEA TUNICA. The same as **ARACHNOIDES**, which see.

ARANEOSA URINA, ἀράχνοειδής ὕλη, in *Cicac*, is Urine containing something like Spiders Webs, with a Fatness at the Top; which indicates a Colliquation. *Celsus*, Lib. 2. Cap. 8. calls it *Urinam quædam Araneis similia subsidentia ostendentem*: “Urine that shews something in it like Spiders Webs.”

ARANEOSUS PULSUS, ἀράχνοειδής σπυγμός, a Spider-like Pulse, is, as *Galen* defines it, ὁ μικρὸς, ὁ πρὸ βραχέως ἀνεγείσασκενόμενος κινούμενός, “a small Pulse, that moves as if it were shaken by short Puffs of Air.”

ARANEUS, Offic. Schrod. 5. 337. Mer. Pin. 203. *Araneus subflavus hirsutus, prælongis pedibus, domesticus*, Liff. Hist. 59. Raii Insect. 27. *Araneus telarius*, quibusdam: *Araneus domesticus*, Mouff. Theat. Insect. 182. *Jonf. de Insect. 92*. **THE SPIDER**.

It is more common than welcome in Houses. Both the Spider and its Web are used in Medicine: The Spider is said to avert the Paroxysms of Fevers, if it be apply'd to the Pulse of the Wrist, or the Temples; but is peculiarly recommended against a Quartan, being inclosed in the Shell of a Hazle-nut. The Web astringes and conglutinates, and is therefore vulncrary, restrains Bleeding, and prevents an Inflammation.

ARANEUS NIGER, Offic. Liff. Hist. 77. Raii Hist. Insect. 33. **THE BLACK SPIDER**.

It is common in Woods, Thickets, and Pastures. Among the approved Remedies of Sir *Matthew Lister*, I find, that the distill'd Water of Black Spiders is an excellent Cure for Wounds, and that this was one of the choice Secrets of Sir *Walter Raleigh*. *Lister, Hist. Dale*.

The Spider which some call the Catcher, or Wolf, being beaten into a Plaister, then sew'd up in Linen, and apply'd to the Forehead or Temples, prevents the Returns of a Tertian. The Web, apply'd, stops Bleeding, and keeps superficial Ulcers from an Inflammation.

There is another Kind of Spider, which spins a white, fine, and thick Web. One of this Sort, wrapped in Leather, and hung about the Arm, will, it is said, avert the Fit of a Quartan. Boiled in Oil of Roses, and instilled into the Ears, it eases Pains in those Parts. *Dioscorides*, Lib. 2. Cap. 68.

Thus we find, that Spiders have in all Ages been celebrated for their febrifuge Virtues; and it is worthy of Remark, that a Spider is usually given to Monkeys, and is esteem'd a sovereign Remedy for the Disorders those Animals are principally subject to.

The Country-people have a Tradition, that a small Quantity of Spiders Web, given about an Hour before the Fit of an Ague, and repeated immediately before it, is effectual in curing that troublesome, and sometimes obstinate Distemper. This Remedy is not confin'd to our own Country; for I am well inform'd, that the Indians about North-Carolina have great Dependence on this Remedy for Agues, to which they

are much subject; and I am acquainted with a Gentleman long resident in those Parts, who assures me he was himself cur'd by it of that Distemper.

The following Case, which is literally true, will be some Evidence in favour of the Virtue of Spiders Webs in intermittent Disorders.

Some time in April 1742. I was desir'd, by Mr. Crawley, an Apothecary in *Berry-street*, to see one Mrs. Radcliffe, who liv'd in a Stable-yard at the lower End of *Duke-street*, near *St. James's Square*. Upon my first Visit I was inform'd, that she some time before came from *Nottinghamshire*, with an inveterate Ague upon her, which return'd every Night at eight o'Clock, and continu'd for about nine Hours, the greatest Part of which Time she was delirious; and, indeed, during the Intermission, she could not be said to be entirely free from the Fever. She was very big with Child, and told me, she had but a Fortnight to reckon, and that she had been subject to Hysterical Disorders all the Time of her Pregnancy.

She had, by the Advice of her Midwife, taken the Bark, without any good Effect.

As the Time of her Delivery was so near, I judg'd it would be of some Importance to remove the Fever before her Labour, for Reasons too obvious to require mentioning. I therefore directed such Evacuations as her Condition would permit, and put her into a short Course of neutral Salts, after which I directed the Bark, which was for some time repeated in various Forms, and with various Additions; but all to very little Purpose, for the Fever never ceas'd for more than three Days, and during that time she was in a worse State of Health than even when her Fever return'd, being affected with an excessive Diarrhoea. In this State she continu'd for about six Weeks, having mistaken in her Reckoning about a Month; and on or about May 26. in the Evening, she was seiz'd with Labour-pains, and much about the same time with her Fever-fit, the Consequence of which was an excessive Delirium. A Man-midwife was call'd, who, not finding she was likely to be deliver'd soon, left her, after having order'd her a Bolus, with Lapis Contrayerva, and a Cordial Julap. In the Night she was deliver'd, but the Gentleman refus'd to attend her again, because he judg'd it impossible for her to recover, as I was inform'd. I was then again consulted, and was told there was an entire Suppression of the Lochia, and that the Fever-fit constantly returned at one o'Clock in the Day, and lasted nine Hours, never without a Delirium. Till June 3. or 4. I us'd all my Endeavours to remove the Fever, and restore the Lochia; which last I effected, but in a Degree scarcely worth Notice; but the Fever perpetually return'd at one o'Clock, and continu'd as usual, and had reduc'd her to an excessive Weakness.

In such a Situation I believe the Gentlemen of the Faculty will not think I did amiss, if, in pursuance of the Advice of *Celsus*, I chose to try a doubtful Remedy, rather than suffer the Patient to perish without using any Means for her Relief. Upon this Principle, on June 4. about Ten in the Morning, I order'd a Bolus, made of a Scruple of Cobweb, with some Syrup, to be given at Eleven o'Clock, and to be repeated before One. My Directions were punctually observ'd, and Mrs. Radcliffe mis'd her Fit that Day. At Night she slept well for seven Hours, which she had not done for some Weeks before. The next Day the Bolus was repeated: At Night she slept nine Hours, and has never since had any Return of her Fit, except once upon a Fright some Weeks after, when the same Remedy again cur'd her. I must not omit taking notice, that when the Fever was removed, the Lochia were very soon plentifully restored.

As the Cobweb had no sensible Operation, that I could learn, it is a Task too difficult for me to account in a mechanical way for the salutary Effects it produc'd; the Fact, however, appears worthy of Regard.

Among the lower Class of animal Beings called Insects, whose Bites or Stings are made venomous, is the Spider; which altho' in ours, or some colder Climates, they are less dreaded, yet even with us there are some (according to the Observation of the curious Dr. Lister, and such are generally of the octonocular Kind) whose Bites are pernicious, and not to be contemned; an Experiment of which was made by the renowned *Harvey*, as we may find by the following Passage.

"Having, for Trial-sake, prick'd my Hand with a Needle, I after rubbed the Point of the same Needle with the Tooth of the Spider, and perforated the Skin therewith in another Part of my Hand, but could distinguish no Difference in the Sense of the Punctures: However, there was one remarkable enough in the Skin; for, in the envenom'd Puncture, the same was soon rais'd up into a Tubercle, looking red with Heat and Inflammations, rising up as it were to shake off the inflicted Evil."

But the Spider, swallow'd and received into the Stomach, whether of Man or other Animals, is not always alike hurtful, of which *Mouffett*, in his Treatise of Insects, gives a singular Example, and which may be infer'd from their being so much coveted by small Birds, to whom they are the greatest Dainties, and which they pick up without Distinction. A farther Proof

of their being inoffensive, otherwise than by their Bites, we may take from their Webs, so much in Request among the Artists, and at this Day, by the common People, apply'd to recent Wounds, on account of the Flux of Blood, which are, according to *Celsus*, a noble Agglutinative for small Hurts: There are even some who hold the Humour flowing out of their Bodies, as a great Secret for these Purposes, so far are they from being thought hurtful by such.

A yet farther Proof of their being inoffensive is set down by *Mouffett*, which is, that Eggs of these Insects, being deposited on some Fruits or Herbs, are frequently (as may be made apparent) taken in, tho' unobserv'd, and well digested by the most tender Stomach.

Signior *Redi* takes Notice, that this Creature, altho' it prove poisonous when instilling its Juice into the Wound, yet may it not happen so at all times when taken into the Stomach; to confirm which, Dr. *Fairfax* alleges Examples of several Persons well known to him, (himself having been an Eye-witness to several of the Experiments) who have commonly swallow'd Spiders, even of the rankest Kind, without any more Harm than happens to Hens, Robin-red-breasts, and other Birds, who make them their daily Food.

Swammerdam, in his Description of this Creature, says, that those Parts which are called by some others its Teeth, he rather takes for two strong and spiked little Claws; or the pointed Parts of two little and less conspicuous Feet, rather than Teeth properly, not much differing in Structure from the Sting of the Scorpion, with which they prick the Part in like manner with it: And if so, saith he, there will be little other Difference than this, that the Spider carries its double *Unguiculi* or *Aculei* in the Fore-part of the Breast, whilst the Scorpion darts out his single one from the hinder Part of his Body. These *Unguiculi*, according to our Author, are made up of two little Joints or Claws, with which they not only catch their Prey, but transfix and wound the same, afterwards sucking up the Juices of their Captives. Dr. *Lister* takes notice of those forked Claws, but says they proceed out of the Mouth itself of the Creature: *Groenart* says much the same; whilst Dr. *Mead* tells us, That the Spider which lives upon Flies, Wasps, and the like Insects, is provided with a hooked Forceps, placed just by the Mouth, very sharp and fine, with which he pierces the Flesh of those little Creatures caught in his Web, and at the same time infuseth a Juice into the Puncture, by which means the Animal being kill'd, he sucks out the Moisture from the Body, and leaves it a dry husky Carcase.

Leeuwenhoek would have the Poison discharged from the Claw itself, at the same time the Wound is inflicted, contrary to Dr. *Mead*, who upon repeated Trials affirms, That having fixed its Claws upon the Prey, he observ'd a short white *Proboscis* thrust out of the Mouth, which instilled a Liquor into the Wound.

Jacobus Hoefnagel, (taken notice of, as I remember, by *Swammerdam*) Painter in Chief to his Imperial Majesty *Rodolph*, hath exactly colour'd by the Life five-and-thirty several Species of this Insect, with three hundred others, which are since cut upon Copper, and printed with the same Emperor's Licence and Privilege, being not inferior to those of *Goedart*.

But if our *English* Spider be not so venomous, yet those of some other Countries are reported to be so in a very high Degree, inasmuch that *Scaliger* takes notice of a certain Species of them, (which he had forgotten) whose Poison was of so great Force as to affect one *Vincentinus* thro' the Sole of his Shoe, by only treading on it. Even in *Gascony* he observes, there is a very small Spider, which, running over a Looking-glass, will crack the same by the Force of her Poison (*A mere Fable*).

Remarkable is the Enmity recorded between this Creature and the Serpent, as also the Toad: Of the former it is reported, That, lying (as he thinks securely) under the Shadow of some Tree, the Spider lets herself down by her Thread, and, striking her *Proboscis* or Sting into the Head, with that Force and Efficacy, injecting likewise her venomous Juice, that, wringing himself about, he immediately grows giddy, and quickly after dies.

When the Toad is bit or stung in Fight with this Creature, the Lizard, Adder, or other that is poisonous, she finds Relief from Plantain, as is said, to which she resorts, and for which that Plant is reckon'd one of the Specifics.

In her Combat with the Toad, the Spider useth the same Stratagem as with the Serpent, hanging by her own Thread from the Bough of some Tree, and striking her Sting into her Enemy's Head, upon which the other, enraged, swells up, and sometimes bursts. To this Effect is the Relation of *Erasmus*, which he saith he had from one of the Spectators, of a Person lying along upon the Floor of his Chamber in the Summer-time, to sleep in a supine Posture, when a Toad, creeping out of some green Rushes, brought just before in, to adorn the Chimney, gets upon his Face, and with his Feet sits across his Lips. To force off the Toad, says the Historian, would have been accounted sudden Death to the Sleeper; and to leave her there, very cruel and dangerous; so that upon Consultation

it was concluded to find out a Spider, which, together with her Web, and the Window she was fasten'd to, was brought carefully, and so contrived as to be held perpendicularly to the Man's Face; which was no sooner done, but the Spider, discovering his Enemy, let himself down, and struck in his Dart, afterwards betaking himself up again to his Web; the Toad swell'd, but as yet kept his Station: The second Wound is given quickly after by the Spider, upon which he swells yet more, but remain'd alive still. The Spider, coming down again by his Thread, gives the third Blow; and the Toad, taking off his Feet from over the Man's Mouth, fell off dead.

And so much for the historical Part: I shall say somewhat now with relation to the Effects and Cure of the Poison; an Instance of which I remember, when a very young Practitioner, being sent for to a certain Woman, whose Custom was usually, when she went to the Vault by Candle-light, to go also a Spider-hunting, setting Fire to their Webs, and burning them with the Flame of the Candle still as she pursued them. It happen'd at length, after this Whimsy had been follow'd a long time, one of them sold his Life much dearer than those Hundreds she had destroy'd; for, lighting upon the melting Tallow of her Candle, near the Flame, and his Legs being entangled therein, so that he could not extricate himself, the Flame or Heat coming on, he was made a Sacrifice to his cruel Persecutor, who delighting her Eyes with the Spectacle, still waiting for the Flame to take hold of him, he presently burst with a great Crack, and threw his Liquor, some into her Eyes, but mostly upon her Lips; by means of which, flinging away her Candle, she cry'd out for Help, as fancying herself kill'd already with the Poison. However, in the Night her Lips swell'd up excessively, and one of her Eyes was much inflam'd; also her Tongue and Gums were somewhat affected; and, whether from the Nausea excited by the Thoughts of the Liquor getting into her Mouth, or from the poisonous Impressions communicated by the nervous *Fibrillæ* of those Parts to those of the Ventricle, a continual Vomiting attended: To take off which, when I was call'd, I order'd a Glass of mull'd Sack, with a Scruple of Salt of Wormwood, and some Hours after a Theriacal Bolus, which she flung up again. I embrocated the Lips with the Oil of Scorpions mix'd with the Oil of Roses; and, in Consideration of the Ophthalmia, tho' I was not certain but the Heat of the Liquor, rais'd by the Flame of the Candle before the Body of the Creature burst, might, as well as the Venom, excite the Disturbance. (altho' Mr. Boyle's Case of a Person blinded by this Liquor dropping from the living Spider, makes the latter sufficient); yet observing the great Tumefaction of the Lips, together with the other Symptoms not likely to arise from simple Heat, I was inclin'd to believe a real Poison in the Case; and therefore, not daring to let her Blood in the Arm, I did, however, with good Success, set Leeches to her Temples, which took off much of the Inflammation; and her Pain was likewise abated, by instilling into her Eyes a thin Mucilage of the Seeds of Quinces and white Poppies extracted with Rose-water; yet the Swelling on the Lips increased; upon which, in the Night, she wore a Cataplasm prepared by boiling the Leaves of Scordium, Rue, and Elder-flowers, and afterwards thicken'd with the Meal of Vetches. In the mean time, her Vomiting having left her, she had given her, between whiles, a little Draught of distill'd Water of Carduus Benedictus and Scordium, with some of the Theriaca dissolved; and upon going off of the Symptoms, an old Woman came luckily in, who, with Assurance suitable to those People, (whose Ignorance and Poverty is their Safety and Protection) took off the Dressings, promising to cure her in two Days time, altho' she made it as many Weeks, yet had the Reputation of the Cure; applying only Plantain-leaves bruised and mixed with Cobwebs, dropping the Juice into her Eye, and giving some Spoonfuls of the same inwardly, two or three times a Day.

I must remark upon this History, which is from Turner, that the Plantain, as a Cooler, was much more likely to cure this Disorder, than warmer Applications and Medicines.

The same young Woman told me, before this Accident happen'd to her, the Smell of their Burning oftentimes so affected her Head, as that the Objects about her seem'd often to turn round; she grew faint also with cold Sweats, and sometimes a light Vomiting; yet so great was her Delight in torturing these Creatures, and beating up their Quarters, that she could not forbear, till one of them thus alarmed her.

Something akin to this was the Case related by Nic. Nicholus, of a Man he saw at his Inn in Florence, burning a large black Spider in the Flame of a Candle, and staying some time in that Place, from the very Fume thence arising, grew feeble, and fell into a fainting Fit, suffering all Night great Palpitation at the Heart, and afterwards a Pulse so very low as was scarce to be felt. He was recover'd, says the Relator, by giving him Theriaca, mixed with the Species Diamoschu, and Powder of Zedoary.

In the same City, Nic. Florent. relates, there happen'd a sad Misfortune in a certain Monastery, by which many of the Monks received their Death, by drinking Wine incautiously

out of a Vessel in which a certain venomous Spider was found drowned, notwithstanding what hath been before said, of their being inoffensively taken into the Stomach; but these latter very likely might be widely differing, if not in their outward Form, yet in their inward compounding Particles, or their malignant Nature and Properties.

Galen, taking notice of this Insect, subjoins this Interrogation: Who would think so small a Creature should work so mighty an Alteration upon the whole Body of Man, as we find she does, only by a little Dart or Sting just entering the outward Skin, by which certainly she conveys a poisonous Moisture, or something, however, more spirituous, yet still venomous to the Blood?

Sennertus takes Notice of the Signs of this Bite or Sting to be a Stupor or Numbness upon the Part, with a Sense of Cold, Horror, or Swelling of the Abdomen, Paleness of the Face, involuntary Tears, Trembling, Contractions, a perpetual Desire to make Water, Convulsions, cold Sweats; but these latter chiefly when the Poison has been received inwardly.

As to the Cure, not slighting the usual Alexipharmics taken internally, he says, the Place bitten must be immediately wash'd with salt Water, or a Sponge dipped in hot Vinegar, or form'd with a Decoction of Mallows, Origanum, and Mother of Thyme; after which a Cataplasm must be laid on of the Leaves of Bay, Rue, Leeks, and the Meal of Barley, boiled with Vinegar, or of Garlick, and Onions, confus'd with Goats Dung, and fat Figs. Mean time the Patient should eat Garlick, and drink Wine freely.

But if the Poison were admitted into the Stomach, Vomiting must be procur'd for its speedy Discharge, and then some proper Antidote prescribed; among which Gesner commends beyond all others the purest, whitest, and fattest Rosin resembling Frankincense; *Fractastorius*, Bole and Vinegar taken inwardly, with which he recovered a Person stung, or bitten in the Neck, by a venomous Spider. *Turner de Morbis Cutaneis*.

Celsus, Lib. 5. Cap. 27. advises to lay a Cataplasm of Rue and Garlick, beat up with Oil, to the Part wounded by a Spider, or Scorpion.

ARANTIA, the same as AURANTIUM, which see. *Blanc.*

ARARA *Fruetus secundus, Cap. 21. Lib. 2. Exot. Clus. Arara Fruetus Americanus, J. B.*

It grows in *Cayana*; the Inhabitants bruise it, and boil it in Water, with which they wash malignant Ulcers. They say, also it is good to loosen the Belly, which I suppose is meant of the Kernel. *Raii Hist. Plant.*

ARATICU. Ray mentions three Sorts of Trees under this Name. The first is the

ARATICU *prima seu simpliciter dicta*, Francis Redi Experiment. Natural. p. 75. *Araticu Ponbe*, Marcgrav. & Pison. This Dr. Robinson thinks is THE SOUR-SOP.

The Tree is like an Orange in its Trunk and Boughs; and the Colour of its Bark, but unlike in Leaves, Flowers, and Fruit.

The Leaves, scorched in the Fire, and apply'd in Oil to an Abscess, maturate, break, and heal it in an excellent manner.

The second is the

ARATICU APE, Pison. Marcgrav. Redi Experiment. Nat. p. 77. *Nostratibus*, THE CUSTARD APPLE. *An Anona Ovied?*

ARATICU *de mato Pison. An Baly Insula Fruetus, asperu Cortice, Clus. Raii Hist. Plant.*

ARBOR, *Sesd. egg*, a Tree, is defined to be a woody Plant, the biggest of all in Thickness and Height, whose Stock is perennial, and single by Nature, and is divided into many larger Branches, which the Greeks call *ἀγκύρα*, and *ῥαχίς*; and afterwards into many small Branches [Sprigs], which the Greeks call *ῥαχίς*, and the Latins *Surculos*. *Miller's Dict.*

ARBOR *Virginiana, Citria vel Limonia Folio, Benzoinum fundens, H. A.* The Benjamin-tree, *vulgo*. This Tree is found in great Plenty in most Parts of Virginia and Carolina, and is kept in curious Gardens of Trees, amongst many other Plants of those Countries, here in England. When it was first introduced, it was generally believed, that the Gum Benjamin of the Shops was an Exudation from this Tree; but it is now thought to proceed from a very different Tree.

ARBOR *Zeylanica, Cotini Folio, subius Lanugine villosis, Floribus albis Cuculi modo laciniatis. Pluk. Phyt.* THE SNOW-DROP-TREE.

ARBOR *Americana, pinnatis Fraxini Folio, Fructu reniformi, Phaseolum experimenti. Pluk. Phyt.* SPANISH ASH.

ARBOR *baccifera laurifolia aromatica, Fructu viridi calyculato racemoso. Sloan. Cat. Jam.* The Winter's-bark, or wild Cinnamon-tree. It grows in the Low-lands of Jamaica in great Plenty, to the Height of thirty Feet, or more. The Leaves, Fruit, Bark, and every Part of this Tree are very aromatic, hot, and biting to the Taste. The Bark is used as Spice in most of the English Plantations in America, and was formerly pretty much used in Medicine in England, under the Title of *Canella Alba*, or *White Cinnamon*, but at present it is not much in Use.

ARBOR laurifolia venenata; Folio leviter serrato oblongo obtuso. copiosum Lac præbens. Sloan. Cat. **THE POISON-TREE.**

This Tree grows plentifully in *Jamaica*, and other warm Parts of *America*. It abounds with a milky Juice, which is accounted very poisonous; if the Leaves are broken, the Juice will flow out very fast; and, if it falls on Cloth, will cause it to wash in Holes, much after the same manner as the Juice of the Manchineel-tree.

ARBOR Americana, Fraxini Folii, Fructu conoide. The Mahogany-tree. It grows chiefly on the North Side of *Jamaica*.

ARBOR excelsa, Coryli Folio ampliore. Houft. It grows only at *Campeachy*.

ARBOR in Aqua nascens, Folii latis acuminatis & non dentatis, Fructu oleagino minore. Catesb. Hist. Nat. **THE TUPELO-TREE.** It grows in *Virginia*, *Maryland*, and *Carolina*.

ARBOR SAPONARIA, Offic. Arbor saponaria Americana, Raii Hist. 2. 1548. Prunifera racemosa, folio alato, costa media, membranulis utrinque extantibus donata, fructu saponario, Cat. Jamaic. 184. Sloan. Hist. 2. 131. Prunifera seu Nuciprunifera, fructu saponario orbiculato monococco nigro, Americana, Pluk. Phytog. 217. Fig. 7. Nuciprunifera arbor Americana, fructu saponario orbiculato monococco nigro, Pluk. Almag. 265. Arbor Misticæ provinciae fructu avellanæ simili, Læet. 260. Jonf. Dendr. 114. Quity, Pison. (Ed. 1658.) 162. Quity Brasiliensis, Marcg. 113. Saponaria sphaerula, Chab. 22. Saponaria sphaerula arboris filicifolia, J. B. 1. 312. Nucula saponaria non edules, C. B. Pin. 511. Sapindus foliis costæ alatæ innascentibus, Tourn. Inst. 639. Bacca Bermudenses, Marl. Obs. SOAP-BERRIES.

It grows in *Jamaica*, and other Parts of the *West-Indies*; the Fruit is ripe in *October*, and, when dry, is spherical, of a reddish Colour, and less than a Gall, of a large Eye, and a bitter Taste, but no Smell, containing one round black Stone.

It is much recommended against the *Chlorosis*, and the Berries are reckoned a singular and specific Remedy against that Distemper, working a perfect Cure after an ineffectual Use of Chalybeates. The Spirit, Tincture, or Extract, are more proper to be used than the crude Berries.

*ARBOR VITÆ, Offic. Ger. 1187. Emac. 1368. Park. Theat. 1478. Raii Hist. 2. 1408. Arbor Vitæ, five Paradisiaca, Chab. 73. Arbor Vitæ, five Paradisiaca vulgò dicta odorata ad Sabinam accedens, J. A. 2. 180. **THE TREE OF LIFE.***

It is a Native of *America*, but is never found in *Europe*, except in the Gardens of the Curious. The Leaves are used as an Alexipharmic, and Diuretic. *Mont.*

It is an opening and warming Plant, provokes the Menfes, and is good against the *Chlorosis*; bruised with Honey, it dissolves Tumors. The Oil is commended against the Gout, being rubbed on the Part; for it acts like Fire, by stimulating and opening. It cleanses Beds from Lice and Fleas. *Boerh. Hist. Dale.*

This Tree never grows to any Bigness with us in *England*, being a Stranger, and only planted in Gardens. The younger Branches are flattish and tough, bearing on each Side several winged Leaves, which grow thick together, scaly, somewhat like Cypress, but are smooth, and not prickly at the End, and very flat; they have a strong resinous unpleasant Scent, which some compare to old rotten Cheese. It bears little small scaly white Cones at the Extremities of the Branches. It came originally from *Canada*.

The Leaves have a digesting attenuating Faculty. *Parkinson* says, that, chewed in the Mouth for several Mornings fasting, they have done great Service in expectorating and freeing the Lungs from thick purulent Phlegm. It is but rarely used. *Miller. Bot. Off.*

This Tree receives the Name of *Arbor Vitæ*, or *The Tree of Life*, because it flourishes with a perpetual Greenness, and breathes a fragrant and delicious Odour: It is also called the *Cedrus Americana*, and the *Arbor Semper Viridis*. It is imported into *Europe* from *Canada* in *America*, and only to be found in the Gardens of the Curious. It is at all Seasons clothed with its Leaves, which, though they become somewhat pale in the Winter-time, do nevertheless resume their native Splendor, and usual Verdure, in the Spring. The Tree itself is strait, but rough and uneven in its Surface; its Bark is of a kind of intermediate Colour between Red and Brown, and is unequal and scabrous. The Wood itself contains a Gum, and sends forth a strong, but, at the same time, an agreeable Smell. In the Beginning of the Summer it bears small yellow Flowers, which contain and fold up in them, as in a kind of Turbant, a bitter Seed. *Castor. Durantes* informs us, that there is a Species of this Tree principally found in *France*, which is of a warming and drying Nature, of a somewhat bitter Taste, but of a very agreeable Smell; and that it also

preserves the Health, and protracts the Life of Men. This Tree, says *Camerarius*, in *Hort. p. 169.* is deservedly had in Esteem, not only on account of its fragrant Smell, which is so strong, that its Branches, bruised and applied to the Nostrils, sometimes occasion a Discharge of Blood from them; but also on account of its other valuable Virtues and Properties. From it there is distill'd a Water and an Oil which prove serviceable in Paroxysms of the Gout, if duly applied to the Parts affected. The Balsam and Oil of *Arbor Vitæ*, or *The Tree of Life*, were very much used during the Time of the Plague in *Dresden*. *Job. Mich. Not. in Schroder. Pharm. Barth. Zorn. Botanolog.*

Bat. 634. **THE STRAWBERRY-TREE.***

It grows in Woods and Thickets, that are warmly situated. The Fruit is used, which is of a sharp and austere Nature. *Dale.*

The *Arbutus* is a Tree like the Quince-tree, of a thin Bark, or with thin Leaves, (*λεπίσφυλλον*) and bearing a Fruit of the Size of a Plum, but without a Stone, and called *Memacylum*, of a deep-yellow or red Colour, when ripe.

The Fruit is very husky Food, hurtful to the Stomach, and causes Head-ach. *Dioscorides, Lib. 1. Cap. 175.*

This Tree grows very frequently in *Spain*, *Sicily*, *Italy*, and *Narbon* in *France*. *Juba* reports, that in *Arabia* it rises to the Height of fifty Cubits, *Plin. L. 15. C. 24. P. Bellonius* informs us, that in the Valleys of *Mount Athos*, so much celebrated by the Antients, the *Arbuti* grew up to Trees of a huge Size and Bulk. Throughout the Winter it retains the Verdure of its Leaves, which are large, and whose Edges are full of Points, and about the Middle of each Leaf there is a reddish Vein. It bears white and fragrant Flowers, which resemble Honey-suckle, or Lilies of the Valley. After its Flowers are fallen, it bears a round thick Fruit as large as a Strawberry, which is at first green, then yellow, and, last of all, red, of a coarse bitter, and not very pungent Taste. Some call its Fruit *Comarus*, and *Unedo*, for this Reason probably, that only one of them should be eaten at a time, according to *Pliny, Galen, Dioscorides*, and some others, assert, that the Fruit, eaten in too large a Quantity, is prejudicial to the Stomach, and excites Head-achs. For my share, says *John Baubine*, they always occasioned a Pain in my Stomach when I happened to eat them. But *Car. Clusius* says, he had eaten many of them without sustaining any manner of Injury, *Lib. 1. rar. Plant. Hist. C. 30.* Many distil a Water from its Leaves and Flowers in *Balneo Maria*, which they look upon as a mighty Preservative against the

the Plague; especially if used soon enough. *Amatus Lusitanus* informs us, that it is a sacred Preservative and Antidote against the Plague and Poisons. *Matthiolus* mixes it with the Powder of Bone of *Stag's Heart*. Many also make use of its Root against the Plague. Tanners use its Leaves in preparing their Leather; and Bird-catchers use its Seeds for catching their Prey in the Winter-season. *Barth. Zorn. Botanolog.*

ARCA Arcanorum. The *Mercurius Philosophorum*. *Castellus*.

ARCANUM, ἀπόκρυφον, ἀπόκρυφον, μυστικόν. A kind of Remedy whose Manner of Preparation, or singular Efficacy, is industriously concealed, in order to enhance its Value. *Paracelsus* describes it to be a principal Medium, which ought to be investigated by Experience.

ARCANUM, by the Chymists, is generally defined a thing secret, incorporeal, and immortal, which cannot be known by Man, unless by Experience; for it is the Virtue of every thing, which operates a thousand times more than the thing itself.

The *Arcanum Materiale* is a specific Extract more nearly allied to the Matter of the Body. But since the Matter of compound Bodies consists of two Elements, the Moist and the Dry, (for Air and Fire are rather the Form, and are to be considered as Efficients) therefore this *Arcanum* must also be of two Kinds, that is, the *Aqua Stillatitia*, and the *Coagulum Specificum*.

The *Arcanum Specificum* is an Extract of the interior Nature, presenting us with the Substance of every thing in a nearer View, so that the Thing itself may be known in it; for which Reason we are to take the utmost Care, that the substantial Crasis or Contexture be not spoiled, because in this respect it is called *Specific*, and differs from the *Quinta Essentia*, which for its consummate Subtlety, and exalted Rank, seems almost to desert from its own to the superior Class of Æthereals. This *Arcanum Specificum* is of two Sorts, one more formal, which is called the *Astral*, the other more material. *Rulandus*.

At present there are three remarkable Remedies, which pass under the specious Name of *Arcanums*, which are,

ARCANUM CORALLINUM.

1. Take of red Precipitate, four Ounces; put it into a Retort; add to it Spirit of Nitre, eight Ounces; set it in a Sand Furnace, and draw off the Spirit by a gradual Heat raised to the fourth Degree. This Operation will be performed in five or six Hours. Return that Spirit of Nitre with four Ounces of new Spirit; and, at last, let it continue at least two Hours, in the fourth Degree of Fire; then let it all cool, and there will be a very red and subtile Powder, which put into a Crucible, and set in a Fire of Charcoal, but not exceeding a Worm-red, half a Quarter of an Hour. Then put it into a Mattrafs, and to it three Pounds of distilled Fountain or Rain-water; set it in a Sand Furnace, and give it a gradual Fire till it boils, and so keep it half an Hour. Pour off that Water by Inclination, and dry the Powder gently; then put to it of tartarized Spirit of Wine, twelve Ounces; and in a gentle Heat draw it off, and so proceed to two Cohobations. Then put to it twelve Ounces of fresh tartarized Spirit of Wine; fit a Glass to the Mouth of the Cucurbit, to make it a Circulatory; let it stand in a gentle Heat of Sand forty-eight Hours; and, at the last of all, let it simmer a little, then let all cool: Decant the Spirit of Wine, and dry the Powder.

This does not greatly differ from the Prince's Powder. Some esteem this the best and safest of this Tribe: It operates chiefly by Stool. Its Dose is from three to ten Grains. This is also reckoned good in the Gout, Dropsy, Scurvy, and Itch, as well as Venereal Infections.

2. ARCANUM DUPLEX, sive DUPLICATUM.

Take any Quantity of the Caput Mortuum of Aqua-fortis, made with equal Parts of Nitre and Vitriol, and dissolve in hot Water by standing some Hours, and now-and-then stirring the Mixture. Let the Water be filtered; evaporate to the Appearance of a Skin upon the Surface, or even to a Dryness, and leave it to shoot.

This is also in some Authors by the Name of *Nitrum Vitriolatum*, and *Sal Ducis Holsatia*; and is greatly extolled for a Diuretic, Sudorific, and, as the Humours are disposed, sometimes for a Cathartic too; but we hardly ever meet with it in Prescription. Its Dose is from half a Scruple to half a Dram.

3. ARCANUM JOVIALE.

Make an Amalgama with equal Quantities of Quicksilver and Tin: Powder it, and pour upon it Spirit of Nitre, till it somewhat more than covers it, which let stand in a

gentle Digestion for some Hours; then by a Retort draw off the Spirit of Nitre. The remaining Matter take out, and wet it with Spirit of Wine rectified, which burn away. This repeat five or six times, until the pungent Taste is worn off.

This is recommended in *Bater's Dispensatory* for a powerful Sudorific. Its Dose is from three to eight Grains. *Quincy's Dispensat.*

ARCEUTHOS. The same as JUNIPERUS, which see.

ARCHÆUS, ἀρχαῖος, ancient, former. Ἀρχαῖον εὖος, in *Hippocrates*, often signifies the former healthy State of the Body before the Attack of a Disease.

ARCHAGATHI EMPLASTRUM LENE. A mollifying Plaster invented by *Archagathus*. Its Preparation is given by *Celsus*, *Lib. 5. Cap. 19.*

ARCHAGATHUS. A celebrated Physician amongst the Romans.

'Tis by some asserted, that before the Arrival of *Archagathus* at Rome, Physic was not so much as known in that City; and if we may believe *Pliny*, this useful Branch of Learning was unknown to the Romans, till after all the other liberal Arts and Sciences were established among them: "The Roman People," says he, [*Lib. 29. Cap. 1.*] were more than six hundred Years without Physicians, though they were very early in cultivating the other Arts, and even fond of Physic itself, till, becoming acquainted with it by Experience, they condemn'd it. *Cassius Hemina* informs us, that *Archagathus* the Son of *Lysanias* the *Peloponnesian* was the first Physician who arrived at Rome, under the Consulship of *Marcus Aurelius* and *Marcus Livius*, in the Year of the City 535. adding, that he had the Freedom of the City bestowed upon him; and that the Public had, at their own Charges, purchased a Shop for him in the Street of *Accilius*, that he might exercise his Profession to the greater Advantage; that at first they gave him the Surname of *Vulnerarius*, or *The Healer of Wounds*; that his Arrival was very agreeable to the People, but that soon after, his Practices of *Burning* and *Cutting* appearing cruel and barbarous in the Eyes of the People, they exchanged his former Surname for that more infamous one of *Executioner*; from which time they conceived an implacable Aversion to Physic and all its Professors."

It appears somewhat surprising, that a People so polite as the Romans were, should be so long without Physicians. To the Authority of *Pliny* we shall oppose that of *Dionysius of Halicarnassus*, who in his tenth Book has these Words: "The Plague beginning to appear in Rome in the Year of the City 301. and happening to rage more violently than any other Plague with which they had been afflicted in the Memory of Man; it carried off almost all the Slaves, and half of the Citizens, the Physicians not being able to attend and take care of such a large Number of Patients." There were then Physicians in Rome at that time, that is, more than two hundred Years before the Period mentioned by *Pliny*, as indeed there have been Practisers of this Art in all Ages among all People. But, in order to reconcile these two Authors, we must suppose, that *Pliny* means only foreign Physicians, especially those of the Greek Nation; and indeed he explains himself to that Purpose a little afterwards in these Words: "In order to be convinced of the Aversion the Romans in those Days bore to Physic, we need only hear the Sentiments of *Marcus Cato* upon that Point, who lived seventy Years after *Archagathus*, and who was a Man of whom we may say, that the Honour of a Triumph decreed in his Favour, and the Dignity of the Censorship, which Office he bore, are the least shining Parts of his Character, since so many other Circumstances concurr'd in his Person to render him venerable and awful." These following are his own Words, taken from a Letter he wrote to his Son: "I will tell you, my Son *Marcus*, at a proper Occasion, what Notion I entertain of these Greeks, and what I think most valuable in Athens. It is not improper to study their Learning and Sciences cursorily, but 'tis by no means necessary to make one's self a complete Master of it. I shall say no more at present of that wicked and arrogant Race; but persuade yourself of this, as much as if an Oracle had spoken it, that as soon as this Nation has communicated her Learning to us, she will spoil and corrupt Rome; and this dire Event will be still more easily brought about, if she continue to send her Physicians to us. They have sworn among themselves to kill all the Barbarians, by means of their Art; and still they exact a Fee for their Pains from the Patients with whom they deal, that they may gain their Confidence more effectually, and consequently have it in their Power to destroy them with the less Danger of Suspicion. They have such a Degree of Insolence as to call not only other Nations, but us, Barbarians; nay, they carry their Arrogance farther, and style us *barbari*, rude, and Strangers to true Politeness. In a Word, my Son, remember, that I have discharged you from having any thing to do with Physicians."

'Tis plain from the Strain of *Cato's* Language, that he had only foreign Physic in his View; and this *Pliny* acknowledges, by starting to himself the following Objection, which he makes use of as a Conclusion: "Must we then believe, that *Cato* condemn'd a thing so useful and beneficial as Physic? Assuredly not; since he himself vouchsafes to inform us by the Use of what Medicines he himself and his Wife had arrived at such an advanced Age; and that he had written a Book, in which he lays down the Method of his Practice, with regard to his Son, his Slaves, and even his Cattle, when they were indisposed."

The *Romans* then were not absolutely without Physicians in the earlier Ages of their Republic; but in all Probability, before the Arrival of *Archagathus*, they only used that *Natural Physic*, or simple Empiricism, which we may well suppose to have been practised by the Infant World, when Men made their first Appearance upon it. This was the Physic relished by *Cato*, and on which he wrote the first of all the *Romans*. He had some Peculiarities in his Practice, which, if they will not inform the Judgment, will, at least, excite the Laughter of every thinking Person; for 'tis well known, that he approved of superstitious Remedies; and in that Part of his Works which has reached our Hands, he has given us an inimitable Formula of Words to be pronounced for the Cure of a Dislocation or Fracture; but because there is not a Possibility of translating them, I shall give them as he himself gave them: "*Luxum si quod est, hac Cautione sanum fiet. Harundinem prende tibi viridem P. 4. aut 5. Longam. Mediam diffinde, & duo Hominibus teneant ad Coccendices. Incipe Cantare in alio. S. F. Motas vata Daries Dardaries, Astartaries Diffunapiter, usque dum coeant. Ferrum insuper jactato. Ubi coierint, & altera alteram tetigerit; id Manu prende, & dextra sinistra praecide. Ad Luxum aut Fracturam alliga, sanum fiet, & tamen quotidie cantato in alio, S. F. vel Luxato, vel hoc modo, buat, banat, huat, ista. Pista, fista, domiabo dannauftra, & luxato. Vel hoc modo, buat, haut, haut, ista, sis tar sis ardannabon dannauftra.*" *Cato de re rustica* Cap. 160.

Pliny also informs us, that *Cato* in his Practice made a great deal of Use of Cabbage, in which, as he observes, the whole Materia Medica of the *Romans* consisted for six hundred Years. This *Paracea* must undoubtedly appear ridiculous in our Days; but we shall be less surpris'd, that this People confided so much in a common Plant, if we call to mind the uncommon Esteem in which it was had among the most learned and skilful of the first *Greek* Physicians.

Plutarch observes, with regard to the Practice of *Cato*, that he did not approve of Abstinence for the Cure of Diseases, but recommended Herbs, and the Flesh of Ducks, Pigeons, and Hares. But this Author does not pay so profound a Veneration to the Physic of *Cato* as *Pliny* does; he observes on the contrary, that the Wife and Son of that *Roman* died before himself; adding at the same time, that if *Cato* lived to so great an Age, it was owing to the natural Goodness of his Constitution, and not the judicious and happy Choice of his Medicines. As *Plutarch* was a *Grecian*, he may possibly be suspected of being animated with too keen a Desire of revenging the Cause of the *Greek* Physicians; though, at the same time, what he asserts has very much the Air of Probability.

As for the Physic of the *Greeks*, 'tis not at all surpris'g, that the *Romans* should be unacquainted with it till the Arrival of *Archagathus* amongst them, since even in other Instances they were very late in cultivating the Sciences and liberal Arts. And tho' *Pliny*, in the Passage already quoted, affirms, that the *Romans* soon received the Arts; yet this is only to be understood of these mechanical Arts, which are absolutely necessary to human Life: "*Cicero* [*Tusculanar. Quæst. Lib. 1.*] informs us, that Poetry was not introduced among the *Romans* till very late, and that even Philosophy had been in great Disrepute till his Days. *Suetonius* also [*De illustrib. Grammaticis*] affirms, that Grammar was not at all in Use among the first *Romans*, much less was it esteemed and valued, because the People of these Days were as yet savage and unpollite, and so thoroughly addicted to the Business of War, that none apply'd themselves very much to the liberal Arts." But there cannot possibly be a more convincing Proof, that Learning made her Entrance into *Rome* very late, than *Cato's* Dread, lest she should make her Appearance in his Days, though he lived, as we have observed, seventy Years after *Archagathus*. Though the greater Part of this Article may seem to be a kind of Digression, yet, upon a closer View, the Whole will appear to have some Connection with the Life and History of *Archagathus*. Besides, 'tis fraught with so much Learning, and has such a direct Tendency to acquaint us with the State of Physic in *Rome*, that it will speak for its own Propriety. *Le Clerc. Histoire de la Médecine.*

ARCHALTES, or, according to *Rulandus*, ARCHATES. By this Word *Paracelsus* means the Foundations or Pillars of the Earth, because they do not seem to be sustained by one an-

other, but by the secret and wonderful Operation of God, *Rulandus. Castellus.*

ARCHANGELICA. See ANGELICA.

ARCHE, ἀρχή, a Beginning, has a Multiplicity of Meanings among Physicians, according to *Galen*. Sometimes, says he, it signifies the first Attack of a Disease without any Length of Time at all; sometimes it means the same continued, tho' but for a short Space. Besides these Significations, ἀρχή denotes the first Stage of the Distemper, the second being the *Anabasis*, ἀνάβασις, for Increase; the third the *Acme*, ἀκμή, "State or Height;" and the last the *Paracme*, παρακμή, "Declension." *Aetius* by the *Arche* of a Distemper understands the Beginning of the Patient's Decubiture. Again, *Galen* tells us, that *Hippocrates*, as well as other Physicians, use this Word to signify the Beginning of a periodical Distemper, on the first Day of the Transition from a healthy to a morbid State, which comes about again on the third or fifth Day in proportion to the Period: He says, moreover, that *Hippocrates*, and the ancient Physicians, meant by *Arche*, a Space of Time in the Beginning of a Disease which admitted of Help, whether by Bleeding, Clysters, &c. and that the *Arche* in a Hætic Fever was not circumscribed or limited by Days or Hours, as it was in other Distempers, but by the Quality of the Affection. In this Sense is *Arche* taken by *Tully*, when he writes to his Friend *Atticus*, *Avrogiā tua mihi valde molesta; medere, amabo, dum est ἀρχή.* "I am very much concern'd about your Difficulty of Urine; let me beg you to get it cur'd while it is recent."

ARCHEGONOS, ἀρχηγόνος, from ἀρχή, a Beginning, and γίνομαι, to be, or be produc'd. Primigenial.

ARCHENDA, a Powder prepar'd of the Leaves of the Egyptian Privet, called *Alcama*, or *Elhamma*, by the Natives, with which they plaster up their Feet after bathing, and wonderfully commend it against all Humidity, ill Smell, and Imbecillity of the Feet, on account of its astringent and strengthening Quality. See *ALCANNA*.

ARCHEUS is a Term introduced by *Paracelsus*, and defined by his Interpreter to be an invisible Species, vague, and separating itself from Bodies, the Physician's Power, and Nature's Virtue. *Paracelsus* says of it, That it is the Nature and Disposer of Things, *De Tartaro*; is the Separator of the Elements, *De Elemento Aquæ*; disposes and orders all Things in Nature, that every thing may be brought to the ultimate Matter of its Nature, i. e. *de Mineralibus*; is constituted to compound Things which ought to be united, *ibid.* and is the Destroyer of Bodies, *Chirurg.* that the Office of the *Archeus* in the Microcosm is to separate the Pure from the Impure, being the prime Operator in the Stomach, that prepares and distributes whatever we eat and drink, and employs the expulsive Powers in discharging the tartareous Recrements by the Intestines and Bladder; and as the *Archeus* of the Stomach is more or less perfect, so in proportion are the Separations of the Pure from the Impure, and of consequence the Microcosm is more or less subject to Disorders, *De Morbis Tartar.* that the great *Archeus* is the Distributor of the different Heats necessary for as many different Digestions according to the Nature of the Parts, *Modus Pharmacandi, Vol. 1. p. 815.* that there is a Virtue in Nature which is the *Archeus*, that disposes all things into their several Essences, separating one Thing from another, and furnishing Things with their proper Seeds, *Meteorum cap. 4. Vol. 2. p. 202.*

Van Helmont makes very frequent Use of this Word, and informs us, that the *Archeus* consists in a Connection of the vital Air, as Matter, with the seminal Form, which is the interior spiritual Nucleus, containing the Fecundity of the Seed, and of which the visible Seed is but the Pod. This *Archeus* is the Contriver and Director of Generation, investing itself with bodily Cloathing. In animate Beings it perambulates all the Recesses of the Seed, and transforms the Matter, according to the Entelechia of its own Image, here placing the Heart, and there the Brain; and to every Part assigning, out of its universal Monarchy, a Governor, according to its Exigency and final Use, which remains in his Office till Death; but the *Archeus* is always fluctuating, and never fix'd to any Member, but keeps a watchful Eye over every particular Governor of a Part, and is always clear and lively, but never idle. *Archeus Faber.*

By these Extracts we may perceive, that these Philosophers only meant Nature, by their *Archeus*.

ARCHIATER.

The Word *Archiater* or *Archiateros* has different Ideas affixed to it by different Persons: Thus *Chassaneus* imagin'd, that it imply'd no more than a Porter or Door-keeper of the Prince's Palace, as if one should say, *Princeps Atrii*; but this Conjecture is so absurd, that it in a manner confutes itself. *Accursus* has succeeded better in translating the Word *Archiater*, Prince or Chief of Physicians, as if one should say ἀρχὴς τῶν ιατρῶν.

This Opinion of *Accursus* was embraced by the ancient Translators of *Galen*, and some other learned Men, who rendered the *Greek* Word *Archiater* by the Latin ones, *Medicus primarius*. *Mercurialis* was the first who declared himself against this Explication of *Accursus*, and maintained that the Word *Archi-*

ater signified the *Physician of the Prince*, as if one should say, *τὸ ἀρχαῖος ἰατρός*. He endeavours to support his Opinion by this Reason, that the Word *Archiater* was never used by any Greek or Latin Author before the Days of the Roman Emperors. He even thinks, that this Word was not known till after the Reigns of *Tiberius* and *Claudius*, which is sufficiently prov'd by this Circumstance, that *Andromachus*, who lived under *Nero*, was the first who assum'd the Title of *Archiater*.

That Title, says *Mercurialis*, was not in Use before the Days of the Emperors, because the Thing imported by it had not as yet a Being; or in other Words, there could not possibly be Physicians to the Emperors, before the Emperors themselves were established. This is one Topic insisted upon by *Mercurialis*, in Defence of his Opinion; to which some may possibly reply, that the Kings or Sovereigns of other Countries might have also given the Name of *Archiatri* to their Physicians, if that Word signifies the *Physician of the Prince*. But one may retort this Argument, and say, that if the Word *Archiater* signifies the Prince or Chief of Physicians, the Greeks would not, in all Probability, have fail'd to bestow that Title upon *Hippocrates*, *Erasistratus*, and some others of their most eminent Physicians. Let this be as it will, 'tis an uncontroverted Fact, that the *Archiatri* were not so much as heard of before the Days of the Emperors.

Mercurialis adduces two Arguments more in Confirmation of his own Hypothesis: The first is, that *Andromachus* is not called simply *Archiater*, without any Mark of Distinction, but the *Archiater of Nero*. The second is, that if *Demetrius* and *Magnus*, who are called *Archiatri*, by the same Author who speaks of *Andromachus*, and had that Title bestowed on them under the Reigns of the *Antonini*, had not been the Physicians of these Emperors, then no Reason can be assigned, why they should have been called *Archiatri*, rather than *Archigenes*, *Soranus*, and several other Physicians, who flourish'd much about the same Time, and whose Names were sufficiently famous.

Alciatus embraces an Opinion, which seems to be a kind of Medium betwixt that of *Accursius* and *Mercurialis*; for he imagin'd, that the *Archiater* was in Reality the Prince of Physicians, because he was the *Physician of the Prince*, since the Man who bears that Character, is, for that very Reason, placed, in some measure, in a higher Sphere than other Physicians; but according to that Lawyer, it does not thence follow, that the Word *Archiater* is form'd of the Greek Words *τὸ ἀρχαῖος ἰατρός*.

These are the three different Opinions embraced with regard to the Meaning of the Word *Archiater*; for that of *Chassaneus* is of so trifling and diminutive a Nature, that it does not deserve a Place among the rest. I know not whether *Alciatus* has had any Abettors, but the Bulk of the learned World in general is divided between the Explications of *Accursius* and *Mercurialis*: Each has his respective Champions, and those too Men of Learning. The Opinion of *Mercurialis* is supported by *Cujacius*, *Zwinger*, *Casaubon*, *Mattius*, and *Vossius*; but notwithstanding the Authority of these great Men, *Meibomius* favours the Interpretation of *Accursius*, and adduces several Arguments in its Defence; the first of which is, that of all the several Greek Words which begin with *Archi*, such as *Architectus*, *Archiepiscopus*, *Architriclinus*, *Archilestes*, *Archireus*, not one denotes any thing pertaining or relating to the Prince, but that they all equally import something that is the first or most excellent of its Kind. Just so says *Meibomius*, the *Archiater* is not the *Physician of the Prince*, but the Prince or Chief of Physicians, otherwise this Word would be the only Exception from the Rule now mentioned. *Casaubon* had indeed pretended, that the Word *ἀρχιπλοῦς*, in a certain Passage quoted by him, denoted the Commander of the Ship in which the King sailed, and not the Commander of the whole Fleet. But *Meibomius* confutes that learned Critic with a great deal of Solidity and Judgment.

The second Argument adduc'd by *Meibomius*, in order to prove, that the *Archiater* was not the Physician of the Prince, is, that some Authors make mention of one *Theon*, and one *Glaucus*, *Archiaters* of *Alexandria*, and of one *Cyrus*, *Archiater* of *Edessa*: Now there were neither Kings nor Princes in these Cities, in the Times of these *Archiaters*. He draws another Proof from a Passage of *Oribasius*, where that Author says, That the Emperor *Julian* had called together all the *Archiatri* of the Country, and selected from their Number seventy-two of those whom he thought most learned, of which Number *Oribasius* himself was one; from which it follows, that the *Archiatri* were very numerous, and dispersed thro' all the Quarters of the Empire. But to this Argument of *Meibomius* it may be reply'd, that the Passage on which 'tis built is not to be met with in the Greek Copy of *Oribasius*. The fourth Argument adduced by this learned Physician is drawn from this, that *Galen*, or the Author of the Book intituled *De Theriaca*, when speaking of *Andromachus*, says, That his Skill in Medicine was very extensive; and that for that Reason the Emperor made Choice of him *ἀρχαῖον ἰατρίαν*, to preside over us, that is, over the Physicians; or, in other Words, to exercise the Office of *Archiater*, since he had the Title of it bestow'd on him. The fifth Argument ad-

duc'd by *Meibomius* in Defence of *Accursius*'s Interpretation, is, that *St. Augustine* calls *Æsculapius Archiater*, by which he undoubtedly meant no more than that he was the Chief of Physicians; and that *St. Jerom* gives the same Title to the Saviour of the World, which is just as much as if he had called *Jesus Christ* the sovereign Physician. *Meibomius* adds, that the Word *Archiater* is translated *Proto-medicus*, by the impure and barbarous Writers of the Latin Language; and says, that the Physicians of the Emperors were only simply call'd Physicians of *Cæsar*, or some Emperor, as appears by some Inscriptions; and that they never assum'd the Title of *Archiatri*, unless they belong'd to the Class of Physicians so call'd.

Godofredus on the other hand, favours the Opinion of *Mercurialis*, with regard to the Etymology of the Word *Archiater*. But he observes, that there were two Sorts of *Archiatri*, which *Mercurialis* had confounded with each other. The former Sort were called *Archiatri S. Palatii*, and according to *Godofredus*, were only employed in the Emperor's Court; whereas the latter Sort were only called simply *Archiatri*, or *Archiatri Populares*, and served the People in the Cities of *Rome* and *Constantinople*. These latter, continues this Author, were, as well as the former, called *Archiatri*, from the City in which they practis'd, just as if one should say *Principis Urbis Medici*, that is, the Physicians of the principal City, or of the City in which the Prince resides. The *Archiatri* of this last Sort were fourteen in Number, one for each of the Districts into which *Rome* was then divided. And as they had Salaries allowed them by the Public, and enjoyed several other Privileges and Immunities, which could not be claimed by other Subjects, they were obliged to visit all sick Persons without Distinction, gratis; for the original End and Design of their Establishment was to guard against the Losses, which the poorer Sort of the Roman Subjects might possibly sustain for want of Physicians.

All we know concerning the Salaries, the Privileges, and the Method of electing the *Archiatri*, is drawn from the several Laws relating to these Matters enacted by different Emperors, and from the Works of some Authors who lived at that Time; first then, from these Sources we find, that these *Archiatri* had Salaries either from the Prince or the People; and, that in Consequence of these Salaries, they were obliged to visit all Patients, whether rich or poor, without demanding any Fees, except what the Patient's Generosity should prompt him to bestow after his Cure was completed. Secondly, from these Laws it appears, that several Privileges were annexed to the Office of *Archiater*; that these Physicians themselves, their Wives and Children, were exempted from all the Taxes and Burdens of the Roman State; that such of them as resided in the Provinces, were neither obliged to quarter Soldiers, nor any other Persons whatever; that they could not be dragged to the Bar, nor obliged to make a personal Appearance before the Judge; that they could not be taken Prisoners; and that none durst insult them without incurring the strictest and severest Penalties. The Law indeed which ordains this, seems to extend these Privileges, and render them common to all the Physicians of the Roman State, or at least to some who were not among the Number of the *Archiatri*. But there is also another Law restraining these Privileges solely to the *Archiatri* of the Palace, and those of the City of *Rome*. Thirdly, from these Laws we may also gather, that the *Archiatri* served both the Emperors and the Public; and that those of them who were discharg'd, either on account of their having bore the Office during the allotted Time, or for some other Reason, were call'd *Exarchiatri*, or *Ex Archiatri*. Finally from these Laws, and the Writings of the Authors who liv'd in these Days, it appears, that there was a College of *Archiatri* composed of a certain Number of Physicians, who took their respective Places, according to the Dates of their Admission; so that when any of their Number died, the Person chosen to succeed him was lowest of all; and that this College judg'd of the Capacity of Candidates, and chose or rejected them accordingly; but that the Emperor confirm'd them after they were elected, or even nominated and propos'd them before, to the *Archiatri*; who afterwards examin'd them, and admitted them into their Number, if their Merit gave them a Title to that Honour.

The *Archiatri* of the Palace were honour'd with a Title somewhat equivalent to our Word *Earl*. This Earldom, *Comitiva*, as the Romans call'd it, was distinguish'd into the first and second Ranks, both which were obtain'd by the *Archiatri* of the Palace. Those who obtain'd the *Comitiva* of the first Order, went equal with *Dukes* and *Vicars*; and, it seems, these Dignities were at first common to several *Archiatri*, or that there were several of these Earls at one and the same time. But, under the Gothic Kings, a Revolution happen'd in this Body of Men; and instead of several *Archiatri*, there was one establish'd, who had a certain Jurisdiction not only over the rest, but also over the other Physicians of the State. The Power of this Earl of the *Archiatri* was very extensive, as we may learn from a Clause of the Formula of his Instalment, which runs thus: "Henceforth we confer upon you the Dignity of Earl of the *Archiatri*, that you alone may shine distinguish'd among the venerable

"Guardians

"Guardians of Health; and that all who shall have any Differences or Disputes, relating to Things of a medicinal Nature, may submit to your Arbitration, and acquiesce in your Decision: You shall be the universal *Arbiter* of the sacred Art of Physic, and the Judge of all those Controversies which were formerly decided by the Caprice of private Physicians. You will, in some Sense, cure the Sick, inasmuch as you will put an End to those Contests which embroil Physic, and consequently prove injurious to them: It is a remarkable Piece of Honour, that Men of Learning and Skill should pay a sincere Deference to your Decisions; and that you should have so rich a Tribute of Veneration from those, who are themselves venerable in the Eyes of the rest of Mankind." The same *Formula* subjoins, that this Head or Chief of the Physicians was particularly oblig'd to take care of the Emperor's Health; and that, for this very Reason, he had free Access to his Person at all Times. See *Cassiodori Formul. Archiatr. Le Clerc*.

I can't, upon this Occasion, forbear instituting the Comparison between the *Pope* and this Head of the *Archiatr*; only I look upon the latter as the more *noxious Animal* of the two: For the Infallibility and decisive Power of the former generally exert themselves upon Modes of Worship, and controverted Points of Divinity; things in which the true and genuine Happiness of Mankind is by no means interested: Whereas the irrevocable Decisions of the latter might tie the Practitioners of Physic down to Theories and Practices, which might depopulate Cities, lay waste Nations, and, in Process of Time, render the Earth itself a Desert. Thus, for Instance, if this *Pope* in Physic should decree, that every Physician should believe, that Fevers are caused by an *Inflammation of the Animal Spirits*, or from something deleterious residing amongst them; and, in consequence of this Doctrine, should ordain, that, in such Cases, Patients should be deny'd all cooling and diluting Liquors; and should be kept to a constant Use of heating Medicines, in order to expel this *imaginary Poison*, or drive out this *inflammatory Matter* by the Pores of the Skin; in this Case, Physic could no longer be esteem'd a salutary Art, since more must necessarily perish by such intended Means of Relief, than by all the Distempers which are naturally produced in the World.

This Word *Archiatr* has made such a Noise in Physic, that if I was to give an Account of every thing that has been said relating to it, I should present the World with several Volumes of critical, classical, and historical Learning: But that not being my Design, I hope I have fix'd the Meaning of the Word *Archiatr*, and given as satisfactory an Account of the *Archiatr* as my intended Brevity would permit.

ARCHIDOKA. The Title of a Chymical Work of *Paracelsus*, which *Libavius* explains *magical*. *Castellus*.

ARCHIGENES. A celebrated Physician among the Antients.

We are inform'd by *Suidas*, that *Archigenes* lived under the Emperor *Trajan*, practis'd Physic at *Rome*, and died in the sixty-third Year of his Age, after having written a great deal on physical and medicinal Subjects. The same Author adds, that he was a Native of *Apamea* in *Syria*, and that his Father's Name was *Philip*; which may possibly have laid a Foundation for the Mistake of *Wolfgangus Justus*, who makes *Archigenes* Physician to *Philip* King of *Syria*.

But *Archigenes* must have not only lived under, but also survived *Adrian*, if it was he who directed that Emperor to a certain Place under his Breast, as most proper to be wounded, in order to procure a speedy Death. *Dion Cassius*, indeed, ascribes this Affair to one *Hermogenes*; but *Mercurialis* is of Opinion, that the Name ought to be read *Archigenes*, and not *Hermogenes*. However, I don't know but *Mercurialis* may be mistaken in this; for we read of one *Hermogenes*, a Follower of *Erasistratus*, and there is nothing to hinder his living in the Days of *Adrian*, since the Sect or School of *Erasistratus* was in Being till a great while after that Time. It also appears, that *Galen* speaks of this same *Hermogenes*, as of one who had not lived a great while before him. Now *Galen* was born under the Emperor *Adrian*. As for that other *Hermogenes*, against whom *Lucilius* made this Epigram, he must have been considerably older.

Ερμώγεμν ἢ ἰατρὸν ἰδὼν Διόφαντος ἐν ὕπνῳ,
Οὐκέτ' ἀννέειπεν, ὅς περ ἄμμιμα φίλων.

That is:

Diophantes, happening to see the Physician Hermogenes in a DREAM, never awaked after; even tho' he wore a PRESERVATIVE about him.

Martial, who imitated this Epigram, attributes the same destructive Influence to another Physician, whom he calls *Hermocrates*; but this, as well as the former Name, may possibly be fictitious. *Martial's* Performance, tho' far short of the Spirit and Pungency of that of *Lucilius*, has nevertheless enough of the Epigram about it to deserve the Name of a masterly Production. It runs thus:

Lotus nobiscum est hilaris, cœnavit & idem;
Inventus mane est mortuus Andragoras.
Tam subitæ mortis causam, Faustine, requiris?
In somnis medicum viderat Hermocratem.

Andragoras sup'd in good Health; but next Morning was found dead. If, *Faustinus*, you should ask the Cause of so sudden a Death, I tell you, he had the Misfortune to see *Hermocrates* in a Dream.

But to return to *Archigenes*; he must certainly be the Physician meant by *Juvenal*, *Sat. 6. l. 236.* in these Words:

----- Tunc corpore sano
Advocat Archigenem, onerosaq; pallia jactat
Quot Themison ægras. -----

From which Passage the Scholiast observes, that *Archigenes* was a very noted Physician of these Days.

And again, *Sat. 13. l. 98.*

Nec dubitet Ladas, si non eget Anticyra, nec
Archigene. -----

And in *Sat. 14. l. 52.*

Ocyus Archigenem quære, atq; eme quod Mithridatis
Composuit. -----

Now as *Juvenal* lived till the twelfth Year of *Adrian's* Reign, he must have been contemporary with *Archigenes*; and the Manner in which he speaks of him, imports, that he was a Physician of great Employment.

But *Juvenal* is not the only Author who establishes the Character and Reputation of *Archigenes*: He has *Galen* also on his Side, whose Suffrage is of the more Importance, as he himself was a Physician, and not very profuse of his Encomiums on People who differ'd from his own Sentiments. "*Archigenes*," says he, [*De Locis Affect. Lib. 2. Cap. 6.*] has taught as well, and with as much Care, as any other, all that relates to the Art of Physic; and this renders all his Writings, which are very numerous, justly valuable. But notwithstanding this, he is not, in every respect, free from Errors; and as he did not hesitate to censure those who went before him, even tho' he received a great deal of Advantage by their Labours; so we hope none will take it amiss, if we, who come after him, treat him as he treated others. It is very difficult, continues *Galen*, for Men not to err on certain Occasions, either by being entirely ignorant of certain things, or by not judging of them as we ought; or by writing sometimes in a too negligent and less accurate manner."

It appears somewhat contradictory, that *Archigenes* should be rank'd among the *Elective*, and among the *Pneumatic* Sect, at one and the same time; but to this I answer, that if *Archigenes* is rank'd among the *Pneumatics*, or if he embraces the Sentiments of *Athenæus*, this does not hinder him from being at Liberty to chuse what he thought best, from among the other Sects. And tho' he, perhaps, acknowledged the same Causes of Diseases with the *Dogmatic* and *Pneumatic* Sects, yet 'tis possible, that to these Causes he may have join'd that which the *Pneumatics* thought of the greatest Importance, which is their *Spirit*; and might, for this Reason, have been inroll'd in the *Pneumatic* Sect. However this be, the Author of the Introduction places *Archigenes* not only in the *Elective*, but also in the *Pneumatic* Sect; and *Galen* himself, who no-where speaks of the former of these Sects, observes, that *Archigenes* was of the same Sect with *Athenæus*, who was a *Pneumatic*. *Le Clerc Histoire de la Médecine*.

ARCHIGENI MORBI. Acute Diseases, so call'd from ἀρχή, the Chief, and γίνομαι, to be; because they hold the principal Rank among Diseases. *Blancard*.

ARCHIMAGIA. Chymistry, which, being the Art of making Gold and Silver, deserves this high Title. *Castellus*.

ARCHIMEDIS TRISPASTUM. The same as **APELLIDIS TRISPASTUM**, which see.

ARCHIMIA differs from *Alchimia*, being, in particular, the Art of changing imperfect Metals into those which are more perfect. *Castellus*.

ARCHOS, ἀρχός. The Anus. It is also taken for the *Intestinum Rectum*, as if it were the primary or chief Intestine. Thus, *Aph. 58. Lib. 5. & Lib. de Fistulis*, ἀρχός φλεγμαίνων, means an Inflammation of the *Intestinum Rectum*, according to that Exposition of *Galen*, ἀρχὸν μὲν ἐν λέγων τὸ ὅλον ἀπευδυσμένον, "calling the whole *Intestinum Rectum* by the Name of "*Archos*." And, *Lib. de Art.* by ἀρχὴ τὸ χαλαρὸν, "the "*Laxity* of the *Rectum*," is understood the *lax Part*, which adheres to the *Os Sacrum*, excluding the Constrictory Muscle call'd the *Sphincter*; and the same is meant, in *Lib. de Moch.* by ἀρχὴ τὸ ἐγκεκλιμένον, "the inclining Part of the *Rectum*."

ARCION,

ARCION, ἀρκεον. The Burdock. See BARDANA.

ARCOS. Burnt Copper. *Rulandus*.

ARCTATIO, ἄρκτησις or συμπέλησις, from ἄρκτη or συμπέλησις, of πέλας, near. A Straightness; in particular, it is apply'd to the Intestines constricted from an Inflammation, and to a preternatural Straightness of the *Muliebri Pudendum*, or *Uterus*. It is also call'd *Arctitudo*.

Arctata Pars, in *Scribonius Largus*, No. 206. is an Expression to signify the Part compress'd or closed by a Fibula.

ARCTION, ἀρκεσιον. Woolly-headed Burdock. See BARDANA.

ARCTOS. The Constellation call'd the URSA MAJOR.

ARCTOSCORDERON, ἀρκτοσκορδον, from ἀρκτος, a Bear, and σκορδον, Garlick. A sort of Garlick call'd Bear-garlick.

ARCTOSTAPHYLOS, ἀρκτοστάφυλος, from ἀρκτος, and σταφύλη, a Grape. *Uva Urvi*, or *Spanish Whortles*. See VACCINIUM.

ARCTURUS, ἀρκτουρος, from ἀρκτος, and ἔρως, a Keeper, in *Erotian* upon *Hippocrates* is expounded, "Ὁν ἵππες ἀρκτοφύλακα προσκαγορεύουσιν, ἕρως γὰρ οἱ φύλακες καλοῦνται ἐστὶ δὲ ἔρως λαμπρὸς ἀστὴρ ἐν τῇ ζώνῃ πρὸς βοῶντι καί μεν." "Which some call *Arctophylax*, (the Keeper of the Bear) for Keepers are call'd *Uri*: It is a bright Star in *Bootes's Belt*." *Hippocr. Lib. 1. Epidem.* Περὶ ἀρκτουρος ἐλπίων, καὶ ἐκ' ἀρκτουρος, &c. "A little before, and at the (Heliacal) Rising of *Arcturus*," &c.

Others derive the Word from ἀρκτος, and ἄρνη, a Tail; and make *Arcturus* a Star in the Tail of the great Bear, of which *Aratus*, as translated by *Tully*:

*Huic autem subter Præcordia fixa videtur
Stella micans radiis Arcturus nomine claro.*

Arcturus rises about our second of September; and sets October the twenty-ninth, as mark'd in the Calendar.

ARCTURUS *Creticus Belli*. See BLATTARIA.

ARCUALIA OSSA, according to some, are the Bones of the *Sinciput*; others take them for the Temple-bones.

Arcualis Sutura is the same as the *Coronalis*. See SUTURA.

ARCUATIO, according to some, is a Gibbosity of the Fore-parts, with a Curvation of the Bones of the *Sternum*. *Castellus*.

ARCUATUS MORBUS. The same as *Arquatus Morbus*, or *ICTERUS*, which see.

ARCULÆ, ἀρκελίδες. The Caverns in which the Eyes are situated. *Ruf. Ephes.*

ARDABAR. A Species of *Arum*. See ARUM.

ARDAS, ARDALOS, ἀρδας, ἀρδαλος, according to *Galen* and *Erotian*, are the same as ῥύπος and μολυσμός; that is, *Sordes* and *Filth*.

ARDEA, Offic. *Schrod.* 5. 315. *Ardea cinerea*, *Mer. Pin.* 181. *Pella* & *Ardea*, *Bellon. des Oyse.* 190. *Ardea cinerea major*, *Raii Synop. A.* 98. *Aldrov. Ornith.* 3. 377. *Charlt. Exer.* 109. *Jonf. de Avib.* 103. *Ardea pulla sive cinerea*, *Gesn. de Avib.* 186. *Ardea cinerea sive pulla*, *Raii Ornith.* 277. *Will. Ornith.* 203. THE HERON.

This Bird is too well known to require a Description. The Fat is recommended for asswaging the Pains of the Gout; for taking off Specks from the Eye, and clearing the Sight; and for curing Deafness, if put into the Ear. *Dale*.

The young Herons are sometimes used as Food; but on account of their Aliment, which is Fish, their Salts must be highly exalted, and their Flesh rank.

ARDEA STELLARIS.

Asterias, Offic. *Ardea Stellaris*, *Mer. Pin.* 181. *Will. Ornith.* 207. *Raii Ornith.* 282. *Ejusd. Synop. A.* 100. *Charlt. Exer.* 110. *Ardea stellaris major*, *Aldrov. Ornith.* 3. 408. *Gesn. de Avib.* 193. *Jonf. de Avib.* 104. *Butor*, *Bellon. des Oyse.* 192. THE BITTERN, or MIRE-DRUM.

The Skin and Feathers of this Bird, if burnt, are said to stop Hæmorrhages.

These Birds are sometimes eaten; but the Flesh is very rank, and their Salts must be much exalted on account of their Food.

ARDENS FEBRIS, from *ardeo*, to burn. A burning Fever. The same as CAUSUS, which see.

ARDENTIA, are Things unfit to be eaten or drank, being of a Nature obnoxious to Combustion, as *Carabe* (Amber), Turpentine, Jet, and the like. *Rulandus*.

ARDESIA. *Hardesia vulgaris*, sive *Ardesia*, *Ind. Med.* 57. *Lapides scissiles*, & *crustosi*, *Mer. Pin.* 212. SLATES.

I do not know why *Dale* has inserted these among the *Materia Medica*, as, he says, he finds no Virtues attributed to them.

ARDOR URINÆ. See DYSURIA.

ARE-ALU. A sort of Indian Fig. See FIGUS.

AREA, according to *Rulandus*, is the Mass dug from the Mines, or the Place whence it is digg'd. In Medicine it is a Species of ALPECIA, which see.

ARECA. THE INDIAN NUT, Offic. *Areca sive Fausel*, THE DRUNKEN DATE-TREE, Ger. *Sive Fausel avellana Indiana versicolor*, THE DISCOLOUR'D SMALL INDIAN NUT, Park.

VOL. I.

This is the Fruit of a kind of Palm-tree, that grows in the *East-Indies*. The outward Coat, or Covering, is about the Bigness and Shape of a Pullet's Egg, and is made up of numerous fine Threads or Filaments, running lengthways from the Stalk to the Head; under which is contain'd the Fruit or Nut, of a brown Colour on the Outside, in Shape like a Nutmeg at one End, but flattish at the other, with a kind of Navel towards one Side; within, it is white, and marbled like a Nutmeg, with purplish Veins of very little Taste.

This Fruit is a kind of Cocoa-nut, containing a woody Kernel, inclosed by two different Substances. The *Indians* chew the *Areca*, roll'd up in a Bitel-leaf, to help Digestion, and to strengthen the Gums, as *Kæmpfer* relates. When fresh, it is a little astringent; and of this Fruit the Extract is made, which in our Shops is call'd *Terra Japonica*. To this Extract they sometimes join that of another Plant named *Lycium*, and also calcin'd Shells. *Geoffrey*. See CATECHU.

AREFACTIO, ἄρρωσις. An Exsiccation, or Drying. It is a way of preparing such Medicines as are redundant in Moisture, in order to their being reduced to a Powder. *Castellus*.

AREMAROS, Cinnabar. *Rulandus*.

ARENA MARIS, Offic. *Arena marina*, *Kentm.* 57. *Arena litoral*, *Mer. Pin.* 211. *Matth.* 1390. SEA-SAND.

Sea-sand dries up the redundant Moisture in Hydropic Constitutions, if the Patient lies cover'd with it as far as the Head. It is sometimes heated, and applied by way of dry Fomentation, instead of Salt or Miller. *Dioscorides*, *Lib. 5. Cap.* 167.

ARENAMEN, ARENARMEI, Bole Armoniac. *Ruland. Johnson*.

ARENARIA. A Species of *Coronopus*, so call'd, because it delights in sandy Places. *Blancard*.

ARENATIO, or SABURRATIO, is casting Plenty of very hot Sea-sand, or, for want thereof, of River-sand, upon the Bodies of the Patients. *Castellus*.

AREOLA is the Circle surrounding the Nipple. See MAMMÆ.

ARES. A Word coin'd by *Paracelsus*, by which he would have us understand the secret Disposer of Nature in the three Principles, whereof every thing consists, who gives it a Form, Species, and Substance, peculiar to it, whereby it is distinguish'd from others. We may here observe, say the Alchymists, the Difference between these three Things, which the Divinity has constituted in Nature. The *Iliastes* is a Substance of the most general Kind, consisting in the first universal Matter of all Things: The *Archeus*, the first Disposer of Nature, distributes this Matter into three Kinds, which are Sulphur, Mercury, and Salt; and thence reduces all Things into their Species. At last comes the *Ares*, another Disposer of Nature, and produces Forms to every Kind, and distributes Species into Individuals. *Johnson*.

Ares is distinguish'd by *Paracelsus* into the *Archeic*, which is natural, and the *Chymic*, which is artificial. Hither also may be refer'd the *Melosophicum*, the Principle of Transmutation, call'd also the *Salamandrine Essence*, such as is ascrib'd to the Philosopher's Stone. *Paracels. de Vit. Long. Lib. 3. Cap.* 12. and *Lib. 4. Cap.* 6.

ARESTA BOVIS. The same as ANONIS, which see.

ARETÆUS. *Le Clerc*, an Author of profound Learning, and singular Penetration, has set the Sentiments and Character of *Aretæus* in a very just Light.

Aretæus is an Author of so uncommon a Character and Reputation, that we should do a manifest Injury both to him and to the World, if, on this Occasion, we should neglect to inquire into the Sect to which he belong'd, and the Time at which he lived; and this Task will at once prove curious and useful, since, as we go along, we shall have Occasion to mention some Circumstances, that place the Sentiments and Practice of *Aretæus* in a clearer Light, than possibly most People are able to view them in without this Assistance.

As to the Sect, then, to which this Physician belonged, there is not perhaps a single Point in the whole History of Physic, that has been either more mistaken, or less adverted to; for *Castellanus*, who writes a small Abridgment of the Lives of the ancient Physicians, expressly affirms, that *Aretæus* was attached to no particular Sect whatever. Something more accurate and explicit might have been expected from *Henischius*, a Physician of *Ausburg*, who wrote Commentaries upon *Aretæus*; but he declares himself of the same Opinion with *Castellanus*, and all along discovers such a Fund of Prejudice and Partiality, that one would be tempted to think he had written his Commentaries with no other View than to misrepresent *Aretæus*, and make him say things he never so much as thought of. Instead of explaining the difficult Passages of his Author, he endeavours to supply the Defects of the Text in such a manner as to speak his own or *Galen's* Sentiments, and not those of *Aretæus*. And, what is still more surprizing, *Hieronymus Mercurialis*, who was so thoroughly acquainted with the Writings of the ancient Physicians, and who had undoubtedly read *Aretæus*, as appears from several Passages in his Works, forgets to take Notice of the

Señt to which this Physician belonged. But notwithstanding the Uncertainty this Point has hitherto laboured under, I shall venture to pronounce, that *Aretæus* was an Abettor of the Pneumatic Señt; and, my Reasons for thinking so, are these:

'Tis well known, that the Pneumatic Señt established a fifth Element, which they called *Spirit*, the Changes and Alterations of which, according to them, laid the Foundations of various Diseases. Now 'tis plain, that *Aretæus* means this same *Spirit*, when he says, that "there are two Sorts of Quinsies, the one caused by an Inflammation of the Instruments of Respiration, of the Amygdalæ, Epiglottis, Pharynx, Uvula, and superior Part of the Aspera Arteria; and the other proceeding from a Disorder of the *Spirit*, which is itself the immediate Cause of this Distemper. In the latter of these Quinsies, adds our Author, the Instruments of Respiration are so far from being distended, that they are rather more contracted than in their natural State; and yet the Suffocation and Difficulty of Breathing are far greater than in the former; for which Reason, those who labour under it, imagine that they have a latent Inflammation in the very Middle of their Lungs, and in the Parts adjacent to their Heart. As for my share, continues he, I am of Opinion, that it is the *Spirit* alone which is affected, and which by an unhappy Change is become very hot and dry, but that there is no Phlegmon or Inflammation in any Part whatever." *Aretæus* confirms his Opinion, by an Example drawn from the Exhalations which arise from the *Charonian Pits*, which in a Moment suffocate those who are exposed to them, though they should happen to be in a State of perfect Health immediately before. He also confirms it by an Instance drawn from the Breath of mad Dogs, which, as he affirms, kills those who receive it, though they have not been bit by the Dogs themselves. From these Examples he concludes, "That a Change, with regard to Respiration, may be produced by internal Causes, which bear an Analogy and Resemblance to such as are external; that, in like manner, there are sometimes Humours in our Bodies, which partake of the Nature of Poisons, as much as external Substances which come under that Denomination; and that we may observe natural Distempers accompanied with the same Symptoms as those produced by Poisons; and Patients vomit the same kind of Matter in Fevers, which others do upon taking Poisons: For which Reason, continues our Author, we ought not to be surprised, if the *Athenians*, who were ignorant of the Analogy between the Effects of certain Poisons, and those of certain pestilential Diseases, imagined that they were afflicted with Distempers of that Nature, because the Inhabitants of the *Peloponnesus*, with whom they were at War, had poisoned the Wells of the *Piræus*."

From these Passages we may infer, that by the Word *Spirit*, *Aretæus* meant no more than the Matter of Respiration; and he seems to confirm that Point in another Passage, where he says, that the Coldness and Humidity of the *Spirit* are the Cause of an *Asthma*: But it is not in these Cases alone, according to *Aretæus*, that the *Spirit* contributes to the Production of Diseases; for the *Iliac Passion* is, in his Opinion, produced by a cold and slow *Spirit*, which cannot easily discharge itself either upwards or downwards. In a Scirrhus of the Spleen, the Belly, says he, is filled with a thick and dark *Spirit*, which seems to be humid, though it is not really so. In a Dropsy called a *Tympanites*, our Author acknowledges a *Spirit* which does not change its Situation, though the Part which includes it, moves upwards and downwards; and adds, that if this *Spirit* is changed into Water or Vapour, the *Tympanites* is changed into an *Ascites*. He asserts in another Passage, that the Smell or Vapour of the Poppy thickens the dry and subtle *Spirit* of Phrenetic Patients. In short, *Aretæus* insists so much on the *Spirit* established as a fifth Element by the Pneumatics, that we have no Reason to doubt of his being a professed Abettor of that Señt.

And even though this should be denied, a great many other Circumstances concur to prove, that *Aretæus* was a real Pneumatic; for 'tis past all Dispute, that the Physicians of that Señt asserted, that Fire, Air, Earth, and Water, were not real Elements; but that the Name of Element rather belonged to the Qualities of which these Bodies were possessed, or to Heat, Cold, Dryness, and Humidity: Now, that *Aretæus* was of the same Sentiment, is plain from a great Number of Passages in his Works.

It must be own'd, that in some Cases the Sentiments of *Aretæus* coincided with those of the Methodic Señt; for though other Physicians acknowledged a Difference between acute and chronical Disorders, yet those of the Methodic Señt first wrote of them separately and apart: Now, that *Aretæus* followed them in this Particular, is plain from his having written four Books upon acute, and as many upon chronical Distempers.

This is not the only Point in which he seems to follow them; for, in Imitation of them, he gives very particular Directions with regard to the Chamber in which Patients, labouring under certain Disorders, should be lodged. He likewise specifies the

Air the Patient ought to breathe, the Bed on which he should lie, and the Manner in which he is to be covered. He also imitates them in recommending all the different Exercises they used to prescribe towards the Termination of Diseases, such as Walking, the different Manners of Gestation, the Exercise of the Voice in Vociferation, or talking loud, and the throwing of the Coit, or other weighty Machines, used for the same Purpose. He also orders a certain Gesticulation of the Hands, which he calls *Chironomia*. Now all these are the professed Tenets of the Methodic Señt. *Aretæus* indeed in one Instance carries the Point of Exercise farther, and advises those who are subject to Vertigos to behave as Prize-fighters do, that is, to beat each other soundly with their Fists. 'Tis no easy matter to comprehend his Meaning by this Advice. *Mercurialis* supposes, that it is a Fault in the Text; which is not improbable, since we can scarce suppose such a Treatment proper for vertiginous People, who are incommoded and rendered worse by the least Noise or Motion. Besides, *Aretæus* had this in common with the Methodic Señt, that he ascribed a great deal to Topics, or external Applications, such as Fomentations, Cataplasms, and Unctions.

Tho' *Aretæus* agreed with the Methodic Señt in the above-mentioned Particulars, yet on other Occasions he argued from quite different Principles, and prescribed Remedies that were openly disapproved of by *Thessalus* and *Soranus*, who were avowed Favourers of the Methodic Señt: For Instance, he orders Purgations, and the Composition called *Hiera*, was what he most used, and most confided in. He also on some Occasions prescribed simple Purgatives, such as the Fecula of wild Cucumbers, Bastard Saffron, and Hellebore. He no less remarkably opposed the Methodic Señt, in venturing on certain Occasions to prescribe acrid and irritating Clysters.

He also used Castor on several Occasions, which the Methodic Señt never did; and, in direct Opposition to them, prescribed Narcotic Medicines, such as Opium and the Poppy. But his Practice with regard to the Use of these was not rash and unguarded, as appears from the important Caution he gives in these Words: "'Tis sometimes necessary, says he, to administer *somniferous Medicines* to such as labour under Peripneumonies, or are afflicted with long Watchings, lest they should become furious, and in order to mitigate and allay their Disorder and Inquietude. But we must beware of using Medicines of this Nature, when the Patients are in Danger of being suffocated with a Defluxion of Humours, or are thought to be on the very Verge of Death, because in these Cases the Physician runs a Risk of being censured for killing the Patient."

Our Author's Practice, with regard to letting Blood, was also very different from that of the Methodic Señt; for in Apoplexies he observed, that taking away too much Blood killed the Patient, and that taking too small a Quantity produced no Effect at all: He was nevertheless of Opinion, that it was most proper to take little at a time, and to repeat the Operation frequently. In a Quinsy, he used Venesection, and allowed the Blood to flow till the Patient was ready to faint away. In Vomitings of Blood proceeding from whatever Cause, he universally recommended Venesection: "For, says he, whether this Discharge of Blood is the Consequence of a Vessel's being broken, or corroded by the acrid Quality of the Blood, Venesection is still very useful; and if this Accident proceeds from the Thinness of the Vessels, Phlebotomy prevents their being burst, in Consequence of their being over-full. We must also take care," continues he, "not to allow the Orifice made in the Vein of the Arm to agglutinate and close up, that we may the more commodiously take away a little Blood at different times for several Days running; a small Quantity must be taken at a time; but the Operation must be repeated the same Day, the following, the third, and the fourth, if the Patient's Strength is not too much exhausted." Some Physicians, in the Days of *Aretæus*, used in Vomitings of Blood to open the Veins of the Hand; but he entirely disapproves of that Practice: "For, says he, why would you rather open a Vein near the Fingers than in the Place where the Elbow bends, since, in the latter, the Vein is larger, and better disposed for an Evacuation of the Blood?" In that Species of continued burning Fevers, called *Causus*, from a Greek Word which signifies to burn, our Author also orders to take away a great deal of Blood, though at different times, and during several Days. We must likewise observe, that he imagined Fevers of this Kind to proceed from a Phlegmon or Inflammation, properly so called, of the Trunk of the *Vena Cava*, or that of the great Artery. But what is surprising is, that the People of his Age imagined, that Patients labouring under that Species of Fever called *Causus* predicted future Events; and that they talked or carried on Correspondences with the Dead. *Aretæus* seems to have been convinced of this himself, since he endeavours to account for it by saying, that the Heat of the Fever having consumed the thicker and more gross Parts of the Humours, the Soul is by that means rendered more pure; and enabled to see things it did not formerly perceive.

ceive. This Opinion seems to have been originally broached by some weak and superstitious Trifler, who listened to the incoherent Reveries of Patients of this Kind, and endeavoured to find out a Sense and Meaning in them. In acute Pains, and Inflammations of the Kidneys caused by the Stone, *Aretæus* prescribed the taking away a great Quantity of Blood, in order to relax the Passage in which the Stone was lodged, and allay the Inflammation of the Parts, which, he said, were compressed or bound up with a kind of Ligature, which could not be resolved by any other Means than by evacuating the Veins.

Aretæus did not confine Venesection to the Arm alone; for he ordered Bleeding in the Forehead, for such as laboured under violent Head-achs, and took about nine Ounces of Blood from that Part, having first blooded the Patient in the Arms.

For the same Disorder he prescribed Bleeding in the Veins, that are situated in the Inside of the Nose, by means of certain Instruments, one of which he calls *κασίδας*, and the other *σοφύμ*. If none of those Instruments can be had, he orders the Barrel of a Goose's Quill, cut at one End like the Teeth of a Saw, to be passed into the Nostrils almost as far as the Os Ethmoides, and to be moved in such a manner with the Hands, as to procure a Discharge of Blood. In an Elephantiasis, of which he gives a very exact Description, he orders Venesection in both Arms, and both Feet, in one and the same Day.

Aretæus in his Practice made use of Vomits, for which Purpose he sometimes recommends the bulbous Part of a Species of *Narcissus*; but confided more in the Efficacy of *White Hellebore*, of which he talks in this Strain: "*White Hellebore*, says he, not only excites Vomitings, but is also the most efficacious and powerful of all purgative Medicines, not with regard to the Quantity and Variety of the Excrements of which it occasions a Discharge; for in the Disease called *Cholera*, the Excrements come away in the same manner: Neither is its Efficacy owing to the Efforts it occasions, or the Violence with which it excites Vomitings, since Nauseas, and Sailing on the Sea, operate with still greater Violence; but its Excellence is owing to a particular Virtue which cannot be sufficiently admired, since, even in the Cases where it purges very little, it nevertheless cures the Patients who use it. Besides, in Diseases of long standing, when other Medicines have proved too weak, it is the only one which operates with Effect. In a word, white Hellebore resembles Fire; for what Fire produces by burning or inflaming, white Hellebore produces more effectually, by penetrating into all the Parts of the human Body. It renders Respiration easy to those who breathe with Difficulty; it restores a fresh Colour to those who were pale, and Fatness to those who were lean and emaciated."

The Manner in which *Aretæus* used *Cantharides*, ought not to be forgot. The Abettors of the Methodic Sect, and even most of the ancient Physicians used Medicines, to which they gave the Name of *Metasyncretical*, in order to draw Humours from the Centre to the Circumference of the Body; for this Purpose they employ'd *Mustard*, or the Plant called the *deadly Carrot*. This was also a Part of *Aretæus*'s Practice; but he likewise used *Cantharides*, in order to attract more powerfully, and raise Blisters on the Skin, which might be full of an acrid and hot Water, and might, in due time, discharge themselves, to the no small Relief of the Patient. This Species of Remedy is in our Days call'd a *Vesicatory*; and I cannot find, that before his Time this Remedy was used by any of the Physicians; or, at least, that *Cantharides* were employ'd for that Purpose by any except *Archigenes*, who was of the same Sect with *Aretæus*, and in all Probability liv'd some time before him.

The Knowledge the Antients had of the Effects produced by *Cantharides* on the urinary Ducts, was probably the Reason why they look'd upon that Insect or Fly as very venomous, and a Species of Poison, which prevented their using them as a Medicine, except on some particular Occasions. Thus, according to *Galen*, "they were mix'd with those Plaisters which were design'd for making distemp'rd Nails fall off; and the Powder of *Cantharides* was used in Medicines against the Leprosy and Itch, and in the Preparations design'd for consuming and rotting the Flesh. He adds, that *Cantharides* were us'd internally, in order to provoke a Discharge of Urine; but that great Precaution, both with regard to the Quantity and Method of Preparation, was absolutely necessary, lest they should prove hurtful."

Aretæus, in Epilepsies, proposes Frictions of the Head with *Cantharides*; and when treating of the Head-ach, he also mentions those Remedies which excite Blisters on the Skin, tho' in that Passage he does not specify *Cantharides*. But as *Archigenes* employ'd them on these Occasions, 'tis not improbable but *Aretæus* might do the same.

Archigenes is by *Actius* represented as speaking in this manner: "We use, says he, a Cataplasm, into whose Composition *Cantharides* enter, and which produces wonderful Effects, provided the little Ulcers it excites remain sufficiently long open, and run sufficiently freely. But the Bladder

"in the mean time must be guarded and defended by the Use of Milk, both internally and externally."

Aretæus was no less remarkable for his singular Modesty, than for the Extent of his Skill and Knowledge: Of this we have a remarkable Instance, in what he says concerning a particular Species of Dropsy, of which other Physicians have made no Mention. "There is, says he, a Species of Dropsy form'd by a great Number of Bladders full of Water, and lodg'd in the Place where the Dropsy Ascites has its Seat [that is, in the lower Belly]. Each of these Vessels is very full; and if we pierce the lower Belly with an Instrument proper for that Purpose, the first of these Bladders which occurs discharges its Contents, but afterwards contracts itself; and if we want, that more Water should be discharged, we must pass the Instrument deeper [in order to pierce others of the Bladders]. Some, says he, affirm, that these Bladders proceed from the Intestines; but for this I have not the Testimony of my own Eyes, and consequently can say nothing concerning it."

Aretæus gives also an Account of another Disease, of a no less singular and uncommon Nature. "There is, says he, a Species of Madness, in which the Patients, prompted by a Principle of Superstition, tear their Bodies, and cut their Flesh, imagining that by these means they render themselves dearer to the Gods they serve, and that these Gods exacted such Things at their Hands. This Species of Madness only takes Place with regard to this Opinion, or religious Sentiment, and the Patients are sensible enough in other respects: They are roused or restored to themselves by the Sound of the Flute, or other Amusements, or by being made drunk, or by Peoples making Remonstrances to them. This is a divine Fury, and, when the Patients are freed from it, they are of a gay and cheerful Humour, believing themselves to be initiated in the Service of the particular God under whose Influence it was pretended they were. Besides, they are pale and ghastly, and their Bodies remain for a long time weaken'd by the Wounds they have inflicted on themselves."

As this is not a proper Occasion for entering upon the Anatomy of *Aretæus*, I shall only take Notice of one Instance of his Conduct in this particular, which is, that he generally begins his Chapters by a short Anatomical Description of the Parts whose Disorders he intends to treat of in the Sequel of the Chapter.

Thus it appears, that *Aretæus* was a very exact and skilful Practitioner, and his Remedies powerful and well-chosen, tho' at the same time it must be own'd, that his Reasoning on Points of Theory was sometimes none of the most conclusive: However, as it does not appear, that it had any great Influence on his Practice, his Success, as a Physician, was not on that account the less considerable.

It now remains, that we fix the particular Time at which *Aretæus* liv'd; a Point which no one has hitherto clear'd up in a satisfactory manner. Some Authors will have him to be after *Galen*, and others will have him to be much more antient. The Opinion of the former is supported on this, that *Galen* does not quote *Aretæus*. But besides this Circumstance of our not having all the Works of *Galen*, it may be answer'd, That it is not possible he should quote all the Physicians who liv'd before him: It was sufficient, that he mention'd the principal Men of each Sect, and spoke, for Instance, of *Athenæus* and *Archigenes*, who were the first and most celebrated of the Pneumatic Sect: Besides, *Galen* might have possibly not cited *Aretæus*, because they might have both liv'd at one and the same Time; so that the Argument drawn from *Galen*'s Silence, with regard to *Aretæus*, proves nothing either one way or the other.

Vossius, who is among the Number of those who believe *Aretæus* much more antient, supports his Conjecture upon this Circumstance alone, That this Physician wrote in the *Ionic Dialect*, which, according to that learned Critic, was in Disuse as well as the *Doric*, long before the *Cæsars*; these two Dialects being never us'd, except when Greece flourish'd. But in this last Assertion, *Vossius* is mistaken, as Mr. Menage [in *Amœnitatibus Juris*] proves by one of the Books of *Arrian*, intitled *Indica*, which is written in the *Ionic Dialect*, and by two other Books written in the same Dialect; the one by an Author call'd *Cephalio* or *Cephala*, who liv'd under *Adrian* as well as *Arrian*, and who is quoted by *Suidas*; the other by one *Dionysius Milesius*, contemporary with *Philostratus*, who liv'd under *Severus*, and who is also quoted by *Suidas*.

These are Facts which cannot be contradicted; and besides, we need only look into *Aretæus* himself, to be convinced, that he is not so antient. This, in all Probability, *Vossius* had not done with that Leisure and Attention he ought to have us'd on such an Occasion. If he had, he would have seen, that this Physician, far from living before the *Cæsars*, could not have liv'd at soonest till under *Nero*. To be convinced of this, he had no more to do than cast his Eyes upon those Passages, in which *Aretæus* [*De Curat. Diuturnor. Lib. 1. Cap. 5. & ibid. Lib. 2. Cap. 5.*] talks of the Antidote compos'd of Vipers; since 'tis well known, that this Antidote is the Invention of *Andromachus* a Physician of *Nero*'s. *Aretæus*, in the above-

cited

cited Passages, also makes mention of the *Antidote of Mithridates*; by which 'tis plain, that he liv'd after that King, and consequently cannot have preceded the first Emperors; which single Circumstance is of itself sufficient to destroy the Conjecture of *Vossius*. I shall not here mention the Compositions of *Philon*, *Bystinus*, and *Symphon*, which *Aretæus* likewise recommends, because the Times in which these Physicians liv'd are uncertain.

From all these Circumstances we conclude, that the precise Time in which *Aretæus* liv'd, cannot be determin'd, tho' the Knowledge we have of his Sect proves, that he could not live till after *Athenæus*, who is supposed to be contemporary with *Pliny*, who liv'd under *Vespasian*. We also know, that *Aretæus* wrote before *Paulus Ægineta* and *Ætius*, because these two Authors quote him. But from all this we cannot infer the precise Time in which *Aretæus* liv'd, because the two last-mention'd Authors did not live till upwards of two Ages after *Pliny*: Neither can we certainly determine whether *Galen* or *Aretæus* wrote first. All we can lay hold of as certain is, that they both liv'd in the Interval between *Pliny*, and *Paulus Ægineta*, and *Ætius*; but this Interval is so long, that we cannot pretend to come very near the precise Time. It is not impossible, as we observ'd before, but *Aretæus* and *Galen* may have been Contemporaries; and it may likewise have happen'd, that the one follow'd a great many Years after the other.

Thus far *Le Clerc*. *Wigan* concludes, that *Aretæus* liv'd after the Beginning of *Nero's* Reign, and before that of *Domitian's*.

EDITIONS of ARETÆUS.

Junius Paulus Crassus publish'd a Latin Translation of *Aretæus* in 4to. *Venetis*, 1552.

Jacobus Goupilus first publish'd *Aretæus* in Greek, and added five Chapters, which were wanting in the Translation of *Crassus*. This was accurately and correctly printed by *Turnebus* at *Paris*, 1554. in 8vo.

In 1554. also, at *Paris*, the Latin Version of *Crassus* was reprinted by *G. Morelius*, and *J. Puteanus*, with Annotations; and the five Chapters which were omitted in the Version of *Crassus*, by an anonymous Author, who is suppos'd to be *Goupilus*.

In 1567. *H. Stevens* publish'd the last-mention'd Translation amongst the *Medicæ Artis Principes*.

Petrus Perma publish'd the Version of *Crassus*, together with the five Books which before were wanting, translated by the same *Crassus*. *Brasil*, 1581. 4to.

Georgius Henischius publish'd an Edition of *Aretæus* in Greek and Latin, *Augustæ Vindelicorum*, 1603.

Dr. John Wigan publish'd a pompous and accurate Edition of this Author, in Greek and Latin, *Fol. Oxon.* 1722.

Menage, *Le Clerc*, and *Wigan*, take notice of a Commentary of *Aretæus* written by *Mr. Petit*, a Physician at *Paris*; and seem to regret its not being publish'd.

It appears by *Boerhaave's* Preface to the *Leyden* Edition of *Aretæus*, that he found means to procure the Manuscript from which these Commentaries are printed in the Edition above-mentioned. It is intituled.

Aretæi Cappadociæ de Causis & Signis acutorum & diuturnorum Morborum Libri Quatuor, de curatione acutorum & diuturnorum Morborum Libri Quatuor, cum Commentariis integris Petri Petiti Medici Parisiensis, atque Clarissimi Joannis Wiganii doctis & laboriosis notis, & celeberrimi Mattairii opusculis in eundem, tandemque eruditissimi atque celebratissimi Danielis Wilhelmi Trilleri Observationibus & Emendatis. Editionem curavit Hermannus Boerhaave, Lugd. Bat. 1735.

ARETE, ἀρετή, Strength and Firmness either of Body or Mind. Ἀρετὴ σώματος, in *Hippoc. Prorrh.* 2. is natural Strength of Body.

AREUS, the Title of a Pessary in *P. Æginet. Lib. 7. Cap. 24.* from *Antyllus*.

ARFAR, ARSAG, Arsenic. *Ruland. Johnson.*

ARGÆUS MONS. A Mountain in *Cappadocia*, producing Lithontriptic Stones. *P. Æginet. Lib. 7. Cap. 3.*

ARGEMON, ARGEMA, ἀργεμον, ἀργεμα, from ἀργός, white. *Erotian* on *Hippocrates* expounds ἀργεμον by πᾶθος τὸ πρὸς τοὺς ὀφθαλμοὺς λευκοματώδες, ὃ ἐκ τῆς ἀπερομένης λευκότητος ἀνομάζεται, "a whitish Affection of the Eyes, which takes its Name from the Whiteness consequent upon it." For the same Reason it is called by the *Latins* *Albugo*. See *ALBUGO*.

ARGEMONE. See *PAPAYER*.

ARGEMONIA. The Name of an Herb in *Marcellus Empiricus*, which he says the *Greeks* call *Sarcocolla*; the same being bruised, if green, or, if dry, macerated in warm Water, that it may the more easily be bruised, and rubbed on the Eyes, soon removes Lividness and Sugillations.

ARGENTINA. The same as *POTENTILLA*, which see.

ARGENTUM, *Offic. Mer. Pin.* 208. *Fabr.* 6. *Aldrov. Mus. Metall.* 72. *Charl. Foss.* 45. *Worm.* 115. *Schrod.* 373. *Schw.* 366. *Calc. Mus.* 439. *Keptm.* 59. *Argentum*, *Luna*, *Mont. Exot.* 13. *SILVER*.

Silver is of much greater Use in Traffic than Medicine. It has been much the Subject of Chymical Researches, more with a Design to meliorate Metals, than forming Remedies; these, however, have by Accident been found out, during Pursuits with very different Views; so that it may be said, that the Love of Riches, amongst many bad Effects, has had, at least, one which is useful.

The Characters of Silver are, that it is,

1. The next in Weight to Lead.

2. Very simple, and discovers the least Diversity of Parts, by any ordinary Means.

3. Fix'd in the Fire, so as, when pure, scarce to lose any thing thereby. Having been kept two Months in a State of Fusion, in the Eye of a Glass Furnace, scarce one Twelfth of its Weight was found wanting. And it may even be doubted whether it had been totally purify'd first.

4. It is malleable, and ductile into very fine Wire.

5. It ignites and fuses at the same time.

6. Dissolves in Aqua-fortis.

7. It is purify'd with Lead, and sustains the same.

8. Turns to Scoria with Antimony, and becomes volatile.

It is found in many Places, and in different Ores, having almost universally a little Quantity of Gold in it.

To the Ore there usually adheres a corrosive bituminous Sulphur, which, by its rapacious Quality, renders the Silver volatile; and dissipates it in the Fire, or even converts it into glassy Scoriae, to the great Loss of the Owner. This, which neither Salts nor Lead will hinder, is however prevented, by means of Mercury, by roasting the Ore, then reducing it to Powder, adding Mercury thereto, and grinding them long together, so as to unite the Silver with the Mercury; which are afterwards to be separated again by Distillation. *Boerhaave's Chymistry, Vol. I.*

The Solution of pure Silver in Spirit of Nitre, or Aqua-fortis, from *BOERHAAVE*.

1. Take an Ounce of Silver, refin'd with ten times its Quantity of Lead, upon the Refiner's Test; melt it in a clean Crucible, and directly pour it into fair cold Water, eight Inches high, in a cylindrical Vessel: The Silver falls into it with a hissing Noise, and is scatter'd about in the Water in Grains: It is now called granulated Silver. Put an Ounce thereof into a clean urinal Glass; then take two Ounces of Aqua-fortis, put thereto a Grain of refin'd Silver; and if it be soon perfectly dissolved, so as to have the Liquor limpid, the Aqua-fortis was good, and fit for this Purpose; but if not dissolved, or the Liquor appears turbid, the Aqua-fortis is not genuine, or proper for this Purpose. The first kind of Aqua-fortis is called Proof Aqua-fortis, by the Refiners. Pour two Ounces of this Proof Aqua-fortis upon an Ounce of granulated Silver, contained in the urinal Glass; the Liquor immediately begins to move, bubbles, grows warm, fumes and hisses about the Surface of the Silver, and then becomes spontaneously hot, briskly agitated, sends out red Fumes, and dissolves the Silver, so that it perfectly disappears. A transparent colourless Liquor is thus obtained, of an exceeding sharp, bitter, and caustic Taste; a little of a very black Powder always remains at the Bottom of the Glass. This Powder is pure Gold, which either always adheres to Silver, or else, perhaps, is easily produced from the Lead in the Fire, as *Mr. Homberg* conceives; and being incapable of dissolving in Aqua-fortis, is thus precipitated from the Solution: Pour off the clear Liquor into a clean Glass, and intitle it the Solution of Silver.

2. If, instead of Aqua-fortis, Spirit of Nitre be employ'd, the Solution is perform'd quicker and stronger; but otherwise, in the same manner; for Aqua-fortis, or Spirit of Nitre, prepared either with Bole or Oil of Vitriol, scarce seem to differ, except in being more or less acid; but if the least Particle of common Salt or Sal Ammoniac should have fallen into the Spirit of Nitre, or Aqua-fortis, or have been mixed with them in the Distillation, or afterwards, they will not dissolve the Silver.

REMARKS.

If this Solution proves limpid, the Silver was pure; but if greenish, it contained some Portion of Copper, and is not fit for the following Experiments: The Silver here, united with the Acid of the Spirit of Nitre, keeps suspended in the Water; a Drop of the Liquor, apply'd to any soft warm Part of the Body, instantly burns and eats it; whence, at once touching, it eats callous and hard Lips of Ulcers, separates the corrupted Part, and presently takes away Marks, Spots, Warts, and small Cancers. It may be diluted with pure Water, without growing thick, or precipitating; but if the Water contains the least saline Matter, the Whole will presently grow turbid. This Solution, well weaken'd with Water,

A R G

Water, is highly detergent ; but stains the Skin it touches with a black Spot, that cannot be got out before the Scarf-skin falls off. Hence we see how the ponderous Body of Silver may lie concealed in a light limpid Liquor ; but it may be discover'd by its violently bitter Taste.

The Vitriol of Silver.

1. To the Solution made in the preceding Process, gradually put single Grains of pure Silver, so long as it will dissolve them. When the last Grain remains perfectly undissolved, set the saturated Solution in a cold Place ; it will presently begin to form little, thin, white Plates, lying over one another, as if compos'd of triangular Needles like Nitre. If the Liquor be poured off from them, we thus obtain the Crystals, Salt, or Vitriol of Silver, which may be dried, but are so sharp, that they cannot safely be touched.
2. If the former Solution be not further saturated with Silver, but inspissated a little, so as to lose about a tenth Part, and then be set by for some time, the Silver will concrete at the Bottom of the Glass in a solid Form, into white Crystals, in other respects like the former, but much sharper, as being here saturated with more Acid. And these also have a much greater caustic Virtue.

R E M A R K S.

We here see the particular and mutual Attraction betwixt Silver and the Acid of Nitre, as Silver scarcely unites with any other Acid ; for tho' it turns black, it does not dissolve with them. This Vitriol of Silver is a most immediate Caustic, and leaves a black Spot upon any Part of the Skin it touches ever so slightly ; and this Spot cannot be got off but by the scaling off of the Skin.

The Lunar Caustic.

1. Take Potters Earth that is well wrought, and not very moist ; make it into a solid Cube, and perforate the upper Surface thereof perpendicularly, with a conical Stick, almost to the Bottom. Let the internal Surface of the Whole be smooth, lest the Matter poured in should come out rough. When as many of these Holes are made as are necessary, press the upper Part of each with the Finger into a wide spherical Cavity, the Middle whereof ends in a conical Hole ; for thus the Matter may be easily poured in.
2. Then take a little Glass Dish, or urinal Bottom, and put into it the first Crystals of Silver of the preceding Process ; set the Glass, without any Fear of breaking, upon burning Coals ; the Crystals will discharge an unctuous Fume, which ceasing to rise, whilst the Matter flows in the Glass, pour it carefully into the conical Cavities made in the Cube of Clay ; it will enter with an hissing Noise. If the Matter in the Glass should happen to grow stiff, set it again over the Fire ; and thus pour out all the prepared Silver into the hollow Moulds.
3. As soon as the whole Matter is grown solid, immediately break the Clay, and take out the conical Sticks of Silver ; wrap them up in hot Paper, and dry them thoroughly therein ; then wipe their Surface with a hot and dry Hare's-foot, and thus immediately put them into a clean Glass, that is to be well stopp'd with a Cork ; and thus an excellent Caustic will be obtained for Chirurgical Uses, and may be kept for many Years.

R E M A R K S.

The Acid of the Spirit of Nitre, in the Glass over the Fire, loses its Water in the Form of Fume, and also that Part of its Acid which remained above what a certain Proportion of Silver could retain ; but the Silver detains a certain Proportion of the Acid with itself, so as not to fume, but remain fixed even in Fusion over the Fire. This Acid, retained in the Body of the pure Silver, forms a solid Mass, in which, perhaps, the Acid is the purest and strongest that can be prepared. When this Acid, adhering to the Silver in a solid Form, is exposed to the Air, it attracts the Moisture thereof, and so dissolves. The Whole of this Caustic will also dissolve in Water ; from whence, by the means of Copper, all the Silver may be recover'd, insipid, inodorous, unactive, no way acid or corrosive, but pure, metalline, and unchanged. It is strange, therefore, that the Acid should so long adhere to the Surface only of the Principles of Silver, without changing them, so as that the Nature of the Metal may be entirely recover'd unhurt. This is a most powerful Caustic, and, by a bare Touch, instantly burns the Parts of a live Body to an Eschar, under which, Nature raises an Inflammation that separates the crude Eschar, and

A R G

leaves the Part pure ; so that, by repeated Touches with this Matter, all superficial, foul, fungous Ulcers and Cancers are excellently cured. Hence skilful Surgeons highly extol the Virtue of this Stone ; and Physicians also learn the wonderful Power of an Acid, when collected and fixed. If given internally in this Form, it is an immediate corrosive Poison, and therefore never to be used in this manner. I have known it prove pernicious to the Artist that prepared it.

The Silver Pill of BOYLE, or ANGELUS SALA.

1. Take an Ounce of pure Nitre, and dissolve it in pure distill'd Water ; then take an Ounce of the pure Crystals of Silver, made according to the Directions above ; dissolve them in thrice their Weight of fair Water, so that the Liquor may be perfectly limpid ; mix the two Solutions together, they will thus make an homogeneous, uniform, and apparently simple Liquor, without precipitating the Silver ; but uniting perfectly with the Nitre. Put the pure Liquor into a clean urinal Glass, and set it over a clear Fire, in a Place free from Dust, till the Water, which will thus be almost pure, exhales, so as to leave a Pellicule. Set the Glass in a cold quiet Place, well covered to keep out the Dust : Crystals, like Nitre, will thus shoot. Pour off the remaining Liquor, and exhale as before ; the Silver and the Nitre will be thus joined in the simple Form of Crystals. Let this Mass be gently dried.
2. Let there be at hand the Bottom-part of an urinal Glass, into which put the Crystals of Silver and Nitre, first dried in Paper ; set this Glass on the Fire, so as to prevent the Matter from running by the two great Heat or Nearness thereof, and permit it only to dry or to fume ; keep it constantly stirring with a Stick of Glass, so that it may every way be exposed to a strong Fire, but so as not to melt, that it may be dried and freed from the sharp Acid that adher'd to the Mass ; and easily render'd it caustic ; but if the Fire should melt it, then the Acid, being more closely united, fixes the corrosive Virtue, which by this gentle Calcination is separated. Let this Calcination be performed with Caution, for a long time, keeping the Matter continually stirring till no more Fume rises, tho' the Fire be now considerably strong, and almost able to melt the Matter ; for at last, after the Heat has separated all this Acid, there is no Harm if the Mass be fused, because all the external Acid is now driven from it ; and thus the purging Silver will be prepared, of an extremely bitter Taste, and should be kept in a dry close Vessel.

R E M A R K S.

It is a wonderful and secret Art to unite Silver with Nitre : Hence the pretended Alchymists can, by this means, conceal Silver in a large Proportion of Nitre, as ten times its Quantity for Example ; and this Nitre, being projected in an equal Quantity upon melted Lead, gives an Increase of one tenth Part in Silver, which, remaining upon the Test, will deceive the Ignorant, as if a tenth Part of the Lead was here turned into Silver. The Way to discover the Cheat is to dissolve the Mass of Nitre and Silver in ten times its Quantity of pure distill'd Rain-water ; then put a polish'd Plate of Copper into the Liquor ; for thus every Particle of the Silver will immediately be precipitated to the Copper and Bottom of the Vessel, and thus be obtained perfectly pure from the Nitre and Spirit of Nitre. If, therefore, any Salt be pretended to, for the making of Silver, let it be examined in that manner. Take this dried Mass, consisting of the Salts of Silver and Nitre ; reduce it to a fine dry Powder, and it will be of an extreme bitter Taste, but by no means so caustic as before. If a little of it be apply'd to Ulcers, it acts like the Lunar Caustic, only much milder ; and if two Grains of it be fine ground with six Grains of Loaf-sugar, in a Glass Mortar, then mixed with ten Grains of the Crumbs of Bread, and formed into nine Pills, and these be taken by a grown Person upon an empty Stomach, drinking after them four or six Ounces of hot Water sweeten'd with Honey ; they will purge gently, and bring away a liquid Water, that often deceives the Patient, as coming away almost without being perceived. It kills Worms, and cures many inveterate ulcerous Disorders ; relieves in the Dropsy, and purges without griping ; but it must not be used too freely, nor in too large a Dose ; for it always proves corrosive and weakening, especially to the Stomach, which Inconvenience is remedy'd by the Rob of Juniper.

Inflammable Silver.

Take an ignited Piece of Dutch Turf, after it ceases to smoke ; place it with its upper flat Surface parallel to the Horizon ; make a little Cavity in the Middle of its Surface, and therein put a Dram of dry Lunar Caustic ; it will here immediately melt, glow, take Flame, hiss, and shine

ARG

shine as briskly in every respect as Nitre. After the Flame ceases, pure Silver will be found in the Hollow, as much in Quantity as was dissolved in making of the Lunar Caustic, and may thus be taken out with a Pair of Forceps, without Loss of Weight.

REMARKS.

This excellent Experiment shews the physical Manner wherein Acids do but superficially adhere to Silver, and the Manner wherein Acids operate, when united to Metals, whilst, surrounding their metallic Mass, they arm the ponderous Principles thereof with Spiculæ. It shews the Immutability of Silver dissolved in an Acid, and the various Ways wherein it may lie concealed, yet still have its Action: It also shews the Difference of potable Silver, while existing in a saline Form by means of an adhering Acid, from that potable Silver of the Adepts, where the Principles of the Silver are supposed converted into a Fluid, that will mix with the Juices of the Body, and cannot be reduced to Silver again; but chiefly it hence appears, that the acid Spirit of Nitre, adhering in a solid Mass to the Silver, is as inflammable along with a combustible Body, as Nitre itself. This seems to happen in Silver alone, which is unchangeable by the Spirit of Nitre. Hence also we see one way whereby Silver may be obtained pure from other adhering Matters, by bare burning. The Acid here acts neither upon the mercurial Part of the Silver, nor its fixing Sulphur.

The Recovery of Silver, when dissolved in Spirit of Nitre.

Dissolve an Ounce of pure Silver in Spirit of Nitre; dilute it with twenty times the Weight of distilled Rain-water; heat the Solution in a cylindrical Glass Vessel, and put therein polished Plates of Copper, the smooth Surfaces whereof will every-where begin to be covered with a grey Colour, and at length appear as if thick set with Down. The Liquor that before was aqueous and colourless, will now gradually turn more and more green, in proportion as the Down upon the Copper Plates grows larger. If a Plate be shaken, the downy Covering falls off from it to the Bottom, and another like the former presently comes on; the Liquor grows greener, and the Plates grow less. The downy Covering being again shaken off, a fresh one grows; and this happens, till at length no more of the Copper dissolves. Now leave the Vessels for six Hours at Rest; afterwards shake off all the grey-coloured downy Matter from the Plates; decant, and filtre the Liquor, it will be of a beautiful green Colour, sharp, and entirely cupreous; the Plates will be much diminished in Bulk and Weight. Let the Matter at the Bottom be washed in several hot Waters, till it becomes thoroughly pure; then dry it over the Fire: It will be a fine shining Silver Powder, and yield nearly all the Silver employed, pure, insipid, and mild, without any Acid; nor will it contain the least Copper.

REMARKS.

This is a Method of calcining Silver to a fine Powder, which cannot easily be obtained so subtle by any other Means. This Powder, being ground with Mercury, easily affords an Amalgama, which is otherwise so difficultly obtained, and not without a great Loss of the Quick-silver. If this Powder be melted in a Crucible, it restores the same Silver that was employed. Hence therefore it appears, how superficially the Acid of the Nitre adhered to the Silver, since the Whole of this Acid is so easily attracted by the Copper from the Silver, without any Remainder. If the Liquor of this Operation be viewed with a Microscope, it appears plainly, that little Particles of Silver are violently carried along with the Acid of the Nitre up to the Copper Plates from all the Points of the Solution. But when these Spiculæ arrive at the smooth Surface of the Plate, the Acid is attracted to the Particle of the Copper, whilst the Particle of the Silver, deprived of its Acid, rests upon the Surface of the Copper; and being there increased by others coming to it in like manner, at last a soft downy Case is composed; and this Attraction is so exquisitely performed, that not the least Particle of Silver remains in the former Solution. Hence it appears, that Copper more strongly attracts the Acid of Nitre, than Silver does; wherefore this Action consists in Attraction, and a Straining of the Acid from the Body of the Liquor; for the Acid passes thro' the Pores of the Copper, leaving behind the Particles of the Silver now set free, and unable to enter; there is scarce a more beautiful Sight than this with a Microscope. The Acid of the Nitre remain'd unchanged in the Silver, and is collected perfect in the Copper, from whence it may again be procured.

ARG

Luna Cornea.

1. To the pure Solution of Silver made with Spirit of Nitre, according to the above Directions, and diluted with four times its Quantity of pure Water, let fall by a Drop at a time, in a capacious Glass Vessel, a small Quantity of a strong and warm Solution of Sea-salt in Water. At the Instant the Drop falls in, the whole Liquor grows white, and surprisngly thick, without any Effervescence. Continue thus dropping in, and shaking the Glass, till the Liquor no longer continues turbid; then let it rest; a gross white Matter will fall to the Bottom in a large Quantity. Let the limpid Liquor at the Top be poured gently off, and drop into it a little hot Solution of Sea-salt; if it grows thick no longer, the Operation is well performed; but otherwise some Silver remains behind, which requires to be separated. Pour clean hot Water upon the white precipitated Matter, and wash it till it becomes perfectly insipid; then boil it in an Urinal, with a little fair Water; shake them together, and pour the Whole into a Paper-filtre, where the Water will pass thro', and leave the white Matter behind, which is to be dried with a gentle Fire, and preserved. This is a subtle Calx of Silver precipitated with Sea-salt from Spirit of Nitre, or Aqua-fortis; it will weigh more than the Silver employed, by nearly a fifth Part, on account of the Salts which adhere thereto.

2. Put this Calx of Silver into a clean Crucible; set it in a Fire of Fusion, till it melts, which it easily does; when melted, pour it out on a Marble. It appears a ponderous, shining, opaque, brown Mass, that breaks brittle with some Degree of Tenacity, whence it is called horny. It contains all the Silver employed, and at the same time the Acid of the Nitre and Sea-salt, wonderfully concreted therewith, so as not to be separated; for by endeavouring with a violent Fire to drive away the Spirit, which is so easily done in the *Lunar Caustic*, the greatest Part here becomes volatile, and the Remainder is scarce recoverable into Silver, but remains changed by the Admixture of the Salts, so intimately united and fixed, as not to manifest themselves by any saline Property. If one Part of pure Silver, calcined according to the above Directions, be mixed with two Parts of Mercury sublimated, and distilled in a Glass Retort, with a strong Sand-heat at last, almost the same perfect *Luna Cornea* will remain at the Bottom of the Retort. And if instead of Salt the Spirit of Sea-salt were used to the Solution of the Silver, the *Luna Cornea* would be perfectly the same. Mr. Boyle says, that Silver, being precipitated from Spirit of Nitre with Oil of Vitriol, then washed and fused, will become a true *Luna Cornea*.

REMARKS.

This Experiment is of infinite Use, and shews how small a Difference in a physical Circumstance may often occasion a great Difference in the thing physically produced; for Silver mixed with *Aqua Regia* does not unite with the Acid thereof; but if, when Silver is dissolved by Spirit of Nitre, Sea-salt is added thereto, tho' it thus only makes an *Aqua Regia*, yet it presently occasions the Acid of the *Aqua Regia* to unite intimately with the Silver, and produce strange Effects: For if two Parts of the precipitated Calx of Silver be well ground with one Part of Regulus of Antimony, and distilled with Sand-heat, there comes over a pure Butter of Antimony, equal in Weight to the Antimony employed, whilst the Silver remaining at the Bottom always affords true Gold upon the Reduction. Hence we may be certain, that the Weight gained by the Calx of Silver is owing to the *Aqua Regia* fixed therein, because it here goes into the mercurial Part of the Antimony; whence it is no Wonder, that those eminent Chymists *Becher*, *Boyle*, *Hemberg*, and *Stahl*, have so much regarded the concealed Nature of the Metals and Salts in this Experiment. Who could conceive, that the exceedingly insipid Body of *Luna Cornea* held a fifth Part of the highly corrosive Acid of *Aqua Regia*? Hence we see what a particular Power Sea-salt has upon Metals, how covertly it may adhere to, and again be recovered from them without Loss of its Virtues. Hence also we see how strangely Metals may be disguised and concealed; and again, how Gold may be obtained from a Matter in which the Assay Masters could not, by all their Art, discover any: And hence Adepts have said, that Nature has only placed Perfection in Salt and Gold; and hence we may also learn to guard against the fraudulent Practices of those who craftily mix this Calx of Silver with Nitre, or throw it into melted Lead, and thus pretend an Increase of Silver or Gold. But our present Design does not lead us farther into this Subject. It is certain that the Industry of Mr. *Hemberg*, by the Means of Tartar, Quick-lime, Sal Ammoniac, and the White of Eggs,

A R G

Eggs, has from half a Pound of Silver obtained, as he declares, three Drams and fifty Grains of running Mercury. And so much of the Nature of Silver for the present. *Luna Cornea* neither dissolves in Aqua Regia, Aqua-fortis, nor the Fire. *Boerhaave's Chymistry, Vol. 2.*

ARGES, in *Hippoc. Lib. 5. Epidem.* seems to be the Name of a Serpent, which crept into the Mouth of a young Man as he lay on his Back asleep after plentiful drinking of Wine. The Event was, that as soon as he was sensible, not being able to speak, or cry out, he clenched his Teeth, and swallow'd the Serpent, and, being seized with dreadful Pains, threw abroad his Arms like one strangled, and tumbled and tossed about, and at last dy'd in Convulsions.

ARGESTES, or *Circius*, in *Actius, Tetrab. 1. Serm. 3. Cap. 163.* is the Name of a Wind between the North and West. The North-west Wind.

ARGILLA, Offic. Mer. Pin. 219. Charlt. Foss. 1. Worm. Mus. 2. Schw. Foss. 365. Aldrov. Mus. Metall. 227. *Argilla nostras figulina*, Ind. Med. 14. **CLAY.**

Clays of all Sorts are esteem'd drying, astringent, and absterging. *Dale.*

Clay, as here understood, is a ponderous Earth, dense, viscid, and slippery. Being held for some time in the Mouth, it makes an Impression on the Tongue, something between that of Soap and Fat. When fresh dug, it may be moulded into any Figure like soft Wax; and by Fire it may be made as hard as a Stone. The Species of Clay are almost innumerable: Some are white, resembling Suet, such as that saponaceous Earth with which the Waters of *Plombiere* in *Lorraine* are impregnated; some are variegated, like the different Kinds of Porphyry and Marble, as certain Earths found in *Bohemia*. Others are of an Ash-colour, red, or black. The Clays used in Physic are, the *Lemnian Earth*, the Earth of *Maltia*, and several other sealed Earths from *Germany*. *Geoffroy.*

Clays which are used in Medicine are known in the Shops by the Name of *Terra*, Earths, of which the principal are

The Terra Chia,	Terra Pnigites,
Terra Cimolia alba,	Terra Portugallica,
Terra Cimolia purpurascens,	Terra Samia,
Terra Eretria,	Terra Sigillata alba & rubra,
Terra Lemnia alba,	Terra Sigillata Livonica,
Terra Lemnia rubra,	Terra Silesiaca,
Terra Noceriana,	Terra Turcica,
Ocra,	Terra Vitriolata.

All these are taken Notice of as they occur.

ARGISTATA, *Incerata*, or waxed. *Ruland. Johnson.*

ARGOS, ἀργός, from a Negative, and ἔργον, Work or Business, as if it were ἀργός. So ἀργός ἀργυρός is Silver not work'd; ἀργοὶ πυροί, in *Hippoc. περὶ ἀρχαῖν* insr. is crude Wheat, not ground or prepared; but such as it is taken from the Floor. Ἀργός also signifies idle, without Business; and thus ἀργός, in *Hippocrates*, is expounded by *Erotian* ἀργύματα ἢ λουαὶ, "without Labour, or Holiday-like;" for λουαὶν ἀμύραν δίδειν is, "to spend a Day in Mirth and Pleasure;" in which Sense we are to understand that of *Silius Italicus*:

--- *Albosque Dies, Horasque serenas.*

ARGYRITIS Terra, ἀργυρίτις γῆ, from ἀργυρός, Silver. A sort of Earth taken out of Silver Mines, which is bespangled with many Particles of Silver intermixed. *Gal. Def.*

There is another *Argyritis*, which is a sort of *Spuma Argenti*, or Litharge. See *SPUMA ARGENTI*.

ARGYROCOME, ἀργυροκόμη, from ἀργυρός, Silver, and κόμη, Hair. A Species of *GNAPHALIUM*, which see. *Blancaard.*

ARGYRODAMAS, ἀργυροδάμας, from ἀργυρός, Silver, and δαμάω, to conquer. A kind of Talc, of the Colour of Silver, that will not yield to the Force of the Fire. The Laminæ hereof swallowed adhere to the Stomach, Fauces, and Throat, and endanger an Inflammation of those Parts. *Castellus.*

ARGYROGONIA, ἀργυρογονία, from ἀργυρός, Silver, and γίνομαι, to be made or generated of. An argentific Seed, perfectly digested from a Solution of Silver, or an argentific Tincture of a white Colour, in the same manner as *Chrysogonia* is the aurific Seed. See *CHRYSOGONIA*. *Castellus.*

ARGYROPHORA, ἀργυροφόρος, from ἀργυρός, Silver, and φέρω, to bring. The Name of an Antidote in *Myrepsus*, which seems to be so called on account of its Costliness.

ARGYROPOEIA, ἀργυροποιία, from ἀργυρός, and ποίω, to make. The Art of making Silver out of more imperfect Metals and Minerals, by Means of the Philosopher's Stone, or the Philosopher's Mercury, or the argentific Seed, spoken of before under *ARGYROGONIA*, which see. *Castellus.*

ARGYRUS, ἀργυρός, Silver.

ARGYROTROPHEMA, ἀργυροτρόφημα, from ἀργυρός, Silver, and τροφή, Nourishment. A kind of Food made of Milk,

A R I

and designed to allay the Heat of the Body, and to moisten it. *Galen. de Succ.*

ARHEUMATISTOS, ἀρθευματίστος, from a Negative, and ῥεύμα, a Defluxion. An Epithet bestow'd on the external Parts, and especially the Joints, while they are free from gouty Rheums. *Castellus.*

ARIA, Offic. *Aria Theophrasti*, Ger. 1146. Emac. 1327. *Aria Alni effigie, folio lanato, major*, Jonst. Dendr. 69. *Sorbus Alpina*, J. B. 1. 65. Raii Hist. 2. 1459. *Sorbus sylvestris*, *Aria Theophrasti dicta*, Park. Theat. 1421. *Mespilus Alni lanato folio, major*, Herm. Cat. Hort. Lugd. Bat. 424. *Mespilus Alni folio subtus incano, Aria Theophrasti dicta*, Raii Synop. 3. 453. *Mespilus Alpina, folio Alni lanato, major*, Rupp. Flor. Jen. 110. *Cratægus Alpinus, Alni folio incano*, Ejusd. *Mespilus Alni effigie, lanato folio, major*, C. B. Pin. 451. **THE WHITE BOAM-TREE.**

It grows in Woods upon rocky Mountains, and flowers in April. The Fruit is recommended for mitigating Coughs, and promoting Expectoration. *Dale.*

ARICYMON, ἀρικύμων (from the augmentative Particle ἀρι, which is never read but in Composition, and κύω, to conceive) in *Hippocrates* περὶ ἐπιπλησίων, is explain'd in *Galen's Exegetis* by ἡ ταχέως ἐγκύμων γυναικὶς, "One who soon conceives." *Aesculapion*, in *Hesychius*, is expounded by εὐσύνλητος, "Easy and prompt to conceive."

ARIDA MEDICAMENTA, ἄριδα φάρμακα, dry Medicines, are such as consist of Powders. *Actius*, in his *Tetrab. 2. Serm. 3.* has a good long Chapter, *Cap. 98.* wholly on dry Collyria for the Eyes.

ARIDITAS Corporis, a Dryness of the Body. See *MARASMUS*. Also the lanuginous Superficies of the Tops of the Hairs, when they look as if they were powder'd, is call'd a Dryness, *ἄριδος*, *Gal. Def. Med.* There is also an *Ariditas Linguae*, Dryness of the Tongue, a common Symptom in Fevers.

ARIDUM, ἄριδον. The same as *SECCUM*, which see.

ARIDURA, a total Consumption, or Syderation, as they call it, of the Body or Members. *Ruland. Johnson.*

ARIES, a Ram. The Flesh of the Ram is more rank and indigestible than that of the Sheep or Wether. See *OVIS*.

ARIGEOS, ἀριγέως, from a Negative, and ῥίγος, Cold, in *Hippocrates, De Rat. Viâ. in Morb. acut.* signifies without Cold; and is there opposed to ἀβαλπίως, which is from a Negative, and βάλλω, Heat; and denotes the Absence of that Quality.

ARILLA, ῥίγαρον. The same as *GIGARTON*, which see.

ARIOBARZANIUM Emplastrum. The *Arto-barzaniæ* Plaster. The Composition see under the Article *ABSCESSUS*.

ARIS, ἀρις, is expounded by *Galen*, in his *Exegetis*, ὅτι μόνον τὸ ἔργον, ἀλλὰ καὶ βόλαν τῆς ἕως ὀνομαζομένης, "Not only an Instrument, but an Herb so call'd;" which is the same as *Arisarum*; or, as others will have it, a small kind of *Arisarum*.

ARISARUM, Offic. *Arisarum angustifolium Dioscoridis forte*, C. B. Pin. 196. Boerh. Ind. A. 2. 73. Hist. Oxon. 3. 545. *Arisarum angustifolium*, Ger. 686. Emac. 835. J. B. 2. 787. Chab. 258. Raii Hist. 2. 1211. *Arisarum longifolium*, Park. Theat. 375. *Arum humile angustifolium, pistillo longissimo tenui inflexo mucronato*, Herm. Cat. Hort. Lugd. Bat. 60. *Arum Scorzoneræ folio*, Elem. Bot. 130. Tourn. Inst. 160. **FRIERS-COWL.**

This grows in Italy and Dalmatia.

Dioscorides says it is a small Plant, with a Root like that of the Olive, and more acrimonious than the Arum, which, he says, stops the Progress of *Noma*, if apply'd to them by way of Cataplasm. Of this Root are also made *Collyria*, which are effectual in curing Fistulas. By *Collyria* *Dioscorides* does not mean what we call so, but Tents made in the Shape of a *COLLYRIUM*, which see. It corrupts the *Pudendum* of any Animal whatever, if introduced into it. *Dioscorides, L. 2. C. 198.*

It heats, dries, incises, opens, absterges, and digests. *Dale* from *Galen*.

ARISTA, is that sharp-pointed Needle that stands out from the Husk or Hove of a Grain of Corn, Grass, &c. and is call'd Awn, or Beard. *Miller's Dictionary.*

ARISTALTHÆA, ἀρισαλθαία, from ἀρις, excellent, and ἀλθαία, the Marshmallow. A Name bestow'd on the *Althea*, or Marshmallow, for its Virtues.

ARISTARCHI Antidotus Paulina. An Antidote of *Aristarchus* call'd *Paulina*; the Preparation of which you have in *Actius, Tetrab. 2. Serm. 4. Cap. 65.*

ARISTEAS. A Physician of *Rhodes*, Author of one of those Antidotes in *Myrepsus*, which are call'd *Acharisti*. The Reason of this Name see under *ACHARISTON*.

ARISTI Emplastrum nigrum. The black Plaster of *Aristus*, a famous Surgeon in *Scribonius Largus, Cap. 80.* It is the same as the *Tetrapharmacum*.

ARI-

ARISTIONIS *Machinamentum*. A Machine for restoring Luxations, invented by *Aristion*; but seems to be no more than an Improvement of the *Glossocomum* of *Nymphiodorus*. *Oribas. de Machin.*

ARISTOGENIS *Malagma*. A Malagma for the Bones and Nerves, invented by *Aristogenes*; the Composition of it is describ'd by *Celsus*, *Lib. 5. Cap. 18.*

ARISTOLOCHIA, Birthwort. Of this celebrated Plant there are many Species taken Notice of by Botanic Authors; as the

Aristolochia longa, *Offic. & Dod. Lob. J. B. Longa vera*, *C. B. Park. Altera radice pollicis crassitudine*, *Cæsalp. Aëso-doxia maxea*, *Diosc. Aristolochia longa Italica sive mascula*.

The Roots of this Birthwort are large and long, often as thick as one's Wrist, and a Foot long, without Fibres till towards the Bottom, sending forth numerous square Branches, two Foot high or more; on which grow alternately, at the Joints, yellowish-green Leaves, somewhat like the Leaves of Ivy, or rather those of black Briony, on pretty long Foot-stalks: From the setting on these arise the Flowers, one at each Leaf, which is made of one long and hollow Tube, with a long Flap at the End, of a brownish-yellow Colour, growing on Foot-stalks, half an Inch long, which are succeeded by roundish Pear-fashion'd Fruit, as big as a Walnut, containing flattish, broad, roundish, brown Seed.

It grows in *Italy*, *Spain*, and the Southern Parts of *France*, and flowers in *May*.

This Root is so call'd, because it is esteem'd excellent in promoting the *Lochia*, or Child-bed Evacuations of Women, after the Fœtus and Secundines are expell'd. It is found in *Sicily*, in *Spain*, and in *Narbon* in *France*. In *Germany* it is only found in some Gardens. It is best when of a very close Texture; hard, entirely free from Worms; externally of a greyish, and internally of a yellowish Colour.

Aristolochia rotunda, vera & major, *Offic. Rotunda*, *Matth. Dod. Lob. J. B. Vera*, *Trag. Cam. Prima*, *Cæsalp. Rotunda vulgaris*, *Park. Rotunda flore ex purpura nigro*, *C. B. Malum terræ*, *Gaz. & Larg. Aristolochium*, *Hipp. Arist. rotunda Italica sive femina*. *Paracelsus* calls it the great *Matrix-root*, because it resembles the *Matrix* of Women. Its Flower also, as is said, bears an exact Resemblance to the Uterus.

The Root of this *Aristolochia* is thick and roundish, hard and tuberos, of a brownish Colour without, and yellow within, of a very bitter Taste. The Stalks grow to the Height of the former, square, and weak; the Leaves are somewhat rounder, and grow on very short Foot-stalks, which seem to encompass the Branches: The Flowers are, in Shape, like the former, but of a dark-purplish Colour on the Inside; the Fruit is likewise of the same Bigness with that; but more round. This grows in the same warm Countries, and flowers about the same time.

Aristolochia adulterina, sive rotunda vulgaris, *Offic. & Trag. Cam. Radix cava major*, *Dod. Clus. Cava herbariorum*, *Lob. Fumaria altera*, *Matth. Tuberosa sive bulbosa, radice cava, major*, *C. B. Radice cava, flore purpurascens*, *J. B. Radice cava major, flore carneo*, *Park. Bulbosa spuria flore, purpurea & alba, radice cava*, *J. G. Volkham. Flor. Pseudofumaria bulbosa*, *A. 2. Rivin. Pistolochia concava*, *Fuch. Capnos phragmites*, *Plin. καπνός χελιδονίας. Capnos chelidonia*, *Lonicer. Capnos bulbosa*, *Capnicium chelidonium*, *Capnos latifolia*, *Pseudaristolochia, pes gallinaceus*.

It grows naturally in moist and shady Places; and is also found in Hedges, Vineyards, and shady Forests. It is also to be met with in some Mountains, from whence it is transplanted into Gardens: The Root is externally of a greyish, and internally of a yellowish-dark Colour, entirely hollow, and bitter to the Taste.

Aristolochia longa nostras, *Offic. Tenuis*, *Koker. Cat. Hort. Med. Harmel. Longa*, *Trag. Matth. Longa vulgaris*, *Cam. Saracenica*, *Ger. Dod. Clematidis recta*, *C. B. Clematidis vulgaris*, *J. B. Arist. altera radice tenui*, *Cæsalp. Aëso-doxia ulnaria*, *Diosc.* This Herb resembles the true *Aristolochia longa* in every respect, except that it bears Flowers that are yellow, or of a brownish Black. It is found in a great many Places in *Germany*, *France*, and *Spain*. In *Germany* it grows wild, and is transplanted into Gardens; but is of no Use.

The Root of this Birthwort is much smaller and slenderer, than the first or long Birthwort, running and spreading much in the Earth: The Stalks are firmer, and grow more erect; and whereas the two former have but one Flower at a Leaf, this has three or four, less than the other, but of the same Colour; the Fruit likewise is bigger, and the Leaves larger and broader.

Aristolochia has always been had in great Esteem; for which Reason *Apuleius*, *L. de Virt. Herb. Cap. 19.* and *Oribasius*, *de Herbar. & Simplic. Virtute*, *L. 1. C. 5.* tell us, that Physicians cannot practise their Art successfully without it. In Apothecaries Shops, the *Aristolochia longa*, & *rotunda*, are principally used. They are of a warm, drying, opening, subtil, purifying, and healing Nature. They are principally used in Diseases of the Head, Lungs, Liver, and Womb. They purge

and drain the Cerebellum of cold Humours; and are of remarkable Efficacy in Epilepsies arising from the Uterus, *Sam. Schonborn. Man. Med. Pract.* They are also good in Palsies and the Cramp; they dislodge the gross Humours of the Breast and Lungs; and greatly relieve those who labour under Disorders of the Lungs, *Arnaldus de Villa Nova, Lib. 2. Breviar. Pract. Joh. Fernel. L. 5. Meth. Med.* They also afford Relief to Asthmatic Patients, *Hier. Reusner. Obs. Med. 151.* In the Asthmatico-scorbutic, and those who are afflicted with Coughs; they fortify the Stomach, kill Worms, remove Obstructions of the Liver and Spleen, dissolve coagulated Blood, carry off Quotidian Fevers, *Joh. Steph. Strobelberg. Remed. Seng. pro Cur. Feb. Introd.* They cure the Dropsy and Cachexy, restore the Menses when obstructed, expel the dead Fœtus and After-birth. The Root also of the *Aristolochia longa*, if tied to a Woman's Thigh, is said to hasten Delivery, *Lud. Merc. L. 3. de Mulier. Affect. Cap. 8. & Lib. 4. Cap. 3.* They are very serviceable for the necessary Purgation of the Matrix after Delivery: They also allay excessive Pains of the Womb after Child-birth. They cleanse and cure internal Ulcers, Wounds, and inveterate Runnings, especially of the *Pudenda*. They destroy fungous Flesh about the Lips of Wounds. Their Powder corrodes and wastes away mortify'd Flesh, either in Ulcers, or in Fistulas, *Gabr. Fallop. L. 2. Secret. P. M. 214. P. Bayr. Lib. 16. Pr. C. 5. Adr. Toll. Comment. ad Prax. Aur. Jo. Stocker, L. 1. C. 16.* "Simon Pauli, only with the Powder of *Aristolochia longa*, boil'd in the Water of Paul's Betony, and apply'd in a Linen Cloth, in the Space of a few Days happily consolidated a malignant Ulcer, which a Surgeon had in vain attempted to cure for the Course of a whole Year." They purify the Skin, dissipate Blotches and the Itch, extract noxious Matter from Wounds or Ulcers, if the Juice of the Herb, or its Powder, are apply'd to them.

The *Aristolochia rotunda* is possess'd of a Quality, by which it cleanses the Filth of the Ears, and strengthens the Hearing. *Matth. Grad. Pr. P. 1. C. 34.* It also opens internal Abscesses. They are also good against Poisons, and venomous Bites, *Cicero de Divinat. 1. Cap. 10.* They are also good in the Plague, and resist Putrefaction; as Myrrh also does, *Joan. Voesh. de Colonia, Tr. 1. de Peste, Cap. 14. M. Unz. Antidot. pestilent. L. 2.* 'Tis also for this Reason they are added to the *Theriaca*. The Powder of the *Aristolochia rotunda* is very successfully given in Cardialgias, and in Disorders of the Heart and Stomach, mix'd with Sugar of Roses; as also in a poach'd Egg, or any other convenient Vehicle, *Joh. Camer. in Hort. Med. p. 21.* For "this Root is most friendly to the Stomach, restores its Ferment, assists Concoction, and powerfully dissipates the Malignity of the Humours. The *Aristolochia longa* is also of singular Efficacy in removing Pains of the Stomach." *Gualt. Bruel. in Prax. Med. G. H. Velsch. Phil. 1. Exot. Curat. & Obser. 439.* The *Rotunda*, according to *Sennertus*, *L. 5. Inst. Med. P. 1. S. 1. P. 4.* & *J. Heurn. L. 2. Meth. ad Prax. C. 8.* opens internal Abscesses. The Root is also excellent in Clysters, exhibited to epileptic and apoplectic Patients. The distill'd Water of the *Aristolochia longa* is good for the Gout and the Cramp, removes Belly-aches, cures beginning Dropsies, the Jaundice, the Falling-sickness, Rheumatic Pains, and Fevers. It cures *Fistulas in Ano*, and other Disorders of the genital Parts of Men and Women. It is also excellent in the Plague. The Extract of the Root of the *Aristolochia rotunda* is also excellent for Oppressions of the Breast, and for those who labour under Disorders of the Lungs; in which Cases the following Pills may be given:

Take of the best Gum Ammoniac, reduced to Powder, one Dram; well prepar'd Flowers of Sulphur, one Scruple; mix with a sufficient Quantity of the Extract of the Root of the *Aristolochia rotunda vera*, and make sixty-six Pills, which shake in any proper Vessel, along with the Powder of the Root of *Florentine Orrice*. Of these let the Patient take eleven for a Dose. Or,

Take of the best Gum Ammoniac, reduced to Powder, one Dram and an half; Root of the *Aristolochia rotunda vera*, reduced to Powder, half a Dram; Flowers of Sulphur, half a Scruple: Mix with a sufficient Quantity of the Extract of the Roots of *Elecampane* and *Aristolochia rotunda vera*, dissolved in Spirit of Scurvy-grass. Make sixty-six Pills, and shake them in a Vessel, along with the best Powder of Liquorice-root. Let eleven of these be taken in the Morning fasting.

Aristolochia also effectually corrects and removes all Corruptions, and Putrefactions of the Body, and answers the same Intentions that the Extract of *Angelica* does, *Jo. Dan. Mylius, L. 4. Antidotar. C. 3.* We may also use a Decoction of the *Aristolochia rotunda vera* in scorbutic Coughs. *Fernelius*, in *Dispensat. & Meth. Med. L. 7. p. M. 1246.* orders Pills, made of the Root of *Aristolochia*, for Epilepsies, for the Lame, and such

such as labour under Disorders of the Lungs; for old Coughs, Obstructions of the Spleen and Liver, Diseases of the Kidneys, Obstructions of the Menfes, Expulsion of the dead Fœtus, and the After-birth. Its distill'd Oil is highly commended for facilitating Delivery, in *Ephem. N. C. Dec. 2. Ann. 3. Obs. 207.* A small Nose-gay made of *Aristolochia* accelerates the Menfes. It also brings away the Fœtus and Secundines, *J. Fernel. L. 6. Meth. M. C. 9.* The *Aristolochia longa vulgaris* is an admirable Root, if mix'd with *Unguentum Populeum*, in the blind Hæmorrhoids, *Joh. Wittich. Vade Mecum, P. M. 341.* *Aristolochia* burnt, and apply'd to the Hæmorrhoids, puts a Stop to them, *J. Matth. Grad. Pract. C. 2. P. 20.* The Quintessence of the *Aristolochia rotunda* thoroughly cures any simple Wounds within the Space of twenty-four Hours, and sooner; so that its Effects seem altogether miraculous, and beyond the Powers of Nature. It also cures deep and compound Wounds so quickly, that a Miracle rather seems to be wrought, than a Cure perform'd by it. It is successfully given to such as have fallen from Heights, or are in a languishing State of Health; and also to such as have received internal Wounds. It dissolves and dissolves grumous Concretions of Blood in the Stomach, or in any other Parts of the Body, *Barthol. Zorn, Botanolog.*

Apuleius gives a whimsical Receipt, attended with many superstitious Ceremonies, for disenchancing those who are render'd impotent. It consists in washing the Patient with a Decoction of what he calls *Leontopodium*, and a subsequent Fumigation with the Herb *Aristolochia*.

The *SERPENTARIA VIRGINIA*, which see, is a Species of *Aristolochia*.

By the Chymical Analysis, it yields a great deal of acid Liquors, Oil, and Earth, a little urinous Spirit, and no volatile concrete Salt. Its fix'd Salt gives no Tincture of Yellow to the Solution of Sublimate; whence we may conjecture, that the Salt of the *Aristolochia* is much the same as the Salt of Coral would be, if one pour'd more Acid upon it than is sufficient to saturate the Coral: Besides this, the Salt of the *Aristolochia* contains a little *Sal Ammoniac*, and is involv'd in a great deal of Sulphur. *Martyn's Tournefort.*

ARISTON, ἀριστον, Dinner. 'Αριστον, "to dine," in *Hippocrates πει ἀρχ. insp.* is oppos'd to *μεινίσσειν*, "to eat but once a Day;" which was at Supper-time. Those who eat twice a Day, took their *Ariston*, or Dinner, three Hours after Sunrise.

Ariston magnum & parvum, according to *Avicenna*, are Remedies prepar'd against a Phthisis, Pains in the Belly, mix'd Fevers, &c.

ARISTOPHANEION, ἀριστοφάνειον. The Name of an emollient Plaster, which consists of four Pounds of Pitch, two Pounds of Apochyma, (see *ZOPISSA*) one Pound of Wax, an Ounce of Opopanax, and half a Pint of Vinegar. *Gorræus, from P. Æginet. Lib. 7. Cap. 17.*

ARITHMOS, ἀριθμός, Number. 'Αριθμοὶ τῶν νοσημάτων, in *Hippoc. de Rat. Vict. in Morb. acut.* signify the numerical Differences of Diseases in Individuals, by which the *Cnidian* Physicians distinguish'd and number'd Diseases. The Passage runs, "Ἐνιοὶ δὲ τὰς ἀριθμοὺς ἐλάττω τῶν νοσημάτων σάρα ἐβλάψαντες, καὶ ὁρθῶς ἔγχεσαν." "Some, endeavouring to give us a clear Account of the Numbers (numerical Differences) of each Disease, have shewn themselves mistaken." This Place to me seems very well clear'd by *Erotian*, when he says, 'Αριθμοὶ, τὰ ὀνόματα τῶν καλῶν. "He calls the Names *Arithmi*;" for the Names of Diseases, by which they are distinguish'd and number'd according to their Differences, are plainly hinted at; and therefore *Hippocrates* subjoins, Μὰρ αὐτὸ δὲ νοσημα δοῦναι εἶναι, ἢ μὴτ' αὐτὸ ὄνομα εἶναι. "Nor takes it for the same Disease, unless it be call'd by the same Name."

ARLADA, ARLADAR. Realgar burnt, or calcin'd.

ARLES CRUDUM, in *Paracelsus*, are Drops falling in June, especially by Night; otherwise call'd *Hydatis*. *Paracels. de Grad. & Comp.*

ARMALA, in *P. Æginet. Lib. 7.* the same as *Harmala*, *Harmela*, or Wild Rue. See *HARMELA*.

ARMARIUM UNGUENTUM, ὀπλόχευμα. See *HOPLOCHRISMA*.

ARMATURA, Arab. *Abges*. The same as *AMNIOS*, which see. *Castellus*.

ARME, ἄρμν, from ἄρμν, to adapt, signifies, according to *Erotian*, every Coalition of Wounds in general; but in *Galen's Exegetis*, it is particularly apply'd to the Suture of the Head. Ἄρμν, in *Hesychius*, denotes the joining together, or framing the Parts of the Body.

ARMENA, τὰ ἀρμενα, in *Hippocrates*, signify the Instruments, with all the Apparatus, necessary for an Operation in Surgery. In *Lib. de Rat. Vict. in Morb. acut.* τὰ ἀρμενα includes all the Apparatus for Bathing; and *Hesychius* expounds τὰ ἀρμενα, in general, by τὰ πρὸς τὴν ὑποκαίμενον πρᾶγμα ἐπιτήδεια. "Such Things as are convenient for the Performance of any Work we are about."

ARMENA Bolus. See *BOLUS*.

VOL. I.

ARMENIACA MALUS, *Præcocia*, Offic. *Armeniaca* *Malus major*, Ger. 1260. Emac. 1448. *Armeniaca*, *Malus Armeniaca*, Mont. 37. *Malus Armeniaca major*, Park. Parad. 579. *Jonf. Dendr. 74.* *Armeniaca Mala majora*, C. B. Pin. 442. J. B. 1. 167. Raii Hist. 2. 1514. *Mala Armeniaca*, Chab. 11. *Armeniaca fructu majori, nuclea amaro*, Tourn. Inst. 623. Elem. Bot. 495. *Armeniaca Malus, fructu majori ex luteo rubescente*, Herm. Cat. Hort. Lugd. Bat. 59. Boerh. Ind. A. 2. 242. **THE APRICOCK-TREE.**

This Tree is so well known, that a slight Description of it is sufficient: It has broad, round Leaves, pointed at the End: The Flowers are larger than those of Plums, of a white Colour. The Fruit is round, and somewhat flat-sided, with a Sinus running on one Side from Head to Stalk; of a yellowish Colour, with a Blush of Red; when ripe, easily parting from the Stone, which is smooth like a Plum-stone, flattish, with three prominent sharp Ridges on one Side, with a bitterish Kernel within. It flowers in March and April, the Fruit not being ripe till after Midsummer.

Apricocks are of very little Use in Medicine; but are eaten as other Summer Fruits, being pleasant and grateful to the Stomach. They are frequently preserv'd with Sugar; and of the Kernels, infused in Brandy, is made the famous Cordial call'd *Ratafia*. *Miller's Bot. Off.*

Lemery adds, there are three Sorts of Apricocks; the first of which are pulpy, almost round, and grow as big as a small *Peach*, flat on the Sides, one of which is of a dark Red, and the other yellowish. The Pulp is tender, pleasant, and of a good Smell: It contains a very hard and flat Stone, wherein there is a bitter Kernel.

The second differs from the first, in that they are of a more whitish Colour, and that the Kernel is sweet:

The third are smaller than the others, but not so well tasted, and of a yellowish Colour. These last grow upon a Tree that is not cultivated like the rest. In chusing your Apricocks, take those that are pulpy, large, well-colour'd, and well-tasted.

They moisten, create an Appetite, provoke Urine, are a Cordial, Pectoral, and promote Expectoration. An Infusion of Apricocks is look'd upon to be good to allay the Heat of Fevers: They also say, that the Kernel of an Apricock kills the Worms.

Apricocks fill the Stomach with Wind, and easily corrupt there; and therefore they ought to be moderately taken:

They contain an indifferent Quantity of Oil and essential Salt, and much Phlegm.

They are good, in hot Weather, for young People that have good Stomachs, and of a bilious and sanguine Complexion.

Apricocks are Fruits of an agreeable Taste, and used more for Pleasure than Health. They cool and moisten, because they contain much Phlegm, intermix'd with a great Quantity of acid, essential Salt; and are fit to allay the violent Motion of the Fluids; yet they create an Appetite, because this acid Salt lightly pricks the Sides of the Stomach.

In the mean time, People ought to be cautious of this sort of Food, which contains a viscous and thick Juice; and sometimes, in the very first Passages, causes Wind and crude Humours.

They preserve *Apricocks*, to render them more pleasing to the Taste, and that they may keep the longer. Being thus order'd, they are the less injurious, because their viscous Phlegm is rarefy'd by the Sugar and Boiling. They are also more pectoral than raw Apricocks; for, besides the oily and embarrassing Parts naturally contain'd in them, the Sugar, wherewith they are preserv'd, supplies them with other Qualities proper to mitigate the Sharpness of the Humours in the Breast.

You may extract an Oil out of them good for Noise in the Ears, for Deafness, and easing the Piles. *Lemery on Foods.*

The Summer Fruits, when crude and unripe, are extremely pernicious, and productive of various Disorders; but when perfectly ripe, perhaps nothing is more wholesome or medicinal; as, in this State, they furnish a saponaceous Juice, capable of resolving Obstructions. But as our Climate seldom ripens these to Perfection, it is prudent to boil, bake, or preserve them; because the Heat ripens them more, and destroys their elastic Air, which is sometimes troublesome on the Stomach.

ARMENUS LAPIS.

Lapis Armenus, Offic. Calc. Mus. 468. Geoff. *Prælect.* 76. Schrod. 346. Worm. 66. Charlt. Foss. 27. *Lapis Armenus Officinarum*, Woodw. Att. Tom. 1. P. 195. N. 26. *Lapis Armenus*, Boet. 292. Math. 1352. *Armenium*, Schw. 366. Aldrov. Mus. Metall. 351. *Azulum, fructu caeruleum Fossile*, Mer. Pin. 218. **ARMENIAN STONE**, per *Woodwardum*, COPPER ORE OF A SKY OR PALE-BLUE COLOUR.

The *Armenian Stone* is opaque, with green, blue, or blackish Spots, smooth, and marked like the *Azure Stone*, with gold-coloured Specks, and friable. There is indeed but very little Difference between the two Stones, they being often found in the same Glebe, and used indifferently for each other, as having the same Virtues; only the *Armenian Stone* is more strongly purgative.

purgative. It is given from six Grains to a Scruple; and, externally used, it is detergent; with some Degree of Acrimony and Stypticity. It is very seldom used in Phytic; but the Painters employ it in making a beautiful blue Colour, with a greenish Cast. *Geoffroy.*

Alexander Trallianus prefers the *Lapis Armenus* to white Hellebore, as a Purge, in melancholy Cases.

ARMERIA, *Lychnis flore laciniato*, Mont. Ind. 37. *Armerius pratensis*, Ger. 480. Emac. 600. *Armerius sylvestris*, Merc. Bot. 1. 21. Phyt. Brit. 10. *Armeraria pratensis mas*, Mer. Pin. 11. *Lychnis plumaria sylvestris simplex*, Park. Parad. 253. Raii Hist. 2. 1000. Synop. 3. 338. *Lychnis pratensis, flore laciniato simplicis*, Hist. Oxon. 2. 537. Tourn. Inst. 336. Elem. Bot. 281. Boerh. Ind. A. 213. Dill. Cat. Giff. 69. Rupp. Flor. Jen. 92. Buxb. 200. *Caryophyllus pratensis, laciniato flore simplicis, sive Flos Cuculi*, C. B. Pin. 210. *Flos Cuculi, Odontitis Plinii*, Chab. 445. **MEADOW-PINK.**

It grows in watry Places, and flowers in May; the Flowers are in Use. It is a good Alexipharmic, and commended against Poison. *Dale.*

ARMILLA, that circular Ligament which comprehends all that Multiplicity of Tendons which belong to the whole Hand within a Circle in the Region of the Carpus, and is easy to be divided into several others; for which Reason some make two of them, one encompassing the Inside of the Carpus, which is broad and strong, and holds together all the Tendons of the Musculi Flexores; the other, on the Back of the Carpus, consists of six lesser ones connected to one another, and rolled about the Musculi Extensores, like so many Rings. *Castellus.*

ARMONICACUM, the same as **AMMONIACUM**, which see.

ARMORACIA, Offic. Schrod. *Raphanus sylvestris*, Ger. 185. Emac. 240. *Rapistrum album articulatum*, Park. Theat. 863. Raii Hist. 1. 805. *Rapistrum flore albo, siliqua articulata*, C. B. Pin. 95. *Rapistrum flore albo*, Mer. Pin. 103. *Rapistrum flore Erucae foliis*, Merc. Bot. 1. 64. Phyt. Brit. 103. *Rapistrum flore albo striato*, *Sinapi agreste album Trago*, J. B. 2. 852. *Rapistrum flore albo striato*, Chab. 273. *Raphanistrum flore albo striato, siliqua articulata striata minore*, Hist. Oxon. 2. 266. Tourn. Inst. 230. Elem. Bot. 197. Boerh. Ind. A. 2. 21. Dill. Cat. Giff. 116. *Raphanistrum siliqua articulata glabra, majore & minore*, Raii Synop. 3. 296. **WILD RADISH.**

It grows amongst Corn, and flowers in June. The Root is in Use. It warms and dries. It incides mucilaginous tartareous Concretions; it attenuates, resolves, opens Obstructions of the Viscera, is diuretic, lithontriptic, and antiscorbutic. *Dale* from *Schrod.*

ARMORUM PUGNA, a sort of Gymnastics. This kind of Exercise, says *Oribasius* from *Antyllus*, was not in Use among the Antients as a Remedy, but was invented by the Romans, principally with a Design to promote the military Art, and is now received among the Gymnastics.

The Patient, who is supposed to prepare himself for a Duel, puts on military Armour, and engages with an Adversary, or fights against a Pillar.

This Exercise is proper to render the Body more fit for Motion, and to increase Flesh; but it tends to make the Flesh soft and loose, and is noxious to the Head, which suffers as well on account of its being so closely streightened and covered with the Cap and Helmet, as by the Weight with which it is oppressed. But this sort of Gymnastics mightily professes and promises to procure us the Benefits of a long Breath, and Firmness of Body, since they who are inured to it may very well bear any other Exercise that requires much Breath. *Oribas. Med. Coll. Lib. 6. Cap. 36.*

ARMUTHEUS LAPIS, corruptly written for **ARMENIUS LAPIS**, by *Nechepsus*. *Aetius Tetrab. 1. Serm. 2. Cap. 47.*

ARNABO, a Name for Zedoary. See **ZEDOARIA**.

ARNACIS, *ἀρνάκιν*, in *Hippocrates* *περὶ ἐπιπλησίᾳ*, is a Lambskin with the Wool.

ARNALDIA, the Name of a malignant, slow, and chronic Disease, formerly pretty common in England, and usually attended with an *Alopecia*, whence it seems to be a kind of *Lues Venerea*. *Blancard.*

ARNICA, a Species of **DORONICUM**, which see.

ARNOGLOSSUM, *ἀρνόγλωσσον*, from *ἄρξ*, a Lamb, and *γλῶσσα*, a Tongue. Lamb's-tongue, a Name for Plantain. See **PLANTAGO**.

AROEIRA, a Species of the Lentisk. See **LENTISCUS**.

AROHOT, Mercury. *Rulandus.*

AROMA, *ἄρωμα*. It signifies any thing fragrant or odorous; but is sometimes taken for Myrrh.

AROMATICA, *ἀρωματικά*, from *ἄρωμα*, a Word apply'd to all fragrant Things, whether Spices, Herbs, Flowers, Seeds, or Roots. It is remarkable, that Aromatics, or Spices, preserve Animal Substances from Putrefaction; and that Providence has taken care to furnish warm Climates with Plenty of Aromatics,

which the Inhabitants make frequent Use of, and probably thereby check that spontaneous Tendency to Putrefaction, to which Heat inclines them.

AROMATICUM ROSATUM. Rose Spice.

Take of exungulated red Roses, fifteen Drams; of Liquorice sliced, seven Drams; of Aloes Wood, and yellow Saunders, each three Drams; of the best Cinnamon, five Drams; of Cloves and Mace, each two Drams and an half; Gum Arabic, and Tragacanth, each eight Scruples; of Nutmegs, the greater Cardamoms, and Galangals, each one Dram; of Indian Spikenard, one Scruple; and let them all be reduced into a Powder to be kept for Use.

This Medicine is frequently used in Cases where there is too great a Quantity of watry and superfluous Matter in the Stomach. It contributes to the Concoction of the Food, prevents Putrefaction, corrects the Relaxation of the Stomach, removes Weakness, strengthens the whole Lower Belly, and Organs of Nutrition. It dissipates the Flatulencies which distend the Stomach, restores the lost Appetite, removes Nauseas, and is surprisingly beneficial to those who labour under Disorders of the Stomach. Besides, it very much refreshes those who are recovering, or have just got the better of any long and tedious Illness. *Zwelfer Not. in Pharm. August.*

AROMATITIS, *ἀρωματίτις*, a precious Stone, of a bituminous Substance, in Colour and Smell resembling Myrrh, whence it takes its Name; it is found in Arabia and Egypt. *Goraeus.*

AROMATOPOLA, *ἀρωματόπῳλος*, from *ἄρωμα*, Spice, and *πῳλῆω*, to sell. A Druggist; also a Grocer. *Blanc.*

ARON, *ἄρον*. See **ARUM**.

ARONIA.

Mespilus Aronia, Offic. *Mespilus Aronia*, *Azarolus*, Mont. Ind. 48. *Mespilus Aronia*, Ger. 1265. Emac. 1454. *Mespilus folio laciniato, spinosa, fructu majori esculento*, Raii Hist. 2. 1458. *Mespilus Aronia veterum*, J. B. 1. 67. Chab. 3. *Mespilus Aronia, sive Neapolitana*, Park. Theat. 1423. *Mespilus Apii folio laciniato*, C. B. Pin. 453. *Jonf. Dendr.* 44. Boerh. Ind. A. 2. 256. Tourn. Inst. 641. Elem. Bot. 503. **THE NEAPOLITAN MEDLAR.**

It is sown with us in the Gardens of the Curious, and flowers in May. The Fruit is in Use. It binds the Belly moderately. *Dale.*

AROPH of *Paracelsus* are either Flowers very finely prepared after a Chymical way, by Sublimation of equal Portions of Lapis Hæmatitis and Sal Ammoniac; or the Word signifies Saffron and Bread moistened with Wine, and inclosed in a Vessel closely stopp'd, and set in Horse-dung for some Days, and afterwards distilled, *Helmont. de Lithiasi*. *Paracelsus* also speaks of *Aroph* as a Thing prepared by Distillation, and endued with a Virtue of destroying the Operation of the Kidneys, *De Vir. Memb. Lib. 2. Cap. 10*. *Aroph* also signifies a Mandrake. *Ruland. Johns.* Some take *Aroph* to be one of *Paracelsus's* Terms of Art, by which he intends to signify a Lithontriptic Medicine, and have expounded it by *Aroma Philosophorum*, *Helmont. de Lithiasi, Cap. 7. No. 14*.

ARQUATA, the Name of a Bird mentioned by *Aldrovandus*. It is called *τερχίλας* by *Oppian*. A Wren.

ARQUATUS MORBUS, the same as **ICTERUS**, which see.

ARQUEBUSADE (Eau de) the same as *Aqua Sclopetaria*. See **AQUA**.

ARRAPHON, *ἄρραφον*, from *a* Negative, and *ῥάφω*, to sew. Without Suture; the Word is applied to the Cranium, when naturally without Sutures. In this Case the Person has sometimes an inveterate and incurable Head-ach.

ARRHEN, **ARSEN**, *ἄρρην*, *ἄρσεν*, Male.

ARRHCEA, *ἄρρῳα*, *ἄρρῳα*, from *a* Negative, and *ῥέω*, to flow. The Stoppage of a Flux, and by *Hippocrates* appropriated to the Suppression of the Menfes; for *ῥρῳα*, in *Galen's* Exegefis, is *ἐποχὴ ἐμμήνων*, "the Stoppage of the Menstrual Flux."

ARRHOSTIA, *ἄρρῳστια*, *ἄρρῳστια*, from *a* Negative, and *ῥῳστυμι*, to be in sound Health. Infirmary, Weakness; it often signifies a Disease, as in 2 *Aph.* 31. and 3 *Aph.* 5.

ARRHYTHMUS, *ἄρρῳθμος*. See **ARYTHMUS**.

ARSACUM, the same as **ACRAI**, which see.

ARSALTOS, the same as **ASPHALTOS**, which see.

ARSANECK, Arsenic sublimed. *Johnson.*

ARSATUM, the same as **ACRAI**, which see.

ARSENICUM, Arsenic. Of this there are three Sorts: **ARSENICUM ALBUM**, Offic. Ind. Med. 15. *Arsenicum factitium album*, Aldrov. Mus. Metall. 354. *Arsenicum*, Mont. Exot. 12. *Arsenicum album seu crystallinum*, Schrod. 3. 498. *Arsenicum album, Risagallum, quibusdam Realgar, Worm. Mus. 29. Charlt. Foss. 13.* **WHITE ARSENIC**, or **RATSBANE**.

ARSENICUM FLAVUM, Offic. *Arsenicum factitium flavum*, Aldrov. Mus. Metall. 358. *Arsenicum citrinum seu flavum*, Schrod. 3. 498. *Arsenicum citrinum*, Pharmacopolis. **YELLOW RATSbane.**

ARSENICUM RUBRUM *factitium*, Offic. Woodw. Art. 2. P. 1. p. 50. **RED ARSENIC.** Dale.

Arsenic, properly so called, is a Substance extracted from an Ore found in *Saxony* and *Bohemia*, named *Cobalt*. It is of three Kinds, Crystalline, Yellow, and Red; and as this Original of Arsenic, and the way of preparing it, are not commonly known, I shall here shew what is the Nature of Cobalt, and in what manner Arsenic, and the other Substances found with it in the Ore, are extracted, also what are the Kinds of factitious or artificial Arsenic.

Geisman Cobalt of the Shops, *Cadmia Metallica* of *Agricola*, is a ponderous, hard, fossil Substance, almost black, not unlike Antimony, or some Kinds of Pyrites, emitting a strong sulphureous Smell when burnt, often mixed with Copper, sometimes with Silver. It is dug out of Mines in *Saxony*, near *Goslar*; in *Bohemia*, in the Valley of *Joachim*; and in *England*, in the *Mendip Hills*, in great Quantities. It has so strong a corrosive Quality as sometimes to turn and ulcerate the Hands and Feet of the Miners, and is a deadly Poison for all known Animals. All the three Kinds of Arsenic are extracted from it; and it likewise serves to make *Zaffera*, used by Potters in giving a blue Colour to their Vessels; and the *Encaustum Coeruleum*, or that kind of Blue sometimes used by Painters, and often by Women to mix with their Starch, for whitening and stiffening Linen. The way of making all these, is taught by *Kunkel*, in his Art of making Glass. To this Purpose they put the Cobalt in a calcining reverberatory Furnace, made for that Purpose in such a manner as that the Flame may just graze upon the Ore, and so set it on Fire. The Flame of the Ore is blue, accompanied with a copious Smoke, which is received on the Cieling of the Furnace, and from thence conveyed out through a large Funnel made of Boards, and above an hundred Ells in Length; but the greatest Part of it sticks to the Inside of the Funnel, in form of a whitish Soot; and every six Months the Labourers sweep the Funnel with Brooms, and carefully preserve this Soot, which afterwards serves to make both crystalline, yellow, and red Arsenic.

Crystalline Arsenic is made only by sublimating the Soot in Iron Vessels into an opaque Substance, sometimes white and shining like the *Encaustum Album*, sometimes streaked with red and crystalline Veins.

Yellow Arsenic is made of the same Soot sublimed with common Sulphur, in the Proportion of one Part of Sulphur to ten of Soot. The sublimed Mass is of a yellow Colour, solid like Sulphur, shining, and not altogether opaque, easily broken, but not friable, or easily crumbled into Dust, and distinguishable from Orpiment, by not taking Fire when thrown upon burning Coals, as Orpiment presently does. Red Arsenic is made of the same Soot and Sulphur, mixed with a small Proportion of a metallic Substance, called the *Spuma of Copper*. The sublimed Mass is solid, of a cinnabarine Colour, and opaque.

The calcined Cobalt, after the Evaporation of the Fumes or Smoke, is powdered and calcined again, and this Operation is repeated till the Calcination is judged to be perfect. Then being very finely powdered, it is mixed with two or three times the Quantity of powdered Flint Stones, and moistened with a little Water in large Tubs, where, in a very short time, it becomes a solid firm Mass, called *Zaffera*, as already said, which is used by the Potters, Glass-men, Enamellers, &c.

If two Parts of calcined Cobalt, one Part of Pot-ash, and three of common Sand, be melted together, a vitreous, opaque, bluish Mass is produced, which is ground in Mills to a very fine blue Powder, which is called *Smaltum*, or *Encaustum Coeruleum*, used by Painters, and in washing Linen.

Arsenic consists of an acid Salt, and a kind of mercurial or metallic Substance, which discovers itself when it is distilled in a Retort, mixed with Soap, Suet, Oil, or any fat or oily Substance; for with a strong Degree of Fire the Arsenic will be raised into the Neck of the Retort in a metallic Form, like Antimony. The Sulphur contained in Arsenic is in so small a Proportion, that it does not flame when cast on burning Coals, though Cobalt contains a great Quantity of Sulphur, which consequently has been separated from the arsenical Parts in the Calcination and Deflagration, and so evaporated; but the Smell of Arsenic proves, that some Sulphur still remains in it. Arsenic is very volatile; for if any Quantity of it is put into a Crucible, and set over the Fire, it will presently evaporate in white Fumes, without leaving any Remainder. If melted, stratified, or cemented with Copper, it turns it of a Silver Colour; but, as it impairs its Ductility, this Change of Colour is rendered of no Use.

Arsenic is a powerful Corrosive, and reckoned among the strongest Poisons. When taken inwardly, it causes many bad

Symptoms, of which some are common to it with other Poisons; such as Anxieties, Swoonings, Palpitations, a sudden Dejection, or Sinking of the Strength and Spirits, Stupors, Deliriums, convulsive Motions of the Limbs, Palsies, Heat and Corrosion of the Fauces, Thirst, Fevers, Vomiting, Pain in the Stomach, and cold Sweats. Other Symptoms are peculiar to this Poison, such as not only an Erosion of the Stomach, but an Extenuation of it, in such a manner, as that all its Coats, taken together, shall not be thicker than a Poppy-leaf in many Places; and at the same time, the small Intestines are found corroded and perforated; a sudden Swelling and Sphacelation of the Parts of the Body; and, after Death, a more speedy Putrefaction than is observed in other Cases, especially in the Parts of Generation belonging to Men. If Death does not immediately follow, the Patient becomes afflicted with an Hectic Fever, Marasmus, Palsy, Tremors, and sometimes Madness. Some recommend Rock Crystal reduced to an impalpable Powder, as an Antidote against Arsenic; but I should depend much more upon drinking large Quantities of Milk, Oil, or fat Broths, while the Poison remains in the Primæ Viæ; but after it has got into the Blood, alexiterial Medicines are to be used, such as *Venice Treacle*, *Mithridate*, *Bezoar*, Powder of *Vipers*, *Contrayerva-root*, and such like, and afterwards a Milk Diet.

Though Arsenic be a quick Poison for both Men and Brutes, it is recommended by some in intermitting Fevers; but, let it be never so much prepared and corrected, its deleterious Qualities are only lessened, never wholly removed; and therefore, though it may be a good Remedy for the present, it will afterwards prove a Poison, and bring on very dismal Symptoms. Arsenic therefore, in my Opinion, is worse than the Fever itself; and among all the Preparations thereof, there is but one which I can recommend, even to be used externally:

Take crude Antimony, yellow Sulphur, and crystalline Arsenic, of each two Ounces; powder and mix them well in a Glass Crucible, and melt them in a gentle Sand-heat, till they come to the Consistence of Pitch; and, the Fire being removed, they will concrete into a Mass of a dark-red Colour, which is to be kept for Use.

This Medicine is only to be applied externally, as being a mild and gentle Caustic, and thought to be endued with a Power of attracting poisonous, or other morbid Matter from the Centre of the Body to the Surface, like a Loadstone; and hence it has the Name of the *Arsenical Magnet*. It is also said to be a powerful Ripener, and is therefore applied to Venereal Buboës, with the *Emplastrum Diachylon Magnum*. It is an Ingredient in the *Emplastrum Magneticum of Angelus Sala*, and recommended for maturing and breaking Venereal Buboës, and is thought to draw the pestilential Virus out of them. It is likewise proper in scrophulous Ulcers, which it opens, cleanses and incarns, without the Assistance of any other Ointment. *Geoffroy*.

After giving the Opinion of *Geoffroy* with respect to the internal Use of Arsenic, I need not caution the younger Practitioners in Phylis to hold as suspected the Advice of *Pitcairn*, who directs Arsenic to be given internally in a Dysentery; and of *Zacutus Lusitanus*, who advises the Use of it in Clysters, for the same Distemper.

Realgar also is called *Arsenicum*, and *Sandaracha*. See **REALGAR**.

ARSIORA, Ceruss. *Johnson*.

ARTABA, *ἀρτάβη*. An Egyptian Measure of dry things, containing five Modii (somewhat above five English Pecks). *Galen. de Mensuris*.

ARTANECK, **ARTANECH**, Arsenic. *Rulandus*.

ARTEMISIA, a celebrated Plant, thus distinguish'd:

Artemisia, Offic. Chab. 375. *Artemisia vulgaris*, J. B. 3. 184. Raii Hist. 1. 372. Synop. 4. 190. Park. 90. *Artemisia vulgaris major*, C. B. Pin. 137. *Artemisia latifolia vulgaris major*, Hist. Oxon. 3. 5. *Artemisia vulgaris major, caule & flore purpurascens*, & *albicante*, Tourn. Inst. 460. Boerh. Ind. A. 127. *Artemisia mater herbarum*, Ger. 945. Emac. 1103. **MUGWORT**. Dale.

It is also called *Mater Herbarum* by *Lobel*, and *Parthenium* by *Apuleius*.

This is also called *Cingulum Sancti Johannis*, because a great many People foolishly imagine, that, if they make a Crown of it, wear it upon St. John's Eve, and throw it into the Fire, mumbling some Verses, they shall for that Year be free from Spectres, Diseases, and Misfortunes. Others call it the *Herba Regia*, *Toxitesia*, *Anactorium*, *Sanguis Hominis*, or *Rapium*. The famous Queen *Artemisia* with this Herb cured several Diseases; for which Reason *Pliny*, L. 25. C. 7. thinks it had her Name bestowed upon it. But others imagine, that it was called *Artemisia* from *Artemis*, that is, *Diana*, since the ancient Pagans believed, that the Goddess *Diána* presided over the Diseases of Women, which they thought could not be cured without this Herb. The Priests, according to *Apuleius*, *Herb.* C. 10.

C. 10. called it *Bubastecordium*, that is, the Heart of *Bubastus*. Now *Bubastus* was a Town in *Egypt*, in which the Worship of *Diana*, and of *Dogs*, mightily prevail'd [according to *Herodot.* in *Euterp.* L. 2.]; to this therefore answers pretty well the *ἀρτεμισία*, that is, the *Dianaea* of the *Greeks*; for *Ἄρτεμις* is *Diana*. It is not material whether the Virtues of this Herb were first discovered by *Dogs*, who are Lovers of it, and, according to *Antonius Musa*, use it as a Medicine against their natural Distempers, or whether they were first found out by *Diana*. See *ATHAN. KIRCHER. Oedip. Egypt. Tom. 3. p. 72.*

Mugwort has many large winged Leaves, very much torn, or cut in, even to the middle Rib, green on the upper Side, and white and hoary underneath; of a pretty strong Smell, if rubb'd between the Fingers; the Stalks grow to be two or three Feet high, channell'd, in some Plants of a hoary Green, in others of a purple Colour, full of a white Pith, and having smaller Leaves, growing alternately. The Flowers are small, round *Corymbi*, yellowish, with a Cast of Purple, standing upright, and not hanging down like Wormwood. The Root is rough and slender, running assant in the Earth, shooting out many white Fibres. It grows in Hedges, and waste Places, and flowers in *June*.

This Herb is universally known, and is the true *Mother-herb*, or Herb for the Matrix; for the Coldness of which it is an admirable Remedy. It also purifies, warms, and fortifies; it appeases the Pains to which it is subject, and cures the Green-sickness, promotes the Menses, expels the dead Foetus, and the Secundines, if used either externally or internally. *Helmant* says, that the Tops of *Artemisia* cut, and given to Women, stop the Menses; but that its inferior Parts cut, and exhibited, promote them. However, all the Diseases of Women, arising from the Matrix and Menses, may be cured with it. It is the grateful Reliever of Women in Child-birth, and of such as labour under any Disorder incident to Women, *Joh. Mich. Fher. de Scorzonar. p. 12.* It also cleanses the Liver when obstructed, purges the Kidneys of Gravel, promotes Urine, and removes the Strangury, and Pains of the Belly. It also resists Poison, and purifies a pestilential Air, *Ambr. Paræus Chir. L. 21. de Pest. C. 25. Casp. Schwenkf. L. 1. Catal. Stirp. Siles.* When boiled in Wine or Water, and taken for forty Days successively, one or two Ounces for a Dose, in the Morning before Breakfast, it cures the Dropsy and Jaundice. *C. Raygerus* says, he saw a dropical Patient thoroughly cured of his Disorder by drinking an Infusion of red *Artemisia* in Wine, *Obs. Med. 51. in Schol.* Its Juice drank with White-wine, or with Water of Maiden-hair, cures the Jaundice, *Joh. Matth. Grad. Pract. p. 2. C. 8.* It is also good for Wounds, and often rank'd among the other vulnerary Herbs. It is also good for the Bites of Serpents and Scorpions, especially when drank in Wine, or apply'd immediately to the Wounds. This Herb is also excellent in gun-shot Wounds; in which Case the Herb is taken fresh, triturated with White-wine, its Juice express'd, and two Spoonfuls of it given twice a Day, pouring at the same time a little of it into the Wound. It also takes away the Pain occasioned by the Heat of the Powder. When the Herb cannot be had fresh, it is usual to take the dry, and boil it in an equal Quantity of Wine and Water, of which they give the Patient to drink, Morning and Night; they also wash the Wound with it. *Th. Tabernamontanus*, in the Siege of *Oletz*, and in a great many other Campaigns, acquired a very great Reputation by means of this Medicine, and assures us, that it never failed him. Those who have the Gout should eat the Root of this Herb, which will in a short time relieve their Pain. *Abrahamus Scilerus, Consil. inter Cratoniana, 235.* affirms, that many have been freed from arthritic Pains only by using the Roots of *Artemisia* boiled in their Viſuals, like Parsley-roots. See also *Arn. Weckard, Thes. Pharmaceut. L. 3. C. 2.* *Artemisia* beat with Axungia and Vinegar cures Pains of the Thighs, if apply'd to them, *P. Bayr. L. 18. Pr. C. 1. and 6. C. V. Schneider. Lib. de Catarrh. Specialiff. Tr. de Arthrit. & Podagr. p. 848.* Some others, as *Crato, L. 2. Conf. 26. Schenck. L. 5. Obs. Med. Solenander, Conf. Med. 24. S. 4.* advise, in order to remove Pains in the Feet, to bathe or foment them with a Decoction of this Herb. For this Purpose also *Ant. Mizaldus* commends the *Oleum Artemisiae, Cent. 5. Memor. Aph. 79.* An old Woman is, by *Simon Pauli, in Quadr. Bot. Class. 3.* said to have thoroughly carried off cedematous Swellings in both her Knees, by applying to them folded Cloths, fumigated with *Artemisia*. This Herb, when boiled in Wine, with Chamomile-flowers, those of Sage and Rosemary, fortifies and restores maimed and refrigerated Limbs, if fomented with the Preparation. It is said, that if People who travel on Foot put some of this Herb into their Shoes, they will not so soon become weary, as they would otherwise do. Travellers who carry *Artemisia* along with them, will not become weary on their Journey, says *Pliny, N. H. L. 26. C. 15.* and *P. Bayr. L. 24. C. 13.* But *Matthiæus* on this Occasion observes, *Let who will believe it; for I cannot.* *Theodor. Tabernamontanus* says, he believes it very readily, provided the Journey be very

short. *Casp. Hoffman, L. 2. de Med. Offic. Cap. 22. Sect. 4.* mentions it as a Piece of Superstition; and wittily says, he will not soon weary, who has in his Journey *Beyfus*, which is the German Name of *Artemisia*, and signifies at the same time another Foot; that is, adds he, the four Feet of a strong Horse. But though this Opinion favours of Superstition, yet 'tis true, that a Bath of *Artemisia* restores Strength and Soundness to Feet weakened and galled by Travelling. See *Gorop. Becan. Herma-then. Lib. 7. p. 135. David Frolich. Viator. P. 1. L. 2. C. 7. Honorat. Taber. de Plantis, Tr. 1. L. 2. Cbr. Fr. Paulin. Part 1. 726. Simon Paul, Quæst. Botan. L. C. Avicenna* confirms this, who asserts, that it is an Herb of a cold Nature, and is of wonderful Efficacy against Weariness. *Philadamon, L. de Fuga Isidis*, also asserts, that this was used by *Isis* against Weariness, when wandering through *Egypt* in Quest of the Body of *Osiris*. Some superstitious People pull up this Herb, and dig under it at a certain Time and Hour, especially on St. John's Eve, for Coals, which they use against the Fever, the Plague, the Falling Sickness, Witchcraft, and other Disorders, tying at the same time the Herb about their Necks. The *Wirttemberg Pharmacopœia* affirms, p. 22. that if on St. John's Eve, before the Rising of the Sun, People dig under the old Trunk of red *Artemisia*, they will find a black Coal, which, if hung about the Neck, is good against the Falling Sickness. *Joh. Chemnitius, Ind. Plantar. Brunsvic. p. 17.* mentions its being sold in some Apothecaries Shops as an Amulet to cure Fevers. *Tragus*, on the contrary, Part 2. *Hebr. C. 113.* and *Joh. Bauhine, Hist. Plant. Univerf. L. 26. C. 78.* call these Coals the Stones of Fools, because they are sought for by weak and foolish People; but *Mich. Etmuller, Comment. in Schrod. Pharm. Sect. 1. & in Ludovic. Pharm. Tit. 14. and in Colleg. Practic. C. de Epileps. P. M. 887.* informs us, that there is nothing either fabulous or superstitious in what is reported of that Coal; and that it was an infallible Remedy against the Epilepsy, which a certain Woman in *Leipsic* had found verified upon her own Son. *Christopher Helwig, in Consil. Medic. de Peste, p. 139.* says, For my share, I look upon this Stone as something miraculous: However, I will not venture to assert, that there is no such thing, since a great many People, who cannot be charg'd with Folly, have given Accounts of very surprising Effects produced by it. *Fernelius* is, in my Opinion, far from being a Fool, yet in his *Consil. pro Epileptico præscript.* he commends that Stone hung about the Neck against the Epilepsy. See also *Anton. Mizald. Cent. 3. Mem. Aph. 10. Casp. Baubin. in Matthiol. p. 619. Ephem. N. C. Dec. 3. An. 9. and 10. Obs. 128. Ofw. Gabelkhrwer, p. m. 24. H. Petrai Disfert. Harm. L. 1. Diff. 6. Sect. 53. Fr. Jeel, Oper. Med. Lib. 1. Sect. 3. de Epilepsia. Fr. Decker, Not. ad Prax. Med. Pauli Barbett, L. 1. C. 1. Th. Mayern. Prax. Med. L. 1. C. 3. G. H. Velsch. Chir. 1. Exat. Cur. 505. & Hecatyst. 2. Obs. Med. 40.* The Roots of *Artemisia* may be kept and preserved for a great many Years. In some foreign Apothecaries Shops we find a Water distilled from this Herb; we there also find a Syrup, a Conserve, an Extract, and a Salt of it. The distill'd Water is serviceable to Women in Child-bed; expels the Foetus, whether dead or alive; brings away the After-birth, promotes the monthly Evacuations when stopt, purges the Kidneys and Urinary Passages, promotes Urine, and expels the Stone; cures the Jaundice, and is good against the Dropsy. The Syrup and Conserve are used for all Weakness, Coldness, Impurities, and Pains in the Matrix; they also promote the Menses, and facilitate Child-birth. The Extract dissolves Stones, and carries off Suppressions of Urine, *Andr. Zeigler, Pharm. Spag. p. 87.* The Conserve is also good to purify and fortify the Matrix: It is likewise good against the Chlorosis. *Zacutus Lusitanus, Lib. 2. Obs. 99. Prax. Adm.* cured a Chlorosis of ten Years standing with it. Its Salt is, among other things, an excellent Antidote against the Plague. *Ambros. Paræus, L. 21. Chir. C. 25. Conrad. Khunrah. Medull. Destill. p. 2. C. 7. Joh. de Cuba, in Hort. San. makes mention of Artemisia, and says, that if any one has this Herb in his House, the Devil can do him no Harm. If any one place a Piece of this Herb above the Door of a House, nothing unlucky can befall that House. See also Dioscor. L. 3. C. 127. Joh. Wier. de Præst. Dæmon. L. 5. 21. Artemisia hung up in the Entry of a House banishes all Witches, P. Bayr, L. 16. Cr. C. 3. Fernelius from Pliny, N. H. L. 25. C. 10. informs us, that Artemisia held in the Hand banishes wild Beasts and Devils. The Down of Artemisia is the Moxa of the Germans, Ephem. N. C. Dec. 2. An. 1. Obs. 6.*

The fabulous Accounts above related concerning the Virtues of *Artemisia*, in banishing Devils, Witches, and Spectres, I have quoted only with a View of shewing the great Veneration which People have had for this Plant, amounting even to Superstition.

Mugwort has a little herby, saltish Taste, and gives a faint red Colour to the blue Paper. The Salt which is naturally in this Plant, probably resembles Sal Ammoniac, but is united with a great deal of Sulphur and Earth; for by the Chymical Analysis we obtain from Mugwort, beside several acid Liquors,

some concreted, volatile, and very lixivial fixed Salt, and a great deal of Sulphur and Earth. All these Principles render this Plant very aperitive, and proper to regulate and restore the Menfes. *Martyn's Tournefort.*

Dioscorides takes Notice of another ARTEMISIA, which he calls ἀρτεμισία, which is, I suppose, the *Artemisia tenuifolia*, or *Abrotanum Campestre*. See ABRROTANUM.

There is another Species of Artemisia which grows in China, from which the Moxa celebrated by Sir William Temple is procur'd, by taking out the gross Fibres of the dry'd Leaves, and rubbing these Leaves with the Hands, till the green Part crumbles away, and the lanuginous Fibres alone remain. Dale calls this Plant *Artemisia*.

Artemisia Chinensis, *cujus mollugo Moxa dicitur*, Pluk. Phytog. Tab. 15. Almag. 50. Hist. Oxon. 3. 5. *Artemisia orientalis vulgaris facie*, Act. Philosoph. Lond. N° 276. p. 1020. *Musia pattrae*, Malab. Moxa, Kempf. Ed. Angl. App. 27. Amanit. Exot. 589. 600. *An Ytzequinpatli*, Hern. MUGWORT OF CHINA.

ARTEMISION. The Name of a Month among the Macedonians, in the Beginning of which happen'd the vernal Equinox. *Gal. Com. 1. in Lib. 1. Epid.*

ARTEMIS DIANIO. The Inventor of a Dentifrice against the Strider Dentium, which consisted of equal Quantities of white Bread, old and dry enough to grate; Salt, Pepper, Indian-leaf, Costus, and Hartshorn, reduced to a very fine Powder. *Marcellus Empiricus*, Cap. 13.

ARTEMONIUM, ἀρτεμόνιον. The Name of a Collyrium described by *Galen*, Lib. 4. de C. M. S. L. Cap. 7.

ARTENNA. The Name of an aquatic web-footed Bird, called also *Diomedea*, because found in the *Diomedean* Isles, now called *Tremiti*. *Castellus*.

ARTERIA, ἀρτηρία, an Artery.

Artein, *Arteria*, in *Hippocrates*, generally signifies what we call the *Aspera Arteria*, that is, the Tube which conveys the Air to the Lungs. However, though this Author was utterly ignorant of the true Sources and Uses of the Arteries, which he confounds with the Veins, it may be of some Importance to the perfect Understanding of his Works, to specify his Notions of the Blood-vessels.

Hippocrates, in one Passage, [*Lib. de Alimento*] acknowledges, That the Veins proceed from the Liver, which is the Origin and Root of them, as the Heart is of the Arteries: And elsewhere he maintains, that the Veins and Arteries proceed equally from the Heart [*Lib. de Carnibus*]. "There are, says he, two hollow Veins which proceed from the Heart, one of which is call'd the Artery, and the other the Hollow Vein." In the Days of *Hippocrates* the Name of VEIN was indifferently apply'd to all Blood-vessels; and the Word Artery [*Artein*, ἀρτηρία] properly denoted the *Aspera Arteria*, or Pipe of the Lungs. *Hippocrates* also gives the Name of Veins to the Ureters, and even to the Nerves. Besides these, there are few Passages in which he makes a formal Distinction betwixt Arteries and Veins; which Circumstance may render the Books, or at least the particular Passages of them, in which this Distinction is made, suspected. "The Artery," adds he immediately after, includes more Heat than the hollow Vein, and is the Reservoir of the Spirit (ταμιεύει τὸ πνεῦμα). "There are as yet other Veins in the Body besides these two. As to that which has the largest Cavity, and is fixed to the Heart, it runs through all the Belly and Diaphragm, and sends a Branch to each Kidney, and at the Loins it divides, and sends Branches to other Parts, and to both Legs. Above the Heart also this Vein divides itself to the Right and the Left, and, mounting to the Head, distributes itself to each Temple. To this may be joined other Veins, which are also very large; but, in one Word, all the several Veins which are dispersed over the whole Body, proceed from the Hollow Vein and the Artery."

Here are already two Opinions concerning the Origin of the Veins and Arteries; and there is still a third found in three other Passages of the Works of the same *Hippocrates*, both with regard to the Origin and the Distribution of the Veins [*Lib. de Offium Natura*, *Lib. de Natura Humana*, & *Lib. de Locis in Homine*]. "The largest Veins of the human Body, says he, are disposed in this manner: There are four Pairs of them in all. The first Pair rise from behind the Head, and, descending by the exterior Part of the Nape of the Neck on each Side the Spine, reach the Hip and Thighs; and, passing thence through the Legs, they reach the external Ankle-bones and Feet. For this Reason, in Pains of the Back or Hip, Bleeding in the Ham, and in the external Ankle, affords great Relief. The second Pair, coming also from the Head, descend from the Ears along the Neck; they are called the Jugular Veins, and follow the Spine in its inner Part, till, arriving at the Loins, they branch out on both hands to the Testicles, the Thighs, and the Insides of the Hams, and pass thence through the internal Ancles to the inner Sides of the Feet: For this Reason, in Pains of the Testicles and Loins, Bleeding in the internal Veins of the Ham and Ankle is very useful. The third Pair rise

VOL. I.

from the Temples; and, passing from the Neck towards the Shoulders, reach the Lungs; and from thence passing on one Side from the Right to the Left, run along under the Breasts to join the Spleen and Kidneys; and on the other Side passing from the Left to the Right, run also by the Breasts to the Liver and Kidneys; and at last they terminate in the strait Intestine. The fourth Pair, rising from the Forehead and Eyes, pass below the Lungs and Clavicles, and thence by the superior Part of the Arm, reach the Elbow, the Hands, and Fingers; and they return again from the Fingers by the Palm of the Hand, by the Elbow, and by the under Side of the Arm, in order to reach the Armpits; and by the superior Part of the Ribs on one Side to the Spleen; and on the other to the Liver. These two Branches, passing beyond the Belly, terminate at last at the private Parts."

As a Salvo for the Contradiction betwixt this Passage and the preceding, it may be alleged; that the Book *De Offium Natura*, was not written by *Hippocrates*, but by *Polybius*, his Son-in-law. Neither *Galen* nor *Erotian*, have made any Mention of it among the Books written by *Hippocrates*; at least, they have not spoken of its Title, though they seem to have explained some Words that occur in the same Book. There is also a Passage of *Aristotle*, [*De Generat. Animal. Lib. 3. Cap. 3.*] in which that Philosopher, talking of the Origin and Distribution of the Veins, and relating the Sentiments of several Physicians with regard to that Point, cites the very Words of the Book *De Natura Offium*, which we have translated, and cites them as being written by *Polybius*. This Proof, though apparently sufficient, does not remove the Whole of the Difficulty, because the same Words are found in the Book *De Natura Humana*, which *Galen* strongly maintains to be written by *Hippocrates*, pretending to prove it by the Authority of *Plato*, who, as he says, has quoted some Passages of it, as belonging to *Hippocrates*, though others have ascribed that Book to *Democritus*. The same *Galen* [*De Hippocratis & Platonis Decretis, Lib. 6. Cap. 3.*] nevertheless denies, that this last Opinion, touching the Origin and Division of the Veins, was embraced either by *Hippocrates* or *Polybius*; and assures us, that it has been foisted into the Text, which, by the way, is not very probable, since we find the same Opinion in the Book *De Locis in Homine*.

There is another Difficulty with regard to the Book *De Carnibus*, whence I have taken what I said about the Veins and Arteries proceeding from the Heart. *Aristotle*, in the Passage just cited, after having observed, that almost all Physicians agreed with *Polybius* to make the Veins proceed from the Head, concludes, that they were all in the wrong, not knowing that it was from the Heart, and not from the Head they rise. If *Hippocrates* is the Author of the Book *De Carnibus*, where this Sentiment of *Aristotle* is clearly establish'd, what Appearance is there, that this Philosopher should have been ignorant of it? And why might he not have read the Writings of *Hippocrates*, as well as those of *Polybius*? One might infer from this, that no more belongs to *Hippocrates*, than that *De Natura Offium*. But it may be, *Aristotle* has in that Passage quoted *Polybius*, or even *Symonides* of Cyprus, or *Diogenes* of Apollonia, Physicians of small Reputation, in Comparison of *Hippocrates*, rather than *Hippocrates* himself, who is only mentioned in one Passage of all his Works [*Politicor. Lib. 7. Cap. 4.*]. It may be, I say, he has omitted quoting him, out of a Principle of Envy, or Ill-will; tho' he seems to speak advantageously of him in the Passage refer'd to. *Plato* has behav'd better, with regard to this ancient Physician, having, in several Passages, made very honourable Mention of him. It is also possible, that the Book we are talking of may not have been written by *Hippocrates*; the Title of it, at least, is not to be found in the List which *Erotian* has given of his Works. *Le Clerc*.

The Arteries are conical Channels, which convey the Blood from the Heart to all the Parts of the Body.

Each Artery is composed of three Coats, of which the first seems to be a Web of fine Blood-vessels and Nerves, for the nourishing of the Coats of the Artery. The second is made up of circular, or rather spiral Fibres, of which there are more or fewer Strata, according to the Bigness of the Artery. These Fibres have a strong Elasticity, by which they contract themselves with some Force, when the Power, by which they have been stretched out, ceases. The third and inmost Coat is a fine, dense, transparent Membrane, which keeps the Blood within its Channels, which otherwise, upon the Dilatation of the Artery, would easily separate the spiral Fibres from one another. As the Arteries grow smaller and smaller, so these Coats grow thinner and thinner, and the Coats of the Veins seem to be only a Continuation of the Coats of the capillary Arteries.

The Structure of the Arteries being thus premised, it will be easy to account for their Pulse. When the Left Ventricle of the Heart contracts, and throws its Blood into the great Artery, the Blood in the Artery is not only thrust forwards towards the Extremities, but the Channel of the Artery is likewise dilated; because Fluids, when they are pressed, press again to all hands,

and their Pressure is always perpendicular to the Sides of the containing Vessels; but the Coats of the Artery, by any small Impetus, may be distended; therefore, upon the Contraction of the Heart, the Blood from the Left Ventricle will not only press the Blood in the Artery forwards, but both together will distend the Sides of the Artery. When the Impetus of the Blood against the Sides of the Artery ceases, that is, when the Left Ventricle ceases to contract, then the spiral Fibres of the Artery, by their natural Elasticity, return again to their former State, and contract the Channel of the Artery till it is again dilated by the Systole of the Heart. This Diastole of the Artery is its Pulse, and the Time the spiral Fibres are returning to their natural State, is the Distance between two Pulses. This Pulse is in all the Arteries of the Body at the same time; for whilst the Blood is thrust out of the Heart into the Artery, the Artery being full, the Blood must move in all the Arteries at the same time; and because the Arteries are conical, and the Blood moves from the Basis of the Cone to the Apex, therefore the Blood must strike against the Sides of the Vessels, and consequently every Point of the Artery must be dilated at the same time that the Blood is thrown out of the Left Ventricle of the Heart; and as soon as the Elasticity of the spiral Fibres can overcome the Impetus of the Blood, the Arteries are again contracted. Thus there are two Causes, which operating alternately, keep the Blood in a continual Motion, viz. the Heart and Fibres of the Arteries: But because the one is stronger than the other, therefore, though the Blood runs continually, yet, when the Artery is open'd, it is seen to move *per saltum*. *Keil's Anatomy*.

Distribution of the ARTERIES, according to WINSLOW.

The Heart throws the Blood into two great Arteries; one of which is named *Aorta*, the other *Arteria Pulmonalis*.

The *Aorta* distributes the Blood to all the Parts of the Body, for the Nourishment of the Parts, and for the Secretion of different Fluids.

The *Arteria Pulmonalis* carries the venous Blood thro' all the capillary Vessels of the Lungs.

Both these great or general Arteries are subdivided into several Branches, and into a great Number of Ramifications. For an Account of the Pulmonary Artery, see PULMONES.

Of the AORTA.

The Basis of the Heart being very much inclined to the Right Side, and turned a little backward, the *Aorta*, *Tab. 5. Fig. 1.* goes out from it in a direct Course, nearly over-against the fourth Vertebra of the Back. Its Course is direct, with respect to the Heart; but, with respect to all the rest of the Body, it ascends obliquely from the Left to the Right-hand, and from before, backward.

Soon after this, it bends obliquely from the Right-hand to the Left, and from before, backward, reaching as high as the second Vertebra of the Back; from whence it runs down again, in the same Direction, forming an oblique Arch. The Middle of this Arch is almost opposite to the Right Side or Edge of the superior Portion of the Sternum, between the cartilaginous Extremities or sternal Articulations of the first two Ribs.

From thence the *Aorta* descends in a direct Course along the anterior Part of the Vertebrae, all the way to the Os Sacrum, lying a little towards the Left-hand, and there it terminates in two subordinate or collateral Trunks, call'd *Arteria Iliaca*, *Tab. 5. Fig. 53. 53.*

The *Aorta* is by Anatomists generally divided into the *Aorta Ascendens*, and the *Aorta Descendens*, tho' both are but one and the same Trunk. It is termed *Ascendens*, from where it leaves the Heart, to the Extremity of the great Curvature or Arch. The remaining Part of this Trunk, from the Arch to the Os Sacrum or Bifurcation, at 28. *Tab. 5.* is named *Descendens*.

The *Aorta descendens* is farther divided into the superior and inferior Portions; the first taking in all that lies above the Diaphragm; the other, all that lies between the Diaphragm and the Bifurcation.

The *Aorta ascendens* is principally distributed to Part of the Thorax, to the Head and upper Extremities. The superior Portion of the *Aorta descendens* furnishes the rest of the Thorax; the inferior Portion furnishes the Abdomen and lower Extremities.

The great Trunk of the *Aorta* thro' its whole Length sends off immediately several Branches, which are afterwards differently ramify'd; and these Arterial Branches may be look'd upon as so many Trunks, with respect to the other Ramifications, which again may be consider'd as small Trunks, with regard to the Ramifications that they send off.

The Branches which go out immediately from the Trunk of the *Aorta*, may be term'd Original or Capital Branches; and of these, some are large, and others very small.

The large capital Branches of the *Aorta* are these: Two *Arteria Subclaviae*; two *Carotides*; one *Celiaca*; one *Mesenterica Superior*; two *Renales*, formerly termed *Emulgentes*; one *Mesenterica Inferior*; and two *Iliaca*.

The small capital Branches are chiefly the *Arteria Coronaria Cordis*, *Bronchiales*, *Oesophagææ*, *Intercostales*, *Diaphragmatica Inferiores*, *Spermaticeæ*, *Lumbares*, and *Sacræ*.

These capital Branches or Arteries are for the most part disposed in Pairs; there being none in odd Numbers but the *Cæliaca*, the two *Mesentericæ*, some of the *Oesophagææ*, the *Bronchialis*, and sometimes the *Sacræ*.

The Ramifications of each capital Branch are in uneven Numbers, with respect to their particular Trunks; but with respect to the Ramifications of the like capital Trunks on the other Side, they are disposed in Pairs. Among the Branches there are in odd Numbers none but the *Arteria Sacra*, when it is single, and the *Oesophagææ*, the Ramifications of which are, however, sometimes found in Pairs.

Before I enter upon the Detail of each of these particular Arteries, many of which have proper Names, it will be convenient to give a short View of the Disposition and Distribution of the principal Arterial Branches, as a general Plan, to which all the Particularities of each Distribution may afterwards be referred; for I have found by Experience, that the common Method of describing the Course of all the Ramifications of these Vessels, without having first given a general Idea of the principal Branches, is very troublesome to Beginners.

The *Aorta* gives Rise to two small Arteries, called *Coronaria Cordis*, which go to the Heart and its Auricles; one of which is situated anteriorly, the other posteriorly, and sometimes they are three in Number. See *Tab. 5. Fig. 2. 2.*

From the upper Part of the Arch or Curvature, the *Aorta* sends out commonly three, sometimes four, large capital Branches, their Origins being very near each other. When there are four, the two Middle Branches are termed *Arteria Carotides*, *Tab. 5. Fig. 5. 5.* the other two *Subclaviae*, *Tab. 5. Fig. 4. 4.* and both are distinguish'd into Right and Left.

When there are but three Branches, which is ofteneft the Case, the first is a short Trunk, common to the Right Subclavian and Carotid; the second is the Left Subclavian, and the third the Left Carotid. Sometimes, tho' very rarely, these four Arteries unite in two Trunks.

The Origin of the Left Subclavian, terminates the *Aorta Ascendens*; but I have sometimes observed four Branches, the first three of which were those already mentioned, and the fourth a distinct Trunk of the Left vertebral Artery.

It must be observed, that these large Branches, which arise from the Curvature of the *Aorta*, are situated obliquely; the first, or that which is most on the Right-hand, lying more forward than the rest; and the last, which is most on the Left-hand, more backward. The first and second, or middle Branches, are generally in the middle of the Arch, and the third lower down. Sometimes the first alone is in the middle; all which Varieties depend on the Obliquity of the Arch.

The *Carotid Arteries* run up directly to the Head, each of them being first divided into two, one external, the other internal. The external Artery, *Tab. 5. Fig. 9, 10, 11, 12.* goes chiefly to the outer Parts of the Head, and *Dura Mater*, or first Covering of the Brain, to which it passes thro' a Foramen of the Cranium at B, B, and others. The internal enters the Cranium thro' the bony Canal of the Os Petrosum; and is distributed thro' the Brain by a great Number of Ramifications, *Tab. 5. Fig. 18. 18.*

The Subclavian Arteries separate laterally, and almost transversely, each toward that Side on which it lies, behind and under the Clavicular, from whence they have their Name. The Left seems to be shorter, and runs more obliquely, than the Right.

The Subclavian on each Side terminates at the upper Edge of the first Rib, between the lower Insertions of the first Scalenus Muscle; and there, as it goes out of the Thorax, takes the Name of *Arteria Axillaris*.

During this Course of the Subclavian Artery, taking in the common Trunk of the Right Subclavian, several Arteries arise from it, viz. the *Mammaria Interna*, *Mediastina*, *Pericardica*, *Diaphragmatica minor seu superior*, *Thymica*, and *Trachealis*.

The *Thymica* and *Trachealis* on each Side are in some Subjects only Branches of one small Trunk, which springs from the common Trunk of the Right Subclavian and Carotid.

They are generally small Arteries, which run sometimes separate, and sometimes partly separate, and partly joined.

The Subclavian sends off likewise the *Vertebrales*, *Cervicales*, and sometimes several of the upper *Intercostales*.

The *Axillary Artery*, which is only a Continuation of the Subclavian, from where it goes out of the Thorax to the Axilla, detaches chiefly the *Mammaria externa*, or *Thoracica superior*, *Thoracica inferior*, *Scapulares externa*, *Scapularis interna*, *Humeralis*, or *Muscularis*, &c. Afterwards it is continued by different Ramifications, and under different Names, over the whole Arm, all the Way to the Ends of the Fingers.

The superior Portion of the *Aorta descendens* gives off the *Arteria Bronchiales*, which arise sometimes by a small common Trunk.

Trunk, sometimes separate, and sometimes do not come immediately from the *Aorta*. It next sends off the *Oesophagæa*, which may be looked upon as *Mediastina Posteriores*; and then the *Intercostales* from its posterior Part, which in some Subjects come all from this Portion of the *Aorta*; in others only the lowest eight or nine.

The small anterior *Arteries* here mentioned are generally, at their Origins, single, and in uneven Numbers; but they divide soon after toward the Right and Left.

The inferior Portion of the descending *Aorta*, as it passes thro' the Diaphragm, gives off the *Diaphragmaticæ inferiores*, or *Phrenicæ*; which, however, do not always come immediately from the *Aorta*: Afterwards it sends off several Branches anteriorly, posteriorly, and laterally.

The anterior Branches are the *Cæliaca*, which supplies the Stomach, Liver, Spleen, Pancreas, &c. the *Mesenterica superior*, which goes chiefly to the Mesentery, to the small Intestines, and to that Part of the great Intestines, which lies on the Right Side of the Abdomen; the *Mesenterica inferior*, which goes to the great Intestines on the Left Side, and produces the *Hæmorrhoidalis interna*; and, lastly, the Right and Left *Arteria Spermaticeæ*, or Spermatic Arteries.

The posterior Branches are the *Arteria Lumbares*, of which there are several Pairs, and the *Sacra*, which do not always come from the Trunk of the *Aorta*.

The lateral Branches are the *Capulares* and *Adiposæ*, the Origin of which often varies; the *Renales*, formerly termed *Emulgentes*; and the *Iliacæ*, which terminate the *Aorta* by the Bifurcation already mentioned.

The *Iliac Artery* on each Side is commonly divided into the external or anterior, and internal or posterior.

The internal *Iliaca* is likewise named *Arteria Hypogastrica*; and its Ramifications are distributed to the Viscera contained in the Pelvis, and to the neighbouring Parts, both internal and external.

The *Iliaca externa*, which is the true Continuation of the *Iliac Trunk*, and alone deserves that Name, goes on to the Inguen, and then out of the Abdomen under the Ligamentum Fallopii, having first detached the *Epigastrica*, which goes to the Musculi Abdominis Recti: Having quitted the Abdomen, it commences *Arteria Cruralis*, which runs down upon the Thigh, and is distributed by many Branches and Ramifications to all the lower Extremity.

I shall now go on to examine particularly all the capital or original Branches of the *Aorta*, from their Origin to the Entry of them, and of their Ramifications, into all the Parts of the Body, and all the different Viscera and Organs.

The CARDIAC or CORONARY ARTERIES of the HEART.

The *Cardiac* or *Coronary Arteries* of the Heart, *Tab. 5. Fig. 2. 2.* arise from the *Aorta* immediately on its leaving the Heart: They are two in Number, and, according to the natural Situation of the Heart, one is rather superior than anterior; the other rather inferior than posterior.

They go out near the two Sides of the pulmonary *Arteries*, which having first surrounded, they afterward run upon the Basis of the Heart, in form of a kind of Crown or Garland, from whence they are called *Coronariæ*, and then pursue the superficial Traces of the Union of the two Ventricles, from the Basis of the Heart to the Apex.

They send communicating Branches to each other, which are afterward lost in the Substance of the Heart.

We sometimes meet with a third *Coronary Artery*, which arises from the *Aorta* more backward, and is spent on the posterior or lower Side of the Heart.

The CAROTID ARTERIES.

The *Carotid Arteries*, *Tab. 5. Fig. 5. 5.* are commonly demonstrated after the Subclavian; but I choose to describe them first, that I may afterwards be able to pursue the *Arteries* of the Thorax arising partly from the *Subclaviæ*, and partly from the *Aorta descendens*, without Interruption.

These *Arteries* are two in Number, one called the Right *Carotid*, the other the Left. They arise near each other, from the Curvature or Arch of the *Aorta*; the Left immediately, the Right most commonly from the Trunk of the *Subclavia* on the same Side, as has been already observed.

They run upon each Side of the *Trachea Arteria*, between it and the internal Jugular Vein, as high as the Larynx, without any Ramification. During this Course, therefore, they may be named *Carotid Trunks*, or general, common, and original *Carotids*. Each of these Trunks is afterwards ramified in the following manner.

The Trunk, having reached as high as the Larynx, is divided into two large Branches, or particular *Carotids*, one named *external*, the other *internal*, because the first goes chiefly to the external Parts of the Head; the second enters the Cranium, and is distributed to the Brain.

The external *Carotid* is anterior, the internal posterior; and the external is even situated more inward, and nearer the La-

rynix, than the other; but the common Names may still be retained, as being taken not from their Situation, but from their Distribution.

The EXTERNAL CAROTID ARTERIES.

The external *Carotid* is the smallest, and yet appears by its Direction to be a Continuation of the common Trunk. It runs insensibly outward, between the external Angle of the lower Jaw, and the parotid Gland, which it supplies as it passes. Afterwards it ascends on the Forefide of the Ear, and ends in the Temples.

In this Course it sends off several Branches, which may well enough be divided into anterior or internal, and posterior or external; and the principal Branches of each kind are these.

The first anterior or internal Branch goes out from the very Origin of the *Carotid* on the Inside; and having presently afterwards taken a little Turn, and sent off Branches to the Jugular Glands near it, to the Fat and Skin, it runs transversely, and is distributed to the Glandulæ Thyroidæ, and to the Muscles and other Parts of the Larynx; for which Reason I name it *Laryngæa* or *Gutturæ superior*. It likewise sends some Branches to the Pharynx and Muscles of the Os Hyoides.

The second anterior Branch passes over the nearest Cornu of the Os Hyoides to the Muscles of that Bone, and of the Tongue, and to the Glandulæ Sublinguales; afterwards passing before the Cornu of the Os Hyoides, it loses itself in the Tongue, from whence it has been called *Arteria Sublingualis*; and it is the same *Artery* which others have named *Ranina*.

The third Branch, or *Arteria maxillaris inferior*, goes to the Maxillary Gland, to the Styloide and Mastoide Muscles, to the Parotid and Sublingual Glands, to the Muscles of the Pharynx, and to the small Flexors of the Head.

The fourth Branch, which I name *Arteria maxillaris externa*, passes anteriorly on the Masseter Muscle, and middle of the lower Jaw near the Chin: Afterwards it runs under the Musculus Triangularis Labiorum, which it supplies as well as the Buccinator, and the Quadratus Mentis.

It sends off a particular Branch, very much contorted, which divides at the angular Commissure of the Lips, and, running in the same manner along the superior and inferior Portions of the Musculus Orbicularis, it communicates on both Sides with its Fellow, and thereby forms a kind of *Arteria Coronaria Labiorum*.

Afterwards it ascends towards the Nares, and is distributed to the Muscles, Cartilages, and other Parts of the Nose, sending down some Twigs, which communicate with the *Coronary Artery* of the Lips. Lastly, it reaches the great Angle of the Eye, and is ramify'd and lost on the Musculus Orbicularis Palpebrarum, Superciliaris, and Frontalis. Thro' all this Course, it is named *Arteria Angularis*.

The fifth Branch arises over-against the Condyle of the lower Jaw, and, as it is very considerable, I call it *Maxillaris Interna*. It passes behind the Condyle, and, having given off a Twig among the Musculi Pterygoidæi, it is divided into three principal Branches.

The first Branch goes thro' the inferior Orbital, or Sphenomaxillary Fissure, to the Orbit, after having supply'd the Musculi Peristaphylini, and the glandulous Membrane of the posterior Nares, thro' the Foramen Spheno-palatinum. I name this Branch *Spheno-maxillaris*.

It is distributed inferiorly and laterally to the Parts contain'd in the Orbit, and detaches a small subaltern Branch through the Extremity of the superior Orbital or Sphenoidal Fissure, which enters the Cranium, and is spent upon the Dura Mater, communicating there with the other *Artery* of the Dura Mater, which enters by the Foramen Spinale of the Sphenoidal Bone.

It sends off likewise another subaltern Branch, which passes thro' the posterior Opening of the Orbital Canal, and, having furnished the Maxillary Sinus, and the Teeth, goes out by the inferior Orbital Hole, and on the Cheek communicates with the *Angular Artery*.

The second of the three Branches runs thro' the Canal of the lower Jaw, and, being distributed to the Alveoli and Teeth, goes out at the Hole near the Chin, and loses itself in the neighbouring Muscles, communicating with the Rami of the *Arteria Maxillaris externa*.

The third Branch of the *Maxillaris interna* runs up between the internal and external *Carotids*, passes thro' the Foramen Spinale of the Sphenoidal Bone, and is distributed to the Dura Mater by several Ramifications, which run forward, upward, and backward; the uppermost communicating with those on the other Side, above the longitudinal Sinus of the Dura Mater.

This *Artery* of the Dura Mater, which may be termed *Spheno-spinalis*, to distinguish it from those that go to the same Part by another Course, arises sometimes from the Trunk of the

the external *Carotid*, behind the Origin of the *Laryngæa* or *Gutturæ* superior, and sometimes from the first Branch of the *Maxillaris interna*, just before it enters the *Spheno-maxillary* Fissure.

The sixth anterior or internal Branch, which is very small, is spent on the *Musculus Masseter*.

The first external or posterior Branch is named *Arteria Occipitalis*, *Tab. 5. Fig. 11. 11.* It passes obliquely before the internal *Jugular Vein*; and, having given Twigs to the *Musculus Stylo-hyoidæus*, *Stylo-glossus*, and *Digastricus*, it runs between the *Styloide* and *Mastoide* Apophyses, along the *Mastoide* Groove, and goes to the *Muscles* and *Integuments* which cover the *Os Occipitis*, turning several times, in an undulating manner, as it ascends backward.

It communicates, by a descending Branch, with the *Vertebral* and *Cervical Arteries*, as has been already said, near the Top of the Head: It communicates likewise with the posterior Branches of the *Temporal Artery*; and it sends a Branch to the *Foramen Mastoideum*.

The second external Branch spreads itself on the outward Ear, by a great many small Twigs on each Side; several of which run inward, and furnish the *Cartilages*, *Meatus Auditorius*, *Skin* of the *Tympanum*, and *Internal Ear*.

The Trunk of the external *Carotid* ascends afterward above the *Zygoma*, passing between the Angle of the lower Jaw and *Parotid Gland*, and forms the *Temporal Artery*, which divides into an anterior, middle, and posterior Branch.

The anterior Branch of the *Temporal Artery* goes to the *Musculus Frontalis*, communicates with the *Arteria Angularis*, and sometimes gives off a very small *Artery*, which pierces the internal Apophysis of the *Os Malæ*, all the way to the Orbit. The middle Branch goes partly to the *Musculus Frontalis*, partly to the *Occipitalis*; the posterior Branch goes to the *Occiput*, and communicates with the *Arteria Occipitalis*. All these Branches likewise furnish the *Integuments*. These Branches of the external *Carotids* are, in some measure, express'd *Tab. 5. Fig. 8, 9, 10, 11, 12.*

The internal CAROTID ARTERY.

The *internal Carotid Artery*, leaving the general Trunk, is at first a little incurvated, appearing as if either it were the only Branch of that Trunk, or a Branch of the Trunk of the external *Carotid*. Sometimes the Curvature is turn'd a little outward, and then more or less inward, passing behind the neighbouring external *Carotid*, *Tab. 5. Fig. 13. 13.*

It is situated a little more backward than the *Carotis externa*, and generally runs up, without any Ramification, as high as the lower Orifice of the great Canal of the Apophysis *Petrosa* of the *Os Temporis*. It enters this Orifice, directly from below, upward, and afterward makes an Angle according to the Direction of the Canal, the rest of which it passes horizontally, being cover'd by a Production of the *Dura Mater*.

At the End of this Canal it is again incurvated from below upward, and enters the *Cranium* through a Notch of the *Sphenoidal Bone*. Then it bends, from behind, forwards, and makes a third Angle on the Side of the *Sella Sphenoidalis*, or *Turcica*; and again, a fourth under the *Clinoid* Apophysis of that *Sella*. See *Tab. 5. Fig. 14. 14.*

As it leaves the bony Canal to enter the *Cranium*, it sends off a Branch thro' the *Sphenoidal Fissure* to the Orbit and Eye; and, soon afterward, another thro' the *Foramen Opticum*, by which it communicates with the external *Carotid*, *Tab. 5. D. D.*

Afterwards the *internal Carotid* runs under the Basis of the Brain to the Side of the *Infundibulum*, where it is at a small Distance from the *internal Carotid* of the other Side; and there it commonly divides into two principal Branches, one anterior, and one posterior.

The anterior Branch runs forward under the Brain, first separating from that on the other Side; then coming nearer again, it unites with it by an *Anastomosis*, or Communication in the Interstice between the *Olfactory Nerves*. Afterwards having sent off some small *Arteries*, which accompany these Nerves, it leaves its Fellow, and divides into two or three Branches.

The first of these Branches goes to the anterior Lobe of the Brain; the second, which is sometimes double, is inverted on the *Corpus Callosum*, to which it gives some Ramifications; as also to the Falc of the *Dura Mater*, and middle Lobe of the Brain. The third, which, in some Subjects, is a distinct Branch, in others, only a Division of the second, goes to the posterior Lobe of the Brain. This might be look'd upon as a third principal Branch, lying between the other two.

The posterior Branch communicates, first of all, with the *Vertebral Artery* of the same Side; and then divides into several Branches, which run between the superficial Circumvolutions of the Brain, and are ramified in many different Directions, on and between these Circumvolutions, all the way to the Bottom of the *Sulci*.

All these Ramifications are cover'd by the *Pia Mater*, in the

Duplicature of which they are distributed, and form capillary reticular Textures in great Numbers; and afterwards they are lost in the inner Substance of the Brain. The anterior and middle Branches produce the same kind of Ramifications; and the anterior, in particular, sends a Twig to the *Corpus Callosum*. The Ramifications of the *internal Carotids* are express'd betwixt the two Figures 18. 18. *Tab. 5.*

The SUBCLAVIAN ARTERY.

The *Subclavian Arteries* (*Tab. 5. 4. 4.*) are named from their Situation near the *Claviculæ*, in the transverse Direction of which they run. They are two in Number, one Right, the other Left; and they arise from the Arch of the *Aorta*, on each Side of the *Left Carotid*, which commonly lies in the Middle between them; but when both *Carotids* go out separately, they both lie between the *Subclavia*. These *Arteries* terminate, or rather change their Name, above the Middle of the two first Ribs, between the anterior Insertions of the *Musculi Scalenii*.

The Right *Subclavian* is larger at the Beginning than the Left, when it produces the *Right Carotid*: Its Origin is likewise more anterior and higher, because of the Obliquity of the Arch of the *Aorta*; for which Reason also the Left is shorter than the Right, and runs more obliquely. Both of them are distributed much in the same manner; and therefore the Description of one may likewise be applied to the other.

The Right *Subclavian*, the longest of the two, gives off, first of all, small *Arteries* to the *Mediastinum*, *Thymus*, *Pericardium*, *Aspera Arteria*, &c. which are named *Mediastina*, *Thymica*, *Pericardica*, and *Tracheales*. These small *Arteries* sometimes go out from the *Subclavian* itself, either separately, or by small common Trunks: Sometimes they are Branches of the *Mammæ interna*, especially the *Mediastina*.

Afterward this Right *Subclavian*, at about a Finger's Breadth from its Origin, often produces the common *Carotid* of the same Side; and, at a small Finger's Breadth from the *Carotid*, it gives off commonly three considerable Branches, viz. the *Mammæ interna*, *Cervicalis*, and *Vertebralis*; and sometimes an *Intercostal Artery*, which goes to the first Ribs, and is call'd *Intercostalis superior*.

The ARTERY of the THYMUS.

The *Arteria Thymica* communicates with the *Mammæ interna*, and sometimes arises from the anterior middle Part of the common Trunk of the *Subclavian* and *Carotid*. The *Thymus* receives likewise some Branches from the *Mammæ interna*, and *Intercostalis superior*. The same Observation may be applied to the *Mediastina* and *Pericardica*.

The ARTERIES of the PERICARDIUM.

The *Pericardica* arises much in the same manner with the *Thymica*; and runs down upon the *Pericardium* all the way to the *Diaphragm*, to which it sends some small Ramifications.

The ARTERIES of the MEDIASTINUM.

The *Mediastina* arises sometimes immediately after the *Thymica*, and is distributed principally to the *Mediastinum*.

The TRACHEAL ARTERY.

The *Trachealis*, which may likewise be named *Gutturæ inferior*, runs up from the *Subclavia*, in a winding Course, along the *Aspera Arteria*, to the *Glandulæ Thyroidææ*, and *Larynx*, detaching small *Arteries* to both Sides, one of which runs to the upper Part of the *Scapula*.

The internal MAMMARY ARTERY.

The *internal Mammary Artery* comes from the anterior and lower Side of the *Subclavia*, near the Middle of the *Clavicula*; and runs down, for about one Finger's Breadth, behind the *Cartilages* of the true Ribs, an Inch distant from the *Sternum*.

In its Passage it sends Branches to the *Thymus*, *Mediastinum*, *Pericardium*, *Pleura*, and *Intercostal Muscles*. It likewise detaches other Branches thro' these *Muscles*, and between the *Cartilages* of the Ribs, to the *Pectoralis Major*, and other neighbouring muscular Portions, to the *Mammæ*, *Membrana Adiposa*, and *Skin*.

Several of these Branches communicate by *Anastomoses* with the *Mammæ externa*, and other *Arteries* of the *Thorax*, especially in the Substance of the *Pectoralis Major*, and likewise with the *Intercostals*. Afterwards it goes out of the *Thorax* on one Side of the *Appendix Eniformis*, and is lost in the *Musculus Abdominis Rectus*, a little below its upper Part; communicating at this Place, by several small Ramifications, with the *Arteria Epigastrica*; and, in its Course, it gives Branches to the *Peritonæum*, and to the anterior Parts of the oblique and transverse *Muscles* of the *Abdomen*.

The CERVICAL ARTERY.

The *Cervical Artery* arises from the upper Side of the *Subclavian*, and is presently afterwards divided into two, which come out

out sometimes separately, sometimes by a small common Trunk. The largest of these two Arteries is anterior, the other posterior. See Tab. 5. Fig. 19.

The anterior *Cervicalis*, running behind the Carotid of the same Side, is distributed to the Musculus Coraco-hyoidæus; Mastoidæus; Cutaneus, Sterno-hyoidæus, and Sterno-thyroidæus; to the Jugular Glands, the *Aspera Arteria*, the Muscles of the Pharynx, Bronchia, Œsophagus, and to the anterior Muscles which move the Neck and Head. This Artery has been observed to send out the *Intercostalis superior*.

The posterior *Cervicalis* arises sometimes a little after the *Vertebralis*, and sometimes from that Artery. It passes under the transverse Apophysis of the last Vertebra of the Neck; and sometimes thro' a particular Hole in that Apophysis; and from thence runs up backward, in a winding Course, on the Vertebral Muscles of the Neck; and then returns in the same manner.

It communicates with a descending Branch of the *Occipital Artery*, and with another of the *Vertebral Artery*, above the second Vertebra. It is distributed to the Musculi Scalenii, Angularis Scapulæ, and Trapezius, and to the Jugular Glands and Integuments.

The VERTEBRAL ARTERY.

The *Vertebral Artery* goes out from the posterior and upper Side of the *Subclavian*, almost opposite to the *Mammaria interna* and *Cervicalis*. It runs up thro' all the Holes in the transverse Apophyses of the Vertebrae of the Neck; and in its Passage sends off little Twigs thro' the lateral Notches of these Vertebrae, to the Medulla Spinalis, and its Coverings. It also gives Arteries to the Vertebral Muscles, and to other Muscles near them. See Tab. 5. Fig. 6. 6.

As it passes thro' the transverse Hole of the second Vertebra, it is generally incurvated, to accommodate itself to the particular Obliquity of this Foramen. And between this Hole and that in the first Vertebra, it takes another larger Turn in a contrary Direction to the former: Having pass'd the transverse Hole of the first Vertebra, it is considerably incurvated a third time, from before, backwards, as it goes thro' the superior and posterior Notch in this Vertebra. See Tab. 5. Fig. 15.

At this third Curvature it sends off a small Branch, which is ramified on the outer and posterior Parts of the Occiput, and communicates with the *Cervical* and *Occipital Arteries*. Having afterwards reach'd the great Foramen of the Os Occipitis, it enters the Cranium, and pierces the Dura Mater; and on these Accounts it may be named *Arteria Occipitalis posterior*, to distinguish it from the other, which is lateral.

As soon as it enters the Cranium, it sends several small Ramifications to the back Part of the Medulla Oblongata, and to the Corpora Olivaria, and Pyramidalia; which are likewise spread on the back Sides of the fourth Ventricle of the Brain, and form the Plexus Choroides of the Cerebellum.

Afterwards it advances on the Apophysis Basilaris of the Os Occipitis, inclining by small Degrees toward the *Vertebral Artery* of the other Side, all the Way to the Extremity of that Apophysis where they both join in one common Trunk, which may be named *Arteria Basilaris*.

The ARTERIA BASILARIS.

The *Arteria Basilaris* runs forward under the great transverse Protuberance of the Medulla Oblongata, to which it gives Ramifications, as well as to the neighbouring Parts of the Medulla. Sometimes this Artery divides again, near the Extremity of the Apophysis Basilaris, into two lateral Branches, which communicate with the posterior Branches of the two internal Carotides, and are lost in the posterior Lobe of the Brain.

The SPINAL ARTERIES.

The *Spinal Arteries* are two in Number, one anterior, and one posterior, both produced by both the *Vertebrales*; each of which, as soon as it enters the Cranium, sends out a small Branch, by the Union of which the posterior *Spinalis* is form'd. Afterwards the *Vertebrales* advancing on the Apophysis Basilaris, or Production of the Occipital Bone, detach backward two other small Branches, which likewise meet, and by their Union form the *Spinalis Anterior*. These *Spinal Arteries* run down on the fore and back Sides of the Medulla Spinalis, and, by small transverse Ramifications, communicate with those which the *Intercostal* and *Lumbar Arteries* send to the same Part.

The internal AUDITORY ARTERY.

The *internal Auditory Artery* goes off from each Side of the *Arteria Basilaris* to the Organ of Hearing, accompanying the Auditory Nerve; having first furnish'd several small Twigs to the Membrana Arachnoides.

The posterior ARTERY of the MENINX, or DURA MATER.

The posterior *Meningea* arises from the same Trunk with the *Auditoria Interna*, and goes to the back Part of the Dura

Mater, on the Occipital and Temporal Bones; and likewise supplies the neighbouring Lobes of the Brain.

The superior INTERCOSTAL ARTERY.

When the *superior Intercostal Artery* does not go out from the Trunk of the *Aorta Descendens*, it commonly arises from the lower Side of the *Subclavian*, and runs down on the Inside of the two, three, or four uppermost true Ribs; near their Heads; and sends off, under each Rib, a Branch which runs along the lower Edge, and supplies the *Intercostal Muscles*, and neighbouring Parts of the Pleura.

These Branches, or particular *Intercostal Arteries*, communicate with each other, at different Distances, by small Branches, which run upward and downward from one to the other, on the *Intercostal Muscles*.

They likewise give Branches to the Musculi Sterno-hyoidæi; Subclavius, Vertebrales, and Bodies of the Vertebrae; and also to the Pectoralis Major and Minor, piercing the *Intercostal Muscles*; and lastly, they send Branches thro' the Notches of the first four Vertebrae to the Medulla Spinalis, and its Coverings.

Sometimes the superior common *Intercostal Artery* comes from the *Cervicalis*, and not immediately from the *Subclavia*. Sometimes it arises from the *Aorta Descendens*, either by small separate Arteries, or by a common Trunk, which divides as it runs obliquely up, upon the Ribs. Lastly, it sometimes arises from the nearest *Bronchialis*, or from several *Bronchiales* together.

The ARTERIAL DUCT converted into a LIGAMENT.

The *Ductus Arteriosus*, which is found only in the Fœtus, and in very young Children, arises from the *Aorta Descendens*, immediately below the Left *Subclavian Artery*. In Adults, this Duct is shrunk up and closed, and appears only like a short Ligament adhering by one End to the *Aorta*, and by the other to the *Pulmonary Artery*; so that, in reality, it deserves no other Name than that of *Ligamentum Arteriosum*. This is refer'd to, but not well express'd, at Fig. 3. Tab. 5.

The BRONCHIAL ARTERIES.

The *Bronchial Arteries* go sometimes from the fore Side of the superior descending *Aorta*, sometimes from the first *Intercostal*, Tab. 5. Fig. 29. and sometimes from the *Arteria Œsophagæa*. Sometimes they arise separately from each Side, to go to each Lobe of the Lungs; and sometimes by a small common Trunk, which afterwards separates towards the Right and Left Hand, at the Bifurcation of the *Aspera Arteria*, and accompanies the Ramifications of the Bronchia.

The *Bronchial Artery*, on the Left Side, often comes from the *Aorta*, while the other arises from the *superior Intercostal* on the same Side; which Variety is owing to the Situation of the *Aorta*. Sometimes there is another *Bronchial Artery*, which goes out from the *Aorta* posteriorly, near the *superior Intercostal*, above the *Bronchialis anterior*.

In the Year 1719. I observ'd a very plain Communication of the Branches of the Left Pulmonary Vein with the Branches of an *Arteria Œsophagæa*, which came from the first Left *Intercostal*, together with a *Bronchial Artery* of the same Side.

The *Bronchialis* gives a small Branch to the neighbouring Auricle of the Heart, which communicates with the *Arteria Coronaria*.

In the Year 1719. or 1720. I discover'd a Communication between the Left *Bronchial Artery* and the *Vena Azygos*; and in the Month of August, 1721. I saw a Branch of this *Bronchial Artery* join'd by an Anastomosis to the Body of the *Azygos*.

The ARTERIES of the ŒSOPHAGUS.

The *Œsophagæa* are generally two or three in Number, sometimes but one. They arise anteriorly from the *Aorta Descendens*, and are distributed to the *Œsophagus*. Sometimes the uppermost *Œsophagæa* produces a *Bronchial Artery*.

The inferior INTERCOSTAL ARTERIES.

The *inferior Intercostals*, Tab. 5. Fig. 31. 31. are commonly seven or eight on each Side, and sometimes ten, when the superior *Intercostals* arise likewise from the *Aorta Descendens*; in which Case these run obliquely upward, as has been already said.

They arise along the back Side of the descending *Aorta*, in Pairs, all the Way to the Diaphragm, and run transversely toward each Side, on the Bodies of the Vertebrae. Those on the Right Side pass behind the *Vena Azygos*; and afterwards they all run to the *Intercostal Muscles*, along the lower Edge of the Ribs, all the Way to the Sternum, or near it.

They send Branches to the Pleura, to the Vertebral Muscles, to those Muscles which lie on the Outfides of the Ribs, and to the upper Portions of the Muscles of the Abdomen; and they communicate with the *Arteria Epigastrica* and *Lumbares*.

Sometimes instead of going out from the *Aorta* in Pairs, they arise by small common Trunks, which afterwards divide, and send an *Artery* to each neighbouring Rib.

Before they take their Course along the Ribs; each of them detaches one Branch between the transverse Apophyses on both Sides, to the Vertebral Muscles, and another which enters the great Canal of the Spina Dorsii. Each of these latter Branches divides at least into two small *Arteries*, one of which runs transversely on the anterior Side of the Canal, the other on the posterior Side: Both of them communicate with the like *Arteries* from the other Side of the Spine, in such a manner, as to form a kind of arterial Rings; which likewise communicate with each other by other small Ramifications. The same is to be observed in the *Arteria Lumbares*.

Afterwards each *Intercostal Artery*, having reach'd the Middle of the Rib, or a little more, divides into two principal Branches, one internal, the other external. Soon after this Division, the *Arteries* that run upon the false Ribs, separate a little from them, being gradually bent downward one after another, and are spread upon the abdominal Muscles. They are likewise distributed to other neighbouring Muscles, and particularly to those of the Diaphragm, almost in the same manner with the *Arteria Phrenica*. They also communicate with the *Lumbares*, and sometimes with Branches of the *Hypogastrica*.

The AXILLARY ARTERIES.

The *Subclavian Artery*, having left the Thorax immediately above the first Rib, in the Interstice left between the Portions of the Scalenus, there receives the Name of *Axillaris*, because it passes under the *Axilla*.

In this Course it gives off, from its Inside, a small Branch to the Inside of the first Rib, and afterwards four or five principal Branches; the *Thoracica Superior*, or *Mammaria Externa*; *Tab. 5. Fig. 21. 21. Thoracica Inferior*, *Muscularis*, or *Scapularis Externa*, *Scapularis Interna*, and *Humeralis*.

The SUPERIOR THORACIC ARTERY.

The *Superior Thoracica*, or *External Mammary Artery*, *Tab. 5. Fig. 21. 21.* runs down in a winding Course on the lateral Parts of the Thorax, and crosses the Ribs. It gives Branches to the two Pectoral Muscles, to the Mamma, *Musculus Subclavius*, *Serratus Major*, *Latissimus Dorsii*, and to the upper Portions of the *Coraco-Brachialis*, and *Biceps*.

These Branches are sometimes separate for some Space; and one of them particularly runs down between the *Deltoides* and *Pectoralis Major*, together with the *Vena Cephalica*, to which it adheres very closely, the Extremity of it piercing the Coat of that Vein, as if there were an Anastomosis between them. Another sometimes runs between the *Musculus Brachizus*, and *Anconæus Internus*, which communicates with a Branch of the *Radial Artery*.

The INFERIOR THORACIC ARTERY.

The *Inferior Thoracic Artery* runs along the Inferior Costa of the Scapula, to the *Musculus Subscapularis*, *Teres Major* and *Minor*, *Infra Spinatus*, *Latissimus Dorsii*, *Serratus Major*, and the neighbouring *Intercostal Muscles*, communicating with the *Arteria Scapulares*.

The SCAPULARY ARTERIES.

The *External Scapulary Artery* passes through the Notch in the Superior Costa of the Scapula, to the *Musculus Supra Spinatus*, and *Infra Spinatus*, *Teres Major* and *Minor*, and to the Articulation of the Scapula with the *Os Humeri*.

The *Internal Scapularis* arises from the *Axillary Artery* near the *Axilla*, and runs backward, to be distributed to the *Subscapularis*, giving Branches to the *Serratus Major*, to the *Axillary Glands*, and to the *Teres Major*, upon which it is ramified in different manners. It likewise sends Branches to the *Infra Spinatus*, and upper Portion of the *Anconæi*.

The HUMERAL ARTERY.

The *Humeral Artery* arises from the Lower and Fore-side of the *Axillaris*, and runs backward between the Head of the *Os Humeri* and *Teres Major*, surrounding the Articulation, till it reaches the posterior Part of the *Deltoides*, to which it is distributed.

During this Course, it gives several Branches to the superior Portions of the *Anconæi*, to the Capsular Ligament of the Joint of the Shoulder, and to the *Os Humeri* itself, through several Holes immediately below the great Tuberosity of the Head of that Bone. It likewise communicates with the *Scapulary Artery*.

Opposite to the Origin of this *Humeral Artery*, the *Axillaris* sends off another small Branch, which runs in a contrary Direction between the Head of the *Os Humeri*, and the common Upper-part of the *Biceps* and *Coraco-Brachialis*; and having given Branches to the Vagina and Channel of the *Biceps*, and to the *Perioosteum*, afterwards joins the principal *Humeralis*.

The BRACHIAL ARTERY. See *Tab. 5. Fig. 23, 24, 25, 26, 27.*

The *Axillary Artery*, having given off these Branches, passes immediately behind the Tendon of the *Pectoralis Major*, where it changes its former Name for that of *Arteria Brachialis*. It runs down on the Inside of the Arm over the *Musculus Coraco-Brachialis*, and *Anconæus Internus*, and along the inner Edge of the *Biceps*, behind the *Vena Basilica*, giving small Branches on both Sides to the neighbouring Muscles, to the *Perioosteum*, and to the Bone.

Between the *Axilla* and Middle of the Arm, it is covered only by the Skin and Fat; but afterwards it is hid under the *Biceps*, and runs obliquely forward as it descends, being at some Distance from the internal Condyle; but it does not reach the Middle of the Fold of the Arm.

Between the *Axilla* and this Place, it sends off many Branches to the *Infra Spinatus*, *Teres Major* and *Minor*, *Subscapularis*, *Latissimus Dorsii*, *Serratus Major*, and other neighbouring Muscles, to the common Integuments, and even to the Nerves. Below the Fold of the Arm, it divides into two principal Branches, one called *Arteria Cubitalis*, the other *Radialis*.

From its upper and inner Part, it sends off a particular Branch, which runs obliquely downward and backward over the *Anconæi*, and then turns forward again near the external Condyle, where it communicates with a Branch of the *Arteria Radialis*.

Immediately below the Insertion of the *Teres Major*, it gives off another Branch, which runs from within outwards, and from behind forward, round the *Os Humeri*, and descends obliquely forward between the *Musculus Brachizus*, and *Anconæus Externus*, to both which it is distributed in its Passage. Having afterwards reached the external Condyle, it unites with the Branch last-mentioned, and likewise communicates with a Branch of the *Arteries* of the Fore-arm, so that there is here a triple Anastomosis.

About the Breadth of a Finger below this second Branch, the *Brachial Artery* sends off a third, which runs down toward the internal Condyle, and communicates with other Branches of the *Arteries* of the Fore-arm, as we shall see hereafter.

About the Middle of the Arm, or a little lower, much about the Place where the *Brachial Artery* begins to be covered by the *Biceps*, it sends off a Branch, which is distributed to the *Perioosteum*, and penetrates the Bone, between the *Musculus Brachizus* and *Anconæus Internus*.

About an Inch lower, it gives off another Branch, which, having furnished Ramifications to the *Anconæus Internus*, runs over the inner Condyle, and likewise communicates with Branches of the *Arteries* of the Fore-arm.

Having got below the Middle of the Arm, the *Brachial Artery* detaches another Branch, which runs behind the inner Condyle in Company with a considerable Nerve; and, having passed over the Muscles inserted in this Condyle, it communicates with that Branch of the *Cubital Artery*, which encompasses the Fold of the Arm.

A little lower, it sometimes sends out another Branch, which passes on the Fore-side of the inner Condyle, and then communicates with a Branch which runs up from the *Cubital Artery*. These three communicating Branches are termed *Collateral Arteries*.

The common Trunk of the *Brachial Artery*, having reached the Fold of the Arm, runs together with a Vein and a Nerve immediately under the Aponeurosis of the *Biceps*, and passes under the *Vena Mediana*, detaching Branches on each Side to the neighbouring Muscles.

About a large Finger's Breadth beyond the Fold of the Arm, this *Artery* divides into two principal Branches, one inner or posterior, named *Cubitalis*; the other outer or anterior, named *Radialis*, as has been already said.

From this Bifurcation the *Brachial Artery* sends Branches on each Side, to the *Supinator Longus*, *Pronator Teres*, *Fat* and *Skin*. It sometimes, though very rarely, happens, that this *Artery* is divided from its Origin into two large Branches, which run down on the Arm, and afterwards on the Fore-arm, where they have the Names of *Cubitalis* and *Radialis*.

The CUBITAL ARTERY.

The *Cubital Artery* sinks in between the *Ulna*, and the upper Parts of the *Pronator Teres*, *Perforatus*, *Ulnaris Gracilis*, and *Radialis Internus*; then leaving the Bone, it runs down between the *Perforatus* and *Ulnaris Internus* all the way to the *Carpus*, and great transverse Ligaments. In this Course it winds and turns several Ways, and sends out several Branches.

The first is a small *Artery* which runs inward to the inner Condyle, and then turns upward like a kind of Recurrent, to communicate by several Branches with the *Collateral Arteries* of the Arm already mentioned, and particularly with the third. A little lower down, another small Branch goes off, which, having run upward a little way, and almost surrounded the Articulation, communicates with the second *Collateral Artery* of the Arm, between the *Olecranon* and inner Condyle.

After-

Afterwards the *Cubital Artery*, having, in its Course between the Heads of the Ulna and Radius, reached the Interosseous Ligament, sends off two principal Branches, one internal, the other external, which I call the *Interosseous Arteries* of the Fore-arm.

The *External Artery* pierces the Ligament about three Fingers Breadth below the Articulation; and presently afterward gives off a Branch, which runs up, like a Recurrent, toward the external Condyle of the Os Humeri, under the Ulnaris Externus, and Anconæus Minimus, to which it is distributed, as also to the Supinator Brevis; and it communicates with the *Collateral Arteries* of the Arm on the same Side.

Afterward this *External Interosseous Artery* runs down on the Outside of the Ligament, and is distributed to the Ulnaris Externus, Extensor Digitorum Communis, and to the Extensores Pollicis, Indicis, and Minimi Digiti, communicating with some Branches of the *Internal Interosseous Artery*.

Having reached the lower Extremity of the Ulna, it unites with a Branch of the *Internal Interosseous Artery*, which at this Place runs from within outward; and is distributed together with it on the convex Side of the Carpus, and Back of the Hand, communicating with the *Arteria Radialis*, and with a Branch of the *Cubitalis*, which will be mentioned hereafter.

By these Communications, this *Artery* forms a sort of irregular Arch, from whence Branches are detached to the external interosseous Muscles, and to the external lateral Parts of the Fingers.

The *Internal Interosseous Artery* runs down very close to the Ligament, till it reaches below the Pronator Teres, between which and the Pronator Quadratus it perforates the Ligament, and goes to the convex Side of the Carpus, and Back of the Hand, where it communicates with the *External Interosseous Artery*, with the *Radialis*, and internal Branches of the *Cubitalis*.

From the Origin of the two *Interosæ*, the *Cubital Artery* runs down between the Perforatus, Perforans, and Ulnaris Internus, along the Ulna, sending Branches to the neighbouring Parts. Below the *Internal Interosæ*, it sometimes sends off a Branch, which runs down between the Flexor Pollicis, Radialis Internus, and Perforatus, to which it is distributed all the way to the Carpus, where it runs under the internal annular Ligament, and communicates on the Hand with Branches of the *Arteria Radialis*.

Afterward the *Cubital Artery* passes over the internal transverse Ligament of the Carpus, by the Side of the Os Pisiforme, and having furnished the Skin, Palmaris Brevis, and Metacarpus, it slips under the Aponeurosis Palmaris, giving off one Branch to the Hypothenar Minimi Digiti, and another, which runs toward the Thumb, between the Tendons of the Flexors of the Fingers, and the Basis of the metacarpal Bones.

It likewise sends off a Branch, which, running between the third and fourth Bones of the Metacarpus, reaches to the Back of the Hand, where it communicates with the *External Interosseous Artery*. Afterwards having supplied the interosseous Muscles, it communicates with the *Radialis*; and they both form an *Arterial Arch* in the Hollow of the Hand, in the following manner:

The *Cubitalis*, having got about two Fingers Breadth beyond the internal annular Ligament of the Carpus, forms an Arch, the convex Side of which is turned to the Fingers, and commonly sends off three or four Branches. The first goes to the inner and back Part of the little Finger; and is sometimes a Continuation or Production of that Branch, which goes to the Hypothenar.

The other three Branches run in the Interstices of the Four metacarpal Bones, near the Heads of which, each of them is divided into two Branches, which pass along the two internal lateral Parts of each Finger, from the Fore-side of the little Finger, to the posterior Side of the Index inclusively; and at the Ends of the Fingers these *Digital Arteries* communicate and unite with each other.

Sometimes the Arch of the *Cubital Artery* terminates by a particular Branch in the Middle Finger, and in that Case it communicates with the *Radial Artery*, which makes up what the other wants.

This Arch sends likewise from its concave Side, toward the second Phalanx of the Thumb, a Branch for the lateral internal Part thereof, and then ends near the Head of the first metacarpal Bone, by a Communication with the *Radialis*, having first given a Branch to the Fore-side of the Index, and another to the Side of the Thumb next the former. These communicate at the Ends of the Fingers with the neighbouring Branches, as in the other Fingers.

This Arch sends likewise small Twigs to the interosseous Muscles, to the Lumbricales, Palmaris, and to other neighbouring Parts; and lastly, to the Integuments.

The RADIAL ARTERY.

The *Radial Artery* begins by detaching a small Branch, which runs upward like a Recurrent, toward the Fold of the Arm,

and turns backward round the external Condyle, communicating with the neighbouring Branches from the Trunk of the *Brachial Artery*, especially with the first collateral Branch on that Side.

It runs down along the Inside of the Radius, between the Supinator Longus, Pronator Teres, and the Integuments, giving Branches to these Muscles, and likewise to the Perforatus, Perforans, and Supinator Brevis. From thence it runs in a winding Course toward the Extremity of the Radius, supplying the Flexors of the Thumb, and Pronator Quadratus.

Having reached the Extremity of the Radius, it runs nearer the Skin, especially toward the anterior Edge of the Bone, being the *Artery* which we there feel when we examine the Pulse.

At the End of the Radius, it gives off a Branch to the Thenar; and, after having communicated with the Arch of the *Cubital Artery* in the Palm of the Hand, and sent off some cutaneous Branches at that Place, it detaches one, along the whole internal lateral Part of the Thumb.

Afterwards it runs between the first Phalanx and Tendons of the Thumb, to the Interstice between the Basis of this first Phalanx, and of the first metacarpal Bone, where it turns toward the Hollow of the Hand.

At this Turning, it sends off a Branch to the external lateral Part of the Thumb, which, having reached the End thereof, communicates by a small Arch with the Branch which goes to the internal lateral Part.

It likewise sends Branches outward, which run more or less transversely between the first two Bones of the Metacarpus and the two Tendons of the Radialis Externus; and it communicates with an opposite Branch of the *Cubitalis*, together with which it furnishes the external interosseous Muscles, and Integuments of the Back of the Hand, and convex Side of the Carpus.

Lastly, the *Radial Artery* terminates in its Passage over the semi-interosseous Muscle of the Index, near the Basis of the first metacarpal Bone, and as it runs under the Tendons of the Flexor Muscles of the Fingers, where it is joined to the Arch of the *Cubitalis*.

It sends off another Branch which runs along the Fore-part of the first Bone of the Metacarpus, to the convex Side of the Index, where it is lost in the Integuments.

It gives likewise a Branch, to the internal lateral Part of the Index, which at the End of that Finger joins an opposite Branch, which comes from the Arch of the *Cubitalis*. It also sends off a small Branch cross the internal interosseous Muscles, where it forms a kind of small irregular Arch, which communicates with the great Arch by several small arterial Branches.

When the Arch of the *Cubitalis* ends at the Middle Finger, the *Radialis* runs along the inner or concave Part of the first metacarpal Bone, at the Head of which it terminates by two Branches.

One of these Branches runs along the inner and anterior lateral Part of the Index, the other passes between the Flexor Tendons of this Finger and the metacarpal Bone; and, having communicated with the cubital Branch of the Middle Finger, it advances on the posterior lateral Part of the Index, all the Way to the End of that Finger, where it unites again with the first Branch.

The DIAPHRAGMATIC ARTERY.

The Left *Diaphragmatic Artery* goes out commonly from the *Aorta Descendens*, as it passes between the Crura of the small Muscle of the Diaphragm. The Right *Diaphragmatic* comes sometimes from the nearest *Lumbar Artery*, but most commonly from the *Cœliaca*. Sometimes both these *Arteries* arise by a small common Trunk immediately from the *Aorta*. They likewise have the Name of *Arteria Phrenica*.

They appear almost always in several Ramifications on the concave or lower Side of the Diaphragm, and seldom on the upper or convex Side. They give small Branches to the Glandulæ Renales, or Capsulæ Atrabiliaræ, which sometimes communicate with the other *Arteries* that go to the same Part.

They send likewise small Branches to the Fat which lies upon the Kidneys, called the *Membrana Adiposa*, from whence they have the Name of *Arteria Adiposa*; and they sometimes come immediately from the Trunk of the *Aorta* on one Side of the *Mesenterica Superior*.

Besides these capital *Diaphragmatic Arteries*, there are others of a subordinate Class, which come from the *Intercostales*, *Mammariæ Internæ*, *Mediastinæ*, *Pericardiæ*, and *Cœliacæ*, as is observed in the Description of these *Arteries*.

The COELIAC ARTERY.

The Ramifications of this *Artery* are not figured in the Table so accurately as they are described by Winslow.

The *Cœliac Artery* arises anteriorly, and a little to the Left Hand, from the *Aorta Descendens*, immediately after its Passage through the small Muscle of the Diaphragm, nearly opposite to the Cartilage between the last Vertebra of the Back, and first

first of the Loins. The Trunk of this Artery is very short, and, near its Origin, it sends off from the Right Side two small *Diaphragmaticæ*, though sometimes there is only one, which goes to the Right Hand, and is afterwards distributed both Ways, communicating with the other Arteries of the same Name, which come from the *Intercostales* and *Mammariæ*. The Left Branch sends Ramifications to the superior Orifice of the Stomach, and to the Glandula Renalis on the same Side; the Right furnishes the Pylorus, and the Renal Gland on the Right Side.

Immediately after this, the *Cœliaca* gives off a considerable Branch, named *Arteria Ventriculi Coronaria*, and *Gastrica*, or *Gastrica Superior*; and then it presently divides into two large Branches, one toward the Right Hand, named *Arteria Hepatica*; the other to the Left, called *Splenica*, which is larger than the former.

Sometimes this Artery is divided into these three Branches at the same Place, very near its Origin; the Trunk going out from the *Aorta* almost in a straight Line, and the Branches from the Trunk almost at Right Angles, like Radii from an Axis, whence this Trunk has been called *Axis Arteriæ Cœliacæ*.

The CORONARY ARTERY of the STOMACH.

The *Coronary Artery* of the Stomach goes first to the Left Side of that Organ, a little beyond the superior Orifice, round which Orifice it throws Branches, and also to every Part of the Stomach near it; and these Branches communicate with those which run along the Bottom of the Stomach to the Pylorus.

Afterwards it runs on the Right Side of the superior Orifice, along the small Curvature of the Stomach, almost to the Pylorus, where it communicates with the *Arteria Pylorica*; and, turning towards the small Lobe of the Liver, it gives off some Branches to it.

Then it advances, under the *Ductus Venosus*, to the Left Lobe of the Liver, in which it loses itself near the Beginning of the just mentioned Duct, having first given off some small Branches to the neighbouring Parts of the Diaphragm and Omentum.

The HEPATIC ARTERY.

As soon as the *Hepatic Artery* leaves the *Cœliaca*, it runs to the upper and inner Part of the Pylorus, in Company with the *Vena Portæ*, sending off two Branches, a small one called *Arteria Pylorica*, and a large one, named *Gastrica Dextra*, or *Gastrica Major*.

The *Pylorica* is ramified on the Pylorus, from whence it has its Name; and, having distributed Branches to the neighbouring Parts of the Stomach, which communicate with those of the Right *Gastrica*, it terminates on the Pylorus by an Anastomosis with the *Coronary Artery* of the Stomach.

The Right *Gastric Artery*, having passed behind and beyond the Pylorus, sends out a considerable Branch named *Arteria Duodenalis* or *Intestinalis*, which sometimes comes from the Trunk of the *Hepatica*, as we shall see hereafter. Afterwards this *Gastric Artery* runs along the Right Side of the great Curvature of the Stomach, to the neighbouring Parts of which, on both Sides, it distributes Branches.

These Branches communicate with those of the *Arteria Pylorica*, and of the *Coronaria Ventriculi*, and with the Right *Gastro-epiploica*, which furnish the nearest Parts of the Omentum, and communicate with the *Mesenterica Superior*. After this the Right *Gastric Artery* ends in the Left, which is a Branch of the *Splenica*.

The *Duodenal* or *Intestinal Artery* runs along the Duodenum on the Side next the Pancreas; to both which it furnishes Branches; and also to the neighbouring Part of the Stomach. Sometimes this Artery goes out from the *Mesenterica Superior*, and sometimes it is double.

The *Hepatic Artery*, having sent out the *Pylorica* and Right *Gastrica*, advances behind the *Ductus Hepaticus*, toward the *Vesicula Fellea*, to which it gives two principal Branches called *Arteria Cystica*; and another named *Biliaria*, which is lost in the great Lobe of the Liver.

Afterwards this Artery enters the Fissure of the Liver, and joins the *Vena Portæ*, with which it runs within a membranous Vagina, called *Capsula Glissonii*, and accompanies it thro' the whole Substance of the Liver by numerous Ramifications, which may be termed *Arteriæ Hepaticæ Propriæ*.

Before it enters the Liver, it gives small Branches to the external Membrane of this Part, and to the *Capsula Glissonii*. The *Gastric* and proper *Hepatic Arteries* come sometimes from the *Mesenterica Superior*, when the ordinary Ramifications are wanting.

The SPLENIC ARTERY.

Immediately after the Origin of the *Splenic Artery* from the *Cœliaca*, it runs toward the Left Hand, under the Stomach and Pancreas, to the Spleen. It adheres closely to the posterior Part of the lower Side of the Pancreas, to which it gives several Branches named *Arteriæ Pancreaticæ*.

Near the Extremity of the Pancreas, under the Left Portion of the Stomach, the *Splenic Artery* gives off a principal Branch call'd *Gastrica Sinistra* or *Minor*, which runs from Left to Right along the Left Portion of the great Curvature of the Stomach, giving Branches to both Sides of this Portion, which communicate with those of the *Coronaria Ventriculi*.

This *Gastric Artery* sends likewise another Branch, at least, to the Extremity of the Pancreas, which communicates with the other *Pancreatic Arteries*. It also supplies the Omentum with Branches, term'd *Gastro-epiploica Sinistræ*; and then it communicates with the Right *Gastrica*, and from this Union the *Gastro-epiploica Mediæ* are produced.

From this Detail we learn, that the *Arteria Coronaria Ventriculi*, *Pylorica*, *Intestinalis*, both *Gastricæ*, *Gastro-epiploica*, and consequently the *Hepatica*, *Splenica*, and *Mesenterica*, communicate all together.

Afterwards the *Splenic Artery* advances towards the Spleen, in a Course more or less contorted; but before it arrives at that Part, it gives two or three Branches to the large Extremity of the Stomach, which are commonly call'd *Vasa Brevia*, and one to the Omentum, named *Epiploica*.

At the Spleen this Artery divides into four or five Branches, which enter that Organ, after having given some small Twigs to the neighbouring Parts of the Stomach and Omentum.

The superior MESENTERIC ARTERY.

The *superior Mesenteric Artery*, Tab. 5. Fig. 43. arises anteriorly from the lower Portion of the *descending Aorta*, a very little Way below the *Cœliaca*, going out a little towards the Right Hand, but bending immediately afterwards to the Left.

Near its Origin it gives off a small Branch, which, dividing into two, goes to the lower Side of the Head of the Pancreas, and neighbouring Part of the Duodenum, communicating with the *Intestinalis* by small Arches, and Areolæ or Masches.

Afterwards it passes over the Duodenum, between this Intestine and the Meseraic Vein, between the two Laminæ of the Mesentery; and then bending, in an oblique Direction, from Left to Right, and from above downward, by very small Degrees, it advances toward the Extremity of the Ileum. By this Incurvation it forms a kind of long Arch, from the convex Side of which a great many Branches go out.

These Branches are sixteen or eighteen in Number, or thereabouts, and almost all of them are bestow'd on the small Intestines, from the lower third Part of the Duodenum to the Cæcum and Colon. The first Branches are very short, and from thence they increase gradually in Length all the Way to the Middle of the Arch; the rest diminishing again by small Degrees.

As they approach the Intestines, all these Branches communicate first by reciprocal Arches, then by Areolæ and Masches of all kinds of Figures, from which is detach'd an infinite Number of small Ramifications, which surround the Intestinal Canal like an annular Piece of Net-work.

These Arches and Masches increase in Number proportionably to the Length of the Branches, and their Size diminishes gradually as they approach the Intestines.

The first Branches from the convex Side of the Mesenteric Arch, which are very short, supply the Pancreas and Mesocolon, and communicate with the *Duodenal Artery*. The last Branches go to the *Appendicula Vermiformis*, and send a Portion of an Arch to the Beginning of the Colon.

The considerable Branches from the concave Side of the Mesenteric Arch are seldom above two or three in Number; but before they arise a small Branch goes out to the Duodenum, and gives some very small Arteries to the Pancreas.

The first considerable Branch from the concave Side of the Arch goes into the Mesocolon, towards the Right Portion of the Colon, being first divided into two Branches; the first of which runs along the whole superior Part of the Colon, where it forms the famous Communication with the *Mesenterica Inferior*; and might be named *Arteria Colica superior*. The other Division of this Branch runs down on the Right Portion of the Colon.

The second principal Branch, having run for some Space thro' the Mesentery, divides into three Branches; the first of which goes to the lower Part of the Right Portion of the Colon, where it communicates with the second Division of the first Branch: The second goes to the Beginning of the Colon, where it communicates with the first, and to the Intestinum Cæcum.

The third Division of this second Branch, having communicated with the second, gives small Twigs to the Cæcum, *Appendicula Vermiformis*, and Extremity of the Ileum. Afterwards it communicates with the Extremity of the Arch, or curve Trunk of the *superior Mesenteric*.

All these Communications are by Arches and Masches, as in those Branches that come from the convex Side of the Arch; and it is to be observ'd in general, that all the Branches of the *Mesenterica superior* are disposed according to the Folds of the Mesentery, and Circumvolutions of the Intestines; giving off Branches,

Branches, through their whole Course, to the Laminæ of the Mesentery, its Cellular Substance, and to the Mesenteric Glands.

The inferior MESENTERIC ARTERY.

The lower Mesenteric Artery, Tab. 5. Fig. 45. goes out anteriorly from the *Aorta Descendens inferior*, about a Finger's Breadth or more above the Bifurcation, and below the *Spermatic Arteries*; and having run about the Length of an Inch, or something more, it is divided into three or four Branches, which gradually separate from each other.

The first or superior Branch, about an Inch from its Origin, divides into two Branches; the first of which runs along the Left Portion of the Colon, and forms the Communication of the two Mesenteric Arteries already mention'd. It may be named *Arteria Colica Sinistra*. The second Branch, having communicated with the first, runs down upon the same Portion of the Colon.

The middle Branch, having run the same Length with the first, divides into two Branches; one of which passes upward on the Extremity of the Colon, communicating by Arches with the second Ramification of the superior Branch; the other runs down on the Extremity of the same Intestine.

When there is another middle Branch, it goes to the first Part of the double Curvature of the Colon, by a like Distribution and Communication from above downward.

The lower Branch goes to the second Portion of the Colon, or to both, when the second middle Branch is wanting, and sends up a Branch which communicates with the foregoing.

It sends another considerable Branch downward, call'd *Arteria Hemorrhoidalis Interna*, which runs down behind the Intestinum Rectum, to which it is distributed by several Ramifications; and it communicates with the *Arteria Hypogastrica*.

The RENAL ARTERIES.

The Renal Arteries, Tab. 5. Fig. 49. 49. call'd commonly *Emulgentes*, are ordinarily two in Number, and go out laterally from the inferior descending *Aorta*, immediately under the *Mesenterica superior*, one to the Right Hand, the other to the Left: The Right is situated more backward, and is longer than the Left, because of the Vena Cava, which lies on the Right Side, between the *Aorta* and the Kidney.

They run commonly without Division, and almost horizontally, to the Kidneys; into the Depressions of which they enter by several Branches, which form Arches in the inner Substance of these Viscera.

From these Arches numerous small Branches go out toward the Circumference, or outer Surface of the Kidneys. Sometimes there is more than one Artery on each Side; sometimes this Augmentation is only on one Side; and these supernumerary Arteries come sometimes immediately from the *Aorta*, and enter at the upper or lower Part of the Kidneys.

Ordinarily the Right Renal Artery passes behind the Vena Cava and Renal Vein on the other Side, and the Left Artery, first behind and then before the Vein. Sometimes they send Branches to the Glandulæ Renales, Membrana Adiposa of the Kidneys, and even to the Diaphragm.

The CAPSULAR ARTERIES.

The Arteries of the Renal Glands, which may be term'd *Arteria Capsulares*, arise sometimes from the *Aorta*, above the *Arteria Renalis*; and give out the *Arteria Adiposa*, which go to the Fat of the Kidneys. Sometimes they come from the Trunk of the *Cœliaca*. The Right Capsular Artery comes most commonly from the *Arteria Renalis* of the same Side, near its Origin; the Left from the *Aorta*, above the *Renalis*.

The SPERMATIC ARTERIES.

The Spermatic Arteries, Tab. 5. Fig. 51. 51. are commonly two in Number; sometimes more. They are very small, and go out anteriorly from the *Aorta Descendens inferior*, near each other, about a Finger's Breadth below the *Arteria Renales*, more or less, between the two Mesentericæ, or between the *Renales* and *Mesentericæ Inferiores*. Sometimes one is higher, or placed more laterally, than the other.

They send off, to the common Membrane of the Kidneys, small Branches named *Arteria Adiposa*; and afterwards they run down upon the Psoas Muscles, on the fore Side of the Ureters, between the two Laminæ of the Peritonæum.

They give several considerable Branches to the Peritonæum, chiefly to those Parts of it which are next the Mesentery; and they communicate both with the *Mesentericæ* and *Adiposa*. They likewise send small Arteries to the Ureters.

Afterwards they pass, in Men, thro' the tendinous Openings of the Abdominal Muscles in the Vagina of the Peritonæum; and are distributed to the Testicles and Epididymes, where they communicate with a Branch of the *Iliaca externa*.

In Women they do not go out of the Abdomen, but are distributed to the Ovaria and Uterus, and communicate with

Branches of the *Hypogastrica*, at the jagged Extremities of the *Tubæ Fallopiæ*.

The LUMBAR ARTERIES.

The Lumbar Arteries, Tab. 5. Fig. 50. go out posteriorly from the inferior descending *Aorta*, in five or six Pairs, or more, much in the same manner with the *Intercostals*.

They may be divided into Superior and Inferior. The Superior send small Branches to the neighbouring Parts of the Diaphragm and Intercostal Muscles, and supply the Place of *Semi-intercostal Arteries*. Sometimes those Pairs go out by a small common Trunk, and not separately.

They are distributed on each Side to the Psoas Muscles, to the *Quadrati Lumborum*, and to the oblique and transverse Muscles of the Abdomen; and by perforating the oblique Muscles, they become *external Hypogastric Arteries*. They go likewise to the Vertebral Muscles, and to the Bodies of the Vertebrae, and enter the Spinal Canal thro' the lateral Notches, to go to the Membranes, &c. forming Rings much in the same manner with the *Intercostals*; and they likewise give small Twigs to the Nerves.

The ARTERIÆ SACRÆ.

The *Arteriæ Sacræ*, Tab. 5. Fig. 52. go out commonly from the back Part of the inferior descending *Aorta*, at the Bifurcation. Sometimes they arise higher from the *Lumbares*, and sometimes lower from the *Iliacæ*. They are two, three, or four in Number; and sometimes but one. They are ramified on the Os Sacrum, and on the neighbouring Parts of the Peritonæum, Intestinum Rectum, Fat, &c. and enter the Canal of the Os Sacrum thro' the anterior Holes, being there distributed toward each Side. They likewise send small Arteries to the large Fasciculi of Nerves, which go out thro' the Holes of the Os Sacrum, and they penetrate the inner Substance of that Bone.

The ILIAC ARTERIES. Tab. 5. Fig. 53. 53.

The inferior descending *Aorta* ends at the last Vertebra of the Loins, and sometimes higher, in two large lateral Branches, one on the Right Hand, the other on the Left, call'd *Arteriæ Iliacæ*; each of which is a common Trunk to two other Arteries of the same Name. This Bifurcation lies on the anterior and Left Side of that of the Vena Cava. See Tab. 4. Fig. 13.

The primitive *Iliac Arteries* divaricate gradually as they descend, advancing obliquely toward the anterior and lower Part of the Os Ilium, without any considerable Ramifications, for about the Breadth of three Fingers; except a few very small Arteries that go to the Os Sacrum, some of which enter by the upper Holes, and are distributed like the *Arteriæ Sacræ*; while others emerge again thro' the posterior Holes, and go to the neighbouring Muscles, &c. They likewise give small Arteries to the Peritonæum, to the Coats of the Veins, and to the Fat and Ureters, behind which the *Iliac* Trunks pass.

The Right *Iliac* Trunk passes first on the fore Side of the Origin of the Left Iliac Vein, and runs down on the fore Side of the Right Vein, almost to the Place where it goes out of the Abdomen, its Course being there directed more inwardly. The Left Trunk goes down likewise before the Left Vein, but lies a little toward the Inside as it leaves the Abdomen.

About three Fingers Breadth from their Origin each *Iliac* Trunk is divided into two secondary Arteries, one external, Tab. 5. Fig. 54. 54. the other internal, Tab. 5. Fig. 55. 55. The external Artery has no particular Name; the internal is term'd *Hypogastrica*, which often appears to be no more than a Branch of the other in Adults; but in young Children, and especially in the Fœtus, the *Hypogastric Artery* looks like the Trunk, and the other like a Branch.

The external *Iliaca*, Tab. 5. Fig. 54. 54. on each Side runs down to the Ligamentum Fallopi, under which it goes out of the Abdomen. In this Course it gives off only a few small Arteries to the Peritonæum, and other Parts near it; but as it passes out of the Abdomen under the Ligament, it detaches two considerable Branches, one internal, the other external.

The internal Branch is named *Arteria Epigastrica*, Tab. 5. Fig. 57. 57. and goes out anteriorly from the external *Iliaca*. From thence it runs obliquely upward, on the Tendon of the transverse Muscle, toward the posterior Part of the Rectus, which it reaches about two or three Fingers Breadth above the Os Pubis.

Afterwards the *Epigastric Artery* runs up along the posterior or inner Side of this Muscle, sending Ramifications to the Tendons of the neighbouring Muscles, and then loses itself by a true Anastomosis of several Ramifications with the *Mammaria Interna*. It likewise communicates with the inferior *Intercostals*, which are spread on the Abdomen.

It sometimes gives out two particular Branches, one of which, accompany'd by a Nerve, goes thro' the Foramen Ovale of the Pelvis to the Triceps Muscles; the other runs down to the Testicles,

Testicles, along with the *Spermatic Artery*, and there communicates with it.

The external Branch of the outer *Iliaca*, *Tab. 5. Fig. 58.* goes off laterally from the Outside of that *Artery*, under the Ligamentum Fallopii; and from thence to the internal Labium of the Os Ilium, where it divides into two; and is ramified on the oblique and transverse Muscles of the Abdomen, communicating with the *Arteria Lumbaris*.

Besides these two Branches, the external *Iliaca* gives off a small Branch internally, under the Ligament which runs to the Vagina of the Spermatic Cord; and sometimes another small Twig goes from the Outside to the Os Ilium.

The internal *Iliaca*, or *Hypogastrica*, *Tab. 5. Fig. 55.* having run a little more than a Finger's Breath inward and backward, bends by small Degrees obliquely forward, and toward the Outside; and afterwards, contracting in its Dimensions, it ends in the *Umbilical Artery*, *Tab. 5. Fig. 56.* which ought to be look'd upon as a true Continuation of the Trunk of the *Hypogastrica*.

This *Arteria Umbilicalis* ascends on the Side of the Bladder; and having detach'd small Branches to that, and to the neighbouring Parts of the Peritonæum, it contracts; and, in Adults, is quite closed up, above the Middle of the Bladder, as in *Tab. 5. Fig. 56.* on the Right Side. It likewise gives Branches to the Uterus in Females, and to the Parts about the Pelvis in both Sexes: Afterwards it ascends, in form of a Ligament, to the Umbilicus, where it joins the *Umbilical Artery* on the other Side; its Name being taken from its Use in the Foetus.

From the convex Side of the Curvature of the *Hypogastric Artery*, four or five principal Branches commonly go out very near each other. Sometimes they all arise separately, sometimes by small common Trunks; and what is the first Branch in some Subjects, is only a Ramification of another principal Branch in others; so much does the Number, Disposition, Origin, and Distribution of these Branches vary in different Subjects. For this Reason, I think it is fit to distinguish them by the following proper Names: *Iliaca minor*, *Glutæa*, *Sciatica*, *Pudica communis*, *sive Pudica Hypogastrica*, and *Obturator*.

The *Iliaca minor*, the most posterior of these Branches, and which is often no more than a Branch of the *Glutæa*, passes between the last two Lumbar Nerves, and divides into two Branches; one of which enters the Canal of the Os Sacrum, thro' the lowest large anterior Holes; the other passes behind the Musculus Psoas, to which it gives Twigs, and behind the Crural Nerve, being afterwards distributed to the Iliac Muscle, and to the middle Part of the Inside of the Os Ilium, penetrating into the Substance of the Bone, sometimes by one Hole, sometimes by more.

The *Arteria Glutæa* is commonly very considerable, and sometimes the largest of all the *Hypogastric* Branches. Near its Beginning it sometimes sends out the *Iliaca minor*, and sometimes the small Branch that goes from that *Artery* to the Os Sacrum, and other Parts fix'd to that Bone. Afterwards this *Artery* goes out of the Pelvis in Company with the Sciatic Nerve, thro' the upper Part of the great Sinus of the Os Innominatum, below the Musculus Pyriformis, and is distributed, in a radiated manner, to the Glutæus Maximus and Medius.

In its Passage it gives some Branches to the Os Sacrum, Os Coccygis, Musculus Pyriformis, the Muscles of the Anus, and to the neighbouring Parts of the Intestinum Rectum, forming a particular *Hæmorrhoidalis Interna*. It likewise sends Twigs to the Bladder, and parts near it; and detaches a pretty long Branch, which runs down with the Sciatic Nerve.

The *Arteria Sciatica* gives, first of all, some Branches to the Musculus Pyriformis, the Quadrigeminus, and the Os Sacrum, and even to the inner Side of the Os Ischium. It likewise detaches a Branch, which runs under the Musculus Quadratus, to the Articulation of the Os Femoris.

It passes obliquely over the Sciatic Nerve, and as they both go thro' the great posterior Sinus of the Os Ilium, it detaches small *Arteries*, which are distributed to the inner Substance of that Nerve. Afterwards it runs up in a radiated manner on the Outside of the Os Ilium, and is distributed to the inner Substance of that Bone, and to the Musculi Glutæi, especially to the Medius and Minimus.

The *Pudica Communis*, call'd commonly *Pudica Interna*, arises sometimes by a Trunk common to it and to the *Glutæa*, and gives out two principal Branches; the first of which passes thro' the great Sinus of the Os Ilium, in Company with the *Glutæa* and *Sciatica*, and then divides into two Branches.

The first Branch goes behind the Spine of the Ischium, between the two Ligaments which lie between that Bone and the Os Sacrum, and runs on the Inside of the Tuberculum Ischii, all the way to the Origin of the Corpus Cavernosum Penis: There it divides into several *Arteries*, one of which goes to the Sphincter Ani, under the Name of *Hæmorrhoidalis Externa*.

The rest are distributed to the neighbouring Integuments, to the Bulb of the Urethra, and to the Corpus Cavernosum Penis; but the last of these *Arteries*, or rather the Extremity of this

first Branch, runs from behind forward, over the Neck of the Os Femoris, and communicates with a Branch of the *Arteria Cruralis*.

The second principal Branch, call'd commonly *Arteria Pudica Externa*, runs between the Bladder and Intestinum Rectum, and is distributed in Men to the Vesiculæ Seminales, Neck of the Bladder, Prostate Gland, and neighbouring Parts of the Rectum.

Afterwards it runs under the Os Pubis, on the Side of a considerable Vein; which lies directly under the Symphysis; and it runs along the Penis between this Vein and a Nerve; being distributed in its Passage to the Corpus Cavernosum, and communicating with the *Pudica minor*, which comes from the *Cruralis*.

This second Branch of the *Pudica major* goes off sometimes separately from the *Hypogastrica*, especially in Women, being distributed to the lateral Parts of the Uterus, where it communicates with the *Spermatic Artery*, near the jagged Extremity of the Tuba Fallopiana, and to the neighbouring Parts of the Vagina.

The *Arteria Obturator* perforates the Obturator Muscles, from whence it has its Name, and goes out of the Pelvis at the upper Part of the Ligament of the Foramen Ovale; having first sent a small Branch, over the Symphysis of the Os Ilium and Os Pubis, to the Inguinal Glands and Integuments.

As it passes by the Muscles, it divides, and is distributed to the Pectineus and Triceps. It likewise sends out another Branch, which communicates with that Branch of the *Sciatica* which goes to the Articulation of the Os Femoris; and gives small *Arteries* to the Holes in the Neck of that Bone.

Afterwards the *Hypogastric Artery* ends in the *Umbilicalis*, as has been already said.

The CRURAL ARTERIES. *Tab. 5. Fig. 69.*

The *Iliac Artery* goes out of the Abdomen between the Ligamentum Fallopii and Tendon of the Psoas, at the Union of the Os Ilium and Os Pubis, and there it takes the Name of *Arteria Cruralis*.

It sends off, first of all, three small Branches; one of which, call'd *Pudica Externa*, goes over the Crural Vein to the Skin and Ligament of the Penis, and to the Inguinal Glands, communicating with the *Pudica Interna*. The second goes to the Musculus Pectineus; and the third to the upper Part of the Sartorius. All these Branches furnish likewise the neighbouring anterior Integuments.

Afterwards the *Crural Artery* runs down on the Head of the Os Femoris; and, by taking a particular Turn, gets on the Inside of the Crural Vein, about three Fingers Breadth from where it goes out of the Abdomen. From its Origin to this Place, it is cover'd only by the Skin and Fat, and lies on the Pectineus and Triceps Primus.

In changing its Situation it sends out three considerable Branches; one external, one middle, and one internal. They all go out, more or less, posteriorly; sometimes by a short common Trunk, sometimes by two.

The external Branch runs on the upper Side of the Thigh to the Crureus, Vastus Externus, Rectus Anterior, Musculus Fasciæ Latæ, and Glutæus Medius, sending up a Branch to the Apex of the great Trochanter, which communicates with the first principal Branch of the *Pudica major* and *Sciatica*, as has been already said.

The middle Branch runs down on the Inside of the Thigh, between the Triceps Muscles, to which it gives several Branches; one whereof perforates the second Muscle, and is distributed to the Glutæus Maximus, Semitendinosus, Semimembranosus, Biceps, and to the neighbouring Integuments.

The internal Branch runs backward on the Quadrigeminus, towards the great Trochanter; and having detach'd a Branch, which goes into the Joint of the Os Femoris, it runs downward, and gives Branches to all the Muscles that lie on the back Side of that Bone, one of which enters the Bone itself on one Side of the Linea Aspera.

Having sent off all these three Branches, the *Arteria Cruralis* runs down between the Sartorius, Vastus Internus, and Triceps, giving Branches to all the Parts near it: It is cover'd by the Sartorius all the Way to the lower Part of the Thigh, where it is inflected backward, over the Triceps Tertius, a little above the internal Condyle of the Os Femoris. Afterwards continuing its Course thro' the Hollow of the Ham, it is call'd *Arteria Poplitea*, being accompany'd by the Vein of the same Name.

The *Poplitea*, while in the Ham, is cover'd only by the Integuments, sending off Branches toward each Side, which run upon the Condyles, and communicate with the lower Ramifications of the *Arteria Cruralis*.

It sends Branches to the Joint of the Knee, one of which, at least, passes between the Crucial Ligaments. As it runs down, it sends Branches to the Gastrocnemii and Popliteus; and,

and, having reach'd the back Side of the Head of the Tibia, it gives off two Branches, one to each Side.

The first or internal Branch surrounds the fore Part of the Head of the Tibia; passing between the Bone and internal lateral Ligament; and, besides several other Ramifications, sends up a small Branch, which communicates with the *Arteries* that lie round the Condyles of the Os Femoris.

The second or external Branch runs over the Head of the Fibula, and between the Head of the Tibia and external lateral Ligament of the Knee, surrounding the Articulation all the Way to the Ligaments of the Patella, and communicating with the Branches which lie round the Condyles of the Os Femoris, together with a Ramification of the first or internal Branch.

Immediately after the Origin of these two Branches, and before the *Poplitea* ends, it sends a small *Artery* down on the back Side of the Interosseous Ligament, very near the Tibia; into which it enters by a particular Hole a little above the middle Portion of the Bone. As the *Poplitea* ends, it divides into two principal Branches, one of which runs between the Heads of the Tibia and Fibula, passing from behind forwards on the Interosseous Ligament, where it takes the Name of *Arteria Tibialis anterior*. The second Branch divides into two others; one internal and larger, call'd *Arteria Tibialis posterior*; the other posterior and smaller, named *Arteria Peronæa posterior*.

The *Tibialis anterior*, having pass'd between the Heads of the Tibia and Fibula, sends small Branches upward and laterally: The superior Branches communicate with those Ramifications of the *Poplitea* which lie round the Articulation; and the lateral Branches go to the neighbouring Parts. Afterwards this *Tibial Artery* runs down, on the fore Side of the Interosseous Ligament, toward the Outside of the Tibia, between the Musculus *Tibialis Anticus* and *Extensor Pollicis*.

Having run laterally on the Tibia for about two Thirds of the Length of that Bone, it passes on the fore Side, under the common annular Ligament and *Extensor Pollicis*, to the Articulation of the Foot; giving off several Branches both to the Right and Left Hand, which communicate laterally with the *Tibialis posterior* and *Peronæa posterior*; so that these two Bones are in a manner surrounded by *Arteries*.

At the Joint of the Foot it sends out Branches, which run between the Astragalus and Os Calcis, being distributed to the Articulation, and to the Bones of the Tarsus. The Communications are here very numerous on all Sides.

Having pass'd the Fold of the Foot, it sends off, toward both Sides, other Branches, which communicate with the *posterior Tibialis* and *Peronæa*; all these Branches, making a kind of Circles round the Tarsus. Afterwards the *anterior Tibial Artery* advances on the convex Side of the Foot, as far as the Interstice, between the first and second Metatarsal Bones; between the Heads of which it sends a large Branch, which perforates the superior Interosseous Muscles, and, joining the *Tibialis posterior*, forms an Arch on the Side of the Foot.

It likewise sends two or three considerable Branches over the other Metatarsal Bones, which go to the rest of the Interosseous Muscles and Integuments, and communicate with each other.

Lastly, this *Artery* terminates by two principal Branches, one of which goes to the Thenar and Inside of the great Toe; the other is spent upon the Outside of the great Toe, and the Inside of the second Toe.

The *Tibialis posterior*, call'd likewise *Suralis*, runs down between the Solei, *Tibialis posticus*, *Flexor Digitorum communis*, and *Flexor Pollicis*; giving Branches to these, to the Tibia, and to the Marrow of that Bone, through a particular Canal in its posterior and upper Part.

Afterwards it runs behind the inner Ankle, communicating with the *Tibialis anterior*, and surrounded by the neighbouring Veins, and passes to the Sole of the Foot, between the concave Side of the Os Calcis and Thenar Muscle; where it divides into two Branches, one large or external, the other small or internal.

The great Branch, or *Arteria Plantaris externa*, passes on the concave Side of the Os Calcis obliquely, under the Sole of the Foot, to the Basis of the fifth Metatarsal Bone; and from thence runs in a kind of Arch toward the great Toe, communicating there with the *Tibialis anterior*, which perforates the Interosseous Muscles, in the Manner already said.

The convex Side of this Arch supplies both Sides of the last three Toes, and the Outside of the second Toe, forming small communicating Arches at the End, and sometimes at the Middle of each Toe, as in the Hand. The concave Side of the Arch furnishes the neighbouring Parts.

The small Branch, or *Arteria Plantaris interna*, having reach'd beyond the Middle of the Sole of the Foot, is divided into two; one of which goes to the great Toe, communicating with the Branch of the *Tibialis anterior*; the other is distributed to the first Phalanges of the other Toes, communicating with the Ramifications from the Arch already mention'd.

The *Arteria Peronæa* runs down on the back Side of the

Fibula, between the Soleus and *Flexor Pollicis*; to which, and to the neighbouring Parts, it gives Branches in its Passage.

Having reach'd to the lower third Part of the Fibula, it sends off a considerable Branch, which runs in between the Tibia and that Bone, passing between their Extremities, from behind, forward; below the Interosseous Ligament, and is distributed to the Integuments of the Tarsus.

Lastly, the *Peronæa* continuing its Course downward, on the back Side of the Fibula, as far as the Os Calcis, forms an Arch with the *Tibialis posterior*, between the Astragalus and the Tendo Achillis.

From thence it runs outward, and, a little above the outer Ankle, communicates with the *Tibialis anterior* by an Arch, which sends several small Ramifications to the neighbouring Parts.

In this Description of the *Arteries*, I have said nothing of the Cutaneous Anastomoses, which are exceedingly beautiful in the Fœtus; nor of the frequent and considerable Communications of small *Arteries* upon the Periosteum, which form a delicate kind of Net-work, or Rete Mirabile.

EXPLICATION of TABLE the Fourth, which represents the Situation of the principal Blood-vessels.

From EUSTACHIUS.

TABLE IV.

1. The Heart.
2. The *external Jugular*, on the Right Side, cut off.
3. The *internal Jugular* on the Left Side.
4. The *Subclavian Vessels* on each Side.
5. The *Axillary Vessels*, arising from the *Subclavian*.
6. The *Cephalic Vein* on each Side.
7. The *Vena Mediana* on each Side.
8. The *Vena Basilica* on the Right Side.
9. The inferior Part of the *Aorta Descendens*.
10. The *Vena Cava*.
11. The *Emulgent Veins*.
12. The *Kidneys*.
13. The *Iliac Vessels* on each Side.
14. The Blood-vessels of the *Penis*.

EXPLICATION of the Fifth TABLE, representing the *Arteries dissected out*.

From DRAKE.

TABLE V.

1. The *Aorta*, or *Arteria magna*, cut from its Origin at the Orifice of the Left Ventricle of the Heart.
- A. The three femilunar Valves of the *Aorta*, as they appear when they hinder the Blood from coming back into the Left Ventricle, when the Heart is in *Diastole*.
2. The Trunk of the *Coronary Arteries* of the Heart, arising from the Beginning of the *Aorta*.
3. *Ligamentum Arteriosum*, not well express'd.
4. The *Subclavian Arteries*, arising from the *Arteria magna*; from which the *Axillary Arteries*, and those of the Arms, (23. 23.) are continued.
5. The two *Carotid Arteries*, the Right arising from the *Subclavian*, the Left from the *Aorta*.
6. The two *Vertebral Arteries*, arising from the *Subclavica*, which pass thro' all the transverse Processes of the *Vertebrae* of the Neck, from whence they are here freed.
7. The *Arteries* which convey Blood to the lower Part of the Face, Tongue, adjacent Muscles, and Glands.
8. The Trunks of the *Temporal Arteries* springing from the *Carotids*, and giving Branches to the *Parotid Glands*, and to,
9. The neighbouring Muscles, hairy Scalp, and Forehead.
10. Trunks which send Blood to the *Foramina Narium*, particularly the Glands of its *Mucous Membrane*.
11. The *Occipital Arteries*, whose Trunks pass close by the *Mammiform Process*, and are distributed on the hinder Part of the hairy Scalp, where they are inosculated with the Branches of the *Temporal Arteries*.
12. *Arteries* which carry Blood to the *Fauces*, *Gargareon*, and Muscles of those Parts.
- B. A small Portion of the *Basis* of the Skull, that is perforated by the *Artery* of the *Dura Mater*, here express'd, with Part of the *Dura Mater* remaining to it.
13. The Contortions of the *Carotid Arteries*, before they pass the *Basis* of the Skull to the Brain.
14. Those Parts of the *Carotid Arteries*, where they pass by each Side of the *Sella Turcica*, where divers small Branches arise from them, and help to compose the *Rete Mirabile*, which is more conspicuous in Quadrupeds than Men.
- C. The *Glandula Pituitaria*, taken out of the *Sella Turcica*, lying between the two contorted Trunks of the *Carotid Arteries* (14. 14.).

D. D. The *Arteriae Ophthalmicae*, which spring from the *Carotids* before they enter the *Pia Mater*.

15. The Contortions of the *Vertebral Arteries*, as they pass the tranverse Processes of the first *Vertebra* of the Neck, towards the great *Foramen* of the *Os Occipitis*. We have, more than once, taken Notice, that the Cavities of these *Arteries*, where they are contorted, have been larger than their inferior Trunks; whereby the *Impetus* of the Blood must necessarily be very much lessen'd, as well as by their Contortions only. In Quadrupeds the Angles of three Contortions of the *Arteries* of the Brain are more acute, which in them is the more necessary to lessen the Force of the Blood at their Extremities, by reason of the horizontal Position of their Trunks.

16. The two Trunks of the *Vertebral Arteries*, that lie on the *Medulla Oblongata*.

17. The communicant Branches between the *Carotid* and *Cervical Artery*.

18. 18. The Ramifications of the *Arteries* within the Skull; the larger Trunks of which lie between the Lobes of the Brain, and in its *Sulci*. From the Extremities of these *Arteries* of the Brain are continued its Veins, whose Trunks vary much in their continued Position from the *Arteries*, these entering the Brain at its *Basis*, and distributing themselves, as above noted; whereas the Trunks of the Veins are extended on the Surface of the Brain, and discharge their Blood into the longitudinal *Sinus*. Nor do the Veins of the Brain accompany their *Arteries* at their Ingress, as in other Parts, and as the *Arteries* and Veins of the *Dura Mater* do; both which pass thro' the same *Foramen* in the *Basis* of the Skull, B. B.

E. E. The *Arteries* of the *Cerebellum*.

19. 19. The *Arteries* of the *Larynx*, *Thyroid Glandules*, and adjacent Muscles and Parts, arising from the *Subclavian Arteries*.

20. 20. Others arising near the former, which convey Blood to the Muscles of the Neck and *Scapula*.

21. 21. The *Mammariae*, which arise also from the *Subclavian Arteries*, and descend on the Cartilages of the true Ribs internally, about half an Inch distant, on each Side the *Os Pectus* or *Sternum*. Some Branches of these pass thro' the *Pectoral* as well as *Intercostal* Muscles, and give Blood to the *Mammæ*, where they meet with some Branches of the *Intercostal Arteries*, with which they are inosculated.

These *Mammary Arteries* join with the large Trunks of the *Epigastrics* (57. 57.) also, by which means the *Impetus* of the Blood of the Integuments of the *Abdomen* is carried on with more Force: The Extremities of the *Intercostal* and *Lumbal Arteries* also inosculate with each other, as well as these.

22. 22. The *Arteries* of the Muscles of the *Os Humeri*, and some of those of the *Scapula*.

23. 23. Those Parts of the large Trunks of the *Arteries* of the Arm, which are liable to be wounded in opening the *Vena Basilica*, or innermost of the three Veins in the bending of the Cubit.

24. 24. The Divisions of the *Arteries* of the Arm, below the Flexure of the Cubit.

25. 25. A communicant Branch of an *Artery*, arising from the Trunk of the *Artery* of the Arm, above its Flexure at the Cubit, which is inosculated with the *Arteries* of the Cubit below. In some Subjects you will not find this communicant Branch, as here represented, in whom there are divers smaller Branches of the same Kind. By these communicant Branches of the upper Part of the *Brachial Artery* with those of the Cubit, the Blood still passes, tho' the Trunk (23.) is firmly tyed; which is done in taking up the *Artery*, as it is call'd, when 'tis wounded in the Case of an *Aneurysm*: Besides firmly tying the Trunk of the *Artery* above the Place where it is wounded, it is also necessary to tie it in like manner below, lest the Blood, convey'd by the communicant Branches to the inferior Trunk, still pours out at the Wound of the *Artery* from below, in a retrograde manner.

26. The *external Artery* of the Cubit, which makes the Pulse near the *Carpus*.

27. 27. The *Arteries* of the Hands and Fingers.

28. 28. The descending Trunk of the *Arteria magna*.

29. The *Arteria Bronchialis*, springing from one of the *Intercostal Arteries*: It sometimes arises immediately from the descending Trunk of the *Aorta*; at other times from the *superior Intercostal Artery*, which springs from the *Subclavian*. These *Bronchial Arteries* inosculate with the *Pulmonary Arteries*. Vid. *Ruyfch. Epist. Anatom.* 6 Fig. c. c. c.

30. A small *Artery*, springing from the fore Part of the *Aorta Descendens*, passing to the *Gula*. *Ruyfch* tells us of Branches of *Arteries* from the *superior Intercostal*, which go to the *Gula*.

31. 31. The *Intercostal Arteries* on each Side the *Arteria magna Descendens*.

N. B. The Representations of the *Arteries* in this Plate, from Fig. 32. to Fig. 42. are not as they usually appear in Subjects. The References also do not agree with the Figures; and the Whole, in this Place, is much confused.

32. The Trunk of the *Arteria Cœliaca*, from whence spring,

33. 33. The *Hepatic Arteries*, and,

34. The *Arteria Cystica*, on the Gall-bladder.

35. *Arteria Coronaria Ventriculi inferior*.

36. The *Pylorica*.

37. The *Epiploica Dextra, Sinistra*, and *Media*, springing from the *Coronaria*.

38. The Ramifications of the *Coronary Artery*, which embrace the Bottom of the Stomach.

39. *Coronaria Ventriculi superior*.

40. 40. The *Phrenic Arteries*, or the two *Arteries* of the Diaphragm; that of the Left Side arising from the Trunk of the *Arteria magna*; the Right springing from the *Cœliaca*.

41. The Trunk of the *Splenic Artery*, arising from the *Cœliaca*, contorted.

42. Two small *Arteries*, going to the upper Part of the *Duodenum* and *Pancreas*; the rest of the *Arteries* of the *Pancreas* spring from the *Splenic Artery* in its Passage to the Spleen.

43. The Trunk of the *Arteria Mesenterica superior*, turn'd towards the Right Side.

44. 44. The Branches of the *superior Mesenteric Artery*, freed from the small Guts. Here the various *Anastomoses* the Branches of this *Artery* make in the *Mesentery* before they arrive at the Intestines, may be observed.

45. The *inferior Mesenteric Artery*, arising from the *Arteria magna*.

46. 46. Remarkable *Anastomoses* of the *Mesenteric Artery* with the *Superior*.

47. 47. The Branches of the *inferior Mesenteric Artery*, as they pass to the *Intestinum Colon*.

48. Those of the *Rectum*.

49. 49. The *Emulgent Arteries* of the Kidneys.

50. The *Vertebral Arteries* of the Loins.

51. 51. The *Spermatic Arteries*, which descend to the *Testes*, and are so small as to escape being fill'd with Wax.

52. *Arteria Sacra*.

53. 53. *Arteria Iliacæ*.

54. 54. *Rami Iliaci externi*.

55. 55. *Iliaci interni*, which are larger in the *Fœtus*, proportionably, than in the Adult, by reason of their Conjunction with the two *Umbilical Arteries*.

56. 56. The two *Umbilical Arteries* cut off; that of the Right Side being drawn as in the *Fœtus*; the Left is express'd as in an Adult.

57. 57. The *Epigastric Arteries*, which ascend under the Right Muscles of the *Abdomen*, and are inosculated with the *Mammariæ*, as above noted.

58. 58. Branches of the *external Iliac Arteries*, passing between the two oblique Muscles of the *Abdomen*.

59. 59. Branches of the *internal Iliac Arteries*, which convey Blood to the *Extensores* and *Obturatores* Muscles of the Thighs.

60. 60. The Trunks of the *Arteries*, which pass to the *Penis*.

61. 61. The *Arteries* of the Bladder of Urine.

62. 62. The *internal Arteries* of the *Pudendum*, which, with those here express'd of the *Penis*, make the *Hypogastric Arteries* in Women. The *external Arteries* of the *Pudendum* arise from the upper Part of the *Crural Artery*, which is immediately below the *Epigastrics*.

63. The *Penis*, distended with Wind, and dry'd.

64. The *Glans Penis*.

65. The upper Part or *Dorsum Penis*, cut from the Body of the *Penis*, and raised to shew the *Corpora Cavernosa Penis*.

66. 66. *Corpora Cavernosa Penis*, freed from the *Ossa Pubis*, and tyed after Inflation.

67. The two *Arteries* of the *Penis*, as they appear injected with Wax, in each cavernous Body of the *Penis*.

68. The *Capsula* and *Septum* of the *Corpora Cavernosa Penis*.

69. The *Crural Arteries*.

70. 70. The *Arteries* which pass to the Muscles of the Thighs and *Tibia*.

71. That Part of the *Crural Artery* that passes the Ham.

72. The three large Trunks of the *Arteries* of the Leg.

73. The *Arteries* of the Foot, with their communicating Branch, from their superior to their inferior Trunk, as well as their Communications at the Extremity of each Toe, like those of the Fingers. *Diak's Anatomy*.

ARTERIACA, *apocrypha*, are Medicines against the Disorders of the Voice and *Aspera Arteria*, whence they take their Name. *Blancard*.

ARTERIOTOMIA, *Arteriotomy*. The opening of an *Artery* with a View of taking away Blood.

This Operation was much practised by the Antients, and is now actually much in Use in some foreign Nations, however rare in Europe. *Oribasius* gives an Account of it from *Galen* and

and *Antyllus*: *Paulus Aegineta* speaks of it as a thing commonly practised; and *Presper Alpinus* tells us, it is frequently performed in *Egypt*. It is from these Authors, and *Heister*, I shall give the Particulars of Arteriotomy.

Physicians cut the *Temporal Arteries* for a Defluxion of hot and flatulent Humours into the Eyes, and the *Arteries* behind the Ears of Persons subject to a Vertigo, especially if they have been long afflicted with Disorders in the Head, proceeding from Heat and Wind, or any other chronic Distemperature of that Part.

When any other Place is affected, they do not cut the *Arteries*, though there are many Parts which require to be relieved this way, rather than by opening a Vein; for where-ever a Disorder arises from a Collection of hot and flatulent Blood in the *Arteries*, the affected Part requires *Arteriotomy*. But since it is difficult to stop the Flux of Blood, and when the Wound is brought to cicatrize, there commences an *Aneurysm*; for these Reasons, Physicians have been cautious of opening the larger *Arteries*; and as for the smaller, they forbear them, as thinking them of little Service: However, the Cutting of a small *Artery* has been known to do much Good, and the Wound has been cicatrized without an *Aneurysm*; and even if one of the larger *Arteries* be opened, a Cicatrix may be induced on it without an *Aneurysm*, that is, by means of cutting it quite through, the doing of which has often delivered the Patient from the Danger of an *Hæmorrhage*. For it plainly appears, that when the *Artery* by a cross Section is divided in two, both Parts being retracted, one retires upwards, and the other downwards. For my own part, having received some clear Admonitions in my Dreams, I cut the *Artery* which lies between the Thumb and Fore-finger of my Right Hand, and suffered the Blood to flow till it ceased of itself; for so I was ordered in my Dreams; but the Quantity was less than a Pound. By this means an inveterate Pain, which principally affected that Part where the Liver joins to the Diaphragm, went off on a sudden. Another, by a Wound in his Ankle, had an *Artery* cut, which ceased not to bleed, till I was sent for; when I came, I divided the *Artery* in two, after which I applied a Remedy, which consisted of Aloes, Frankincense, and Whites of Eggs, spread upon the soft Fur of Hares; and the Wound was cicatrized without an *Aneurysm*, the Orifice of the *Artery* being incarn'd; and the Patient, who for four Years past had felt a Pain in his Hip, with very short Intervals, was perfectly cured from that Time. This Success has often induced me to use *Arteriotomy* in the Joints of the upper Extremities, and in the Head itself, for all Pains proceeding from a hot and flatulent Matter; but especially when a Membrane is affected with a sort of pricking Pain, which extends itself by Degrees in such a manner, that the pungent Sensation seems, as it were, fixed in the Centre of the Place affected, while all the circumjacent Parts labour under a Tension. *Oribasius, Med. Collect. Lib. 7. Cap. 13.* from *Galen*.

We cut the *Artery* that lies under the Top of the Head towards the hinder Part, among the Tendons; or we open the *Artery* behind the Ears, or those which lie on each Side of the *Vertex* towards the fore Part of the Head, for they belong to the coronal and middle Sutures. Those *Arteries* which reach from the Temples to the Forehead, are not cut, because they are situated against a Muscle; but they may be safely opened, if the Patient, in Compliance with Directions, move his Cheeks forcibly, by which means all the Muscles of the Temples, throughout their whole Extent, are visibly put in Motion. We have an Opportunity then of letting alone the Part in the Forehead that moves, and making the Section in the Part that is at Rest. However, the Blood does not flow very fast, nor in any great Quantity, from these *Arteries*, because of their Smallness; nor does it issue forth with much Spirit, because they approach the Nature of Veins. The *Arteries* before the Ears, where the Muscles of the Jaws arise, are very firm and strong; but are seldom cut without Danger, because of the Nearness of the Muscles, and the Foldings of the Membranes of that Place. In the *Arteriotomy* on the Occiput, the *Artery* is to be cut home to the Bone, which is to be scraped, that Flesh may repullulate upon it for the Reception of the Mouths of the *Artery*. In cutting the *Artery*, the best way is to treat it like a Varix, by taking it up with the Forceps, or some such Instruments, and making not a great Incision, but several small ones. When you have drawn off a sufficient Quantity of Blood, the Vessel is to be taken up with the Forceps, and quite divided; for by this means it will never be joined again, nor will there be any Danger of an *Hæmorrhage*; the Mouths of the *Arteries* being drawn back into the Flesh. *Oribasius, Med. Coll. Lib. 7. Cap. 14.* from *Antyllus*.

For Defluxions in the Eyes of long Standing, and vertiginous Affections, we use to cut the *Arteries* behind the Ears. In order to this Operation, the hinder Part of the Head is first to be shaved, and then felt with the Fingers; for by the Pulse in that Place, we very easily discover the Situation of the *Artery*. We then cut home to the Bone, making an Incision of two Fingers Breadth in Length, the Place being before marked with

Ink. If we miss the *Artery*, we are to take the Distance of three Fingers Breadth from the Ears, and perform the Operation, cutting the *Arteries* across, till we perceive the Blood to flow with a Pulsation, and our Instrument touches the Bone. After taking away a moderate Quantity of Blood, we divide the *Pericranium*, that it might not be distended; and so inflamed; and having scraped the Bone, thrust a Linen Tent into the Wound, and heal it with Dressings of Lint. If the Bone in that Place still remains bare, we repeat the scraping it. *P. Aeginet. Lib. 6. Cap. 4.*

Arteriotomy, or the opening *Arteries* in order to procure an Evacuation of Blood, was among the *Egyptians* an Operation as common, and undertaken with as little Dread, as Venesection itself. This Practice they not only used on many Occasions, but looked upon it as a divine Secret, and the safest and most infallible Means of Recovery in long-standing and inveterate Inflammations of the Eyes; as also for long-protracted Head-achs, and obstinate Pains of the Viscera.

Some Physicians in After-ages declared themselves Enemies to this Practice, and supported their Judgment by a Passage of *Galen*, who [in *Lib. de Curat. per Sang. Miss.*] has these Words: "I have known some die in Consequence of the inferior *Artery* of the Cubit lying under the Vein being opened. In some I have found Gangrenes immediately produced by the Application of Bandage, with a View to stop the *Hæmorrhage*; and I have known others expire under the Operation for the *Aneurysm*." They imagined, that an opened *Artery* could not be agglutinated, and that the Danger of an *Aneurysm*, at least, and even of Death itself, must of Consequence be the Result of *Arteriotomy*. But these Physicians seem to have forgot the Reasoning of *Galen* their great Master, in the sixth Chapter of the fifth Book of his *Methodus Medendi*, where he uses these Words: "Some, says he, assert that one of the Coats of an *Artery* is hard and cartilaginous; and a Substance of that Nature cannot possibly coalesce and agglutinate, since a Disposition to join and unite is only found in soft Bodies. As in external Objects we do not find, that a Stone, for Instance, unites with its Neighbour Stone, nor a Shell with a Shell; so neither with ourselves do Cartilages unite with Cartilages, nor Bones with Bones; for broken Bones do not cohere by Union, but are joined by a glutinous *Callus*, which the *Greeks* call *σπέρμα*. It must be owned, that such is the Nature of an *Artery* as to render the Agglutination of its hard Coat difficult; but yet this Difficulty is not altogether unsurmountable, since an *Artery* is neither so dry nor so hard as a Bone or Cartilage, but much softer, and of a more fleshy Nature. And we have the less Reason to despair of agglutinating the Orifice of an *Artery*; since the *Artery* itself is small, and the Body of a Man of a soft and yielding Nature. Experience herself seems in this Case to join her friendly Voice to Reason, since in Children and Women, who have moist and soft Bodies, I have seen the *Arteries* agglutinated; and especially in one Youth, who had one of his *Arteries* slightly cut. But though an Orifice in an *Artery* is more difficultly agglutinated, than that in a Vein, yet the Medicines used in both Cases are not very different, but plainly of the same Species, and only vary in Degree; for an *Artery* requires Medicines somewhat drier than a Vein; but if the Intention is to produce Flesh around the Orifice, the Medicines to be used are the same in both Cases." Two things concur to render the Agglutination of *Arteries*, and the Cure of Ulcers formed in them, difficult; for, as *Galen* justly observes, that Ulcers in the Lungs cannot be cured by reason of their continual Motion; so the Motion and Pulsation of the *Arteries* is a great Obstruction to the Agglutination of Wounds made in them. The Difficulty of Agglutination is also augmented by the Hardness of that Substance of which the *Artery* consists. The Pulsation of the *Artery* is most efficaciously prevented by the Application of a smooth, round and thick Plate of Brass, after having duly united the Orifice. The *Egyptians* used to open all the *Arteries* discoverable in the Head; for in Head-achs of a long standing, especially such as are attended with Pulsation, and in all Inflammations of the Head, they used to cut the *Arteries*, and those placed behind the Ears; in opening all of which they were successful; but they most commonly opened that in the Forehead, especially in case of old Inflammations of the Eyes; and I myself, when in *Grand Cairo*, saw many cured, as by a Charm, of old Head-achs, and obstinate Inflammations of the Eyes, by opening the *Artery* in the Forehead, and making a sudden Evacuation of Blood. This Practice was known to *Galen*, as is plain from these Words in the fourteenth Book of his *Methodus Medendi*: "The Head, says he, must be shaved, and those *Arteries* which are situated near the Ears, and those behind them, those also in the Forehead and Temples, are to be carefully felt. And those of them which are felt warmer, and whose Pulsation is stronger than that of the others, are to be cut. But of those which are small, and lie near the Skin, it is proper to cut out a Part, as we used to do in *Varices* of the Legs." This Practice is very frequent among the *Egyptians*, and

and that very deservedly; since the *Arteries* which appear large and warm, contain much hot Blood mixed with a kind of stultent Matter.

“Among the several *Arteries* of the Head, the *Temporal* is sometimes burned; and this is done with a View to intercept and cut off these subtle Defluxions, which fall down upon the Eyes: And the two *Arteries* behind the Ears are opened for certain Species of Ophthalmies, watry Humours, *Nyctalops*, and old Pains of the Liver; but there is always some Danger in opening them, and they require a long Time to consolidate.”

I never indeed saw the *Egyptian* Physicians cut an *Artery* quite thro', or contract any Part of it; but I have often seen them open *Arteries* just as we do Veins. They often burn the *Temporal Arteries* in order to prevent Fluxions on the Eyes; for which Reason you may observe many People in all Parts of *Egypt* with their Temples burned. This Practice of burning the *Temporal* and other *Arteries*; they first had from *Ethiopia*; for many of the *Ethiopians* and *Abyssinians* use this Method of burning. I never saw, that any of them used this Operation on the *Arteries* behind the Ears for Disorders of the Eyes, and Pains of the Liver; for when the Liver is affected, they used to open the *Artery* between the Thumb and Fore-finger, which Practice is also approved of by *Galen*, in his Book *De Curat. per Sang. Miss.* These Physicians also told me, that they opened the *Jugular Arteries* in Patients who were in Danger of Suffocation, but I never had an Opportunity of seeing that Operation performed. They open the *Artery* between the Thumb and fore Finger, for Pains and Inflammations of the Viscera. The Method of opening an *Artery* among the *Egyptians* was this: The Operator first of all applies a Linen Ligature to the Part in which the *Artery* is to be opened, just as in Venesection; and suffers the *Artery* to become turgid, and full of Blood; then he makes an oblique Incision with a very sharp Lancet or Incision-knife; but in performing this Operation, the Incision ought always to be made very little, because the Blood contained in the *Arteries* is very thin, and because a large Orifice agglutinates with more Difficulty than a small one. Having thus opened the *Artery*, he takes away as much Blood as he judges necessary: But the Rule observed by most, with regard to the Quantity of Blood to be taken, is to let it flow till it stops of its own Accord. When a sufficient Quantity is taken away, they bring the divided Lips of the *Artery* into Contact with their Fingers, just as we use to do these of Veins; then they apply a little Cotton to the Orifice of the *Artery*, over which they lay a large Brass Coin, called by them *Follara*, which they tie upon the wounded *Artery* for three Days; at the End of which Time they take away the Ligature and Coin, using no other Step in the Cure; and all the times I saw this Operation performed, I observed the Patients rendered entirely sound by the foregoing Method. Others, before tying the *Artery*, and applying the Cotton to it, use a little Frankincense made warm in the Flame of a Candle, with which they unite the Lips of the Orifice; then they apply the Cotton, and, last of all, the *Follara*. Two things then, in the *Egyptians* Method of performing this Operation, deserve to be duly reflected upon: First, that they made the Incision very small, oblique, and with a very sharp Instrument. Secondly, the Application of the Brass Coin, by means of the Coldness and Hardness of which the Pulsation of the *Artery* was so far destroy'd, as to allow the Agglutination and Cure of the Incision made in the *Artery*. *Prosper. Alpini Medicina Egyptiorum.*

The Word *Arteriotomy*, according to its Etymology, signifies that Chirurgical Operation, by which, for the Safety of the Patient, the *Arteries* are opened almost in the same manner with the Veins, in order to procure a Discharge of Blood. But though in our own Days this Operation is not so frequently attempted as in former Ages, for fear not only of too great an Effusion of Blood, but also of an *Aneurysm*; yet if it is cautiously performed, it has the Suffrage of the greatest Physicians in its Favour, as being a Practice of singular Use, and unattended with any bad Consequences. Accordingly we read of the more antient Physicians opening *Arteries* in various Parts of the Body; in the Forehead, for Instance, in the Temples, behind the Ears, in the hinder Part of the Head, between the Thumb and the fore Finger, and in every other Part of the Body where the Pulsation was felt by the Touch. The modern Physicians; on the other hand, scarce open any other *Artery* than that situated in the Temples; for it is generally most easily opened, because it is sufficiently exposed to the Touch; and its Aperture is attended with the least Danger, either of an Effusion of Blood, or an *Aneurysm*, because it lies on the *Os Frontis*, and may therefore be easily compressed. No one in his Senses will, however, deny that 'tis, for the most part, far more difficult to open *Arteries* than *Veins*; since the former are not exposed to our Sight, but must be discovered by the Impressions made on the Touch by their Pulsations. But not to spend Time in describing the now obsolete Methods of *Arteriotomy* practised by the Antients, I come to give an Account of that used by some of the later and more modern Surgeons.

The first Step then to be taken is, to place the Patient in a Chair or Bed, and make him recline his Head from that Side on which the *Artery* to be opened lies. Then the Surgeon is carefully to explore and find out the *Artery*, in which the Incision is to be made; the most proper Method of doing which, is by applying his Left Hand to the Temple in which it lies. Then having discovered the *Artery* by its Pulsations, and duly observed its Situation, he is to fix and secure it by his two first Fingers, which must yet be removed at such a Distance from each other, that a Lancet may be commodiously passed between them into the Cavity of the *Artery*. But the Lancet must, for the most part, be passed deeper in this Operation than in Venesection, and carried transversely upwards in its Retraction, to the end the *Artery* may be the more infallibly reached; nor is there any Danger, though the whole *Artery* should be cut asunder. As soon therefore as the Incision is made, if a ruddy and florid Blood, whose Stream, as it were, beats Time to the several Pulsations of the *Arteries*, bursts from the Orifice, we are sure the *Artery* is opened, and the Operation well performed. But if it should happen otherwise, the Lancet is a second time to be passed deeper, till by the forementioned Signs we discover, that the *Artery* is either opened, or cut asunder. But as the Point of an ordinary Lancet is slender, and may on this Occasion be easily broken on the Bones of the Head, I have learned from Experience, that this *Artery*, especially if the Incision is made downwards, and not upwards, may more commodiously be laid open by a strait Incision-knife, represented by the Letter G, in *Tab. 22.* But that the Operation may produce the more happy Effects, a large Quantity of Blood, that is, a Pound, or, if a Plethora call for it, a Pound and an half, may be allowed to flow from the *Artery*, otherwise its having been opened proves of little Service; so that we need not be surpris'd at the antient Physicians, whose Practice was to allow the Blood to flow till such time as the Patient began to faint away. If an *Artery* is to be opened behind the Ear, in the back Part of the Head, or in any other Part of the Body, this same Method is to be followed, so far as the different Situations of Parts, and other Circumstances, will admit of it.

When as much Blood is taken from the Patient as the Physician shall judge proper, Bandage must be forthwith applied; for which Purpose three square Compresses of different Sizes must be provided. The least of these must be applied immediately to the Orifice, the intermediate one over it, and the largest over both: Nor on this Occasion is it improper to fold up a Piece of Money, or a small Piece of Lead, in the undermost or intermediate Compress, or to apply a Piece of chewed Paper to the Orifice itself, using the Compress at the same time over it; for thus the Blood will not only be the more easily stopped, but the opened *Artery* the more effectually preserved from bursting out afresh. And that all these may be the more securely fixed upon the Wound, the knotted Bandage, (See *FASCIA NODOSA*) or some other proper Bandage, must be applied pretty tight, and kept so for about eight Days, that an *Hæmorrhage* or *Aneurysm* may be the more effectually guarded against; and if it should happen to be relaxed, it is again carefully to be rendered tight, and so kept, if possible, till the Wound is entirely agglutinated.

As for the Uses of *Arteriotomy*, they are by some Physicians extolled as so numerous, and of a Nature so uncommon, that the most obstinate Diseases of the Head and Eyes, provided they owe their Origin to too great a Quantity of Blood, must receive remarkable Relief from this Operation, even after they have resisted the Force of all other Medicines. It is also a common Observation, that *Arteriotomy* is generally highly beneficial in Vertigos, obstinate Head-achs, Epilepsies, Suffusions, and Inflammations of the Eyes, proceeding from too great a Quantity of Blood. And *Catherwood*, a late *English* Writer, has in a Book, intitled, *A new Method of curing the Apoplexy*, endeavoured to shew, that the *Morbus Attonitus*, or *Apoplexy*, may be very speedily removed by it; but I must on this Occasion take Notice, that I myself performed the Operation of *Arteriotomy* upon two *Apoplectic* Patients, one of whom was young, and the other old; but they both soon after died, notwithstanding the Operation was performed in the very Beginning of the Disease, and other proper Remedies were used; so that *Arteriotomy* is not always effectual in Apoplexies. Since *Arteriotomy* then is observed in many Cases to be attended with Advantages superior to those of Venesection, and since the whole Danger of it may be prevented by proper Compress and Bandage, we may hence be enabled to make a due Estimate of the Opinion of those who not only pronounce it dangerous, but also place it upon a Level with Venesection in point of Efficacy. Notwithstanding what has been said, I must nevertheless own, that those Physicians most effectually consult both the Welfare of the Patients, and their own Reputation, who in Diseases, where Life is not immediately threatened, never have recourse to *Arteriotomy*, till they have found all other Remedies ineffectual. But, that the Effects to be expected from this Operation may be the more speedily and sensibly produced, it seems necessary, at the same time, to injoin a proper Regimen, and

other Medicines, that have a Tendency to remove the Disorder under which the Patient labours, and for which the Operation was performed. *Heister's Institutiones Chirurgicae.*

ARTETISCIUS, ARTETISCOS. One who suffers the Loss of any Member. *Rulandus.*

ARTHANITA. A Plant of which *Dale* mentions two Sorts. The first is the

Arthanita Cyclamen, Offic. *Cyclamen*, Schrod. Lib. 4. p. 59. *Cyclamen orbiculato folio*, Ger. 694. Emac. 843. *Cyclamen orbiculato folio inferne purpurascens*, C. B. Pin. Tourn. Inst. 154. Elem. Bot. 158. Boerh. Ind. A. 2. 150. Hist. Oxon. 3. 552. *Cyclamen vulgare, folio rotundo*, Park. Parad. 198. *Cyclaminus folio rotundiore vulgatiore*, J. B. 2. 551. Raii Hist. 2. 1205. *Cyclamen, Panis Porcinus*, Chab. 510. SOW-BREAD.

The Root of Sowbread is round, and somewhat flattish, like a small Turnep, of a dark-brown Colour on the Outside, with several dark Fibres shooting from the Bottom. The Leaves grow on thick, reddish Stalks, of a darkish Green above; frequently marked with white Spots, and underneath of a reddish or purplish Colour, in Shape like the Leaves of *Asarabacca*, round, and hollow'd in next the Stalk. Among these arise the Flowers, each on its own Foot-stalk, which is usually slenderest next the Ground. They are made up of one single pendulous Leaf, divided into five sharp-pointed Segments, which turn themselves backward when they open, and are of a pale purple or bloom Colour: When these are fallen, the Stalk with the Seed-vessel coils itself round towards the Earth like a little Snaker. Sowbread is planted with us only in Gardens, its native Place being the *Alps*, and the Mountains of *Austria* and *Styria*. It flowers in *September* and *October*.

The Root of Sowbread is very forcing, and principally used to bring away the Birth and the Secundines, and to provoke the Menfes. The Juice is commended by some against vertiginous Disorders of the Head, used in Form of any Errhine. It is of Service also against cutaneous Eruptions. *Miller's Bot. Off.*

Dale says it should be used with Caution internally:

The second is the

This Species agrees in Virtues with the preceding; and is the sort which is kept in our Shops. *Dale.*

ARTHETICA, or ARTHRETICA, is the Herb Ground-pine, so called from *ἄρθρον*, a Joint. It cures Affections of the Joints. *Blancard.*

ARTHOICUM is a red Oil extracted from the Roots of Herbs together with Bread artfully digested in Dung. *Ruland. Johnson.*

It should rather be written **ARTOICUM**, as *Castellus* observes, because derived from *ἄρτος*, Bread. *Rulandus* calls it also *Pannonium*.

ARTHREMBOLUS, *ἄρθρεμβολος*, from *ἄρθρον*, a Joint, and *ἐμβάλλω*, to impel, or force in. An Instrument, by means of which the luxated Bone of a Joint is restored to its natural Place and Situation. *Castellus* from *Sponius*.

ARTHRITICA, *ἀρθρίτις*, is the same as

ARTHRITIS, the Gout, from *ἄρθρον*, a Joint; as if we should say the Disease of the Joints, or Joint-evil.

So much has been said on this Distemper by Authors of almost all Ages; and so many trifling Theories have been erected with respect to the Gout, that it would take up a great Number of Volumes to give only an Extract of what has been said on this copious Subject. Much of this I shall therefore pass over; and the Reader will sustain but little Loss by this Omission, because Success in Practice, the only thing which can render a Theory valuable, has not yet confirmed the Speculations of any Author; inasmuch that the Distemper has remained incurable, notwithstanding all the Visions of Theorists, and Boasts of Empirics.

The Method I shall take in this Article will be to give, first, the Sentiments of two Authors only amongst the Antients, which are *Arætaus*, and *Cælius Aurelianus*.

Secondly, the History of the Distemper from *Sydenham*.

Thirdly, the History of the *Anomalous*, or Irregular Gout, with the Method of Cure, from *Musgrave*.

And lastly, I shall take the Liberty of making some Remarks relating to this obstinate Distemper.

From **ARÆTÆUS.**

The Pain which affects all the Joints in common is an *Arthritis*; if it be seated in the Feet, it is called *Podagra*; if in the Hips, it is a *Sciatica*; if in the Hands, a *Chiragra*: And thus it is, whether the Pain immediately attacks the Patient from some sudden Cause; or the Matter of the Disease, which

had for a long time lain dormant; is, upon some slight Occasion, kindled into a Fit. If the Disease becomes universal, it affects the whole nervous System. The Pain, first seizes the Nerves, the Ligaments of the Joints, and all those Parts which arise from and terminate in the Bones. And here it is Matter of great Admiration, that the Bones, which are utterly insensible to a Cut, or a Bruise, should under this Distemper acquire so exquisite a Sensation of Pain, as no Blows from an Iron Bar, no Compression with Cords, no Wounds with a Sword, nor Burnings with Fire, are capable of producing, but are rather wish'd for and chosen as Alleviations and Remedies of greater Pains. Nay, if the affected Bones were even to be amputated, the Pain endur'd under the Section would be diminished, as a small thing is by Comparison with a greater; or, if it should happen to prevail, the Patient would by that means receive a Pleasure from the Oblivion of his former Pain. Such then are the Misfortunes which are incident to the Teeth, as well as the Bones.

The true and undoubted Cause hereof is only known to the Gods, but Men may be allow'd to assign a probable Reason for it, which I shall do in short as follows. Bodies of a very dense Substance are insensible to the Touch and Wounds, and therefore can feel no Pain from such Impressions: For Pain is a Sensation of Asperities; but a dense Substance is not subject to be exasperated, and therefore is unsuceptible of Pain: On the contrary, whatever is of a rare Contexture, is quick of Sensation, and exasperated with a Wound. But since dense Substances are also animated by their native Heat, they exercise Sensation by the same Heat. Tho' there be a substantial efficient Cause then of a Wound, as a Sword, or a Stone, the Substance of the suffering Body receives no painful Sensation, because of its natural Denseness. But if the native Heat be alter'd from its just Temperament, the Sensation is perverted, and the Heat of such Substances, being excited by an internal Impulse of the sensitive Faculty, begets its own Pain; but Pains proceed from an Increase or Luxuriance of Nature.

The *Arthritis* makes its Attacks after different Manners, according to the Nature of the Joint. Sometimes it seizes upon the Hips, and often leaves a Lameness behind it; but is more favourable to the rest of the Members, and spares the smaller ones, as the Feet and Hands. For if it fixes on a large Member, which has Room to entertain it, it does not transgress the Bounds of that Limb; but if it begins with a small Part, it makes its Entrance in a mild and unexpected manner. In the *Sciatica* it begins with the hinder Part of the Thigh, the Ham, or the Tibia; at other times the Pain seizes upon the Acetabulum of the Os Femoris, and then makes an Attack upon the Buttocks or Loins, and seems to be any thing rather than a *Sciatica*. In the Joints it begins its Course in the following manner: First, the great Toe is seized with a Pain; after that, the fore Part of the Heel, on which we lay most Stress; then the Cavity near the same Part, and last of all the Ankle-bone swells. The Patients ascribe their Illness to wrong Causes; some lay the Fault on their new Shoes, others on a long Walk; one imputes it to a Stroke, another to a Tread: None thinks the Cause to be internal, nor will the Patients believe those who are so wise as to tell them the Truth. For this Reason the Distemper becomes incurable, because it is not opposed by a Physician in the Beginning, when it was in its weakest State; but when it has acquired Strength with Time, all the Care and Thought spent about it are thrown away. Some then are fetter'd with the Gout in their Feet during Life; in others it extends itself through the whole Compass of the Body; but for the most part it rushes from the Feet upon the Hands; for the Difference is not much, whether the Disease be in the Hands or the Feet, both these Parts being of the same Nature, slender and void of Flesh, most exposed to the outward Cold, and most remote from the internal Heat. Hence it ascends to the Elbow and Knee, and seizes on the Acetabula of the Os Femoris, where altering its Course, and winding about, it makes a Transition to the Muscles of the Back and Thorax. The Disorder spreads at an incredible rate, takes Possession of the Vertebrae of the Neck and Spine, and fixes itself on the Extremity of the Os Sacrum; and though all these Parts labour under one common Disease, each Part has its peculiar Pain. To proceed, the Tendons, Glands, and Muscles, suffer all together under Pain and Tension; the Muscles of the Jaws, and of the Temples, and afterwards those of the Kidneys and Bladder; and, what is most of all to be admired, the very Nostriils, Ears, and Lips, are affected*, for Nerves and Muscles are found in every Part.

A certain Person was afflicted with a Pain of the Sutures of the Head, and being ignorant of the Parts affected, described the Figures of the Sutures, as the oblique, strait, and transverse Sutures, on the fore and hinder Part of the Head, complaining of a dull Pain which had fix'd itself in the Bones; for the Disease prey'd as much upon every Closure of the Bones, as upon a Joint of the Foot or Hand. The Joints are also beset with Callosities, which at first resemble an Abscess; but growing

* M. Petit here takes Occasion to profess his Wonder, how *Arætaus*, so exact and masterly in his Descriptions, should overlook what *Ætius* after him observed, which was, that in the Extremity of the Disease the Iris is sometimes affected.

more and more condensed, and the humid Matter being concreted, Inflexion becomes painful. At last white, solid Substances, or Tophi, are formed, and small Tubercles, like Pimples in the Face, and sometimes bigger, overspread the Part. The Humour itself is white, thick, and of a Substance like Hail; and indeed the Nature of the Disease is to diffuse a Coldness like that of Hail over the Body. To some this Distemper seems to consist in something different from Heat or Cold, for we receive Pleasure sometimes from one, and sometimes from the other; but I am of Opinion, that the Disease is one in Essence, and has one Cause, that is, innate Cold. But if it should increase very fast, and there appear all the Signs of Heat, there is Need of Refrigeration, in order to mitigate and repress the Violence of this, which they call the hot Species of *Arthritis*. But if the internal Pain of the Nerves continues, and the Joint be cold, without any Swelling, the Disease may be said to be of the cold Kind, for which heating Medicines are required for restoring Heat to the Part. And for the most part such Medicines as are endued with a great deal of Acrimony are necessary to be used, which, by their stimulating Warmth, may raise the collapsed Parts into a Tumor, and draw the internal Heat to the Superficies; after which Refrigerants may be serviceable, as appears from considering that the same Treatment does not always agree with the same Patients; for what is beneficial at one time, proves hurtful at another; but, to say all in a Word, Heat is necessary in the Beginning, and Cold at the End. The *Podagra* is seldom perpetual; sometimes it takes its Leave of the Patient for a long time together, because it happens to be rarefy'd. A gouty Person at the Olympic Games, on a Remission of his Fit, won the Prize at a Foot-race.

Men are more subject to this Distemper than Women, but endure it better; on the contrary, Women are not so frequently afflicted with it as Men, but more severely. For whatever Evils we submit to from Necessity, their strange and unfamiliar Form increases the Calamity. The Age which lies most obnoxious to the *Arthritis* is after five-and-thirty; but it may be contracted sooner or later, according to the Constitution, and way of Living. The Pains indeed are great, but the Symptoms which accompany them are more to be dreaded; such are, a Lipothymy at being touched, Inability to move, Loss of Appetite, Thirst, and want of Sleep. If the Patients recover, just as if they had escaped from Death, they lead a remiss Life, becoming intemperate, open, merry, bountiful, and luxurious in Diet; and, as if they were sure to escape from Death once more, enjoy the present Life with all manner of Freedom. The *Podagra* often degenerates into a Dropsy, and sometimes into an *Asthma*, in which Cases Death is unavoidable. *Arctæus πρὸς αἰσ. ὑπομ. χρο. παθ. Lib. 2. Cap. 12.*

*** Food, and Radishes often, after which recourse must be had to Hellebore. The Diet in such Cases must be such as is commonly prescrib'd in other chronic Disorders; and, next to Diet, Unctions, and cold Bathing in Sea-water, are the most usual Remedies for all gouty Patients. Hellebore is indeed a noble Medicine in the first Attacks of the Gout; but if the Disease be grown inveterate, and descend by hereditary Succession from the Parents, it accompanies the Patient to the Grave.

The following Method is advisable under a Fit of the Gout: Let the affected Part be wrapped in Sheeps greasy Wool, and embrocated with Wine and Oil of Roses. Some have received Benefit from the Application of a Sponge dipt in Oxycrate. After these let a Cataplasm be made of Bread, and Refrigerants, as Gourds, Pumpions, the small Gourd, Plantain, and Rose-leaves. The Herb *Sideritis* is also a Lenitive, used with Bread, Moss, Comfrey-roots, the Herb Cinquefoil, and Horehound with fine slender Leaves, the Decoction of which drank mitigates Pain; and the Herb, with Crums of Bread and Barley-flower, makes a Cataplasm. Also that Part of a Citron which is not eatable, together with Polenta, is an excellent Remedy; and so are dry Figs and Almonds, with Meal of one sort or other. These Remedies are of the Class of Refrigerants; and some of these have been found to relieve in particular Cases, and the same has also sometimes been effectual in others.

Others require heating Medicines, and among these the same does Good to different Persons, on a different Account. The following is commonly esteemed as an excellent Lenitive: Feed a Goat with Iris, as much as it will eat; and after allowing a sufficient Time for Digestion, kill the Goat, and let the Patient put his Feet into its Belly amongst the Dung. There are a thousand Remedies for the Gout; for this Distemper puts every one who has the Misfortune to labour under it upon being his own Physician. *Arctæus πρὸς ὁσπ. χρο. παθ. Lib. 2. Cap. 12.*

As to the Theory of *Arctæus*, it is much on a Level with those of later Date.

As *Arctæus* is imperfect with respect to the Cure, I shall give the Methods of the Antients

From COELIUS AURELIANUS.

If the Patient is costive, a simple Clyster is to be injected; and when the Disease has arriv'd at its greatest Height, so that the Parts appear tumid and inflated, Scarification is to be used;

and if the Situation of the Parts will admit of it, Cupping Glasses or Leeches are to be apply'd. But Scarification without Cupping is the more gentle of these Methods; for in this Case there is none of that Shattering of the Parts, which is the necessary Consequence of Cupping. The Bites of Leeches are also accompany'd with such a Degree of Pain, that a simple Scarification is still more tolerable. Vaporation with Sponges is also to be used; and Fomentation with warm Water, or warm Water and Oil; or with a Decoction of Fenugreek, Linseed, or Marshmallows. A lenitive Cataplasm is also now to be used, though before it was highly improper; because Parts that are swelling, ought not to be loaded and encumbered with any Weight. For this Purpose then we are to use Bread thoroughly softened, either alone, or mixed with the boiled Roots of Comfrey, which the Greeks call *σύνεργον*, or those of Marshmallows, or such other things as we approve of for Vaporation. When the Disease is evidently and indisputably on the Decline, we are to prescribe Bathings, Variety of Foods, and Water for the Patients Drink; and in order to allay the Pain caused by the Distemper, we are to use Cerats made up with sweet Oil, or Cyprian Oil, of that Medicine prepared of Far, which the Greeks call *διδυμῶν*, then a Malagma of *Dyachylon*, or *Mnafeum*, or what is commonly call'd *Diateles*, or *Diozeleum*, or *Diathalassestum*. The Patients Body is by little and little to be strengthened by walking in easy Shoes; he is at the same time carefully to guard against every thing that may hurt him, and all Excesses, especially in Wine, Venery, and every thing that has a Tendency to bring on Indigestion. 'Tis also proper to give Arthritic Patients Wax to mould soft by their Fingers; or those Instruments which the Gymnastics called *Halteres*, are to be held in their Hands, and mov'd; and these Instruments ought at first to be of Wax, or Wood with a little Lead melted here and there into it; then more weighty Bodies may be given them, according to the Advances of the Cure. And even though the Disease should be long protracted, the above-mentioned Simplicity of Cure is to be observed during the Paroxysms; but in the Intervals, the Body is to be strengthened and recruited: For this Purpose let Gestation, according to the Patients Strength, be used, then walking upon Ground made even with soft Straw, together with Vociferation, and Unction of the Body; for in this Case, as well as in other Disorders of an old Date, the want of due and proper Exercise renders the Patients gross and corpulent, by which means the Joints are rack'd, and the unexercised Nerves weakened. Bathings are also to be employed on stated Occasions, and the Patient is to have Variety of Food of a neutral Quality. He is also to use a small Quantity of mild Wine; but that must always be done after his Meals; then a simple or compound *Dropax*, and a *Paroptesis*, or Provocation of Sweat by Fire, the Heat of the Sun, warm Skins, or hot Sea-bath; after these, Sprinklings, which the Greeks call *συνδάματα*, of Nitre, *Adarce*, and *Euphorbium*. Then Ointments are to be apply'd; and such Medicines as remove Weariness and Pain, call'd by the Greeks *Acopa*, composed of Squills, wild Cucumber, as also of *Euphorbium* and *Adarce*. Then a Malagma is to be used of what we call *Diabalon* or *Diadaphnidon*, or *Diadarce*, or a Lixivium of *Diasfaste*, or any thing else of a like Nature. The Rubification of the Skin, by the Greeks call'd *κόκκινος*, is also to be procured by Applications of Mustard. He is also to be directed what the Greeks call *Drimsphagia*, or the Use of acrid Substances, and the Regimen of the *Metasyneritic Cycle*; as also Vomits of emetic Roots, and Hellebore, and Bathings, such as are prescribed for those who labour under *Sciaticas*. Fomentations are also to be used made of Decoctions of Mugwort, or warm Sea-water. Then the Patient is to use Swimming, either in warm or cold Water. The Use of natural Waters is also proper both of the hot and cold Kind, such as those of the *Tyber*, and *Cutilian Lake* in Italy. The Use of all the above-mentioned Remedies is to be continued; for they will either produce a perfect Cure, or, which is next to it, render the Return of the Paroxysms less frequent.

Some of the Antients prescribed Medicines in this Disease to be drank for a Year, such as that they call'd *Diacentaurion* and *Diastordeon*. These were to be used for a complete Year running, by those in whom the Distemper was not of long Standing, that is, if they had not contracted it above five Years before the Use of this Course, which they did not approve of, till the Patient's Body was disposed by proper Evacuations for entering upon it. If the Course was not persisted in for the Year running, yet it was to be followed for the Number of Days of which a Year consists, though considerable Intervals should happen between them. But in my Opinion, according to the Advice of *Sorānus*, a long-protracted Course of taking Medicines is to be dreaded in its Consequences, since of course the ordinary and most salutary Foods to which the Patient was formerly accustomed, cannot be used by him. Thus in some of the Antients we find Accounts of some Patients falling into acute Diseases, by a constant and protracted Use of Medicines; of others who have died of Apoplexies, Pleurifies, and Peripneumonies; and that others, by the same means, have been afflicted

afflicted with a continual Difficulty of Breathing, which the *Greeks* call *ἄστυα*. They who affirm, that they have found Advantage from such a Course, do not advert, that the Benefit they received was the Result of Digestion being preserved by means of a good and slender Regimen; for the Excess of peccant Humours abating, and Health continuing, some have been afraid to give over their Course, and have been so much prejudiced in its Favour, that they could not possibly believe, that any other Means could contribute to their Health and Preservation. Some advise burning the gouty Protuberances, and Parts most immediately affected. But I disapprove of this Practice, since it has a Tendency to draw the adjacent Parts into Consent, and by that means excite Tumors. Some also approve of trying different Means, and prescribe Ointments and Cataplasms of widely differing Qualities, till they light on the very Medicine by means of which the Patient is relieved; for some things seem in their Natures adapted to some Patients, and others to others; and the Use of different Medicines will in different Patients produce the same Effect; that is, the Mitigation of Pain. Remedies of quite contrary Intentions have also been order'd in this Case; for Instance, laxative Medicines in Conjunction with Astringents and Restorers, such as the Malagma call'd *Mnaseum*, or Diachylon. Some, on the contrary, have order'd the more violent Astringents alone, such as *Dyateon* (*ῥα ἰσὺν ἑῖς*) *Cyzicenum*, and the *Emplastrum Erasistratium*; as also a Cataplasm of the Powder of *Panic* and Lintseed; and of wild Cabbage or Groundsel, or Water-sea-green, or Mandrake, or Henbane, or Lentils, or the Heart of a Citron, or Pompion, or Origanum, or Thyme, or Lupins, or Purslain, or Beets, or Pomgranates with green Leaves; or its Blossom, which the *Latins* call *Ampullagium*, boil'd with Vinegar; or wild Rue with Vinegar alone, or with common *Alica*; or the Sediment of Vinegar with Smallage; or the Leaves of the Vine with common *Polenta*; or fine Meal of the bitter Vetch; or of Beans, Barley, Darnel, or Lupins, with the Dregs of Wine or Vinegar; or Figs boil'd with Water and Wine, and beat into the Consistence of Honey; then separating the harder Parts, they order the Remainder to be again boiled. As also of the tender Stalks of Poppy, which the *Greeks* call *κασία*; or their Leaves, and Quinces and Pomgranates boil'd in Wine, and their Pulp with Honey; or the Root of Henbane with Storax; or Roots and Leaves of Hyacinth and Horehound; as also Lime boil'd in Honey; and Opium, Storax, and bitter Almonds thoroughly boil'd in *Cyprian* Oil and Vinegar: With these they order the Parts affected to be anointed. Thus, without any Order, and, in a manner, repugnant to the Art of Physic, they order things the most directly opposite, and pass from one Medicine to another, till they light on such as are proper for the Disease; since different Patients are reliev'd by different Means. This Method of trying Experiments is, by the *Greeks* called *ῥηδισμὸς ὡς ἐστὶν*, which does not adhere to certain stated Medicines for the Cure of Diseases; but makes Trial of Numbers till the Intention is answer'd. Besides, it sometimes happens, that the Paroxysms do not seize the Patient for a long time, and of their own accord become gradually more gentle, and, the Disease declining apace, the Patient is perfectly cured. But those Medicines which are thought proper in the declining State of the Disease, are found hurtful in its Beginning or first Stage, since they are not applied at a seasonable Time; they therefore think, that some are relieved by one Set of Medicines, and others by another. But we ought to be very careful to adjust and proportion Medicines to the Stages of the Disease, and the State of the Patient; for, in the Beginnings of the Distemper, moderate Astringents are proper; but in its Increase and Height, mitigating and laxative Medicines are to be used. In the Declension, Emollients are proper. In the Intervals, corroborating and recruiting Medicines take Place. But cold and repellent Medicines, call'd by the *Greeks* *ἀνταρσινὰ*, are proper even when the Disorder is attended with an Erysipelas. But some affirm, that even in this Case Coolers are serviceable, as they moderate the Inflammation; for their Application, say they, is agreeable to those burning Heats which arise from Tumors, and allays them just as cold Water poured into hot Water reduces it to a mild and tepid Heat. But this Conclusion is plainly false, since 'tis what the *Greeks* call *σophisma*; for if their Reasoning was good, it would follow, that cold Substances were proper for all Tumors. We are therefore to adjust Medicines to the Natures of Disorders, and their several Stages. Some in gouty Cases commend an *Acopum* of Toads. Some anoint their Feet with the Fat of a Sea-calf, and wear Shoes made of its Skin. Others again boil this Animal alive, and others a Wolf, and affirm that anointing with the Oil, produced, is of singular Efficacy; for many foolish Medicines are believed by credulous People to be effectual, because they have been apply'd at a Time when the Disease was not fixed, but beginning with a gentle Attack on the Body, and often changing its Appearances.

Many have, in like manner, approv'd of Vomits exhibited after Meals twice or thrice every Month, imagining that by

that means the peccant Matter was hinder'd from reaching the Joints, and Indigestion prevented; not adverting that the Patient suffer'd still more and more, since by this means the Gums become putrid, the Teeth are render'd loose, the Eyes distorted and weaken'd, the whole Head fill'd, the Stomach violently affected, and all the Nerves drawn into Consent. A spare and slender Diet is therefore more commendable in this Case, and the Foundation of the Cure is to be laid in Abstinence.

Many Physical Writers in this Distemper recommend the more acrid Purgatives, and such Medicines as promote Urine; which they call *Diuretic*. But we must carefully guard against Irritations of the Stomach, which are very readily produced by Variety of Medicines; we must also take care not to irritate the Bladder, which is of a very nervous, and consequently a very sensible Nature; and when it is affected, by its nervous Quality it conveys Pain and Uneasiness to all the Parts of the Body: But, not to enumerate all the Errors of the Antients, I think what they have written concerning the Gout vain, prolix, and frivolous; and that the several Steps of Cure above-mention'd are sufficient; but as I have hitherto made no mention of the several Authors from whom they were taken, I shall here subjoin an Account of them. The first then is *Dioscorides* in the Books he wrote concerning Diseases, their Causes and Cures. *Praxagoras* in his third Book of Diseases. *Erasistratus* in the Book he wrote concerning the Gout, in which, tho' he forbids Purgatives call'd *Cathartics*, yet he promised a Malagma to King *Ptolemy*, a Receipt of which he has not left; tho' some People mention their having seen this Medicine of *Erasistratus*. Many also of the Followers of *Herophilus*, and *Asclepiades* in his Books wrote to *Erasistratus*, and *Heracides Tarentinus*; and *Themison* in his second Book of chronical Disease, who sometimes talks like one of the Methodic Sect, and sometimes not; for he recommends Phlebotomy in the Feet, does not account for any Part of his Practice, and confounds the Qualities of Cataplasms, not distinguishing between Astringents and Laxatives: But what occasion have we to confute his Sentiment in this Particular, since 'tis as well known, that Phlebotomy in the Feet occasions a Derivation of Humours to the Parts affected, as 'tis, that excessive Drinking weakens the Nerves? *Theffalus*, however, in his second Book, which he calls *Regularis*, has laid down the Cure of the Gout imperfectly indeed, but in a manner consistent enough with the Principles of the Methodic Sect. *Cael. Aurel. Chron. Lib. 5. Cap. 3.*

From SYDENHAM.

The Gout generally attacks those aged Persons who have spent most Part of their Lives in Ease, Voluptuousness, High-living, and too free an Use of Wine, and other spirituous Liquors, and at length, on account of the common Inability to Motion in old Age, entirely left off those Exercises, which young Persons generally use. And further, such as are liable to this Disease have large Heads, and are generally of a plethoric, moist, and lax Habit of Body, and withal of a strong and vigorous Constitution, and possessed of the best Stamina Vitæ.

The Gout, however, not only seizes the gross and corpulent, but sometimes, tho' less frequently, affects lean and slender People; neither does it always wait till old Age comes, but sometimes attacks such as are in the Prime of Life, when they have received the Seeds of it from gouty Parents, or have otherwise occasioned it by an over-early Use of Venery, or the leaving off such Exercises as they formerly indulged to Excess; and besides have had a voracious Appetite, and used spirituous Liquors immoderately, and afterwards quitted them of a sudden for those of a thin and cooling kind.

When it seizes a Person far advanced in Years, for the first time, it never has such stated Periods, nor proves so violent, as when it attacks one that is younger, because, he generally perishes before the Disease accompany'd with its natural Symptoms, comes to its Height; and because the native Heat and Vigour of the Body being diminish'd, the Distemper cannot be so constantly and effectually propell'd and fix'd upon the Joints. But when it comes on sooner, tho' it may not yet fix on one Part, nor prove so severe, but affect the Patient occasionally, keeping no certain Period, giving only a little Pain for a few Days, and coming on and going off without any Regularity; yet, however, in time it takes full Possession, and becomes regular both with respect to the Time of its coming, and the Duration of the Fit; so that it is more severe in its Progress than in its Beginning.

I shall first treat of the *Regular Gouts*, and next of the *Irregular*; whether occasioned by an unadvised Use of improper Remedies, or the Weakness of the Subject.

The Gout, when *regular*, generally seizes the Patient in the following manner. It comes on a sudden towards the Close of *January*, or the Beginning of *February*, giving scarce any Sign of its Approach, except that the Patient is afflicted for some Weeks previous thereto, with a bad Digestion, Crudities of the

Stomach, and much Flatulency and Heaviness, that gradually increase till the Fit at last commences; which, however, is preceded for a few Days by a Numbness of the Thighs, and a sort of Defect of Flatulencies thro' the fleshy Parts thereof, along with convulsive Motions; and the Day preceding the Fit, the Appetite is sharp, but preternatural. The Patient goes to Bed, and sleeps quietly till about Two in the Morning, when He is awakened by a Pain which usually seizes the great Toe, but sometimes the Heel, the Calf of the Leg, or the Ankle. The Pain resembles that of a dislocated Bone, and is attended with a Sensation, as if warm Water were poured upon the Membranes of the Part affected; and these Symptoms are immediately succeeded by a Chillness, Shivering, and a slight Fever. The Chillness and Shivering abate in proportion as the Pain increases, which is mild in the Beginning, but grows gradually more violent every Hour, and comes to its Height towards Evening, adapting itself to the numerous Bones of the Tarsus and Metatarsus, the Ligaments whereof it affects; sometimes resembling a Tension or Laceration of those Ligaments, sometimes the Gnawing of a Dog, and sometimes a Weight and Constriction of the Membranes of the Parts affected, which becomes so exquisitely painful, as not to endure the Weight of the Cloaths, nor the shaking of the Room from walking briskly therein. And hence the Night is not only passed in Pain, but likewise with a restless Removal of the Part affected from one Place to another, and a continual Change of its Posture: Nor does the perpetual Restlessness of the whole Body, which always accompanies the Fit, and especially in the Beginning, fall short of the Agitation and Pain of the *gouty* Member. Hence numberless fruitless Endeavours are used to ease the Pain, by continually changing the Situation of the Body, and of the Part affected, which notwithstanding abates not till two or three o'Clock in the Morning, that is, twenty-four Hours from the first Approach of the Fit; when the Patient is suddenly relieved by means of a moderate Digestion, and some Dissipation of the peccant Matter, tho' he erroneously judges the Ease to proceed from the last Position of the Part affected. And, being now in a breathing Sweat, he falls asleep, and upon waking finds the Pain much abated, and the Part affected to be then swell'd; whereas before only a remarkable Swelling of the Veins thereof appeared, as is usual in all *gouty* Paroxysms. The next Day, and perhaps two or three Days afterwards, if the *gouty* Matter be copious, the Part affected will be somewhat pained, and the Pain will increase towards the Evening, and remit about Break of Day. In a few Days it seizes the other Foot in the same manner; and if the Pain be violent in this, and that which was first seized be quite easy, the Weakness thereof soon vanishes, and it becomes as strong and easy as if it had never been indisposed: Nevertheless, the Gout affects the Foot last seized, as it did the former, both with respect to the Vehemence and Duration of the Pain: And sometimes, when the peccant Matter in the Beginning of the Fit is too copious for one Foot to contain, it affects both at the same time with equal Violence, but it generally attacks the Feet successively, as above remarked. When it has seized both Feet, the following Fits are irregular, both with respect to the Time of Seizure, and their Continuance; but the Pain always increases in the Evening, and remits in the Morning; and what we usually call a Fit of the *Gout*, which goes off sooner or later, according to the Age of the Patient, is made up of a Number of these smaller Paroxysms. For when this Disease lasts two or three Months, it is not to be esteemed one continued Fit, but rather a Series or Assemblage of small Fits, the last of which proves milder and shorter, till the peccant Matter being at length entirely expelled, the Patient recovers his former Health; which in strong Constitutions, and such as seldom have the *Gout*, often happens in the Space of fourteen Days; and in the Aged, and those that have frequent Returns of the Disease, in two Months; but in such as are more debilitated, either with Age, or the long Duration of the Distemper, it does not go off till Summer advances, which drives it away. During the first fourteen Days the Urine is high-colour'd, and, after Separation or Standing, lets fall a red, gravelly Sediment; and not above a third Part of the Liquids taken in is voided by Urine, and the Body is generally costive during this Time. The Fit is accompanied throughout with Loss of Appetite, a Chillness of the whole Body towards the Evening, and a Heaviness and Uneasiness even of those Parts that are not affected by the Disease. When the Fit is going off, a violent Itching seizes the Foot, especially between the Toes, whence the Skin peels off, as if the Patient had taken Poison. The Disease being over, the Appetite and Strength return sooner or later, according as the immediately preceding Fit hath been more or less severe; and, in Consequence of this, the following Fit comes on in a shorter or longer Space of Time; for, if the last Fit proved very violent, the next will not attack the Patient till the same Season of the Year returns again.

In this manner does the regular *Gout*, accompany'd with its genuine and proper Symptoms, appear; but when it is exasperated, either by wrong Management, or long Continuance,

so that the Substance of the Body is in a manner changed into Supplies for the Disease, and Nature unable to expel it according to her usual Way, the Symptoms differ considerably from those just described: For, whereas the Pain hitherto only affected the Feet, (which are the genuine Seat of the morbid Matter, which, whenever it attacks any other Part, clearly proves, either that the Course of the Disease is obstructed, or the Strength gradually impair'd) it now seizes the Hands, Wrists, Elbows, Knees, and other Parts, no less severely than it did the Feet before: For sometimes it renders one or more of the Fingers crooked and motionless by Degrees, and at length forms stony Concretions in the Ligaments of the Joints, which destroying both the Scarf-skin and Skin of the Joints, Stones not unlike Chalk or Crabs-eyes appear, and may be pick'd out with a Needle. Sometimes the morbid Matter is thrown upon the Elbows, and occasions a whitish Swelling, almost as large as an Egg, which becomes gradually inflamed and red. Sometimes it affects the Thigh, which seems to sustain a great Weight, yet without much Pain; but thence gaining the Knee, it attacks that Part more violently, depriving it of Motion, so as to nail it, as it were, to one Place in the Bed. And when it is necessary to move the Patient, either on account of the Restlessness of the whole Body, which is so frequent in this Disease, or some other urgent Occasion, it ought to be done with great Caution, as the least contrary Motion or Shock may perhaps give Pain, which is only tolerable for this Reason, because it soon goes off. And, indeed, this Necessity of moving the Patient with such Care and Tenderness by the Assistants, is no inconsiderable Part of the Evils which attend the *Gout*; for an Excess of Pain does not last during the whole Paroxysm, in case the Part affected be kept perfectly without Motion.

As the *Gout* heretofore did not usually come on till the Decline of Winter, and went off in two or three Months, it now continues all the Year, excepting two or three of the warmest Summer Months. And it is further to be observed, that as the cardinal or general Fit continues longer now than it did heretofore, so likewise those particular Fits, of which the general one is made up, rage a longer time; for whereas one of these did not last above a Day or two before, it now, where-ever it fixes, does not go off till the fourteenth Day, especially if the Feet or Knees be affected thereby. To this may be added, that the Patient on the first or second Day after its coming, besides the Pain, is afflicted with Sickness, and a total Loss of Appetite.

In the last Place, before the Disease came to such a Height, the Patient not only enjoy'd longer Intervals between the Fits, but likewise had no Pain in the Limbs, and the other Parts of the Body, all the bodily Functions being duly performed; whereas now his Limbs, during the Intermision of the Disease, are so contracted and disabled, that tho' he can stand, and perhaps walk a little, yet it is very slowly, with great Trouble, and so lamely, that it scarcely deserves the Name of walking; and if he endeavours to walk beyond his Strength, in order to recover the Use of his Feet, the stronger they grow, and the less liable they are to Pain upon this Account, so much more does the morbid Matter, not wholly dissipated during this Interval, threaten the Bowels, to the great Danger of the Patient, as it cannot be so freely thrown upon the Feet, which, in this State of the Disease, are never quite free from Pain, but always have an uneasy Sensation in some Degree.

Moreover, the Patient is afflicted with several other Symptoms; as a Pain in the Haemorrhoidal Veins, nidorous Eructations resembling the Taste of the Aliment last taken in, and corrupted in the Stomach; this happens always after eating any thing of difficult Digestion, or even no more than is proper for a healthy Person: Add to these a Loss of Appetite, and a Debility of the whole Body, for want of Spirits; which render his Life melancholy and uncomfortable. The Urine, which was before high-colour'd, especially in the Fits, and voided in a small Quantity, now resembles that which is evacuated in a Diabetes both in Colour and Quantity, and the Back and other Parts itch much towards Bed-time.

It also happens, when the Disease is grown inveterate, that after Yawning, especially in the Morning, the Ligaments of the Bones of the Metatarsus are violently convulsed, and seem to be forcibly press'd by a strong Hand. And sometimes, tho' no Yawning has preceded, when the Patient is composing himself to Sleep, he feels a sudden Pain, as if the Metatarsus were breaking in Pieces by a Blow with a Stick, so that he wakes crying out with Pain. The Tendons of the Muscles of the Tibiae are sometimes seized with so sharp and violent a Convulsion or Cramp, that if the Pain it occasions were to last only a short Time, it would overcome all human Patience.

But after many racking Pains, the following Paroxysms become less painful, as an Earnest of the Delivery which approaching Death is about to give, Nature being in part oppress'd by the Quantity of the morbid Matter; and in part by old Age, so as not to be able to propel it constantly and vigorously to the Extremities; but instead of the usual external Pain, a certain Sickness, a Pain in the Belly, a spontaneous Lassitude, and some-

sometimes a Tendency to a Diarrhoea, succeed. When these Symptoms are violent, they ease the Pain of the Limbs, which returns upon their going off; and the Paroxysms are much prolonged by this alternate Succession of Pain and Sickness. For it is to be observed, that when the Disease has continued several Years, the Pain diminishes gradually every Fit, and the Patient at last is worn out rather by the Sickness than the Pain, which in these Fits, tho' it be longer, is not near so violent as that which he usually suffer'd, when his Strength was less impaired. But nevertheless this Violence of the Disease was ordinarily recompensed by longer Intervals between the Fits, and the good State of Health the Patient enjoy'd during the Intermission. For Pain in this Disease is the disagreeable Remedy of Nature; and the more violent it proves, the sooner the Fit terminates, and the longer and more perfect is the Intermission; and so on the contrary.

But besides the above-mention'd Symptoms, as the Pain, Lameness, Inability to Motion of the Parts affected, the Sickness, and other Symptoms above enumerated, the *Gout* breeds the Stone in the Kidneys in many Subjects, either because the Patient is obliged to lie long on his Back, or because the secretory Organs have ceased performing their proper Functions, or else because the Stone is form'd from a Part of the same morbid Matter; which, however, I do not pretend to determine. But from what Cause soever this Disease proceeds, the Patient is sometimes at a Loss to know whether the Stone or the *Gout* be most severe. And sometimes it happens, that a Stone in one or both of the Ureters, intercepting the Passage of the Urine to the Bladder, destroys him without waiting for the slow Advances of the *Gout*.

The Patient is not only reduced to this helpless Condition, but, to complete his Misery, his Mind, during the Fit, sympathizes with his Body, so that 'tis not easy to determine which of the two is most afflicted. For every Paroxysm may be as justly denominated a Fit of Anger, as a Fit of the *Gout*; the rational Faculties being so enervated by the Weakness of the Body, as to be disordered upon every trifling Occasion; whence the Patient becomes as troublesome to others, as he is to himself. Moreover he is equally subject to the rest of the Passions, as Fear, Anxiety, and the like, which also torment him till the Declension of the Disease, when the Mind is restored to Health along with the Body, having recovered its former Tranquillity.

To conclude, the Viscera in time are so much injured, from the Stagnation of the morbid Matter therein, that the Organs of Secretion no longer perform their Functions; whence the Blood, overcharged with vitiated Humours, stagnates, and the *gouty* Matter ceases to be thrown upon the Extremities as formerly; so that at last the Patient is so happy, as to be freed from a most painful and burdensome Life, by Death, the ultimate Remedy.

But what may be a Consolation to me, and other *gouty* Persons of moderate Fortunes, and slender Abilities, is, that Kings, Princes, Generals, Admirals, Philosophers, and several other great Men, have thus lived and died. In short, it may in a more especial manner be affirmed of this Disease, that it destroys more rich than poor Persons, and more wise Men than Fools; which seems to demonstrate the Justice and strict Impartiality of Providence, who abundantly supplies those that want some of the Conveniences of Life, with other Advantages, and tempers his Profusion to others with an equal Mixture of Evil; so that it appears to be universally and absolutely decreed, that no Man shall enjoy unmixed Happiness or Misery, but experience both; and this Mixture of Good and Evil, so adapted to our Weakness, and perishable Condition, is, perhaps, admirably suited to our present State.

The *Gout* seldom infects Women, except they are far advanced in Years, and of a masculine Habit of Body; for such as are lean and emaciated, who in their Youth, or ripen Age, are seized with Symptoms not unlike the *Gout*, owe them to hysteric Disorders, or some preceding Rheumatism, the morbid Matter whereof was not sufficiently carried off in the Beginning. Nor have I hitherto found Children, or People not yet arrived at Maturity, affected with the true *Gout*. Yet I have known some who have felt slight Touches of it before Manhood; but these were such as were begot whilst their Father actually laboured under the *Gout*; and let this suffice for the History of this Disease.

Upon a thorough Attention to the various Symptoms of this Disease, I judge it to proceed from an universally depraved Concoction; for such as are subject to it, are either worn out by old Age, or have contracted prematurely the Infirmities of it by Debauchery; and hence labour under an universal Defect of Animal Spirits, wasted by the immoderate Exercise of the vigorous Functions in the Heat of Youth: For Instance, by a too early, and excessive Use of Venery; by an extravagant and incessant Pursuit after Pleasures, and the like; to which must be added, the leaving off such bodily Exercises on a sudden as they had formerly used, (whether through Age or Indolence)

which served to invigorate the Blood; and strengthen the Tone of the Solids; whence the Strength decays, and the Concoctions are no longer duly performed; but on the contrary, the excrementitious Part of the Juices, which was formerly expelled by means of such Exercises, is accumulated in the Vessels in order to nourish the Disease. And sometimes it has happened, that the Disease hath been increased by a long-continued Application to Study and Meditation, whereby the finer and more volatile Spirits are diverted from their proper Function of assisting the Concoctions.

Again, such as are subject to the *Gout*, besides having a voracious Appetite in general, principally covet Aliment that is difficult to digest; of which, when they have eaten as plentifully as they usually did when they used Exercise, their Organs are unequal to the Task of digesting it properly. But this way of Living does not occasion the *Gout* so frequently as the excessive Use of Wine, which destroys the Ferments designed for various Concoctions, hurts the Concoctions themselves, and overcomes and dissipates the natural Spirits, by reason of the Abundance of adventitious Vapours. Now the Spirits, which are the Instruments of Concoction, being weakened, and the Blood at the same time overburdened with Juices, all the Concoctions must necessarily be depraved, as all the Viscera are so oppress'd. Hence the Spirits, that have long been in a declining State, are now quite exhausted. For if this Disease proceeded only from a Debility of the Spirits, it would equally affect Children, Women, and People debilitated by a tedious Illness; whereas the strongest and most robust Constitutions are principally subject to it, but not before Abundance of Humours are collected in the Body, through the Decay and Waste of the natural Heat and Spirits, which in Conjunction pervert the vitiated Concoctions.

Again, as each of the Causes we have enumerated promotes Indigestion, so most of them contribute, in some measure, to introduce a Laxity of the Habit, and Muscles of the Body, which makes way for the Reception of crude and indigested Juices, as often as they are thrown upon the external Parts. For when, by lying long in the Blood, they are increased in Quantity, and have put on a morbid Quality, they at last acquire a Heat sufficient for Putrefaction; and, Nature being then no longer able to regulate them, they shew themselves in the Form of a Disease, and fall upon the Joints, and, by their Heat and Acrimony, occasion exquisite Pains in the Ligaments and Membranes that cover the Bones; which, being weakened and relaxed, either by Age or Intemperance, easily admit them. But this Translation of the Humours occasioning the *Gout*, and forming a *gouty* Fit, happens sooner or later, according as these Humours are put in Motion by adequate Causes.

As to the Cure, in treating of which I shall first specify the things to be avoided, if regard be had to the Humours, and the Indigestion occasioning them, it should seem at first View, that the curative Indications should principally tend, first, to evacuate the Humours already generated; and, secondly, to strengthen the Concoction or digestive Powers, so as to prevent the Accumulation of other Humours; these being the usual Indications to be answered in most other Humoral Diseases. But nevertheless, in the *Gout*, Nature seems to have this singular Prerogative, to expel the peccant Matter according to its own Method, and deposit it upon the Joints, there to be carried off by insensible Perspiration. Now there are only three ways proposed of expelling the morbid Matter of the *Gout*, which are Bleeding, Purging, and Sweating; but none of these will ever answer the End.

Though Bleeding seems to bid fair for evacuating the Humours, as well those which are upon the point of falling on the Extremities, as those already in the Joints, yet it manifestly interferes with that Indication, which the antecedent Cause, that is, Indigestion, arising from a Depravity or Defect of Spirits, demands, which Bleeding further weakens and diminishes. For this Reason, Bleeding is not to be practised either by way of preventing an approaching, or easing a present Fit, especially in those advanced in Years; for though the Blood which is taken away, generally resembles Pleuritic or Rheumatic Blood; yet Bleeding is found to do as much Mischief in this Disease, as it does Good in those. And Bleeding in the Intervals, though long after the Paroxysm, is subject to occasion a fresh Fit by the Agitation of the Blood and Juices, which may continue longer, and be attended with more violent Symptoms than the former; the Vigour of the Blood being thus impaired, by means whereof the morbid Matter should be powerfully and constantly expelled. This Inconvenience always happens from Bleeding in the Beginning of the Fit; and if it be used immediately after the Fit, there is great Danger, lest Nature, on account of the present Debility of the Blood, which has lost much of its Vigour by the preceding Fit, should be so far debilitated as to sink into a Dropsy. However, if the Patient be young, and overheated by hard Drinking, a Vein may be opened in the Beginning of the Fit; but if Bleeding be always used in the succeeding Paroxysms, it will soon render the

the *Gout* inveterate, even in Youth, and cause it to spread more universally in a few Years, than it otherwise would have done in many.

With respect to Vomiting and Purging, it must be observed, that as it is a fixed Law of Nature, and interwoven with the Essence of this Disease, that the morbid Matter thereof ought always to be translated to the Joints, Emetics or Cathartics will only invite the *gouty* Matter back into the Blood, which was thrown off by Nature upon the Extremities; and hence what ought to be thrown upon the Joints, fixes, perhaps, on some of the Viscera, and so hazards the Life of the Patient, who was before in no Danger. And this hath often been observed to prove fatal to those who have ordinarily had recourse to Purgatives by way of Prevention, or, which is worse, to ease the Pain in the Fit; for when Nature is prevented from pursuing her usual, safest, and best Method of translating the morbid Matter to the Joints, and the Humours are forced inwards upon the Bowels, then, instead of Pain in the Joints, which is either slight, or none at all, the Patient is afflicted, and almost destroyed, by Sickness at the Stomach, Gripings, Faintings, and a numerous Train of irregular Symptoms.

For my own part, I am abundantly convinced from much Experience, that either lenient, or more powerful Cathartics, of those Sorts which are usually thought to purge the Joints, prove very prejudicial, whether they be used in the Fit to lessen the morbid Matter; or in its Declension, to carry off the Remainder; or in a perfect Intermission, or healthy State, to prevent an approaching Fit. For I have learned at my own Peril, as well as that of others, that Purgatives exhibited at any of these Seasons have, instead of doing Service, hastened the Mischief they were intended to prevent. Purging, therefore, during the Fit, by disturbing Nature when she is employed in separating the *gouty* Matter, and throwing it off upon the Joints, sometimes causes a considerable Disorder in the Spirits, which renders the Fit more violent, and likewise evidently endangers the Life of the Patient. Secondly, Purgatives administered at the End of a Fit, instead of expelling the Remains of the Disease, excite another Fit, as severe as the former; and thus the Patient, deceived by fruitless Hopes, brings those Evils upon himself, which he had escaped, if the Humours had not been exasperated afresh. And this Inconvenience, I myself often experienced, after having had recourse to Medicine to expel what I esteemed the Remains of the Distemper. Thirdly, as to purging at certain times in the Intervals, by way of Prevention, though it must be owned, that there is not so much Danger of occasioning a fresh Fit, as in the Instance just mentioned, the Patient in that Case not being perfectly recovered, yet, even at this Time, it is productive of a Fit, for the Reasons above specified; and though, perhaps, it may not come on immediately, the Disease nevertheless will not go off entirely, by taking any Purge constantly at proper Intervals; for I have known some *gouty* Persons, who, to recover their Health, not only purged Spring and Autumn, but monthly, and even weekly, and yet not one of them escaped the *Gout*, which afflicted them more severely afterwards, and was accompanied with more violent Symptoms, than if they had totally abstained from Medicine. For tho' such Purging might carry off a Part of the *gouty* Matter, yet as it does not at all contribute to strengthen Concoction, but rather weakens it, and injures Nature afresh, it only strikes at one Cause, and is by no means adequate to the Cure of the Distemper.

To these Observations it must be added, that the same Defect of Spirits which impairs the Concoctions in *gouty* Subjects, renders their nervous System weak and languid, so that the Spirits in general are soon disturbed by any Cause which violently agitates either the Body or Mind, and consequently are very volatile, and easy to be dissipated, as they frequently are in hysteric and hypochondriac Patients. And from this Tendency of the Spirits to irregular Motions it happens, that the *Gout* usually follows the slightest Evacuation. For the Tone of the Parts being destroyed, which the Firmness of the Spirits, so long as they continue strong, preserves unrelaxed and healthy, the peccant Matter moves without Interruption; and hence a Fit immediately breaks out.

But notwithstanding this Method is so very pernicious, yet there have been Empirics, who have acquired a great Character by artfully concealing the Cathartic they used in this Case. For it must be observed, that whilst the Medicine operates, the Patient feels no Pain at all, or but a slight one; and, if a Course of Purgatives can be continued for some Days, without

bringing on a recent Fit, the present Paroxysm will soon go off. But the Patient will suffer greatly afterwards, on account of the Tumult occasioned by this Agitation of the Humours.

Finally, the carrying off the peccant Matter by Sweat is manifestly prejudicial, though in a less Degree, than the above-mentioned Evacuations; for though it does not repel the morbid Matter to the Viscera, but on the contrary propels it into the Habit, it is notwithstanding detrimental for these Reasons:

First, Because, during the Interval of the Fit, it forces the Humours, which are yet crude, and not fitted for a due Separation, upon the Limbs; and thus occasions a Fit before its Time, and in Opposition to Nature.

Secondly, The promoting Sweat in the Fit throws and fixes the *gouty* Matter too powerfully upon the Part affected, at the same time occasioning intolerable Pain; and, if there be a greater Quantity thereof than can be received by the Part affected, it immediately throws it upon some other Parts, and thus raises a violent Ebullition of the Blood and other Juices; and, if the Body abounds considerably with a ferous Matter fit for the Generation of the *Gout*, an Apoplexy is hence to be apprehended.

Hence therefore, it is a very dangerous Practice, both in this and all other Diseases, in which it is customary to extort Sweats by Art, with a View of eliminating the morbid Matter, without waiting till they naturally arise, to force it out too violently, and beyond that Degree of Concoction, which the Humours to be carried off have spontaneously acquired*. The excellent Aphorism of *Hippocrates*, intimating, that *concocted and not crude Humours are to be evacuated*, holds good with respect to Sweating, as well as Purging, as appears manifestly from that Sweat which ordinarily terminates the Paroxysms of Intermitents; which, provided it be moderate, and proportioned to the Quantity of febrile Matter, concocted by the preceding Fit, relieves the Patient considerably; but in case it be promoted beyond the Limits prescribed by Nature, by keeping the Patient constantly in Bed, a continued Fever thence arises, and, instead of extinguishing the former Heat, an additional one is excited. So in the *Gout*, the gentle breathing Sweat, that generally comes on spontaneously in the Morning after each of the small Fits, of which, as I have before observed, the Cardinal Fit is compounded, eases the Pain and Restlessness, which tormented the Patient so much during the Night; but on the contrary, if this gentle Moisture, which is naturally of short Duration, be violently forced, and continued longer than the Quantity of the morbid Matter concocted by the preceding Fit requires, the Disease is thereby exasperated. In this therefore, and all other Diseases that I have met with, excepting only the Plague, it is Nature's Province, more than the Physician's, to excite Sweat, as we cannot possibly learn how much Matter is already prepared for such a Separation, and consequently what Method is to be taken in order to promote Sweat.

Since then it evidently appears from what has been delivered, that it is both a fruitless and a pernicious Attempt to endeavour to cure the *Gout* by evacuating Medicines, we are next to inquire what other Purpose the curative Indications are to be directed to answer. And, from a thorough Attention to the Symptoms above enumerated, we learn, that Regard must be had to two Causes principally in the Cure of this Disease.

First, The antecedent or primary Cause, or the Indigestion of the Humours, proceeding from a Defect of the natural Heat and Spirits. Secondly, The immediate Cause, or the Heat and Effervescence of these Humours after the Putrefaction and Acrimony they have acquired by continuing too long in the Body, which is occasioned by the Indigestion above-mentioned. Now these Causes differ so much from one another, that the Medicines which do Service in the one, prove pernicious in the other; and hence it is, that this Disease is so difficult of Cure. For at the same time that we endeavour to cure the Indigestion by warm Medicines, we run the Risk, on the other hand, of increasing the Heat of the Humours; and on the contrary, whilst we strive to mitigate the Heat and Acrimony of the Humour, by a cooling Regimen or Medicines, we bring on Indigestion, the natural Heat being already impaired. But here, by the immediate Cause, I do not only mean that which is actually deposited in the Joints, and forms the present Fit, but that also which still lies concealed in the Blood, and is not yet prepared for Separation. For all the morbid Matter is seldom so entirely expelled by the Fit, how lasting and severe soever it be, as to leave no Remains of it in the Body, after the Fit is

* If *Sydenham* had never written more than this Paragraph, he had merited thereby immortal Honours. For nothing more pernicious can be contrived than to force Sweats by heating Medicines. When the vital Powers have rendered the morbid Matter of any acute Distemper fit for Expulsion, Nature will find a Method of discharging it out of the Habit; and Sweats, if they are necessary, will spontaneously arise, provided all Obstacles are removed. It must be confessed, that Art may assist the vital Powers in attenuating the Mass of Humours, and rendering them fit for a subsequent Extermination. This, however, cannot be done by hot Sudorifics. Warm Remedies, it must be confessed, considered as Cordials, may possibly be of Advantage in the latter End of some acute Cases, as they may rouse the vital Powers, and excite them to Action, when too languid; but the great Abuse of these, which has prevailed to a surprising Degree, renders this Note the more necessary, which does not so much relate to the *Gout*, as to febrile Disorders.

gone off; so that, of course, Regard is to be had to this Cause both in the Fit, and during the Intervals. But as the Expulsion of the immediate Cause is entirely the Business of Nature, and to be perform'd according to her own Method, since nothing in the mean time can be done to cool the hot and acrimonious Humours, without injuring the digestive Powers, unless it be by avoiding a hot Regimen, and Medicines which inflame the Humours; so, doubtless, the chief curative Intention is, after the indigested Humours are removed, to strengthen the digestive Powers, which I shall now treat of; but in such manner, however, that I may, in the Course of this Dissertation, as Occasion offers, also mention those Remedies which tend to mitigate the Heat of the Humours, and correct their Acrimony.

Whatever Remedies, therefore, assist Nature to perform her Functions duly, either by strengthening the Stomach, so that the Aliment may be well digested; or the Blood, that it may sufficiently assimilate the Chyle received into the Mass; or the Solids, so as to enable them the better to change the Juices, design'd for their Nutrition and Growth, into their proper Substance; and lastly, whatever preserves the Secretory Vessels, and the Emunctories, in such a State, that the excrementitious Parts of the whole System may be carried off in due Time and Order; these, and all Medicines of the same Kind, contribute towards answering this Intention, and are properly intitled Digestives, whether they be of the medicinal or dietetic Kind, Exercise, or any other of those Things which are call'd the fix Non-naturals.

Such Medicines, in general, are those which are moderately heating, bitter, or of a mild pungent Taste, inasmuch as they agree well with the Stomach, purify the Blood, and strengthen the other Parts. For Instance, the Roots of *Angelica* and *Elecampane*, the Leaves of *Wormwood*, the *Lesser Centory*, *Germander*, *Ground-pine*, and the like: To which may be added, such as are commonly call'd *Antiscorbutics*, as the Roots of *Horse-radish*, the Leaves of *Garden Scurvy-grass*, *Water-cresses*, and the like. But these acrid and pungent Herbs, how agreeable and serviceable soever they may be to the Stomach, yet as they agitate the morbid Matter, which has long been generated, and increase the Heat, are to be used more sparingly than those, which by their mild Heat and Bitterness both strengthen the Stomach, and mend the Blood.

And, in my Opinion, a judicious Mixture of some Kinds of them answers the End of digesting the Humours better than any single Simple of this Class. For tho', whenever we have Occasion for a specific Virtue of any Medicine, it be a true Axiom, that the more simple it is, the better it is for the Purpose; yet, when a Cure is intended to be made by answering a particular Indication, every Ingredient contributes something towards curing the Disease; and in this Case, the more Simples the Medicine contains, the more powerfully it will operate. For this Reason, various Forms of Medicines may be elegantly compounded of the Ingredients above-enumerated, and the rest of the like Kind. I give the Preference to an Electuary made after the manner of *Venice Treacle*; because the Fermentation of the Simples together improves their Virtues, and produces a third Substance; which possesses greater Virtues in the Mixture, than any single Ingredient in the same Quantity. But I freely leave the Choice of such Ingredients, and the Forms in which they are to be given, to the judicious Physician; for I never thought myself obliged to write Prescriptions, but rather to point at the true curative Indications. The following is, however, the Form I myself generally make use of:

Take of the Roots of *Angelica*, Sweet-flag, Master-wort, Elecampane, the Leaves of *Wormwood*, the *Lesser Centory*, White Horehound, *Germander*, *Ground-pine*, *Scordium*, common Calamint, *Feverfew*, Wild Saxifrage, *St. John's-wort*, *Golden-rod*, *Thyme*, *Mint*, *Sage*, *Holy Thistle*, *Penyroyal*, *Southernwood*, the Flowers of *Chamomile*, *Tansy*, *Lily of the Valley*, *English Saffron*, the Seeds of *Treacle-mustard*, *Garden Scurvy-grass*, *Caraway* and *Juniper-berries*, of each a sufficient Quantity: Let the Herbs, Flowers, and Roots, be gather'd when they are in their utmost Perfection; dry them in Paper Bags till they are reducible into fine Powder. To six Ounces of each, well mix'd together, add enough of clarify'd Honey and Canary to make the Whole into an Electuary, of which let the Patient take two Drams, Morning and Night.

Or, for want of this, let the following be used:

Take of the Conserve of *Garden Scurvy-grass*, an Ounce and an half; *Roman Wormwood*, and *Orange-peel*, of each an Ounce; candied *Angelica* and *Nutmeg*, of each half an Ounce; *Venice Treacle*, three Drams; compound Powder of *Arum*, two Drams; and, with a sufficient Quantity of the Syrup of *Oranges*, mix them up into an Electuary: Let two Drams of it be taken twice a Day,

Vol. I.

with five or six Spoonfuls of the following distill'd Water after every Dose:

Take of the Roots of *Horse-radish*, sliced, three Ounces; *Garden Scurvy-grass*, twelve Handfuls; *Water-cresses*, *Brook-lime*, *Sage*, and *Mint*, of each four Handfuls; the Peel of two *Oranges*; two *Nutmegs* bruised; *Brunswick Beer* or *Mum*; twelve Pints: Draw off only six Pints by the Alembic.

Of all the Medicines commonly known, *Venice Treacle* is the best for strengthening the digestive Organs; but as it contains many Ingredients that over-heat, and withal a large Quantity of *Opium*, an Electuary, like that above-describ'd, may be more commodiously compos'd of the principal warming and strengthening Plants. But Care must be taken to make Choice of such Simples as are most agreeable to the Patient's Palate, because it must be continued a long time; that is, for the greatest Part of his Life. Of all Simples the *Peruvian Bark* is the best; for a few Grains of it, taken Morning and Evening, strengthen and enliven the Blood.

And, in reality, these and such-like Medicines, which strengthen the Blood, and quicken the Circulation, (provided their Heat be not owing to vinous Spirits) do most Service in this and most other Chronic Diseases; inasmuch as every Disease of this kind is, in my Opinion, to be referr'd to the same general Cause, that is, the Indigestion of the Humours.

It is certain, that warm Herbs do great Service, where there is no manifest Contra-indication, not only in the *Gout*, but in most Chronical Diseases, as they procure a Warmth like that of Summer, even in the Midst of Winter; tho', if we accustom ourselves to use them in Summer, they will more effectually prevent such Diseases as are ordinarily occasion'd by the contrary Season: And, in reality, if we defer or neglect taking them till the Approach of Winter, at which time a considerable Quantity of Humours is amass'd, it is to be apprehended it may then be too late to have recourse to this Refuge.

But tho' (as I have already shewn) the *Gout* is of so peculiar a Nature, as to be render'd worse by Cathartics; yet, in most other Chronical Diseases, Bleeding and Purging are to be repeated as there is Occasion, previous to the Use of the strengthening and stomachic Remedies here recommended; but when the Patient has begun to take these, they must be continued without any intermediate Evacuations; for it is always to be remember'd, that whenever the Cure of any Disease is attempted by means of strengthening Remedies, all kinds of Evacuations prove highly injurious. Lastly, I do not assert, that the stomachic Medicines, just enumerated, are the most excellent of the Kind; but I maintain, that whoever can discover the most effectual Remedy to answer this Intention, is able to do much more Service in curing Chronical Diseases, than he himself may imagine.

But amongst the Remarks I proceed to communicate, relating to the Cure of the *Gout*, it is primarily and principally to be attended to, that all stomachic or digestive Remedies, whether they be medicinal, dietetic, or relate to Exercise, are not to be enter'd upon superficially, but are to be persisted in daily with great Exactness: For since the Cause in this, and most other Chronical Distempers, is become habitual, and in a manner chang'd into a second Nature, it cannot reasonably be imagined, that the Cure can be accomplish'd by means of some slight and momentary Change made in the Blood and Juices, by any kind of Medicine or Regimen, but the whole Constitution is to be alter'd, and the Body is to be in a manner fram'd anew. For it is otherwise here than in some acute Diseases, where a Person in full Strength, and perfect Health, is suddenly seiz'd with a Fever; whereas in the *Gout*, a Person, by indulging himself in Luxury, hard Drinking, neglecting his usual Exercise for several Years together, and debilitating his Constitution by Idleness, or an immoderate Application to Study, and other Errors of Life, injures, as it were designedly, the various Ferments of the Body, and oppresses the Animal Spirits, which are the principal Instruments of Digestion; whence the vitiated Juices, amass'd in the Habit, break out as soon as they are exalted to the utmost State, and produce great Evils, relaxing the fleshy Parts, and weakening the Joints, so that they readily receive the Humours thrown upon them. And in this manner a different Constitution is form'd by Degrees, the original one being quite destroy'd: And those Fits which engross the Attention of indiscreet and injudicious Physicians, are no more, in Effect, than the Succession and Order of Symptoms, resulting from that Method which Nature ordinarily employs to expel the morbid Matter. Hence, therefore, 'tis a fruitless Labour to attempt the Cure of this Disease, by using any Medicine or Regimen occasionally; for since this Habit is chiefly founded on, and consists in, a Weakness of all the Digestions, and a Relaxation of all the Parts, both these Disorders must be remedied; and the Strength of the digestive Powers, as well as the Tone of the Parts, must be restor'd and recover'd, by Degrees,

greets, to the former healthy State. But tho' it may seem impossible to accomplish this End effectually, not only because any particular Habit cannot easily be changed into a contrary one, but also because old Age, which ordinarily accompanies this Disease, greatly obstructs this Design; yet the Cure is to be attempted, as far as the Strength and Age of the Patient will permit, who will have the *Gout* more or less severely, in proportion to his Advancement in Years.

Further, it is to be observed, that digestive Remedies, either of the medicinal or dietetic Kind, are to be used principally in the Intervals of the *Gout*, and at as great a Distance as may be from the subsequent Fit: For Age obstructs the Cure so much, that the strengthening the digestive Powers, the recovering the debilitated Ferments of the Body, and restoring the Blood and Viscera to their due healthy State, cannot be speedily accomplished, and requires a continued Use of Medicine.

But tho' these and the like Remedies do Service, yet they are not able, alone, to answer this Intention of strengthening, but require the joint Assistance of such Things as do not properly belong to Medicine; it being an Error to imagine, that this, or any other Chronical Disease, can be cured, by Medicine alone. (1.) Therefore, Moderation in Eating and Drinking is to be observed; so as, on the one hand, to avoid taking in more than the Stomach can conveniently digest, and of course, increasing the Disease thereby; and, on the other hand, defrauding the Parts, by immoderate Abstinence; of the Degree of Nourishment requisite to preserve the Strength, which will weaken them still more; either of these Extremes being equally prejudicial, as I have often experienced, both in myself and others. (2.) As to the Quality of the Food, tho' whatever is easy of Digestion, singly consider'd, deserves the Preference, yet Regard must be had to the Palate and Appetite; because it is frequently found, that what the Stomach earnestly covets, tho' of difficult Digestion, does nevertheless digest better than what is esteem'd of easier Digestion, in case the Stomach nauseates it; but, however, Aliments, difficult of Digestion, should be used sparingly. (3.) I am of Opinion, the Patient ought to eat only of one Dish at a Meal, because feeding on different Sorts of Flesh injures the Stomach more than eating an equal Quantity of any one Kind; but, excepting Flesh, he may eat other Things at Pleasure, provided they be not acrid, nor season'd with Salt or Aromatics; because, tho' such Food does not hurt Digestion, it nevertheless does Mischief by agitating the morbid Matter.

As to the Times of Eating, it is prudent to eat at Dinner only; for, as the Night should seem peculiarly design'd to digest the Humours, it would be wrong to waste that Time in digesting the Aliment. For this Reason, *gouty* Persons should forbear Suppers; but they may drink a large Draught of small Beer, as being generally subject to the Stone in the Kidneys; the Increase whereof is considerably prevented by drinking such a Liquor at this time, as it cools and cleanses the Kidneys.

A Milk-diet, or the drinking Milk, either as it comes from the Cow, or boil'd, without adding any thing to it, except perhaps a Piece of Bread once a Day, hath been used these twenty Years past, and hath done more Service in abundance of *gouty* Subjects, whilst they persisted in it exactly, than all other kinds of Remedies: But upon quitting it, and returning to the ordinary way of Living of healthy Persons, tho' they used the mildest and slenderest Diet, the *Gout* return'd with much more Violence than ever; for, as this Regimen weakens the Constitution, the Patient cannot so well struggle with the Distemper, whence, of course, it proves more dangerous and lasting. Whoever, therefore, intends to begin and go on with this Regimen, ought, before-hand, to consider maturely, whether he be able to persevere in it for Life, which perhaps he will find too much for him, tho' he should have great Resolution. For I knew a Nobleman, who, after living a whole Year on Milk only with much Pleasure, during which time he had one or more Motions every Day, was constrain'd to leave it off, because he grew costive on a sudden; the Temper of his Body was alter'd, and his Stomach at last nauseated Milk, tho' he had still a Liking to it.

Again, it is observable, that some Hypochondriac Persons of a gross Habit of Body, or those who have been long used to drink spirituous Liquors freely, cannot bear Milk. And further, the short and fleeting Benefit which those who can bear Milk receive from this Regimen, is not only derivable from its exceeding Simplicity, whence I doubt not but Water-gruel may have the same Effect, provided the Stomach will bear it; but from its rendering the Blood softer and smoother, by blunting the sharp Particles contain'd in the Mafs. And moreover, which I esteem the principal Thing, Milk, being an Alimentary Motion of the Humours which occasions the *Gout*; and for this Reason, the few with whom it agrees, escape this Disease, so long as they live upon Milk only, but no longer: For as it runs directly counter to the original Cause of the *Gout*, which is the Debility of the Digestions and Ferments, it does

much more Mischief in this respect, than Benefit in the other. And for want of sufficient Attention to this Particular, some inconsiderate People have fallen into gross, and manifestly fatal Errors; having, by attempting to attack the containing Cause of the Disease, that is, the Heat and Acrimony of the Humours, destroy'd the Digestions, and all the natural Functions.

As to Liquors, those are best, in my Opinion, which are weaker than Wine, and not so weak as Water, such as our *London* small Beer, hopp'd or unhopp'd, Extremes on either hand being pernicious. For, first, as to Wine, tho' the common Proverb intimates, that whether a Person does, or does not, drink Wine, he will have the *Gout*; yet it is certain, and confirm'd by the Experience of abundance of *gouty* Patients, that Wine is, in Fact, detrimental: For tho' it may be supposed to do Service by strengthening the digestive Powers, the Weakness whereof I have long look'd upon as the antecedent or primary Cause of the *Gout*; yet, with respect to the containing Cause thereof, it must be deem'd wholly pernicious, because it inflames and agitates the Humours which feed the Disease. Neither do we grant, that Wine, used by way of common Drink, helps Digestion; but rather assert, that it destroys it, unless in such as have been long inur'd to it. For tho' Wine may, in passing thro' the Vessels, communicate some Heat to the Parts, yet it certainly depraves the Ferments of the Body, and wastes the natural Spirits: And hence I conceive it is, that great Drinkers generally die of the *Gout*, Palsy, Dropsy, and other cold Diseases. Furthermore, the continued and immoderate Use of Wine relaxes and enervates the Body, rendering it like the Bodies of Women; whereas moderately heating Liquors strengthen the Tone of the Parts; whence such as have always drank small Liquors are rarely afflicted with the *Gout*. It must farther be remark'd, that those are chiefly subject to this Disease, who, tho' they have naturally a weak Digestion, do notwithstanding receive too much Nourishment from a certain Richness of the Blood, and have their Bulk increas'd by a Kind of indigested Matter, instead of a solid, wholesome Substance: And the Use of Wine adds to this Richness of the Blood, and so not only amasses a new Collection of Matter, but also actually occasions the Disease, by stirring up the Cause of it, which had long lain conceal'd and inactive. Again, as the Blood of *gouty* Subjects nearly resembles that which is taken away in a Pleurisy, and other inflammatory Diseases, it is absurd to inflame it more with spirituous Liquors. And it is as dangerous, on the contrary, to have recourse to over-cooling Liquors, which, by utterly destroying both the Digestions, and natural Heat, do more Mischief; not occasioning Pain, as Wine doth, but Death itself; as Experience evinces in those Persons, who, having accustom'd themselves to drink Wine freely from their Youth upwards to old Age, and quitted it on a sudden for small Liquors, have soon destroy'd themselves thereby.

Gouty Persons should therefore observe it as a Rule in this Particular, to drink such Liquors as will not inebriate, if drank in a larger Quantity, or injure the Stomach by their Chilness. Of this Kind, as I before hinted, is our small Beer; and in other Countries a similar Liquor may be made, by diluting Wine well with Water.

As to Water alone, I esteem it crude and pernicious, and have found it so to my Cost; but young Persons may drink it with Safety; and it is, at this Day, the common Drink of the greatest Part of Mankind, who are more happy in their Poverty, than we are with all our Luxury and Abundance. This is confirm'd by the great Multitude of Diseases, with which we are afflicted upon this Account, as the Stone, *Gout*, Apoplexy, and Palsy; besides the Injury done to the Mind in being forcibly acted upon, contrary to its natural Rectitude, by the Disturbance which the preternatural Spirits of such Liquors, together with the Animal Spirits, which are subservient to Thinking, occasion, by volatilizing it too much, and suggesting vain and idle Notions, instead of solid and weighty Reasonings; and thus, at length, rendering us facetious and witty, instead of wise; between which the Difference is almost as great, as between a Substance and a Shadow. But enough of this.

But tho' a Person who has the *Gout* mildly, and only at Intervals, need only use small Beer, or Wine diluted with Water, this Degree of the Disease not requiring a stricter Regimen; yet, when the whole Substance of the Body is in a manner degenerated into the *Gout*, it cannot be conquer'd without a total Abstinence from all Kinds of fermented Liquors, how small and soft soever they be; inasmuch as all Liquors of this Kind contain a pungent Spirit, with some Degree of Acrimony; and, what is worse, being possess'd of a Ferment, they dispose the Humours to a perpetual Fermentation, in the same manner as Yeast, added to Malt Liquors, communicates its fermenting Quality to the whole Liquor. For this Reason a Diet-drink is to be order'd for common Drink, to be made of those Ingredients which are commonly known and used for this Purpose; but it must not be too strong, because in that

Cafe it will inflame the Humours as much as Wine; neither, on the contrary, must it be so small as to injure the natural Functions by over-cooling. And this kind of Drink, provided it be made of such Ingredients as are most agreeable to the Patient, tho' it may occasion some Loathing for the first Week or Fortnight, nevertheless proves as agreeable afterwards as any other Liquors he has been used to drink. It will also excite the Appetite, and render it more natural than it used to be with fermented Liquors; and will be attended with this further Convenience, that whoever uses it for his own common Drink, may indulge more freely in other kinds of Diet, than when he drank Wine or Beer: For the Errors in point of Diet, which it is hardly possible to avoid entirely, will be, in some measure, corrected and amended thereby. But the principal Benefit, derivable from it, is its preserving from the Stone, which is the general Attendant of the *Gout*; as sharp and attenuating Liquors both contribute to breed the Stone, and occasion a Fit thereof. I prefer the following Decoction for its agreeable Colour and Taste:

Take of Sarsaparilla, six Ounces; Sassafras-wood, China-root, and the Shavings of Hartshorn, each two Ounces; Liquorice-root, an Ounce: Boil them together in two Gallons of Spring-water for half an Hour; afterwards infuse them upon hot Ashes, close cover'd, for twelve Hours; then boil them till a third Part of the Liquor is exhaled; and as soon as it is taken off the Fire, infuse therein half an Ounce of Aniseeds for two Hours. Lastly, strain it off, and let it rest, till it becomes clear, and put it up into Bottles for Use.

It is most proper to begin with this Decoction, immediately after the Fit of the *Gout* is gone off; and it must be continued, both in the Fit, and in the Intervals, during the Remainder of Life. For it is not sufficient at a time when the Disease actually rages to study for new Medicines, as Nature, whilst the Humours are in such Commotion and Disturbance, cannot well bear the Exchange of fermented Liquors of an active and spirituous Quality, for such as are small and without Spirit. At the same time the above-mentioned Electuary must be used, taking it in like manner, both in the Fit, and in the Intervals; for the Warmth of this will in some measure correct the Smallness of the Diet-drink, as it will communicate a due Degree of Heat to the Blood and Viscera, without that Agitation which is generally occasioned by the Heat of fermented Liquors.

If it be objected, that a total Abstinence from Wine, and other fermented Liquors, would render Life in a manner insupportable, I answer, it must be considered, whether it be not much worse to be tortured daily by the Pain accompanying an inveterate *Gout*, (for, when it is gentle, there is no Need of so strict a Regimen) than to be confined to this Decoction, which if the Patient continues, he may indulge himself in most other Eatables; not to repeat, that this Drink, like all other things, grows pleasant by Custom. Doubtless, whoever hath had this Disease, supposing him not void of Reason, will not hesitate at all, to which he should give the Preference.

But notwithstanding, if the Patient, either from a long-continued and immoderate Use of spirituous Liquors, from Age, or, lastly, from great Weakness, cannot digest his Food without Wine, or some other fermented Liquor, 'tis certainly dangerous for him to leave off Wine on a sudden; an Error that has in Reality destroyed Abundance of People. Such a Person, therefore, in my Opinion, should either not use the dietetic Apozem above prescribed; or, if he be resolv'd to take it, should accustom himself to it by Degrees, (drinking a Glass of Wine for some time at Meals) and rather by way of Medicine than Diet, till it becomes more familiar to him. But *Spanish Wine* is to be prefer'd here to *Rhenish*, or *French Wine*, these last being subject to exasperate the Humours, and increase the morbid Matter, notwithstanding they are very grateful to the Stomach. To which we may add, that as they are almost as crude and indigested as our Cyder, they are consequently not so warm and cardiac, as the Case demands. And these Particulars may suffice concerning the Diet of *gouty* People. There is another Caution to be inculcated, which, though it may seem trifling, is of great Moment, both in digesting the *gouty* Matter during the Fit, and preventing the Generation thereof in the Intervals; and that is going to Bed early, especially in Winter; for, next to Bleeding and Purgings, nothing impairs the Strength more than sitting up late at Nights; which every Valetudinarian can affirm from his own Experience, provided he has only carefully observed how much more vigorous and chearful he rises in the Morning when he goes to Bed early, and how languid and faint he has found himself after sitting up late. And tho' there should seem to be no Difference betwixt going to Bed earlier or later, provided a Person lies in Bed for the same time, as for Instance, whether he goes to Bed at Nine and rises at Five, or at Eleven and rises at Seven, it is not an indifferent Matter; and I conceive, for this Reason principally, that in the Day the

Spirits are dissipated, either by Exercises of the Body or Mind, which are so weak in Valetudinarians, that they require the Assistance of Sleep earlier in the Evening; and, as the Approach of Night occasions a kind of Relaxation of the Animal Economy, which was preserved in the Day by the Heat of the Sun, the Heat of the Bed becomes necessary to supply the Place of the Sun, especially during the Winter Season. But the Spirits being refreshed and invigorated in the Morning by the preceding Night's Sleep, together with the Warmth of the Bed, and the ensuing Day likewise strengthening the Tone of the Parts still more, the rising early at this time, though it may take an Hour or two from the Morning Sleep, hurts the Constitution less than sitting up an Hour or two later in the Evening. This being the Case, I would advise such as are subject to the *Gout* to go early to Bed, especially in Winter, and to rise betimes in the Morning; though their having had less Sleep than usual may incline them to lie longer, in order to make it up. For the Sleep which is got in the Morning will rob them of as much the ensuing Night; and thus at last by doing Violence to Nature, and despising its wise Lessons, the Night may be preposterously turned into Day, and the Day into Night.

The Patient must also use his utmost Endeavour to keep his Mind easy, as all unbounded Appetites, and inordinate Passions, eminently tend to dissolve the Texture of the Spirits, which are the Instruments of Digestion, and so of course to increase the *Gout*. He should therefore wisely reflect on his Mortality, and not vainly imagine he is to escape the Evils that are necessarily annexed to this State. For, whether any Affliction of Mind befalls him through his own Fault, or that of others, certain it is, that he will never be able to prescribe Laws to the World, which has not always obey'd any single Person hitherto, how powerful and wise soever he has been; nor will every thing always answer any one's Expectation so exactly, as he may have promised himself; and perhaps, whilst he is intent upon worldly Affairs, unexpected Death renders him an Example of human Frailty, whilst he foolishly deprives himself of the transitory Enjoyments of Life. Too much Application to Study and Business is likewise equally pernicious; for as this Disease is more frequently accompanied with Melancholy than any other, such as are subject to it ordinarily fatigue and oppress the Spirits to that Degree, by long and intense Meditation, even without the artificial Help of Books, that the Body cannot long preserve itself in a healthy State; and hence I conceive it is, that few Fools have had the *Gout*.

But nothing so effectually prevents the Indigestion of the Humours, (which I esteem the principal Cause of the *Gout*) and consequently strengthens the Fluids and Solids, as Exercise. It must, however, be observed, as I have already mentioned, that as there is more Necessity for making a thorough Change in the Constitution in this than in any other Chronical Disease, so Exercise, unless it be used daily, will do no Service; for if it be intermitted at times, it will avail little towards changing the Constitution, now reduced to a languishing and effeminate Condition by Idleness and Indulgence, and may perhaps do Mischief by causing a Fit, after leaving it off for a considerable Space of Time. But Exercise should be moderate, because the contrary in aged Persons, who are principally subject to the *Gout*, wastes the Spirits too much, and consequently hurts the digestive Faculties. And though this may not be relished by one, who besides old Age, Inability to Motion, and Slothfulness, which are natural in this Disease, is likewise tormented with Pain, yet, if Exercise be omitted, all the Remedies which have been hitherto discovered will not avail. And as the Intervals between the Fits cannot be long without constant Exercise, so the Patient will likewise without it be more subject to the Stone, which is a more dangerous and painful Disease than the *Gout*.

To these add a Particular of some Importance, which is, that the chalky Concretions are considerably increased in the Joints, and especially in the Fingers by long Inactivity; so that at last these Parts are entirely deprived of Motion. For, however positively some may assert, that the Matter of these Concretions is only the Tartar of the Blood translated to the Joints, it will nevertheless readily appear, upon considering the Matter with a little more Attention, that when a large Quantity of indigested *gouty* Matter falls upon some of the Joints, and occasions a lasting Swelling of the neighbouring Parts, it happens at last partly from their assimilating Property being destroyed, and partly from the Obstruction caused therein by this sluggish Humour, that this Matter is generated; which is changed into this kind of Substance by the Heat and Pain of the Joint, and increased every Day in Bulk, converting the Skin and Flesh of the Joint into its own Nature, and may be got out with a Needle, and resembles Chalk, Crab's-eyes, or some similar Substance. But I have experienced in my own Case, that not only the Generation of these Concretions may be prevented by daily and long-continued Exercise, which duly distributes the *gouty* Humours throughout the whole Body, that otherwise readily attack a particular Part, but it also dissolves old and indurated

durated Concretions, provided they be not come to such a Degree of Hardness, as to change the external Skin into their Substance.

As to the Kind of Exercise, Riding on Horseback is certainly the best, provided it be not contra-indicated by Age, or the Stone; and indeed I have often thought, if a Person was possessed of as effectual a Remedy as Exercise is in this and most Chronical Diseases, and had the Art also of concealing it, he might easily raise a considerable Fortune. But if Riding on Horseback cannot be used, frequent Riding in a Coach nearly answers the same End; and in this respect at least, the Generality of *gouty* Persons have no Cause for Complaint, because their Riches, which excited them to indulge those Excesses that occasioned the Disease, enable them to keep a Coach, in which they may take the Air, when they cannot ride on Horseback. It must be remark'd however, that a wholesome Air is greatly preferable to one which is unwholesome for this Purpose: Thus the Country is better than the Town, where the Air is full of Vapours that exhale from the Shops of different Mechanics, and render'd still more dense by the Closeness of the Buildings, as it is in *London*, which is esteem'd the largest City in the Universe. But the great Difference there is between using Exercise in the Country, or in Town, a *gouty* Person will soon find upon Trial.

With respect to Venery, if the *gouty* Patient be in Years, as he is unprovided now with a sufficient Share of Spirits to promote the Digestions, and his Joints, and the neighbouring Parts, are consequently too much debilitated and relaxed, without any Assistance from this destructive Quarter; in this Case, I say, it is as imprudent for such an one, in my Opinion, to indulge those Pleasures, as it would be for a Person, after having engaged to go a long Journey, to spend all his Stock of Provisions before setting out. Moreover, besides the Mischief it does himself, for want of restraining the languid Inclinations of declining Age, he loses the great Privilege of enjoying that exquisite Satisfaction, which by the particular Indulgence of Nature is reserved for the Aged only, who, towards the Period of their Lives, are freed from the Violence of those Passions, which, like so many savage Beasts, prey'd upon them perpetually in Youth; the Gratification of them being by no means an Equivalent for the long Train of Evils which either accompany, or follow it.—And let this suffice for the Regimen.

But though a *gouty* Person, by carefully observing these Rules relating to Diet, and the rest of the Non-naturals, may prevent violent Fits, and so strengthen the Blood, and solid Parts, as to free himself from that Multitude of Evils, which render the Disease not only intolerable, but in, the End, fatal; yet, notwithstanding, after some Intervals, he will sometimes be seized with the *Gout*, especially towards the Close of Winter. For though in the Summer-season, whilst the Tone and Strength of the Blood are mended, and preserved in that State by the Heat of the Sun, and Perspiration goes on in a proper manner, the Digestions must necessarily be much better performed than in Winter; yet, as the Blood is weakened, and Perspiration obstructed, upon the Approach of this Season, there must necessarily be a copious indigested Matter amassed, which at last, by its long Continuance in the Habit, will form a Distemper, and manifest itself by proper Symptoms, giving a Fit upon the first Occasion, either by the Humours being put into Motion by the nearer Approach of the Sun, the Use of Wine, violent Exercise, or any other evident Cause.

'Tis clear from what has been delivered, that whoever undertakes the Cure of this Disease, must endeavour to make a thorough Change of his Habit of Body, and restore it to its former Constitution, as far as Age, and other Circumstances, will permit; and this must be attempted only in the Intervals between the Fits. For when the morbid Matter is not only generated, but already thrown upon the Joints; it will be too late to endeavour to change it, or to expel it, any other way; since it must be expelled by that Method only which Nature points out, and the Business is to be left entirely to her Management. This Practice obtains in the Paroxysms of Intermittents; which, for the same Reason, we do not attempt to remove till the Heat be over. For it is equally absurd to be solicitous to take off the Heat, Thirst, Restlessness, and other Symptoms of these Fevers, as to think the *Gout* is to be cured by endeavouring only to abate the Symptoms, whereas the Cure is by this means obstructed and prolonged. For the more the Pain is eased, the more the Concoction of the Humours is prevented; and, in the same Degree, the Lameness is relieved, and the Expulsion of the morbid Matter is check'd. Again, the more the Violence of the Fit is suppressed, the longer it will last, and the shorter likewise the Interval will be between the Fits, and less free from every Degree of the Symptoms accompanying this Disease; which will be acknowledged by any one who has attentively considered what we have delivered above, in our History of this Disease.

But though nothing considerable must be attempted in the Fit, excepting only, that those Symptoms are to be relieved,

which an improper Method of Cure sometimes occasions; yet, as this Disease is unanimously held to arise from a Plenitude of Humours, it may not, perhaps, be amiss for the Patient to forbear Flesh for a few Days in the Beginning of the Fit, and instead of it to use Water-gruel, or some such Aliment; for such a slender Diet will greatly contribute towards lessening the Quantity of the morbid Matter, and give Nature an Opportunity of digesting it sooner. But as Constitutions differ considerably, inasmuch that some Persons cannot bear to abstain from Flesh, without being immediately seized with a Disturbance of the Spirits, Faintings, and other Symptoms of the hysteric Kind; such therefore will receive Hurt by refraining from Flesh any longer than the Stomach is set against it, which, for the most part, is only the first or second Day of those particular Fits; all which, joined together, constitute the whole Fit, as we have intimated above. But whether the Patient eats Flesh sooner or later, he must be equally cautious, both with respect to eating more, during the Fit, than is requisite to support Nature, and to the Quality of the Food. For great Care should be had to guard against every Error, either in the Quantity or Quality of the Diet, both as to Solids and Liquids, even in the Intervals of the Fit, and especially in the Fit itself. And further, no little regard is to be had, in the Intervals, to the rest of the Non-naturals, of which we have discoursed largely above; and though the Pain, and great Inability to Motion, may seem to contra-indicate Exercise, which I have principally recommended in this Distemper, the Labour must nevertheless be undertaken; for though the Patient may think himself utterly unable to bear to be carried into a Coach in the Beginning of the Fit, and much more so to abide the Motion of it; yet, upon Trial, he will soon find himself more easy from such a Motion, than when he is at home in his Chair. Again, if this kind of Exercise be used Morning and Afternoon for some Hours; another Advantage attends it, which is, that it causes him to rest a great Part of the Night, which he could not do when he kept constantly within Doors; for very moderate Exercise fatigues a *gouty* Person so much, that he falls asleep. Besides, this kind of Exercise is, in some Degree, preventive of the Stone, which an idle and sedentary Life generally occasions. But the principal Advantage derivable from the constant Use of Exercise, is the preventing the Loss of Motion in the Limbs, which seizes several People after the first or second long Fit, occasioned by the Contraction of the Tendons of the Hams and Heels; for when the Pain has been so violent, that they have lain still a long time, not caring to stretch out their Legs when it has attacked the Knees, they at last lose the Use of their Legs and Feet, for the Remainder of Life, both during the Intervals, and in the Fits, which nevertheless they do not escape. Again, in aged People, whose Concoctions are considerably vitiated, and who, through the long Continuance of the Disease, have the Substance of their Bodies, in a manner, changed into the *Gout*, it is not to be expected, that the Disease can ever be brought to Digestion without Exercise; for when it exceeds the natural Strength, they frequently perish by Faintings and Sickness, occasioned by the copious morbid indigestible Matter; which cannot be assimilated, and destroys them like Poison.

But notwithstanding what has been said of the Usefulness of Exercise in the Paroxysms of the *Gout*, yet, if the Fit be so violent as to sink the Patient in the Beginning of it, (which happens chiefly in those Subjects in whom the *Gout* is in the Height, and hath continued in that State for many Years) and confine him to his Room, it will be proper for him to keep his Bed a few Days, till the Pain abates, as the Warmth thereof will, in some measure, supply the Want of Exercise; for lying constantly in Bed digests the morbid Matter more effectually in a few Days, than sitting up does in many, especially in the Infancy of the Disease, provided the Patient can forbear Flesh without Faintings, and other bad Symptoms, and be contented only with Water-gruel, small Beer, and the like. But it is well worth observing, that if the *Gout* be inveterate, and disposes the Patient to Faintings, Gripings, a Looseness, and the like Symptoms, he is in great Danger of being destroyed by one of these Fits, unless he uses Exercise in a free and open Air, for abundance of *gouty* Persons have been carried off by these Symptoms, which they have been subject to from being confined within Doors, and especially in Bed, who had lived longer, if they would have undergone the Fatigue of Riding in a Coach a great Part of the Day. For though a Person, who is afflicted only with a Pain of his Limbs, may keep his Room, yet another, who, instead of violent Pain, is troubled with Sickness, and the other Symptoms above enumerated, cannot do the same, without endangering his Life. And, in Effect, it is well for the Patient, that there is no great Necessity for Motion or Exercise, so long as the Pain continues so severe, that he cannot bear it; his Life being secured by the Pain, which is the salutary, though disagreeable Remedy of Nature.

But as to the Symptoms of the *Gout*, we are to relieve those which threaten Life; the most frequent of which are the Weakness and Languor of the Stomach, with Gripings, as if occasioned by Wind; and these happen either to those who have had

had the Gout many Years; or those, who, though they have not had it long, have nevertheless brought it on too hastily by quitting spirituous Liquors, on a sudden, for those which are thin and very cooling, or by applying repelling Plaisters, and other cooling Topics, to the Parts affected, to ease the Pain; whence the morbid Matter, which should have been deposited on the Joints, is translated to the Viscera: I have tried several Remedies in my Fits, of late Years, to relieve these Symptoms; but nothing did me so much Service as a small Draught of Canary, taken occasionally, as the Sickness and Faintness required. Neither red French Wine, Venice Treacle, or any other of the Cardiacs I am hitherto acquainted with, is so efficacious. But we are not to imagine, that Canary, or any other Cordial, can wholly secure the Patient without the Use of Exercise.

But if some violent Symptom comes on suddenly, from the striking in of the gouty Matter, and threatens Life, we are not to trust to the Wine or Exercise above commended; but here, provided only the natural or vital Parts, and not the Head, be affected, we must have immediate recourse to Laudanum, exhibiting twenty Drops of it in a small Draught of Plague-water, and the Patient must compose himself to Rest in Bed.

But if the gouty Matter occasions a Looseness for want of being translated to the Limbs, provided it be not the Crisis of a particular Fit, and yields not to Laudanum and Exercise of all Kinds, (for this is to be tried first in the Cure of a Looseness) but continues, attended with Sickness, Gripings, and the like Symptoms, the only Remedy I know in this Case, is to raise a Sweat by a suitable Method, and proper Medicines; and, if this be done every Morning and Night, for two or three Days together, keeping it up two or three Hours at a time, it generally checks the Looseness, and forces the morbid Matter to the Limbs. To this Method I owe my Recovery from this Disease some Years since, (which I had imprudently occasioned by drinking cold Water for my common Drink) after having used Cardiacs and Astringents of various Kinds to no Purpose.

There is another Symptom, which I have often seen, though it is not so common, which is a Translation of the peccant Matter to the Lungs by a Cough in the Winter-season, occasioned by taking Cold in the Fit, which, by Degrees, invites the Matter to those Parts; the Joints, the mean while, being in great part, or totally, freed from the Pain and Swelling, by the Translation of the morbid Matter to another Part. In this single Case, the curative Indication is not to be levelled at the Gout; but this Symptom is to be treated like a true Peripneumony; that is, by repeated Bleeding, and cooling and in-crasating Medicines and Regimen, as the Blood which is taken away, exactly resembles that of Pleuritic Persons. The Patient likewise should be gently purged in the Intervals of Bleeding, to carry off the Matter that is lodged in the Lungs. But Sweating, how effectual soever it may be in forcing the morbid Matter upon the Limbs, proves detrimental in this Case, by hardening the Matter that is forced upon the Lungs; whence proceed small Abscesses, and in the End, certain Death. See *Musgrave's Sentiments on this, below.*

It is farther to be remarked, that most gouty People, after the Disease has been of long Standing, become subject to the Stone in the Kidneys, and are generally seized with Nephritic Pains, either at the Height, or more frequently at the Decline, of the Cardinal Fit, which are very severe, and weaken the Patient considerably, who was too much debilitated and exhausted by the preceding Distemper. In this Case, omitting all other Remedies, let him immediately drink a Gallon of Poffet-drink, in which two Ounces of Marshmallow-roots have been boiled, and inject the following Clyster:

Take of the Roots of Marshmallows, and white Lilies, of each an Ounce; the Leaves of Mallows, Pellitory of the Wall, Bears-breech, and Chamomile-flowers, of each one Handful; Linseed and Fenugreek-seed, of each half an Ounce; boil them together in a sufficient Quantity of Water to a Pint and an half; dissolve in the strained Liquor brown Sugar, and Syrup of Marshmallows, of each two Ounces; mix the Whole for a Clyster.

As soon as the Poffet-drink is ejected by Vomit, and the Clyster come away, exhibit twenty-five Drops of *Liquid Laudanum*, or fifteen Grains of *Matthew's Pills*.

If outward Applications be inquired after to ease the Pain in the Gout, I know of none, (though I have tried abundance, both in myself and others) besides Coolers and Repellents, which I have already shewn to be unsafe. And I scruple not to affirm, from a long Course of Experience, that most of those who are supposed to perish by the Gout, are rather destroyed by wrong Management, than by the Disease itself. But if any one be desirous of trying the Efficacy of such external Medicines as are esteemed certain Anodynes, to prevent being mistaken, in-

VOL. I.

stead of applying them at the Declension of a particular Fit, when the Pain is just going off spontaneously, let them be used in the Beginning, and he will soon be convinced of their Insignificance, and the Groundlessness of his Expectation, as they sometimes do Mischief, but can never do Service.

For this Reason I have laid aside the Use of Topics for several Years; but I found most Benefit formerly from a Cataplasm, made of white Bread and Saffron boiled in Milk, with the Addition afterwards of a small Quantity of Oil of Roses; which, however, did not at all relieve me in the Beginning of the Fit. If therefore the Pain be extremely severe, the Patient had better keep in Bed till it abates a little, than to have recourse to Anodynes; but however, it will be proper, if the Pain be very violent, to take a Dose of Laudanum in the Evening, otherwise it is better omitted.

But now I am treating of external Applications, I must say something of a certain Indian Moss, intituled *Moxa*, which is highly esteemed of late in the Cure of the Gout; the manner of using it being to burn a small Quantity of it upon the Part affected. Now, though this Remedy is said to come from the *East-Indies*, and to have been unknown to the Europeans till of late Years, it will nevertheless appear to be of more antient Date with us, by consulting the Writings of *Hippocrates*, compiled above two thousand Years ago. Treating of the Sciatica, he advises, "If the Pain be fixed in any one Part, and does not yield to Medicines, in whatever Part it be, to burn it with raw Flax;" and a little farther, speaking of the Gout in the Feet, he says, "The same Things are proper here, that do Service in the Gout of the Joints; and indeed, this is a long and painful, but not a mortal Disease: If the Pain, however, continue in the Fingers, burn the Veins above the Joints with raw Flax." Now, I am of Opinion, that no one can imagine, that there is such a Specific Difference betwixt the Flame of burning Flax, and that of Indian Moss, as to render the latter more effectual in the Cure of the Gout than the former, any more than he can suppose, that a Fire made with Oak Billets can do more than another made of Ash. This Burning of the Part affected bids fair to ease the Pain, and may sometimes effect it, the most subtle and spirituous Part of the morbid Matter deposited on the Part being by this means expelled. But the Relief hereby obtained must necessarily be of short Duration, because it does not at all amend the Indigestion, which is the antecedent Cause of the Gout; and it seems superfluous to observe, that it is to be used only in the Beginning of this Disease. For when the Gout, either on account of its long Continuance, or through wrong Management, retreats to the internal Parts, which sometimes happens, and instead of Pain causes Sickness, Gripings, and Abundance of the like Symptoms, no judicious Person will be for using Fire. See *Moxa*.

And now I have delivered all that I have hitherto discovered concerning the Cure of this Disease; but if it be objected, that there are many specific Remedies for the Gout, I freely own I know none; and fear that those who boast of such Medicines are as ignorant as myself. And, in Effect, it is to be regretted, that the excellent Art of Medicine should be so much disgraced by such Trifles, which the Credulous are deceived with, either through the Ignorance or Knavery of Authors; Remedies of this Kind being extravagantly magnified in most Diseases by those who offer them to Sale. *Sydenham*.

Before I proceed to *Musgrave's* Account of the *Anomalous Gout*, I must specify the Preparation of some Remedies he frequently refers to. The first of these is what he calls

ALCOHOL MARTIS.

Put ten Pounds of the Filings of Steel into a Pan, or glazed Earthen Vessel; moisten them with human Urine, then dry them, either by the Heat of the Sun, or that of the Fire; then moisten them again with the same Liquor, stirring the Particles twice a Day with an Iron Spatula to prevent their Coalescence; continue this till the whole Mass is reduced, as it were, to Rust; when it is so, pound it in an Iron Mortar. When 'tis pounded, throw it into a Vessel in which there are about four Gallons of Spring-water; mix the Powder with the Water. About a quarter of an Hour after, gently draw off the uppermost and least turbid Part of the Water, and evaporate it till the Powder swimming in it is left dry. Let the Liquor also left in the Vessel be evaporated in like manner. Let the grosser Powder in the Bottom be moistened with Urine, and managed in the same manner as at first. Let the Nutrition, Trituration, and Separation by Water, be thus continued, till the Whole of the Iron is reduced to a very fine Powder. Put this Powder, when dry, into a Piece of coarse Paper wrapt up in the Form of a Cone; pour upon it by little and little, and at different times, warm Spring-water, till the urinous Salt being quite washed away, an insipid Water drops through the Paper; then dry the Powder again, and keep it for Use.

8 F

This

This most subtle Rust of Steel is a mere *Alcohol* of uncommon Efficacy, not only in the Gout, but also in most other chronical Disorders, especially if the Patients are of weakly and tender Constitutions.

The Dose is half a Scruple, either once or twice a Day, as the Circumstances of the Patient seem to require.

PULVIS RUBER EXONIENSIS.

Take of the Tops of Pimpernel, Scabious, Dragons, Betony, Germander, and Tormentil, each four Ounces; mix them together, and cut them. Digest for twenty-four Hours in a Sand-heat, in four Pounds of white Port Wine, the Glass in the mean time being well stopp'd; then strain off, and make an Expression.

Then take of the Powder of *Armenian Bole*, one Pound; with the aforesaid Infusion let it be reduced to the Consistence of a Liniment; shake it often, then moisten it again with the Infusion. Thus let the Mass be nourished or moistened with the Infusion; but along with the last half Pound of the Infusion, let there be added to the Mass one Ounce of Mithridate, one Ounce and an half of Diacordium, Confection of Kermes, and Powder of Turmeric-root, each half an Ounce; *Virginian Snake-root*, and *English Saffron*, each two Drams. Mix all together, and dry the Whole; make into Troches, or little Cakes, to be hardened in the Heat of the Sun, and preserved for Use. The Dose is from one Scruple to one and an half, or two Scruples.

AQUA HISPANORUM ARTHRITICA.

The *Spanish Gout Water*, as 'tis called, is by some highly esteemed, and is indeed of very great Efficacy; 'tis prepared in the following manner:

Take of Cloves, Nutmegs, Ginger, Mace, Cinnamon, Black Pepper, Saffron, Zedoary, Galangals, Juniper-berries, Citron and Orange-peel, Spikenard, Cubebs, Hepatic Aloes, Wood of Aloes, Sweet Flag, and Stoechas, each half an Ounce; Tops of Sage, Basil, Rosemary, Mint, Marjoram, of common Bay-berries, Pennyroyal, Shavings of Gentian, Elder-flowers, White and Red Roses, Ground-pine, Germander, Calamint, Baum, Origanum, and Feverfew, each two Handfuls; of Figs, Dates, Bitter Almonds, Pine-nut Kernels, and Raisins of the Sun, each six Ounces; of Virgin Honey, one Pound; of the finest Sugar, one Pound; and grated Musk, one Dram. When these Ingredients are cut and bruised, let them be put into fifteen Pounds of the best Canary Wine to infuse for ten or twelve Days; then distil in Balneo Mariæ.

This Water is esteemed of uncommon Efficacy in Arthritic Disorders of the Stomach and Intestines. The Dose is half an Ounce, to be taken with a little Sugar or Crumb of Bread; it may be repeated at Pleasure. It is also used externally for removing arthritic Pains of the Joints; and the Method of applying it is, to make it very warm, and then embrocate the Part affected with it.

From MUSGRAVE.

Whilst the Arthritic Matter is deposited upon the Extremities, particularly the Joints, and remains there without any Danger of returning, Nature is pursuing her Purpose, and defending herself from the Danger she would be in from a Retrocession of the Gout, and its fixing upon any Part of the Trunk.

These anomalous Symptoms of the Gout, when they appear before the Patient has had a Fit regularly, are very difficult to be distinguished from other Diseases, which the Part where it fixes, is subject to. And therefore *Musgrave* says, 'tis impossible to know anomalous Symptoms of the Gout, without a previous Fit.

The Arthritis Vaga is attended with Pain, and sometimes with a white Swelling, like an Oedema.

Those who have the regular Gout, have seldom, unless by Accident, any other great Disorder.

The anomalous Gout visits most frequently the Stomach and Intestines; whence arise Loss of Appetite, and bad Digestion, Vomiting, Colic, Dysentery, Diarrhoea, and sometimes Arthritic Abscesses.

Sometimes it seizes the Head, and causes a Cephalalgia, Vertigo, or Apoplexy; and sometimes seizing the Nerves, causes a Palsy.

It often fixes upon the Organs of Respiration, and causes an Asthma, Cough, Hæmoptoe, and Phthisis.

Sometimes it appears in the Shape of an Angina.

At some times it seizes the Gums, and is called *Dentium Podagra*, improperly.

At other times it seizes upon the Kidneys, and causes the Stone, Dysury, and Strangury.

No Part of the Body is free from it.

The natural or acquired Weakness of any of the Viscera, or internal Parts, is the Cause of the Gout's fixing upon them.

Whatever repels the Gout from the Extremities, as Cataplasms, Plaisters, &c. causes it to fix upon the Viscera.

The Symptoms of the Anomalous Gout differ exceedingly, as they happen to fix upon different Parts, causing in Appearance different Distempers.

They also differ, as the Matter is sometimes purely gouty, and sometimes has with it a Mixture of some other Distemper, as Scrophula, Scurvy, or the like.

The Anomalous Gout is driven into the Extremities from some Parts much more easily than from others. From the Fauces it removes without much Trouble, and almost of its own Accord. On the contrary, it is removed from the Nerves with the utmost Difficulty.

Too tight Shoes are sometimes the Cause of the Gout's leaving the Extremities, and fixing on the Viscera.

Those things which evacuate the gouty Matter, tho' sometimes absolutely necessary, yet seldom cure the Distemper, but are even prejudicial when improperly used. But the Cure of the Distemper can be no otherwise completed, than by an Expulsion of the Gout into the Extremities.

Those Medicines which expel the gouty Matter, and drive it upon the Extremities, are taken from the Classes of Cardiacs and Diaphoretics, amongst which are the following:

Powders of Zedoary, Contrayerva, Gentian, *Virginian Snake-root*, *Gascoign's Powder*, the Pulvis Purpureus of *Bates*, Goa Stone, Contrayerva Stone, Species Diambæ, Confectio Liberans; the Pulvis Alexipharmacus, and Pulvis Stomachicus Amarus, of *Fuller*; the Pulvis Bezoarticus of *Willis*; the Pulvis Ruber Exoniensis; the Flowers of Sal Ammoniac, and others of the same Kind.

Venice Treacle, Mithridate, the Electuarium de Ovo.

Spirit of Hartshorn, either simple or succinated; Spirits of human Blood, of Urine, of Silk, and Sal Volatile Oleosum.

Amongst Wines, the most effectual are *French White-wine*, *Champaign*, *Mosel*, *Rhenish*, *Burgundy*, *Bordeaux*, *Portuguese Wines*, to which may be added subacid Cyder.

As gouty Patients are generally forbid the Use of some of these Wines, it may seem extraordinary to such, that *Musgrave* should recommend them. But it must be considered, that they are directed to abstain from such Wines, because they promote Fits of the Gout; with which View *Musgrave* recommends them, in order to render an anomalous Gout regular in the Extremities.

But of all Remedies, *Musgrave* thinks nothing so powerful as Steel, the best Preparation of which is, the *Alcohol Martis* above described.

If, after the Use of these Medicines for four or five Days, no Pain is perceived in the Extremities, we must then proceed to such external Applications, as invite the arthritic Matter downwards. Therefore apply to the Part, which used to be pained in Fits of the Gout, a Plaister of Gum Caranna, or that called *Oxyroceum*; or the Cephalic Plaister, with one half, a third, or a fourth of *Burgundy Pitch*.

Urtication (*whipping with Nettles*) is of Use, which was much practised by the Antients; as also extremely hot Baths, and the Skins of Animals just taken off, and Oil Cast.

In Cases of extreme Danger, where the Strength of the Patient can bear it, such a *Phænimus* as the following may be of great Use:

Take of old Barm, two Parts; of Mustard-seed, Horseradish, Garlick, the Tops of Rue, and Pigeons-dung, of each equal Parts; beat up these to the Consistence of a Cataplasm, with sharp White-wine Vinegar.

Part of this is to be applied, as hot as the Patient can bear it, and the Part must be covered with Flannels, or the Cataplasms may be spread on Flannels, and applied, renewing it when it grows cold, till it causes a Tumor. Mean time, if the Patient is low, or faint, through Excess of Pain, he should have a Cardiac Julap, or a Glass of generous Wine, which is much better. When a Tumor is formed, an Epispastic must be applied to let out the contain'd Matter, lest otherwise it should return into the Blood.

When there is no Necessity for immediate Help, and the Patient is weak, tender, or impatient of Pain, a common Epispastic should be applied to the Legs, or Cubit, according as the Gout used to verge towards the upper or lower Parts; and, this being taken off twelve or eighteen Hours after, the following Plaister must be applied to continue the Running:

Take of Hog's Lard two Drams and an half; of Melilot Plaster, a Dram and an half; Powder of Cantharides, a Dram.

By this means the Running should be continu'd six, eight, or ten Days, according to the Circumstances of the Case.

Either of these Proceedings generally relieves the *Gout* in a few Days. Mean time the Matter discharg'd is so salt, that it makes the adjacent Parts itch, and sometimes inflames them. When this Ichor is evacuated, the Symptoms generally are relieved, and the Patient gets hearty, and recovers his Appetite and Spirits, and for some time is free from another Fit of the *Gout*.

Musgrave is of Opinion, that the most dangerous thing a Person long afflicted with the *Gout*, and us'd to a free Way of living, can attempt, is to endeavour to conquer it by Abstinence.

Of the GOUT in the STOMACH.

As the primigenial *Gout* is often caused by Indigestion, and Weakness of the Stomach, so no Part is so often, or so much, afflicted with the anomalous *Gout*.

This Facility to receive and retain the *Gout*, is often owing to a connate Imbecillity; and sometimes to a Weakness contracted from too much Venery, Grief, Fear, or any other relaxing Passion of the Mind, by which Imbecillity the Stomach becomes more liable to receive, and less capable to repel, the arthritic Matter.

But it very frequently happens, that the *Gout* is invited into the Stomach by crude, acid, bilious, or some other vicious Juices contain'd therein, which stimulate the Coats thereof; and this happens just for the same Reasons that Sinapisms and Epispastics invite it to the Extremities.

Sometimes external repelling Cataplasms or Plaisters, apply'd injudiciously to the Extremities, are the Cause of the *Gout*'s fixing in the Stomach. External Cold has the same Effect, either from the Air or Baths.

When the *Gout* has been for some time regular, and the Patient has had many Accessions and Receptions in the Extremities at Intervals, we often see the Fit shorten'd, or broken off, unexpectedly, by means of Cold, repelling Plaisters, Cataplasms, or Unguents; or else by a Debauch, overloading the Stomach, or some Error in point of Diet; or else the Interval has been longer than usual, and the Paroxysm has been deferred longer than was consistent with Health.

This Interruption or Intermision of the *Gout* is often follow'd by Loss of Appetite, and loathing of Food; to which afterward a Weight in the Breast is joined, and then Eructations, Vomiting, and Heart-burn. To these frequently are join'd an Oppression of the Intestines, with Pain, Constriction, and sometimes Heat; an interrupted and freight Respiration; frequent Oscitation; (*Yawning*) Head-ach, Vertigo, and sometimes Dejectedness; frequent and sudden Dimness of Sight, Paleness of the Face, and, after some time, an universal Imbecillity and Leanness.

These Symptoms, perhaps, never appear all at the same time, in the same Person, but frequently a great many of them.

From the Time that these internal Symptoms appear, there is little or no *Gout* in the Extremities. The Patient, who before was confin'd to his Bed, can now get up and walk about with great Ease. Mean time, the internal Complaints grow daily worse and worse; and the Patient, worn out with want of Food, Languors, and Pain, after some Months miserably spent, dies, unless the Weather changing from immoderately cold, to warm and mild, or proper Medicines, restore a regular Fit of the *Gout*.

This *Gout* in the Stomach afflicts old People most frequently; however, young People often have it, probably, from their Carelessness and Licentiousness in point of Diet, because these generally fall into it, immediately after an Error in either Eating or Drinking.

Tho' this Distemper happens at any time of the Year, yet 'tis most frequent in Autumn, which may be owing, in some measure, to Fruits eaten at that Season, and lying in a State of Putrefaction in the Intestinal Tube.

Sometimes these Symptoms will happen, without any Cause so evident as is above specify'd; sometimes with a regular Fit; and sometimes at a greater Distance from its Interruption.

Sometimes old People, now grown sober and abstemious, but who have drank hard, and lived freely in their Youth, are subject to Hypochondriacal Disorders, which are somewhat like *gouty* Symptoms, as perpetual Languors, Eructations, Anxieties, Dejectedness, sometimes Pain, and other Disorders of the Stomach. Now, in order to enable us to distinguish these from the *Gout*, we are to weigh the Circumstances attending, as the Manner in which they seize the Patient, their Vehemence, and the Intervals, and then the Case will be pretty plain.

It makes no Difference in these Cases, whether the *Gout*, leaving the Intestines, goes directly into the Stomach; or whether

it takes a round-about Way, seizing first the Fauces, some contus'd Part, or any other Place; nor whether it immediately follows the fix'd or erratic *Gout*.

It is farther observable, that such as have an hereditary *Gout*, are more subject to these Disorders than others; those who are born of old Parents, than those born of young ones; those who have a bad Appetite, than those who enjoy a good one; those who have a languid, cold *Gout*, than those who have a hot, sharp, and painful one.

The CURE.

The Curative Indication is to relieve, as soon as safely may be, the Stomach, and to free it from the *Gout*: And, in order to this, two things are requisite:

First, To remove all Impurities from the Stomach, which attract and detain the *Gout* in its Coats, by proper Vomits or Purges.

Secondly, After this is done, or omitted, if not necessary, to drive the *Gout* from the Stomach into the Extremities.

If a Shortness, or Difficulty in Breathing, a Gravity and Inflation of the Stomach, and particularly an Eructation, Nausea, or Vomiting, are troublesome, a gentle, but effectual Vomit will be necessary; provided the Patient has sufficient Strength, and there are no Reasons to the contrary.

A great deal of Caution is necessary in making Choice of a proper Emetic; for, on the one hand, those which are too languid to operate well, are trifling; and, on the other, those which operate with too much Violence, are dangerous.

For such as vomit easily, an Infusion of green Tea-leaves, or the Tops of *Carduus Benedictus*, is sufficient, drank so as to vomit four, five, or six times, and in the Quantity of eight, ten, or twelve Pints in the Whole, if the Patient can bear it.

Those who are not sufficiently affected by this sort of Vomit, should take a proper Quantity of Salt of Vitriol in every, every other, or every third Pint of the Infusion.

Those who vomit with more Difficulty, should take Wine, or Oxymel of Squills, or equal Parts of both, in the Quantity of two or three Ounces together; and, half an Hour after taking it, should work it off with some simple or bitter Posset-drink.

But those who either cannot, or will not, drink a sufficient Quantity of Posset-drink, warm Water, or some other Liquid, should never take any officinal Emetic; for, by this means, there would be a great Quantity of Humours invited into the Stomach, and none discharg'd out of it, which would injure the Patient.

Sometimes neither Posset-drinks, Decoctions, nor any other Medicines of this Kind, can safely be given the Patient, because they give him violent Gripes and Spasms, especially Hard-drinkers.

The Reason of this seems to be, because they are too cold for the Stomach.

In this Case *Musgrave* says he has saved many Patients from the Jaws of Death, by giving Quantities of Wine as an Emetic, but which is, at the same time, a good Cardiac.

The Matter evacuated by Vomit is sometimes bilious, sometimes crude, especially after a Debauch of Eating or Drinking.

The good Effects of a Vomit appear in an Amendment of Respiration, and a Removal of the Gravity of the Breast.

And sometimes it happens, that the very Efforts of Vomiting, and the Agitation of the Blood caus'd thereby, drive the *Gout* from the Stomach, and it immediately falls on the Extremities.

An Hour after the Vomit, especially if promoted by any of the Officinals, a Clyster should be administer'd, in order to carry the Remains of it out of the Intestines; and at Night a Bolus, with *Venice-treacle*, and the *Countess of Kent's Powder*, with a Draught of burnt Wine, should be exhibited. After this, let the Patient take, three or four times a Day, a Draught of bitter Wine, with a Scruple or half a Dram of the *Countess of Kent's Powder*, till it is time to purge him.

After one Day's Interval from the Vomit, provided the Patient has sufficient Strength, he should be purged. But in case of too great Weakness, this should be deferr'd a little; however, as soon as possible, a Purge should be given, such a one as will sufficiently clear the Intestines, without causing a Hypercatharsis: For 'tis a certain Rule, that the Cure of this anomalous *Gout* is most likely to succeed, if 'tis begun by clearing the Stomach and Intestines.

Proper Purges on this Occasion are, *Tinctura Sacra*, in the Quantity of three or four Ounces. *Pill Rudii*; Dose half a Dram, or two Scruples. *Earl of Warwick's Powder*; Dose about half a Dram. *Manna* and *Salts* dissolved, with an Addition of *Daffy's Elixir*.

If the Purge does not operate in six Hours, it will be proper to give a Clyster.

At Night, let the Patient take such a Bolus as after the Vomit.

Sometimes it happens, that after even sufficient Vomiting and Purging, a troublesome Nausea remains, inasmuch that all Medicines are thrown off the Stomach, as soon as taken, by Vomit. This is probably caused by the Arthritic Matter lodg'd in the Coats of the Stomach. In order to prevent this, exhibit about ten Drops of *Liquid Laudanum*, in two Drams of *strong Cinnamon* or *Wormwood-water*, or *Spirit of Mint*, every fourth, fifth, or sixth Hour; that is, in such a Dose, and at such Intervals, as will stop the Vomiting, and give the Stomach Power to retain the Medicines destin'd to expel the Gout, which should be given in the Intervals betwixt the Doses of *Laudanum*: For Example, if the *Laudanum* is given at six and twelve, the other Medicines should be administer'd at three and nine. As soon as there is no farther Occasion for the *Laudanum*, it must be omitted, being then prejudicial.

What has been hitherto said about Evacuations, must be understood of such as have Occasion for both Vomiting and Purging, and Strength sufficient to bear it: But when there is no Occasion for it, as it happens when this anomalous Gout is brought upon the Stomach by Grief, or when there is a Deficiency of Strength, we must begin with Medicines that drive the Gout from the Stomach, omitting these Evacuations.

Steel has a peculiar Excellence in driving the Gout from the Stomach.

Musgrave recommends the following Forms:

Take either of *Gascoign's Powder*, or the *Pulvis Purpureus*, or *Goa Stone*, or the *Pulvis Ruber Exoniensis*, a Scruple, or half a Dram; of *Virginian Snake-root*, ten Grains; *Alcohol Martis*, five Grains. Mix and make a Powder.

Instead of *Virginia Snake-root*, *Gentian*, *Zedoary*, or *Contrayerva-root* may be used in the same or a larger Quantity.

Take of the compound *Arum-powder*, and *Pulvis Ruber Exoniensis*, each a Scruple; *Alcohol Martis*, five Grains. Make a Powder. Or,

Take of *Species Diambrae*, (or *Aromaticum Rosatum*) and *Gascoign's Powder*, a Scruple, or half a Dram; *Alcohol Martis*, five Grains. Mix and make a Powder. Or,

Take of *Ginger* candy'd in the *Indies*, a Scruple (or *Pods of Pepper* candy'd, six Grains); *Pulvis Purpureus*, a Scruple, or half a Dram; *Alcohol Martis*, five Grains; *Syrup of Wormwood*, a sufficient Quantity to make a Bolus. Or,

Take of *Species Diambrae*, and *Lapis Contrayerva*, in Powder, each a Scruple; *Alcohol Martis*, five Grains; Confection of *Kermes*, enough to make a Bolus. Or,

Take of the *Species* call'd *Aromaticum Rosatum*, (or *Dianthus*) two Scruples; *Flowers of Sal Ammoniac*, ten Grains; *Syrup of Cloves*, enough to make a Bolus. Or,

Take of the Conserve of *Roman Wormwood* and *Gascoign's Powder*, each a Scruple; *Oil of Caraway-seeds*, one Drop; *Alcohol Martis*, five Grains; *Syrup of Citron-peel*, enough to make a Bolus. Or,

Take of *Venice Treacle*, (or *Mithridate*, or the *Electuarium Stomachicum* of *Fuller*) and of *Gascoign's Powder*, each a Scruple; *Alcohol Martis*, five Grains; *Syrup of Mint*, enough to make a Bolus. Or,

Take of *Camphire*, five Grains; of the Powder of *Contrayerva-root*, fifteen Grains; of the Extract of *Rue*, a sufficient Quantity. Form into Pills. Or,

Take of the Powder of *Long-pepper* (or of the *Species Diatrium Piperaceum*) five Grains; *Gentian Powder*, half a Scruple; *Myrrh*, five Grains; Extract of the lesser *Centaury*, a sufficient Quantity. Form into Pills. Or,

Take of the Powder of *Virginian Snake-root*, one Scruple; of *Alcohol Martis*, five Grains; of *Syrup of Oranges*, a sufficient Quantity. Form into Pills.

With every Bolus, or Dose of the Powder or Pills, a Draught of the following Julap is to be taken:

Take of the Waters of *Carduus*, *Mint*, *Alexiterial Milk-water*, compound *Gentian-water*, compound *Wormwood-water*, or *strong Cinnamon-water*, each four Ounces; prepar'd *Pearls*, two Scruples; *Sugar*, a sufficient Quantity. Make into a Julap.

The Chymical Oils incorporated with the Julap, by means of *Sugar*, render it much more efficacious than it would otherwise be. For a liquid Form I recommend the following Infusions:

Take of *Zedoary-root*, of *Gentian*, of the Tops of *Roman Wormwood*, of *Agrimony*, or *Marsh-trefoil*, each two

Drams; *Cochineal*, one Scruple; *Orange-pill*, two Scruples. Infuse in two Pounds of *Red Port Wine*, or *Spanish Wine*, till the Wine is sufficiently impregnated. Then strain off for Use. The Dose is two or three Ounces.

After the same manner Infusions may be prepar'd from other Aromatics, as the *Cortex Winteranus*, *Cubebs*, the *Seeds of Cardamoms*, *Anise*, *Caraway*, *sweet Fennil*, and *Scurvy-grafs*.

Every Draught of bitter or aromatic Wine should have ten Drops of Tincture of Steel, or else *Alcohol Martis* taken with it.

The Poor may readily have an Infusion of *Garlick*, *Saffron*, *Ginger* rasp'd, with the Tops of *Roman Wormwood*.

It sometimes happens that the Patient cannot take Medicines in any solid Form, or by way of Infusion; and in this Case *Spirit of Mint*, *Juniper*, or *Wormwood*, may be both useful and serviceable. The *Aqua Hispanorum Arthritica* is much esteemed by some, the Preparation of which see above.

After sufficient Purging, *Musgrave* recommends the Use of the above described Medicines, or the like, in the following manner.

In the Morning, about Nine, a Draught of bitter Wine.

At Three in the Afternoon, Pills or Powders.

At Nine in the Evening, a Bolus, especially that with *Venice-treacle*.

At Three in the Morning, Powder or Pills.

The Patient must drink, after every Dose of each, a Draught of *Port Wine*, or of some proper Julap.

Sometimes it happens, that in two or three Days, by the Use of these Remedies given after this manner, the Gout is driven from the Stomach, and fixes upon the Joints. Sometimes this is not done without a long Perseverance; and sometimes not without other Remedies call'd in to our Assistance.

If, after persisting in the Use of these Medicines for two Days, no Pain or Tumor appears, it will then be prudent to apply to the Part where the Gout used formerly to fix, the *Cephalic Plaister*, with equal Parts of *Burgundy Pitch*; or the *Green Cerate*; or else a Blister to each Cubit or Leg, to invite the Humour downwards.

If these external and internal Remedies are not sufficient, with united Forces, to remove the Gout from the Stomach, the Strength of one or both must be increased, and other Aids must be called in, if necessary. The Dose, for Example, of the *Alcohol Martis* must be increased to ten Grains, and the Tincture of Steel to twenty Drops.

Moreover, every intermediate Hour betwixt the Doses of Medicines, let the Patient drink a Glass of *Port Wine*, so as to drink two or three Pints in twenty-four Hours, reckoning also what is taken with the Medicines. But this is principally serviceable to those who have used themselves to drink Quantities of Wine, and cannot well do without it.

Those who cannot drink such Quantities of Wine, should take some Drops of fuccinated Spirit of *Hartshorn* in a proper Julap, at the intermediate Hours.

Finally, the Use of these Medicines and Wine should be continued, till a Heat and Orgasm is raised in the Blood, and the Stomach is relieved, unless there should be some great Reason to discontinue them sooner.

At the same time, the Force of the internal Applications should be increased, and that till the gouty Humour is expell'd, and a Tumor is raised in some external Part, proper to receive the Gout. For this purpose, the Extremities may be wrapp'd in a Sheep-skin just taken off.

But nothing answers the End surer or sooner, than an acrid and stimulating *Phœnigmus* apply'd very hot to a proper Part, and renew'd as it grows cool, whilst the Tumor is rising.

Those who are too nice to bear the Smell of a Sheep-skin, or too tender to bear the Pain of the *Phœnigmus*, may use a hot Brick or Plate of Iron, wrapt up in Linen, and apply'd to the Part.

During the whole Course of this Method, the Patient should keep in Bed, or in his Chamber, and guard particularly against Cold.

Mean time let the Patient eat *Panada*, *Jelly of Hartshorn*, or *Chicken-broth*, or some such Food which is thin and easy of Digestion.

If the Pain thus raised should be so intolerable as to cause a *Lipothymia*, something of the Force of Medicines, and stimulating Applications, may be abated.

If the Fever should run too high, the Dose of the *Cardiacs* should be lessen'd, or they should be entirely omitted. Let the Patient drink as much white Decoction as he pleases, to temperate his Heat.

As soon as a sufficient Orgasm is excited in the Blood, the gouty Matter generally fixes where the external Applications invite it, upon the Extremities; inasmuch, that sometimes in an Hour's Time after the Application of the *Phœnigmus*, a Tumor will appear.

Mean time; such a Fomentation as the following should be apply'd to the Abdomen twice or three times a Day, by means of flannel Stuphs.

Take of the Tops of common Wormwood, Mint, Red Rose-leaves, and Chamomile-flowers, each half an Ounce; of Anise and Caraway-seeds, each two Drams; Powder of Cinnamon, Cubebs, and Cloves, each one Scruple; common Spirit of Wine, half a Pound; of Red Port Wine, one Pint and an half. Let them macerate for three or four Hours in a well-stopt Glass plac'd in *Balneo Mariae*. Let the strain'd Liquor be apply'd as hot as possible. Or, let such a Plaster as this be worn constantly on the Abdomen.

Take of Japan Earth, Balsam of Chili or Peru, each half a Dram; Gum Galbanum, a Dram; Burgundy Pitch, two Drams; of the Magisterial Stomach-plaster, half an Ounce; of Chymical Oil of Cinnamon and Nutmegs, each two Drops.

These Applications are of most Use after Purging, and that in those Constitutions which are enervated with Age, or the Distemper: However, the Physician is to take care, lest, in sanguine and robust People, these Applications do not rather invite the Gout to the Part, than defend against it.

As soon as a considerable Tumor is rais'd, *Musgrave* advises a Blister to be laid on the Part, to evacuate the Humour, lest it should return into the Blood. These sometimes discharge a vast Quantity, and continue running a great while, inflaming the Skin, and causing an Itching; insomuch that it is not to be doubted but that the arthritic Poison is discharg'd with the Serum.

As soon as ever the Tumor and Pain are sufficiently raised, the Dose of the Medicines is to be decreased, and not given so often.

But if it should happen, that by reason of the Inclemency of the Air, or the Coldness of the Season, or some Error in Eating or Drinking, the Gout should leave the Extremities, and return to the Stomach, which is often the Case, the Cause of the Relapse must be diligently inquir'd into, and immediately removed.

If fresh Crudities are collected in the Stomach, they must be evacuated by a lenient, and very gentle Purge.

If the Skin is contracted by Cold, it must be relax'd by external Warmth, and warm Cloathing: In both these Cases, internal Medicines must be plentifully administer'd.

Podagragogue Medicines are requir'd so strong, and in so great Quantities, in no Case, as in a Relapse, or where the Body is loaded with Crudities, which cannot be purged off by reason of the Weakness of the Patient, or the long Continuance of the Disease. In these Cases, the Medicines should be compos'd of Steel, Ginger, and Pepper, and full of volatile Salts; and should be taken in much greater Quantities, than above directed; and even then they will sometimes fail us, and the Patient will die sometimes unexpectedly, complaining all the while of an inexplicable Depression of Spirits, and Coldness of the Stomach. Sometimes, in the Irregularities of the *wandering Gout*, it is sufficient to reduce the Gout to the Inter-nodes: And sometimes 'tis even sufficient to free the Stomach from the gouty Matter, tho' it is only resorb'd and retain'd in the Blood. But in the Irregularities of the *fix'd Gout*, the most desirable Method is to have the Gout fix'd upon the Extremities.

It is entertaining to observe, that as the Pain, Tumor, and Symptoms of a regular Gout appear and increase, the Pain of the Stomach, Nausea, Cardialgia, and other Symptoms, disappear; to which succeed Hunger, good Digestion, a healthful Lustre of the Eyes, and other Signs of returning Health.

In order to guard against these irregular Fits, the Use of the Steel-waters is very good, drank properly, and for a long time; to which may be added, such Stomachics as cause Hunger and Digestion; particularly the *Conserve of Roman Wormwood*, *Red Roses*, or *Hips*; the *compound Powder of Arum*; *Salt of Steel*, and *Ens Veneris*. Mean time, Care must be taken to avoid Indigestions, Cold, and all evident Causes of these Irregularities.

It is also useful to have an Issue in the Arm, or below the Knee, according as the Gout is more subject to fix on the Hands or Feet.

Musgrave observes, that Affections of the Mind will sometimes make the Gout recede from the Extremities, and fix upon the Stomach, and gives a Case to this Purpose.

He also gives some Cases, which prove that cold Weather and Frost will sometimes prevent the Gout from falling on the Extremities, especially in old People; or make it recede.

THE ARTHRITIC COLIC.

The *Arthritic Colic* is very frequent, and extremely painful, and has its Seat in the whole intestinal Tube from the Stomach to the Anus, tho' not in every Part at the same time;

and it often happens, that the Stomach suffers at the same time.

Both the fixed and wandering *Gout*, the regular and irregular, the primogenial and symptomatic, sometimes appear in the Shape of the *Colic*: But principally that kind of symptomatic *Gout*, which begins originally with the *Colic*; for the Seat of this is somewhat ambiguous, fixing alternately on the Extremities and Intestines. This very often seizes upon old and infirm People, and sometimes affects those of Athletic Constitutions, who have not yet passed the Meridian of Life.

When a Person has been for a long time used to have regular Fits of the *Gout* at Intervals, and now grows old, Nature begins to leave off these Paroxysms, and gives no Fit at all, or very seldom, or else little and short ones, either thro' Weakness, or some other Cause, which must diligently be inquir'd into. And then an Evil of another Kind, either sooner or later, generally seizes upon the internal Parts.

First, the Patient perceives an universal Indisposition, and Loss of Appetite; and frequently a Nausea and Pain in the Intestines, which is usually fixed to some one Point of the Abdomen; generally about the Navel. Another Symptom is an Oppression and Heaviness of the Breast, as if it was press'd by a Weight. This happens to most of those that are afflicted with the *Colic*, and is extremely troublesome.

These two Symptoms, Pain in the Abdomen, and Oppression of the Breast, may be esteemed the primary Symptoms. The secondary are, a Distention of the Præcordia, Murmurs in the Intestines, Eructations, Vomiting of Matter generally bilious, and Costiveness. To these are to be join'd some others, which happen only sympathetically, as Languor of the Eyes, Dejection of the Spirits, Want of Sleep, Indolence, Anxiety; and if the Distemper continues long, a Weakness, and Emaciation of the whole Body.

This often, tho' not always, begins in Autumn, and, without proper Relief, miserably afflicts the Patient all Winter following: For from the first seizing of the Intestines, he languishes and is oppressed with Wind, Uneasiness, and Pain, lies awake all Night, and laments himself all Day, till at last, depriv'd of Sleep, Food, and all the Refreshments of Life, weary'd with perpetual Strainings to vomit, enervated and worn out with Pain, and extremely emaciated, Death, sooner or later, frees him from his Torments.

It seems to be very plain, that the *gouty Matter* is the Cause of all these Disorders. But these Symptoms, particularly the aforesaid Pain in the Belly, and Heaviness of the Breast, give a great Light into the Case; yet as these are not so peculiar to the *gouty Colic*, but that they sometimes appear in *Colics* of another Kind, we must take the Diagnostic from the preceding Distemper, that is, the *Regular Gout*: We must therefore observe, if the Patient has lately had a Fit, whether it has suddenly remitted, or gone off; and whether the *Colic* immediately follow'd this Intermision. And from these Circumstances we may easily judge of the Nature of the *Colic*.

The external Causes of the *Colic* are Cold, too tight Shoes, or any sort of Ligatures, repellent Plasters, Unguents, or Cataplasms.

The internal Causes are, a natural Imbecillity of the Intestines; an Accumulation of Impurities in the Viscera, which, being discharged from the Liver, Pancreas, and other Glands that empty themselves into the Intestines, invite the *gouty Humour* to those Parts by their Stimulus, just in the same manner as stimulating Applications do to the Feet. And Crudities from the Stomach act in just the same manner. But no Impurities are more frequent here than those which are bilious, as the Stools, and what is thrown up by Vomit, evidently shew. Amongst the internal Causes, may also be reckon'd the eating or drinking improper Things; as Fruit, too sharp Cyder taken in large Quantities, or any other Error in point of Aliment, especially those that are of a cold Nature.

This *Arthritic Colic* is often fatal, and always dangerous. If the Heaviness in the Breast, and Pain in the Intestines, especially if it is pungent, continue long, 'tis a bad Sign, and the Patient generally grows gradually worse and worse, till he dies.

There is seldom any Safety till the *Gout* is expell'd into the Extremities, and even then, not in every Case, nor always. For tho' the *Gout* gives Pain in the Joints, yet, if the Mass of Humours remain within, the Hopes we have from this Pain are very precarious; for the *Gout* is frequently invited thereby into the Intestines again, and destroys the Patient.

But if the Pain of the Intestines, Oppression of the Breast, and Costiveness, entirely vanish, and at the same time Pain appears in the Extremities, it gives a much better Prospect.

But if the Pains of the internal Parts entirely cease, the Appetite returns, and at the same time the Pain of the Intestines is considerable, the Patient in all Probability is out of all Danger.

In regard to the Cure, so far as a bilious Fever sometimes accompanies this Disorder, regard must be had to the Fever and its Symptoms, as Thirst, Heat, Velocity of the Pulse, &c.

Therefore, if Occasion requires, the first Step we take should be to bleed the Patient, but very sparingly, and only just so much as will prevent the Inflammation, lest, by taking away too much, we at the same time take away all Possibility of expelling the Gout.

Then, in case the Stomach is loaded with Crudities, the Patient should vomit, by means of Tea, or an Infusion of *Carduus Benedictus*; for it may not be adviseable to give any stronger Emetic.

The Day after the Vomit, the Patient should be purged, if his Strength will permit it, or else two Days after, with *Extractum Rudii*, and Refin of Jalap, to which may be added, *Mercurius dulcis*; or with Syrup of Buckthorn, and Elixir *Salutis*; or, if the Fever is considerable, with a Solution of Manna, and purging Salts, in Barley-water; or by any other proper Purge. But no Paregoric must be given at Night after it, unless in case of a Hypercatharsis, lest it should put a Stop to the Eruption of the Gout upon the Extremities.

Purging is here of the utmost Importance; for without it, and that too sufficiently, the Cure will be extremely perplex'd; and therefore Purging must be repeated, till the End of clearing the Intestines is answer'd.

Mean time, on the Days betwixt purging, the Patient must take the *Tessaceous Powder*, if the Intestines abound with an Acid; but if they abound with Bile, a bitter Alterative Infusion is preferable.

This Work being finish'd, which is half the Cure, we are then to endeavour at the Expulsion of the Gout, and not sooner.

To this End, besides the Remedies mention'd above for this Purpose, there are some others, which have always been esteem'd good for the Colic; and Aromatics too are here good; and, with these, those above-mention'd may be very properly join'd.

What is here meant, are these following:

Powder of Zedoary-root.
Compound Powder of Arum-root.
The Pulvis Aurantiorum Compositus, and } of Fuller.
Pulvis Bezoardicus,
Species Diatrien Piperacem.
Simple Species of Calamint.
Species Diambrae, and Dianthus.
Electuarium e Baccis Lauri.
Mithridate.
Ginger, candied in the Indies, and its Syrup.
The Chymical Oils of Juniper, Cumin, Caraway, sweet Fennel, Anise, and such-like Carminatives and Aromatics.
Amongst Wines, the strong Spanish and Portuguese red Wines, either alone, or impregnated with Bitters, have the Preference.

Prepar'd in this manner, we are to attempt removing the Gout in the following manner, and endeavour to throw it upon the Extremities.

The Patient must be put to Bed, and must take a Powder, Bolus, or Dose of Pills, made after some of the following Forms:

Take *Gascoign's Powder*, a Scruple or half a Dram; Alcohol Martis, five Grains: Mix and make a Powder. Or,

Take of the Powder of Zedoary, half a Scruple; Species of Calamint, or *Diambrae*, one Scruple; Alcohol Martis, five Grains: Reduce to a Powder.

The Forms of proper Boluses are these following:

Take of the Electuary of Bay-berries, or of Mithridate, of the compound Powder of Crabs-claws, each one Scruple, or one Scruple and an half; Alcohol Martis, five Grains; Syrup of Oranges, a sufficient Quantity: Make into a Bolus. Or,

Take of Ginger, candied in the Indies, compound Powder of Arum-root, each one Scruple, or one Scruple and an half; Alcohol Martis, five Grains; Syrup of Nutmegs, a sufficient Quantity: Make into a Bolus. Or,

Take of candied Nutmegs, and Species *Diambrae*, each one Scruple; Alcohol Martis, five Grains; Chymical Oil of Juniper, one Drop; Confection of Kermes, without Perfumes, a sufficient Quantity: Make into a Bolus.

Or, the following Pills may be used:

Take of the Species, with the three Peppers, and Powder of *Virginian Snake-root*, each half a Scruple; Alcohol Martis, five Grains; Extract of Rue, a sufficient Quantity: Form into Pills.

After each Dose of these Medicines the Patient is to drink a Glas of Spanish Wine, or red Port; or a Draught of some of the following Julaps:

Take of *Carduus* and Mint-waters, of Alexiterial Milk-water, and compound Chamomile-water, each three

Ounces; Spirit of Juniper, half an Ounce, or a whole Ounce; prepar'd Pearls, half a Dram; the finest Sugar, a sufficient Quantity: Make into a Julap. Or,

Take of Alexiterial Milk-water, twelve Ounces; *Brunswic Mum*, four Ounces; prepar'd Pearls, half a Dram; and a sufficient Quantity of Sugar: Make into a Julap.

If the Patient likes a liquid Form better than any other, let him have a Draught of the following Infusion, with the Addition of Steel:

Take of Zedoary-root, Galangals, sweet Flag, and Tops of *Roman Wormwood*, each two Drains; Juniper-berries, and *English Saffron*, each one Dram: Infuse in two Pounds of Spanish Wine, till the Liquor is sufficiently impregnated; then let the Infusion be strain'd off.

Take three Ounces of this Infusion, and five Grains of *Alcohol Martis*, for a Draught: Let it be shaken before the Patient drinks it.

Let the Patient take some one of these Medicines every four, five, or six Hours; and in the Middle of the Intervals, betwixt each Dose, let him drink a Glas of one of the above-mention'd, or some other generous Wine, in as large a Quantity as he can with Safety.

This Rule is to be observ'd in regard to his Medicines, that they must be taken in such a Dose, and repeated so often, as is sufficient to remove the Gout to the Extremities, without raising any greater Degree of Fever, or any greater Orgasm in the Blood, than what is sufficient for this Purpose.

It sometimes happens, that, after Vomiting and Purging, the Gout discharges itself upon the Extremities, and becomes regular, especially in robust Constitutions; and then nothing remains farther to be done, but to take care, that it discharges all its Fury there, and that it remains where it is.

But as many Difficulties often occur, before the gouty Matter can be brought to fix upon the Extremities, it is necessary to point them out.

Sometimes, then, the Intestines are so contracted with Spasms, that very strong purging Medicines will have no Effect, nor in the least purge the Patient: In this Case, a Fomentation must be apply'd to the Abdomen, which must be occasionally repeated:

Take of the Tops of Southernwood, and Mugwort, each an Ounce; of the Roots of round Birthwort, and Chamomile-flowers, each two Ounces; of Bay-berries, an Ounce; of the Seeds of Caraway, and sweet Fennel, each half an Ounce: Boil in ten Pints of Spring-water to five; and to the strain'd Liquor add camphorated Spirits of Wine, a Pint. Make a Fomentation, to be apply'd, as hot as it can be endur'd, to the Region of the Belly.

After each Fomentation, let the following Liniment be rubb'd in:

Take of Soldiers Ointment, two Ounces; Oil of Turpentine or Tar, and Chymical Oil of *Rhodum*, each six Drops: Make into a Liniment.

Instead of using this, the whole Belly may be anointed with the *Galbanetum Paracelsi*, describ'd in *Riverius* from *Crato*, *Cap. de Colica*, and is as follows:

Take of Gum Elemi, Hedera, Galbanum, Oil of Bays, each equal Parts: Distil in a Retort by a Sand-heat; let the Water which comes over first, the clear Oil, and the thick Oil which comes over last, of the Consistence of Honey, be kept separate; the last of which is to be used.

It sometimes happens, especially in tender Constitutions, that, after purging, considerable spasmodic Contractions, and a great deal of Pain, will still remain, which is sometimes continual, and sometimes intermittent. These must be cur'd partly by the above describ'd Fomentations and Liniment, and partly by the following Clyster:

Take of Canary Wine, half a Pound; Electuary of Bay-berries, half an Ounce. This Clyster is to be retain'd as long as possible.

Sometimes the Intestines are so weak, that they will not bear Steel, but immediately throw off that, together with whatever other Medicines are join'd with it, by Stool. In such a Case, it would be adviseable to give the other Medicines without the Steel.

Sometimes not only Steel, but even testaceous Powders, will run off by Stool. When this happens, the Diarrhoea must be stopp'd;

stopp'd; for there is no Hope of the regular Gout whilst that continues: And therefore we must, upon this Occasion, call in to our Assistance *Japan Earth*, *Chalk*, *Dragon's-blood*, *Venice Treacle*, *Electuary of Bay-berries*, and the above-mention'd Species taken from the Vegetable Kingdom, as also the Chymical Oils, in order to put a Stop to it.

As soon as a Medicine is found out which will agree with the Patient's Stomach, he must continue the Use of it for two or three Days; and if, in that Time, there is no Appearance of the Gout in the Extremities; we must call to our Assistance stimulating Plaisters, Cerats, or Cataplasms: And even after the Gout appears in the Extremities, it will be convenient to continue the internal Medicines till it is entirely fix'd there, and has quite left the Intestines. And when this Point is gain'd, we should still continue the Medicines, either in half the former Dose, or else repeated half as often, for four, six, or eight Days; that is, till we have Reason to believe the Intestines out of Danger from any Revisit from the Gout.

Mean time, 'tis very agreeable to observe, that as soon as the Gout is once fix'd upon the Extremities, all the Complaints of the Intestines suddenly vanish, and a certain Sprightliness returns to the Eyes, and appears in the Countenance; as does also a good Appetite, and due Digestion.

During this whole Course the Patient should have a most exact Diet prescrib'd him.

Panada, Jelly of Hartshorn, of Ivory, Biscuit, Chicken-broth, are very proper; but Wine is particularly useful, either by itself, or mix'd with the White Decoction.

But very great things may be expected from a plentiful Use of Wine, in the Cases of such as have been much used to it. But the very best Sort is red Port, of which the Patient may be allow'd to drink from half a Pint to a Quart in a Day and a Night, as Occasion requires. Mean time, if there is any considerable Costiveness, which is very common, the Patient should, every other Day, have a lubricating Clyster, either of Oils, or Mutton-broths. It is to be observ'd, that sometimes, tho' the Intestines are entirely deliver'd from the Gout, and it is driven into the Extremities, the Belly is inflated with Wind, and is still full of Pain, so as to make the Patient almost out of Hopes of a Recovery. But as this is only owing to a Flatus, (*Wind*) and the Weakness which the Distemper has left, it may be generally cur'd by this Clyster, continued every Day, or every other Day.

In this Case also the bitter Infusion, and such sort of Stomachics as increase the Appetite, and mend Digestion, are very useful.

In order to prevent Returns of this Disorder, the Patient must eat sparingly, and do all he can to promote Digestion. He must frequently take some gentle Purge which is stomachic, and must use other stomachic and gently restraining Medicines.

The Mineral Waters, both purging and diuretic, have been of signal Service to many; and many others have found great Benefit by taking, twice or three times a Year, either the *Alford Waters*, purging Salts, or *Tartarum Laxans*, dissolved in *Barley-water*. Some have found Relief by mixing the purging with the diuretic Waters. The *Bath Waters* have long been esteem'd good against the Colic, and are particularly useful in this Species of it. In the Intervals betwixt the Use of the diuretic Water, some proper Alteratives are to be taken; as, at ten in the Morning, a Draught of a bitter Infusion; made with white Port; as also every Day, after Dinner, some Spoonfuls of the same Wine alone. At five in the Afternoon a Dram of the following Electuary, with any convenient Vehicle, will be proper:

Take of the Conserve of Hips, or of red Roses, pass'd thro' a Sierce, *Roman Wormwood*, Ginger candied in the *Indies*, each half an Ounce; Salt of Steel, four Scruples; Syrup of Ginger, one Ounce and a half; Chymical Oil of Cinnamon, five Drops: Make into an Electuary. Or,

Take of Hedychroi Troches, and Conserve of Orange-peel, each half an Ounce; Salt of Steel, one Dram; Species Diabribæ, one Dram; Alcohol Martis, three Drams; Syrup of Wormwood, a sufficient Quantity: Make into an Electuary.

But forasmuch as this Colic generally takes its Rise from external Cold, we are to guard against it by warm Cloathing, and avoiding the Inclemencies of the Air.

It must be added, that People of an advanced Age, who have once had this Distemper, and have been hinder'd, either by their Business or Pleasures, from preventing a Return, have seldom fail'd to pay for this Neglect, either with their Health or Life.

Musgrave, in Confirmation of his Doctrine, very justly quotes a Passage of Hippocrates, from the sixth Book of Epidemics, Sect. 4. It runs thus, *ὅτι ἡ νόσος ἐν τῇ ἐξέσει ἀφ' ἑκτονος ἐγένετο, ἢ νουχάτερος ἐπεί τ' αὐτὸν ἰατροὺν, καὶ νοσητέον.*

certain Person, having a Pain in his Intestines, on the Right Side, being seiz'd with the Gout, became better; but when he was cured of this, he relapsed into his former Pain, and grew worse.

This Hippocrates repeats at the latter End of his Treatise *μετ' ἡμῶν*.

Musgrave might also have taken Notice, in Confirmation of his Practice, that Hippocrates, in the second Book of Epidemics, directs, when there is a slight Ileus, (*ἐίλεος*) that is, Pain in the Ileum, the Patient must drink a reasonable Quantity of unmix'd Wine, till he falls asleep, or perceives a Pain in his Legs.

If there is a thick white Crust upon the Surface of the Blood, after 'tis drawn away, it abundantly confirms this Colic to be Arthritic; because in the genuine Colic it is not usually so.

However, in an Inflammation of the Intestines, which is often mistaken for the Colic, the Blood generally appears fizy.

In History 3. Musgrave gives an Account of an old gouty and paralytic Gentleman, who, upon a Suppression of a Discharge of the Saliva, which had for a long time been considerable, and a Cessation of the Gout, and Swelling of the Feet, which had for many Years been very great, had this Colic; but upon purging, and taking *Goddard's Drops*, and *Alcohol Martis*, the Gout, Salivation, and Swelling of the Feet, return'd, and he was cured of the Colic.

The Purge he took was Calomel, with Refin of Jalap, and *Extractum Rudii*.

Hist. 8. he tells us of a Gentleman who was afflicted with the Gout for twenty Years, who, every Autumn that he mis'd having the Gout, had an Epiphora, which discharged an acrid and pungent Serum from the Eyes, for six or eight Weeks.

AN ARTHRITIC DIARRHOEA.

If a Person, long used to the Gout, in the midst of his Fit, falls into a Diarrhoea, and at the same time the Pain and external Swelling decrease, and soon entirely vanish, 'tis very evident, that this Diarrhoea is Arthritic.

It also frequently happens, that before the Patient feels Pain in the Joints, the Diarrhoea diverts the gouty Humours from the Extremities, where it would otherwise fall, and carries it off by the Intestines.

This Diarrhoea, which anticipates the Fit of the Gout, is frequently found to be salutary, Health and Vigour returning after it; but this happens only in good Constitutions, where the Fibres are robust, and the Spirits firm.

But the Cases where this Diarrhoea is most frequent are, when either a Purge has been given, or else when the Intestines are loaded with Crudities, which stimulate, and find a Passage for themselves, together with the gouty Matter.

The Event of this Diarrhoea is extremely uncertain; for if it stops in time, and is not excessive, it very often proves of Use, as it carries off the gouty Matter by a Way that is safe enough, tho' not the most common; and it has this Advantage attending it, that the Paroxysm does not return of a long time after it.

But in those whose Viscera are debilitated by Debauchery, so as to render Nature incapable of moderating the Crisis, it sometimes becomes so excessive as to destroy the Patient.

In this Diarrhoea nothing is more foolish nor dangerous, than to do too much; for an officious Diligence disturbs Nature, and interrupts her in the Work she has begun, when it is better to leave her to herself, and permit that to be discharged, which, if retain'd, would do Mischief.

But if the Diarrhoea becomes too excessive, and is too great for the Patient's Strength, it must be moderated by Astringents, and the Strength must be kept up by Cardiacs.

But whether the Diarrhoea stops of its own Accord, or is stopp'd by Medicines, after some time the Relicts are to be purg'd off by the Purging Waters, with an Addition of *Tartarum Laxans*, or Manna, if the Case requires such Addition.

If this Diarrhoea should happen from taking a Purge, Medicine in this Case, as in the former, is unnecessary, we having only to guard against an *Hypercatharsis*.

But in case this Diarrhoea arises from Crudities, which is, of all, the most dangerous Case, it must be treated in a different manner. Here it sometimes happens, that the Stomach is loaded, and then a Vomit of Tea, or Carduus, may be proper. After which, or without one, a gentle Purge should be given: And then recourse must be had to Restraining, and such Medicines as will moderate the Diarrhoea. Let the Patient take, every fourth, fifth, or sixth Hour, a Bolus of

Diafcardium, Species of the Confection of Hyacinth, astringent Crocus of Mars, *Japan Earth*, and Syrup of Roses. After which let him drink a Draught of the Cretaceous Julap.

Let the Patient have also a Clyster of *Canary Wine*, Jelly of Starch, or Diafcardium.

Let the Belly also be frequently fomented with a Decoction of the Roots of Bistort, Tormentil, and Balaustines, made in strong Beer.

Let his Drink be the White Decoction, or an Infusion of red Roses, and sometimes some red Wine burnt.

If the Pulse will permit, Opiates are of excellent Use, as a few Drops of Laudanum, or about a Grain of Opium, with half a Dram or two Scruples of *Venice Treacle*.

If there should be any Danger of the Diarrhoea running into a Dysentery, let the following Emulsion be taken :

Take of calcin'd Hartshorn, half an Ounce ; Gum *Arabic*, and Tragacanth, each two Drams : Boil in three Pounds of Rice-water, of the third Decoction, till they are reduced to two. Let the strain'd Liquor be pour'd upon decorticated sweet Almonds, and white Poppy-seeds, during the Time they are bruising : Then strain the Liquor a second time, and give it an aromatic Flavour with strong Cinnamon-water : Then edulcorate it with Sugar.

When the Patient is much reduc'd by the Diarrhoea, Vomiting and Purging must be omitted ; and Cardiacs and Astringents only must be used.

But to whatever Cause this *Arthritic Diarrhoea* owes its Origin, the best and most pleasant prophylactic Cure is that by the Steel-waters, to which some Preparation of Steel should be added ; and, amongst all the Preparations of Steel, the *Alcohol Martis* is the best.

In his sixth *History*, *Musgrave* mentions frequent Oscitation as a Fore-runner of a *gouty* Diarrhoea, in a certain Person he mentions.

AN ARTHRITIC DYSENTERY.

An *Arthritic Dysentery* principally seizes upon those who have a thin Habit of Body, and particularly weak Intestines, and are used to the *Gout*.

An *Arthritic Colic* generally precedes this Distemper, and when the Fibres of the Intestines are weaken'd by frequent Fits of it, and either some external Cause forces the *gouty* Humour inward, or some internal Cause invites it thither, it falls with Fury on the Intestines, by the Coeliac and Mesenteric Arteries.

Hence arises a gnawing and eroding Pain, with a quick Pulse, and a small Fever. If, at the same time, there is any *Gout* in the Extremities, it immediately vanishes, and all flies to the Intestines ; and there, breaking the distended Arteries, the extravasated Blood is pour'd into the Intestines ; and is thence thrown out by the Anus, and sometimes by the Mouth, in the Quantity of a Pint, and sometimes two. Great Languors immediately succeed this, and Loss of Strength ; the Extremities grow cold, the Patient falls into frequent Deliquia, and his Life is in imminent Danger.

The Pain is eased by this Evacuation ; and if the Patient can sustain the Violence of the Fit, he grows easy, and is for some time free from any Fit of the *Gout* : For after the *gouty* Matter has been in this manner discharg'd, a new Fit cannot happen, till new Matter is form'd in the Blood.

This Distemper is not always content with one Visit, but oftentimes returns, and exactly resembles the *Gout* in regard to its Periods ; and sometimes the first time, sometimes at its Return, leaves an Ulcer or Abscess in the Intestines.

The Patient must rest either in Bed, or in a Chair, whilst the Paroxysm lasts, lest the Motion should exagitate the Blood, and increase the Flux.

Mean time, it may be of vast Prejudice to give Cardiacs in Quantities large enough to inflame the Blood, and by that means increase the Disorder. They must therefore be carefully given, and only in such Proportion as is sufficient to support the Spirits, and keep off a Deliquium.

In case the Discharge becomes too considerable to be easily supported, it must be stopp'd by Laudanum : And therefore some Laudanum should be held upon the Tongue, and in the Mouth ; and must be continued in this manner till the Flux ceases ; for if it goes into the Stomach, it will immediately be return'd by Vomit.

Our Author has often found the White Decoction of great Service : It must be taken in small Quantities, and often ; and the Patient must take nothing else for some time, either of Food or Medicine.

As Care must be used, on one hand, that the Intestines are not too much open ; so, on the other, they must not be contracted ; and if the latter happens, they must be gently relax'd. It must be remember'd, that this Dysentery is critical, and that therefore an Error, on either Side, is attended with Inconveniencies, so that a Medium is best ; and this Mediocrity must be discover'd and obtain'd by having a proper Regard to the Patient's Strength.

It often happens, that after the *Gout* is expell'd by these bloody Stools, all is easy and quiet ; but in case it happens otherwise, and the Dysentery continues, it is proper to give

such Remedies as will stop it, and contract the Wound of the Intestines. As,

Tincture of *Japan Earth*, dropp'd into the White Decoction, or into some vulnerary Decoction ; or the Balsam of *Lucatellus*, with Olibanum, Mastich, Dragon's-blood, and the astringent Crocus of Mars ; or with the true Bole, in the Form of Pills ; or with Conserve of Hips, or red Roses, pass'd thro' a Sierce, the Species of the Confection of Hyacinth, with Syrup of dry'd Roses, in the Form of a Bolus, to be taken in the same Vehicle.

Let the Abdomen be fomented with Stuphs wrung out of a restraining Decoction, with an Addition of red Wine.

If the Vein, from whence the Blood is discharg'd, happens to be near the Anus, a Clyster of the Jelly of Starch, or some such gluish Medicine, should be injected, and retained for a long time. Mean time all Acids are to be avoided as pernicious, by reason of their Stimulus.

Let the Patient's Diet be Jelly of Hartshorn, or Ivory, or Calves Feet, poach'd Eggs, Rice boiled in Milk, or Cremor of Rice ; and such sort of things which nourish, incrassate, and agglutinate Wounds.

It is easy to perceive, that the Cure of this *Arthritic Dysentery* is very different from that of a common Dysentery ; for the latter requires repeated Purging, whereas the former seldom admits of any purging Medicines at all.

The *Tunbridge*, *Bampton*, or such sort of chalybeate Waters, are the best Medicines that can be used in order to guard against a Return, especially if some Preparation of Steel, with Restringtons, are taken at the same time.

In *Hist. 1.* *Musgrave* tells us, he directed a Sheepskin, just taken off, to be apply'd to the Feet, in order to invite the *Gout* thither.

In *Hist. 2.* he gives an Instance of his directing *Venice Turpentine*, with Powder of Marshmallows, in a Bolus, twice a Day, in order to heal the Wound in the Intestines, which the Dysentery had made, or rather the *Gout*.

ARTHRITIC OR GOUTY ABSCESSSES OF THE INTESTINES, see under the Article ABSCESSUS.

ARTHRITIC MELANCHOLY.

This sort of Melancholy affects those People most, who are of soft, tender, and delicate Constitutions, who are naturally timorous, or who from any other Cause have been inclined to Melancholy from their Infancy. These, whilst they have regular Fits of the *Gout* in the Extremities, are, during the Intervals, very chearful and well ; but when the Paroxysms either altogether cease, or are insufficient to carry off the *gouty* Matter, but particularly when the *Gout* seizes upon the Stomach and Intestines, the Appetite and Digestion begin to be deprav'd. Then the Patient is troubled with Hypochondriac Wind, Murmurings in the Intestines, Distention of the Præcordia, and sometimes an almost continual Pain of the Intestines. Hence, by the Consent of Parts, the Brain and nervous System is affected, and the Patient becomes melancholy. Nothing can be more miserable than the State of these unfortunate People ; for they neither sleep nor eat, and are so dejected, as to be even weary of their Lives, and will not so much as hope to be ever in a better State.

No Species of the anomalous *Gout* is more chronical than this, nor scarce any more frequent. It generally begins about the forty-fifth or fiftieth Year, and seldom leaves the Patient entirely, unless Medicine effectually interposes ; but returns at Intervals, and those often very short ones. However, when the *Gout* is worse, this Melancholy is better, and *vice versa*.

Musgrave distinguishes between the *Melancholia Arthritica*, and the *Arthritis Melancholica* ; the former being, according to him, a *Gout* terminating in Melancholy ; the latter, Melancholy terminating in the *Gout*. The Cure is to begin with unloading the Stomach and Intestines of the Mass of undigested Humours contained therein, by a Vomit, if necessary, and Purges of the milder Sort, as Tea and Carduus Posset-drink for a Vomit ; as Rhubarb, the Tartar Pills of *Bontius*, the Stomachic Pills with the Gums, or something of this Kind, for a Purge.

The Evening after the Operation of the Purge, a Cardiac must be given instead of a Purgative ; and afterwards, when we come to Alteratives, they must be given in a Quantity sufficient to expel the *Gout* from the external Parts into the Extremities.

In order to prevent a Relapse, the Diuretic Waters must be drank regularly for a considerable time ; and if the *Gout* does not return regularly at Spring or Autumn, or both, spontaneously, Fits must be procured by Medicines proper for that Purpose. Mean time the Patient must be extremely regular in point of Diet ; a gentle Purge must also be frequently given, in order to carry off any undigested Remains of the Aliment. *Musgrave* recommends the following, which he calls *Pilula Melancholica*.

Take

Take of the Pills of *Macrus*, (in the old *London Dispensary*) and of the Stomachic Pills, with the Gums, each one Dram and an half; of the Pills of *Rudius*, one Dram; Resin of *Jalap*, half a Dram; Chymical Oil of *Cinnamon*, ten Drops; Balfam of *Peru*, a sufficient Quantity: Form into a Pill.

The Dose is half a Dram, to be taken every Morning once a Month; or instead of these, the Laxative Tartar and Manna, each in the Quantity of half an Ounce or an Ounce, dissolved in a Quart of any purging Water, may be taken.

A Paregoric must be given at Night after each of these Doses, taken by way of Prevention.

Nothing is more serviceable in this Case than Exercise, particularly Riding.

N. B. The Cases which *Musgrave* relates are worth observing, in one of which, in order to clear the Head, he recommends the following Snuff:

Take of the Stalks of Tobacco, one Dram; Tops of *Margoram*, *Rosemary*, and *Sage*, each half a Dram; Root of white *Hellebore*, one Scruple; Musk, two Grains: Of all these dry'd make a Powder for an Errhine.

An ARTHRITIC SYNCOPE.

The Gout often causes a Syncope, especially after drinking cold and thin Liquors, or eating any thing which the Stomach is not able to digest.

In this Case the Patient first finds himself ill all over, then grows pale, and breaks out into a cold Sweat. His Pulse is weak, slow, and unequal, and sometimes intermits; at last he faints away, and loses all Sense and Motion. Mean time if there were any Signs of the Gout in the Extremities, it instantly retires, and the Patient dies, without immediate Assistance.

The best Medicines are Cardiacs in very large Doses, and a liquid Form, to be repeated often. *Musgrave* recommends the *Aqua Hispanorum Arthritica*: Or the following Julap:

Take of Compound Wormwood Water, twelve Ounces; Spirit of Mint, and Compound Spirit of Lavender, each two Ounces; and of the finest Sugar, a sufficient Quantity: Mix up into a Julap.

The Dose of this is half an Ounce, an Ounce, or two Ounces, to be repeated as Occasion requires.

With the first or second Dose of this may be given the following Bolus or Powder:

Take of *Venice Treacle*, half a Dram; Flowers of *Sal Ammoniac*, half a Scruple; Conserve of *Rosemary-flowers*, one Scruple; Syrup of *Citron-peel*, a sufficient Quantity: Make into a Bolus: Or,

Take of Powder of *Virginian Snake-root*, half a Scruple; *Species Diambrae*, one Scruple, or one Scruple and an half; of *Long-pepper*, three, four, or five Grains; of Chymical Oil of *Cinnamon*, one Drop: Reduce to a Powder.

For want of these Medicines, burnt Brandy will answer the End; or succinated Spirit of *Hartshorn* may be added to the Cordial Waters, for the same Purpose.

Mean time Frictions must be used; and Stups immersed in hot Wine or Brandy must be applied to the *Scrobiculum Cordis*, and all over the *Abdomen*, which must frequently be renew'd.

This Method must be pursued till the Patient comes to himself, and is recovered, which however seldom happens till the Gout is forced into the Extremities, and fixes there.

If the Patient has eaten any thing difficult to digest, and is inclined to vomit, as soon as he comes a little to himself, it should be brought off his Stomach, by a Decoction of Tea or *Carduus*. But if he is so bad, that there is no Time to lose, he must drink a large Quantity of Wine, in a very little time, that it may answer the End of a Cardiac, and at the same time of a Vomit.

If these Fits return frequently, the Patient must always have some Cardiac Waters by him, to take as soon as he finds himself disordered.

These strong Waters, though extremely injurious to People in Health, are, however, excellent for old gouty People, who have been accustomed to drink Quantities of Wine, and are troubled with this sort of Syncope.

In a Case of this sort *Musgrave* gave a Patient a few Grains of *Alcohol Martis* with his Julap, after he began to complain of a Pain in his Foot; the Consequence of which was, that in a few Hours, before he had taken a Scruple, his Pulse became more quick and strong; he began to be very hot all over; the Hemorrhoidal Veins discharged some Blood; he had great Thirst, a violent Agitation of his Spirits, and Swelling with Redness in his great Toe.

VOL. I.

He then blistered him in several Places, and apply'd a Plaister to his Toe, made up of equal Parts of *Burgundy Pitch*, and *Cephalic Plaister*, and put the Whole of the Foot in a Sock of green Cerate, tying it on with a woollen Roller.

Soon afterwards the Gout seized his Shoulder, whilst he all along used the Cordial Waters internally; and in order to invite it thither, he apply'd to the Part affected a Plaister of Gum Caranna.

The STONE in the KIDNEYS from the GOUT.

This Distemper is easily distinguish'd from the *Arthritic Colic*; for in this there is no Difficulty of Breathing, no acute Pains about the umbilical Region, no Melancholy, nor Discharge of crude, acid, and bilious Matter by Vomit, which are Symptoms of the other.

The Method of Cure of the Stone, attended with the Gout, differs from the Cure of the Stone without it in some Particulars: For in the former, we must be very cautious of Bleeding, and of using acid Medicines; nor must we apply Fomentations, Liniments, and Cataplasms, to the Back, especially if the Patient has a Fit of the Gout at the same time.

But a Paregoric may be given in such a Dose, and repeated so often, that the Pain may be eased without prejudicing the Head by driving the gouty Matter upon it.

But if the Stone happens in a gouty Constitution, without being accompanied with a Fit, the Method of Cure is different; for then the Patient must lose some Blood, especially if he is Plethoric; and soon after let him have the following Clyster:

Take of the common Clyster Decoction, and new Oil of sweet Almonds, each half a Pound; of *Venice Turpentine* dissolved with the Yolk of an Egg, one Ounce. Let it be injected.

Next Day give a Purge of Lenitive Electuary, or *Rhubarb*, or Manna, dissolved in a Decoction of *Sena*: At Night give as much of *Matthew's Pills*, as contains one Grain of Opium.

If the Pain is very violent, in order to relieve it, and prevent Spasms of the Intestines, a Paregoric may be given a few Hours before the Purge; and if it does not operate, give a Clyster.

When the urinary Passages are by these means dilated, the Stone must be brought away by *Opobalsamum*, or the Balfam of *Chili* or *Peru*, taken two, three or four times a Day, in Syrup of *Marshmallows*, or the balsamic Syrup.

The Dose of *Opobalsamum* is half a Scruple.

Mean time the Patient may drink soft Ale like that commonly called *Grout-ale*, or Apozems made of the Roots of *Marshmallows*, *Liquorice*, and *Eringo*, *Pearl Barley*, &c. or other things of a like Nature, or Green Tea, or Emulsions made of sweet Almonds, and the above-mentioned Decoction or Apozem.

Musgrave recommends an Emulsion made of ten sweet Almonds, and two Pounds of the Infusion of Tea, with the Addition of *Rose-water*, or *Cinnamon* or *Barley-water*, and a sufficient Quantity of fine Sugar; or a proper Liquor may be prepared of *White-wine*, Oil of sweet Almonds, and fine Sugar.

This Author recommends, by way of Prophylactic, *Bristol Waters*, taken with *Opobalsamum*, and some lubricating and diuretic Syrup; or for want of these Waters, green Tea every Morning.

It has however been found, that sometimes the *Bristol Waters* cause stony Concretions, and increase the Disorder.

Musgrave says, he knew one who in some measure kept himself free from the Stone, by taking three or four times a Year one Dram of *Venice Turpentine*, reduced to the Form of Pills by the Addition of *Liquorice-powder*; after which he drank some Pints of Small-beer or Posset-drink, and immediately rode four or five Miles upon a trotting Horse.

Lenient Purges must always precede Diuretics.

In case of a Dysury proceeding from Spasms of the urinary Ducts, nothing is more efficacious than Opiates joined with Diuretics.

The Dose of *Peruvian Balfam* is ten Drops taken in a Spoonful of the balsamic Syrup twice, or at most three times, a Day.

An ARTHRITIC ASTHMA.

Those People are subject to an *Arthritic Asthma*, who have a bad Conformation of the Breast and Organs of Respiration; and those whose Parents were Asthmatic, or *Arthritic*, or both, are most subject to this Disorder.

An Opiate improperly given, any thing that repels the Gout from the Extremities, a sudden Suppression of any habitual Evacuation, either of Blood, the *Lochia*, or from an Ulcer, cause this sort of Asthma; and it often happens, that an Asthma immediately follows a regular Gout, when the Fit has by any means

means been shortened; as a Fit of the *Gout* often cures an Asthma.

Arthritic Asthmas, like others, are of two Kinds, the dry and moist Asthma: In the former the Patient's Respiration is very short and difficult, gasping as it were for Breath, with a great Oppression of the Breast; mean time he has very little, if any Cough, and spits but little. Those who have used themselves to drink Brandy, and such spirituous Liquors, are most subject to this Sort.

In the moist Asthma the Patient coughs up generally a thick, viscid Matter, by which he is relieved, till a fresh Supply is furnished by the Blood. This commonly affects People of a thin, lax Habit, and principally in Autumn.

Musgrave says, the *Arthritic* Matter is cough'd up inviscated as it were in this Phlegm, insomuch that he has known several *gouty* People preserved from more dangerous Distempers by this Discharge, when regular Fits on the Extremities have been wanting.

This Author imagines, that in a dry Asthma the *Arthritic* Matter is fixed upon the Membranes, Nerves, and Muscles of the Organs of Respiration; and in the moist Asthma, that the same Matter is mixed with the Serum of the Blood.

Sometimes the *Gout* appears originally in the Shape of an Asthma, with much the same Symptoms as those which attend a genuine Asthma, from which it is not easily distinguished, till in Process of Time the *Arthritic* Matter falling upon the Joints sets the Lungs at Liberty.

The Prognostics in an *Arthritic* Asthma are different from those in a genuine Asthma; for whereas in the latter young Men are said to be cured with Difficulty, and old ones not at all; in the former, Patients are more easily relieved, more frequently freed from it, and sometimes so as not to return again. However, the dry Asthma is much the most dangerous, and often suffocates those whom it seizes.

The Cure is to be attempted by Evacuations, or by forcing the *gouty* Matter upon the Extremities. Amongst Evacuations Bleeding is most proper for Plethoric People, and Purging for such as have indulged themselves in eating.

When the Strength will permit, take nine Ounces of Blood from the Patient; and soon after give a Clyster. The next Day give a Purge of Aloes, Pilulæ Cochiae, or some such Cathartic, without any Paregoric at Night after its Operation.

After these Evacuations, Spirit of Hartshorn, Flowers of Sal Ammoniac, and such-like Volatiles, are of great Service in a dry *Arthritic* Asthma.

Take of Gascoign's Powder, and Conserve of Colts-foot, each one Scruple; Flowers of Sal Ammoniac, half a Scruple; of balsamic Syrup, a sufficient Quantity: Make a Bolus, to be taken every fifth or sixth Hour in a proper Vehicle.

In the moist *Arthritic* Asthma Vesicatories apply'd between the Shoulders very much relieve the Lungs. Preparations of Sulphur, such as the balsamic Tincture of the Flowers of Sulphur, dislodge the Phlegm, and at the same time expel the *Gout*. Gum Ammoniac, Gum Bdellium, Balsam of Peru of *Cbili*, and of *Capivi*, produce the same good Effect.

Give twenty Drops of the Tincture of Sulphur in a Spoonful of balsamic Syrup, and repeat the Dose every six, nine, or twelve Hours; or prescribe ten or fifteen Drops of the following Balsam in the same manner:

Take of the Tincture of Gum Guaiacum, and of Balsam of Peru, equal Parts: Mix together. *N. B.* This is like the Balsamum Polychreston.

Though Clysters and Purging may properly enough be repeated in a genuine Asthma, in the *Arthritic* Sort 'tis never to be prescribed more than once, for fear it should hinder the *gouty* Matter from falling upon the Extremities.

In both the dry and moist *Arthritic* Asthma, the Patient must persist in the above-mentioned Remedies, till his Lungs are easy, and he respire without Difficulty.

The Cough may sometimes be relieved by the common expectorating Medicines, such as Oil of sweet Almonds, Linseed Oil, the balsamic Syrup, or Syrup of Maiden-hair.

In case the Fit is very violent, and not to be relieved by the above-mentioned Remedies, give Oxyssel of Squills, either by Spoonfuls at certain Intervals, or in a Dose sufficient to operate by way of Vomit, which helps to remove the *gouty* Matter to the Extremities; for *Musgrave* says, he has often known an irregular *Gout* made regular by one Vomit.

This Author recommends the Smoke of Tobacco, Coffee, and Frictions; but says Unguents and Liniments, which are recommended for a genuine Asthma, are here of no Service.

By way of Preservative, *Musgrave* recommends, in a moist Asthma, Diuretics and Antiasthmatics, after previous Cathartics, scapulary Issues, and Vesicatories, especially those made perpetual.

In the dry Asthma he recommends Steel joined with Antiasthmatics, as Gum Ammoniac, &c.

In both Sorts fresh Air is of great Service; as is also an exact Regimen, avoiding various Kinds of Diet, and keeping to simple Aliment.

The Piles are of great Relief in this Disorder.

Some Patients breathe with most Difficulty when the Wind is in the East or North-east. 'Tis not proper for Patients under any of these Disorders to eat Suppers.

An ARTHRITIC CATARRH, COUGH, and PERIPNEUMONY.

Those are most subject to these Disorders who have naturally a bad Conformation of the Breast, and a tender Constitution, or whose Lungs have been hurt by a Blow, Fall, Vociferation, or violent Exercise; or those whose Parents were Consumptive or Asthmatic.

'Tis very difficult to distinguish when the *Gout* is the Cause of these Distempers in such as have never had it in their Extremities; but as the Distempers of the Parents may give us some Light in this Affair, 'tis prudent to have them always in view.

When People that have been used to regular Fits of the *Gout* have them more seldom or more mild than usual, or the Fit is interrupted by an external Cause, as improper Applications to the Part, Cold, &c. there frequently comes on a Heaviness of the Breast, and Infarction, Shortness of Breath, a Titillation of the Aspera Arteria, a Cough, and thereby a Discharge of Matter, at first very thin, and afterwards more thick; and these Circumstances assure us, that the *Gout* is the Cause of the Disorder.

Sometimes, though the Fit is not interrupted, these Accidents will happen, because it is too mild; and this may make it doubtful, whether the *Gout* is the Cause or not; but a regular Fit returning some time after with greater Violence, frequently manifests the true Cause.

Old Men, and those of a middle Age, are most subject to these *gouty* Disorders of the Lungs; but young Men seldom are troubled with them.

Women are seldom affected with these *gouty* Symptoms before they have born Children, or before the Catamenia cease.

The Spitting is, at first, but small in Quantity, and that thin; but in a little time increases, and that so much, as to oppress the Breast greatly, and stuff the Lungs, at the same time causing Hoarseness, and Difficulty of Breathing; and if it lasts for a long time, wastes and weakens the Patient, and at last destroys him.

The *Gout* in the Extremities decreases, as the Spitting increases.

Though this Discharge by Spitting, provided it is not immoderate, is found generally to be of Service; yet in extreme old Age 'tis sometimes too great, so as to weaken, and at last destroy the Patient; but this seldom happens.

All these Disorders are relieved by a regular Fit falling upon the Extremities; and as that increases, these decrease, and vice versa.

A Cough is the most frequent of all these Accidents, and generally follows a regular Fit; but seldom accompanies it, unless in very *Arthritic* Constitutions, and where the Lungs are at the same time weak.

This Cough sometimes ends in a regular Fit, especially if assisted by some brisk Cathartic, that is capable of exagitating the Blood.

Sometimes a Cough is very troublesome for four or five Days before a Fit, and may be looked upon as one of the preceding Symptoms thereof.

A Catarrh is always accompanied with an Asthma and Hæmoptoe, which, though it may affright the Patient, is not dangerous, provided the Lungs are naturally good, and are hurt by no Accident, and a proper Method of Cure is early applied.

These Coughs and Catarrhs have often their Intervals, and return by Fits when the *gouty* Matter abounds in the Blood. They most frequently happen in Autumn.

These Coughs are generally without any Fever, or are accompanied with a very slight one; but if the Patient takes Cold, or indulges himself in the Use of spirituous Liquors, there is Danger of a Peripneumony, the Signs of which are the same as those of a Peripneumony from any other Cause. But when it appears to be *Arthritic*, some regard is to be had to the Cause.

In all these Bleeding is proper, when nothing contra-indicates; in tender and weak Constitutions, it is scarce ever proper; in those worn out with Age and Diseases, never. In case of an Hæmoptoe or Peripneumony, Patients seldom recover when that is omitted; but upon these Occasions we must always bleed with Caution, for fear of rendering the Constitution too weak to expel the *Gout*, and throw it upon the Extremities.

The next thing to be done is to purge, which is serviceable in all these Disorders; but more particularly in a gross Constitution, or where the Intestines are loaded, and the Patient has lost no Blood. Those Purges are best, which exagitate the Blood considerably,

considerably; and help to move the *gouty* Matter. After these Evacuations, we must proceed to such Medicines as help to remove the *Gout* from the Lungs, and drive it to the Extremities, and with these Pectorals must be joined: For Example,

Take Alcohol Martis, and Balsam of Capivi, each half a Scruple; Conserve of Hips, one Scruple; Syrup of Maiden-hair, a sufficient Quantity; make into a Bolus: Or,

Take Flowers of Sulphur, or Benzoin, and Alcohol Martis, each half a Scruple; Gum Ammoniac dissolved, a sufficient Quantity; make into Pills.

Let this Bolus, or these Pills, be taken twice a Day in a Spoonful of Balsamic Syrup, drinking after it a Draught of the Pectoral Decoction, provided there is no Suspicion of a Fever. Let the Patient also take a little of the same Syrup frequently every Day.

If a liquid Form is more agreeable,

Take of the Syrup of Colts-foot, or Maiden-hair, half an Ounce; Tincture of Sulphur, ten Drops; to which, when well mixed, add of the Powder of Olibanum, and Alcohol Martis, each half a Scruple; Hyssop-water, two Ounces and an half; use as a Draught.

Instead of the Tincture of Sulphur, the following Medicines may be taken in their proper Doses.

Anisated Balsam of Sulphur, or Balsam of Sulphur prepared with Turpentine, Balsam of Capivi, of *Chili*, of *Gilead*, and that of *Peru*.

Musgrave says, when the Disorder has been inveterate, he has frequently given, with great Success, the *Peruvian Bark*, in order to prevent too great a Colliquation of the Blood.

Pectorals either in the Form of Troches, Eclegmas, &c. are proper to relieve the Cough.

If after three or four Days Use of these Medicines, no Signs of the *Gout* appear in the Joints, apply to the Part it usually affects, the Cephalic Plaster, either alone, or with an equal Quantity of Burgundy Pitch, or the Green Cerate.

But if these do not answer the End proposed, and the Lungs are not relieved thereby, more stimulating Applications must be used, as acrid Cataplasms, and Vesicatories. But in the Use of these, it must be observed, the weakest are always to be tried; nor are we to use the most severe, unless the Patient's Strength will permit them.

By way of Preservative, the Patient should have Issues opened in the Back; should contrive to breathe an Air that is dry, and agitated by the Winds; and should direct all his Endeavours to procure a regular Fit of the *Gout* at proper Intervals.

If this Method is omitted, or negligently pursued, the Cough grows worse, and the Body becomes emaciated; the Matter discharged by the Lungs, which was at first thin, grows more thick, and more difficult to cough up, and sometimes bloody: Hence the Lungs are exulcerated, and the Patient dies of a Consumption.

In an *Arthritic* Peripneumony there is much more Danger, and care must be taken in the very Beginning, or else it will afterwards be in vain. Therefore immediately let the Patient lose some Blood, a few Hours after give a Clyster, and the next Day a Purge; let the Patient also take, every Hour, Oil of Sweet Almonds, or Linseed Oil in the Form of a Linctus.

Emulsions and Decoctions, that are too cold, must be avoided; and if there is any Appearance of the *Gout* in the Joints, or any Hopes of bringing it thither, *Musgrave* advises Medicines which will promote it: He therefore recommends, from repeated Experience, Diaphoretics, and such external Applications as are likely to bring the *Gout* into the Extremities, contrary to the Opinion of *Sydenham*, which see in the above Quotations from that Author.

ARTHRITIC CONSUMPTION.

When the *gouty* Matter is repelled by any external Cause, and driven upon the Lungs, or is invited thither by the Weakness of the Part, the Patient is first seized with a Heaviness in the Breast, Difficulty of Breathing, and Hoarseness; then he begins to spit, first a thin Phlegm, which, by Degrees, grows thicker: In Process of Time his Flesh grows flaccid, he wastes by Degrees, and loses his Strength in proportion as the Discharge from his Lungs increases. Mean time, there is no *gouty* Tumor, or Pain, in the Extremities, or, at most, but very little, and that of a short Duration. The Paleness of his Face, and an universal Emaciation, daily increase; and the violent Cough, which attends it, sometimes brings on a Spitting of Blood. At last, an *Hectic Heat* comes on with a quick Pulse, and dry Skin, especially in the Evening, which is succeeded by symptomatic Sweats. So that at last the Patient is worn out by a violent Cough, great Spitting, colliquative Sweats, obstinate Diarrhoea, or, if there is no Diarrhoea, Swelling of the Feet.

A genuine Phthisis generally seizes upon young People; but that which is *Arthritic* rarely affects any but those who are old.

Women however are subject to it when they cease to breed; and the Catamenia leave them.

An *Arthritic* Phthisis is generally very chronical and slow, and is attended with an *Hectic Fever* only in the last Stage; whereas a genuine Phthisis is accompanied with an *Hectic Heat* from the very Beginning, and sometimes it precedes all the other Symptoms.

Sometimes a Cough does not end in a Consumption till after the *Arthritic* Matter has for several Years been changing its Situation, and falling alternately upon the Lungs, and Extremities.

Therefore, in order to adapt a proper Method of Cure to this Distemper, a Physician must carefully examine what Analogy it has with the *Gout*.

In the Beginning of the Distemper, when the Cough is troublesome, and a Phthisis is coming on, very good Effects are to be expected from Bleeding and Purging, if properly administered; for by these means the *gouty* Matter is sometimes evacuated, or at least removed, from the Lungs; but as this Effect is not perpetual, and cannot be depended on, these Evacuations must be used with Caution, and confined to proper Limits, lest the Constitution should be so far weakened by them, as to be rendered too weak to expel the *Gout*.

After either Bleeding, or Purging, or both, if necessary, or without either, if improper, we must have recourse to Pectorals, and Remedies calculated to expel the *Gout*. Let the Patient therefore take every other, or every third Hour, a Spoonful of a Linctus of recent Oil of Sweet Almonds, or Linseed Oil, with Balsamic Syrup, Syrup of white Horehound, Syrup of Turneps, or some other expectorating Syrup.

When there are no Signs of a Fever, let him take, with the Linctus, a proper Dose of Pills every sixth or eighth Hour, made of *Gascoign's Powder*, Alcohol Martis, Juice of Liquorice, and Balsam of *Peru*.

The Patient may take, in a liquid Form, ten Drops of the Balsam of *Peru*, or Tincture of Sulphur, in a Spoonful of the Linctus; and in the Intervals, six or eight Grains of Alcohol Martis.

These warm Medicines must be used in such Doses, and so often repeated, as the Expulsion of the *Gout* requires, and the Danger of the Fever will permit.

Musgrave assures us, he has never observed any great Danger from this Method, especially in old *Arthritics*, who are most subject to this Sort of Phthisis.

If the Fever is too much raised, either of its own Accord, or by the Use of warm Medicines; that is, if it runs higher than the Expulsion of the *Gout* requires, it must be mitigated by withdrawing these heating Medicines, by Clysters, by Bleeding, and the *Peruvian Bark*, together with such Medicines as are usually serviceable in a Peripneumony; and, when the Fever is conquered, the Patient must return to warm Medicines as much as the Circumstances will admit of.

After these Remedies have been used for two or three Days, or sooner, if any *gouty* Pain is perceived in the Extremities; stimulating Topics must be applied to the Part in Pain, or, if there is no Pain, to the Part which used to be most frequently affected.

Opiates, and such Medicines as render the Discharge from the Lungs thick, must not be used without great Caution, and in very small Quantities.

As soon as the *Gout* is expelled, and driven upon the Extremities, the Patient is surprisingly relieved, and the Lungs grow easy in proportion as the extreme Parts become painful. *Musgrave* says he has seen, by this Method, the Cough made tolerable, the Spitting diminished, and at last both entirely cured; insomuch that the Patient has soon recovered his Colour, Flesh, and Strength.

When these good Effects begin to appear, those Remedies which expel the *Gout*, and those Topics which invite it to the Extremities, must be obstinately persisted in, till the Lungs are entirely free.

As the Lungs are generally left weak, in order to prevent a Relapse, the Steel Diuretic Waters are excellent, as is also a good Air; therefore let them be drank for a Month; or, if that cannot conveniently be done, let half a Pint of Tea be drank every Morning for some Months, and let the Patient take a Diet-drink constantly, made with pectoral Ingredients, as Ground-ivy, Harts-tongue, Maiden-hair, Fir-tops, Cypress-tops, Burdock, Seeds of the Wild Carrot, Juniper-berries, and dried Millepedes. Let this be used for the Patient's ordinary Drink.

A Maritime Air is much recommended by *Musgrave*, because, he says, the Sailors are seldom affected with a Cough, and very seldom die of a Consumption.

Riding also is much recommended, and Frictions of the external Parts, and those pretty strong ones, twice or three times a Day, as also large Issues upon the Back. *Musgrave* also mentions Chocolate, either with or without the Yolk of an Egg, as a proper Food; and cautions particularly against taking Cold, and contracting Catarrhs; to guard against which, he orders,

orders, during the Winter Half-year, a Decoction to be taken twice a Day of Sassafras Wood with its Bark, and the Roots of China and Sarsaparilla.

Musgrave thinks Cyder does Hurt in this Disorder.

The ARTHRITIC QUINSEY.

Musgrave says this Distemper has yet been but very little considered by Physicians.

It often seizes the Patient at the very same time with the Arthritic Pain in the Joints; and frequently follows some little time after a regular Fit.

When it forms an Abscess, which discharges Pus plentifully, it supplies the Place of an Arthritic Fit, renders the Patient healthful and chearful, and frees him for some time from the Gout.

This Quinsey often ends in a Fit of the Gout, by a Translation of the gouty Matter upon the Extremities, which sometimes happens by Accident, and sometimes is procured by Art.

This Species of Quinsey those People are most subject to, that have short and thick Necks, and moist lax and weak Constitutions.

Women are not so often affected with it as Men; the latter generally have it about the middle Time of Life, the former after the Meneses have for some time left them; but in both Sexes, those whose Blood is bilious, hot, and thin, are most liable to it.

Musgrave is of Opinion it never happens to any body, unless when the Blood is full of the Arthritic Matter, and ready to break out into a Fit.

A greater Fever precedes this Quinsey than any other Species of Anomalous Gout; this is soon after succeeded by a Pain, and inflammatory Tumor, in the Fauces, which is sometimes so great as to prevent the Patient from eating, or drinking, or taking his Breath without the utmost Difficulty, for three or four Days; sometimes a great Quantity of Saliva is discharged from the Fauces, the Patient has no Stools, and the Blood, when taken away, appears extremely fizy, even more than in the regular Gout.

The gouty Matter is frequently transferred from the Fauces, and falls upon the Hand, Foot, Knee, or any other Part of the Body.

If a Nausea and Sickness of the Stomach, Heaviness, Torpor, and wandering Pains, have preceded this Disorder, there is great Reason to believe it proceeds from a gouty Cause, when these Symptoms happen to a Patient who has been used to violent regular Fits at stated Times, which have been interrupted for a long time.

The Method of Cure must begin with taking away a considerable Quantity of Blood: Presently after give a Clyster; the next Day give a Purge, which must be of the lenient Kind, because of the Fever, already too violent, which would be increased by one more stimulating.

After the Intestines are evacuated by one Purge, they should not be stimulated any more for four or five Days, for fear of inviting the Gout to them.

After the Operation of the Purge, apply a very large Blister to the Neck; twenty-four Hours after, apply to the vesicated Part Melilot mixed with powdered Cantharides, in order to continue the Discharge of Serum.

Incising and aperient Gargarisms are of perpetual Use from the very Beginning.

Take of Barley-water, one Pound; Diamoron, four Ounces; Spirit of Sulphur by the Bell, as much as the Tongue can endure; use as a Gargarism: Or,

To Honey of Roses, add Spirit of Salt or Nitre, so that the Tartness be not too great; let it be kept in the Mouth a little while, and then discharged with the Saliva.

But nothing is more effectual, or causes a greater Discharge of Saliva, than the following Powder:

Take of Sal Prunellæ, and Sugar-candy, each equal Parts; mix, and let a Scruple of the Mixture be held in the Mouth till 'tis full of Saliva; then spit it out, and about a quarter of an Hour, or half an Hour after, let it be repeated, provided the Patient is not asleep.

'Tis of great Service to receive into the Mouth the Vapour of a Decoction of the following Plants: Mugwort, Sage, Marjoram, Rosemary, Elder, Chamomile, Calamint, and Feverfew.

The next Day but one, or sooner, if the Symptoms run high, as Difficulty of Breathing, and of Swallowing, Bleeding must be repeated in the Jugular Vein, which is sometimes necessary more than once.

If the Throat is in great Pain, apply to it a Cataplasim of Marshmallow-roots, Mallow-leaves, and bruised Figs, boiled in Barley-water, adding three Ounces of this Magma:

Take of boiled Onions, one Ounce and an half; Linseed; half an Ounce; Crums of Bread, an Ounce; Oil of white Lilies, a sufficient Quantity.

Let the Mouth be frequently gargled with Milk and Water in equal Quantities.

If the Case grows so desperate, that the Patient would immediately be suffocated without instant Help, the Operation of Bronchotomy must be performed.

During the Use of these Medicines, all Methods must be used to bring the Gout into the Extremities. Therefore, after Purging, let the Patient be permitted to drink Cyder, White-wine, Rhenish, and such sort of acidish Liquors, and sometimes pretty freely.

Apply to the Joint which used to be most frequently affected with the Gout, a Plaister made of equal Parts of Oxycroceum, the Cephalic Plaister, and Burgundy Pitch; or, if more acrid Applications are necessary, stimulating Cataplasms.

Bathing the Feet in Water as hot as the Patient can bear it, invites the Gout to the Part.

As soon as any Tumor is excited, let it be wrapped in soft Flannel, or double Linen.

As soon as a Tumor appears in the Extremities, that of the Fauces generally subsides; and soon after Pain, with all the Signs of a regular Gout, returns, and the Patient soon gets rid of the Quinsey.

If a Vomica should be formed in the Throat, and break, an Emollient and Suppurative Gargarism must be used; for Example, of a Decoction of Barley, Liquorice, and Figs; and after that, one moderately restraining. Meantime, let the Patient live on Gruel, Barley-water, and such sort of thin Aliment. In the Day-time, let him abstain from lying on the Bed as much as possible. When he is in Bed, let his Head be elevated: When he is up, the Legs ought to hang down.

When the Case is over, let the Cure be finished with a lenient Purge.

The Cyder that is drank in this Disorder, should be generous and rough, such as that of Devonshire.

Musgrave says, that of all the Patients he has seen labouring under this Disorder, all but one were young Men.

This Author sometimes allows a Pint or two of Cyder in twenty-four Hours.

The ARTHRITIC HEAD-ACH and VERTIGO.

An Arthritic Head-ach generally seizes those who have been gouty for many Years, and who, being now past the Meridian of Life, indulge themselves too much in eating and drinking, and, at the same time, use but little Exercise, and hence become plethoric and gross. People that are full of Blood, are most of all subject to this Disorder, especially if they have short Necks.

This Head-ach is frequently preceded by the Signs of an approaching Fit of the Gout, which last for some Days, and then end in a regular Fit: But the Gout then receding, or being too languid, an Head-ach ensues, which lasts for many Weeks, and sometimes Months; and at last ends in an Apoplexy, unless the Gout is transferred to the Extremities, or, at least, removed from the Head; and, indeed, it seldom ends, except in a regular Fit, or an Apoplexy.

The Pain is sometimes not very great, but of long Continuance; sometimes excessive and intolerable, arising almost to a Delirium.

Sometimes the Patient complains of the Head-ach only; but 'tis commonly accompanied with a Vertigo, and sometimes with a Noise in the Ears, Difficulty of Breathing, a large Pulse, wandering Pains in the Limbs, and a florid Colour of the Face; all which Symptoms vanish as soon as the gouty Matter, falling upon the Extremities, causes a regular Fit.

An Arthritic Vertigo exactly agrees with an Arthritic Head-ach; the same sort of People are principally subject to it; it has the same Causes, is accompanied with the same Accidents, and is in like manner cured by a regular Fit.

A Vertigo is sometimes slight, and a Sign of an approaching Fit, ceasing when the Fit becomes regular. But 'tis sometimes very troublesome, insomuch that the Patient can scarcely walk without falling.

This in a little time ends in an Apoplexy, if a regular Fit does not happen time enough to prevent it.

Musgrave says, he never knew an Arthritic Vertigo terminate in an Epilepsy, which is very common in one of the genuine Kind.

The Cure must begin with Bleeding in both Cases, that of a Head-ach, or Vertigo; especially when accompanied with Dimness of Sight, Redness of the Face, and Pulsation of the Temporal Artery, which threaten an Apoplexy. But as in all Arthritic Disorders, so in this, regard must be had to the Gout; so that we are not to bleed so much, and so often, as in these Distempers when the Gout is not in the Case. This must therefore be regulated in such a manner, that enough may be taken away

away to relieve the Head, and no more, for fear of preventing the Expulsion of the Gout to the Extremities.

Sometimes the Gout begins to be felt in the Joints, immediately after Bleeding.

If there is any Complaint of Sickness at the Stomach, it may be proper to wash it with a Decoction of Tea, or Carduus Posset-drink, taken by way of Vomit.

Purge with Pilulæ Ruffi, the lesser Pilulæ Cochizæ, or the Pilulæ ex Duobus, with an Addition of some few Grains of Resin of Jalap, very soon after Bleeding or Vomiting, if that is thought necessary.

In Constitutions which are easily purg'd, a Solution of Cathartic Salt in Water, or the Alford Waters, are sufficient.

One Purge is not always enough, when its Operation is but gentle, or the Constitution is much loaded; it must therefore be repeated in such a manner, as to answer the End of removing the Gout from the Head to the Extremities.

After Purging, the Patient very frequently begins to feel Pain in the Extremities; but if he does not, we must proceed to such Medicines as remove the Gout into the Joints; but these must be used with great Care and Caution, lest, instead of answering the Design, they should drive the Blood, and with it the gouty Matter, more forcibly into the Head, increase the Disorder, and destroy the Patient. Therefore, we must abstain from powerful Chalybeates, and strong Podagragogues, and substitute the following Cephalics in their room; but even these must not be used, till the Heat has been much reliev'd by Bleeding and Purging.

Proper Cephalics, in this Case, are red Coral, simple or compound Powder of Crabs-claws, and white Amber: These, and such of this Class as are yet milder, may be taken by themselves, or made into the Form of a Bolus, with Conserve of Rosemary-flowers, Flowers of Betony, Syrup of Stoechas, simple Syrup of Piony; or they may be made into Pills, with Extract of Gentian, together with Powder of Dittany of Crete, Castor, or Piony-seeds.

After plentiful Evacuations, three or four Grains of Salt of Steel, or even Alcohol Martis, may be added to these Medicines, and repeated every six or eight Hours.

After each Dose, let the Patient take a Draught of a Julap made of the simple and compound Waters of black Cherries, Lime-tree-flowers, and Piony, with compound Spirit of Lavender: Let him take, once in the Intervals, a few Drops of the Tincture of Amber; or, if the Fever does not run high, of the Spirit of Sal Volatile Oleosum, or Hartshorn, in an Infusion of the Tops of Sage, Rosemary, or Tea.

To these may be added the Species Diambraz, without the Perfumes, or its Tincture.

Coffee is very good, especially if made with an Infusion of some Cephalic-Plant.

In like manner in an Arthritic Vertigo, after Evacuations, the following Medicines may be taken alone:

Powder of Rue-seeds, Male Piony, Castor, Valerian-root, Wild Cypress, Winter's-bark, Orange-peel, compound Powder of Rosemary-flowers, Species *Diamoschi dulcis*; or some of these may be made into an Electuary, with Conserve of Piony-flowers, or Syrup of Piony, or Syrup of Nutmeg candied in the Indies.

Pills may also be given, made of the *Pulvis de Gutteta* and *Ens Veneris*, with Extract of *Calamus Aromaticus*, or a Solution of *Asa-fetida*.

To these may be added Salt of Steel, or Salt of Amber; and these may be taken every six or eight Hours, in a moderate Dose; that is, in such a manner that the Spirits may be reliev'd, and not disturb'd thereby.

After each Dose of these, a Draught of the Cephalic Julap should be taken.

In the Intervals let one Dose of the above-mention'd Infusion be taken, with some Drops of Tincture of Amber.

Fetids, apply'd to the Nose, are also of Service, as Spirit of Sal Ammoniac, with Salt of Tartar, Castor, and *Asa-fetida*.

Things of a grateful Flavour have also sometimes a good Effect.

Musgrave advises to anoint the Temples and Nostrils with the following Balsam:

Take of the Chymical Oils of Rosemary, Lavender, Marjoram, Thyme, Origanum, Hyssop, each one Scruple; Oils of Cinnamon, Oranges, Angelica, and Rue, each one Dram; Oil of Amber, half a Dram; Oil of Cloves, half a Scruple; Oil of Nutmegs, by Expression, four Ounces; Ambergrise, two Drams; Musk, one Dram; Balsam of Peru, five Drams: Let the Ambergrise and Musk be laid upon a Marble; let them be moisten'd with the Oils, and levigated with the Stone for that Purpose, till they are reduced to a Mass of the Consistence of Pomatum. To this Mixture add some Peruvian Balsam, and

continue the Levigation for half an Hour: Then add the Oil of Nutmegs by Expression; and continue the Trituration for an Hour longer. Let this fragrant Cephalic Balsam be preserv'd for Use in a Phial.

After these Cephalic Medicines have been taken for a Day or two, in either of these Disorders, apply to the Joint commonly affected some stimulating Topic, as a Plaister, made of two Parts of Gum Caranna, one Part of yellow Wax, and a sufficient Quantity of the Oil of Worms: But if this is not sufficient, and the Disorder of the Head still remains, or increases, we must proceed to Sinapisms, Vesicatories, Flannel, and Ligatures.

Musgrave is of Opinion, that cooling Emulsions and Decoctions, Narcotics, cooling Embrocations, Epithems, and washing the Head with cold Water, are dangerous in this Case, tho' they may be of Service in Disorders of this Kind from another Cause.

He also disapproves of applying Leeches to the Hemorrhoidal Veins, for fear of an Inflammation or Fistula.

By way of Precaution, and to hinder a Return of the Disorder, it would be proper to apply a Blister sometimes to the Neck or Arm, to bleed in the Spring; to take a Purge every Month, and always to avoid being costive, and to keep the Feet very warmly cloath'd.

Those that are subject to these Disorders, should religiously abstain from Errhines, from sleeping after Dinner, and from hard Drinking.

An ARTHRITIC APOPLEXY.

Gouty People, who have been so for many Years, have short and thick Necks, who begin to grow old; and particularly those who indulge themselves in Eating and Drinking, and become plethoric, after leaving off some accustom'd Exercise, are most subject to an Arthritic Apoplexy; which happens when a regular Fit of the Gout is interrupted, or deferr'd too long, or else is not sufficiently violent to carry off the gouty Matter.

The Cure of this Distemper is different from that of a genuine Apoplexy.

The Signs of an approaching Arthritic Apoplexy are, a Head-ach, or Vertigo, or both together; the Head is heavy, the Face is bloated and red, the Tongue falters often, the Motions of the Patient's Body are disorderly, and his Steps unequal; and if the Disorder increases, he is suddenly deprived of all Sense and Motion, and his Eyes become greenish, as if he was dead: A Stertor and Snoring, and all the other Symptoms of a genuine Apoplexy, attend this, so that its Arthritic Nature must be discover'd by adverting to the State of the Constitution, and considering what Sort of gouty Paroxysms have preceded.

Tight Bandage about the Neck very much contributes to keep the Blood in the Head, and cause an Apoplexy, especially when People are full of Drink: These People, therefore, when they go to Bed, should have the Collars of their Shirts unbutton'd.

An excessive Use of Opiates and Errhines contributes much to this Disorder; as does also whatever repels the Gout from the Extremities.

The Spring and Autumn favour the Production of an Arthritic Apoplexy.

If a right Method of Cure is apply'd, many Patients recover of this Distemper; and afterwards enjoy a much better State of Health, than those who recover of a genuine Apoplexy, especially if they become regular, temperate, and sober.

The proper Method of Cure consists in relieving the Brain by Evacuations and Revulsion, and removing the Gout to the Extremities; at the same time removing all Obstacles which may prevent a regular Fit, as Shoes or Stockings that are too tight. Bleed therefore immediately, to twelve, fourteen, or fifteen Ounces, according to the Strength and Constitution of the Patient.

Immediately after give a Clyster of human Urine; or the common Decoction for Clysters, with common Salt, or roasted Aloes, or some other stimulating Ingredients.

Soon after this give a stimulating Purge, as half a Dram or two Scruples of the Countess of Warwick's Powder; or else one Scruple of the Extract of *Rudius*; between six and ten Grains of the Resin of Jalap; of Elixir Proprietatis, a sufficient Quantity to form into Pills; or three Ounces of the purgative bitter Decoction; or one Ounce, or an Ounce and an half, of the Syrup of Buckthorn.

If the Purge does not work briskly in three or four Hours, let a Clyster be repeated.

During all this time let the Patient be kept in an erect Posture.

After Purging repeat Bleeding, either in the Arm or Neck. Cupping betwixt the Scapulæ is of great Service.

After these Evacuations, apply to the Joint that has lately been painful, some powerfully stimulating Plaister, as, for Instance, that made of Burgundy Pitch and Venice Turpentine;

or the Cephalic Plaister, with Euphorbium: Mean time keep the whole Limb extremely warm with Flannels.

Musgrave relates, that he has known exceeding great Effects from keeping the Feet a considerable time in Water, as hot as the Patient could possibly bear it; for by this means he was saved, tho' before, in all Appearance, expiring.

If this Method does not relieve the Patient, apply a Blister to the Neck, to the Sinciput, or all over the Head, after it has been shav'd, and let it lie on four or five Days.

Apply also Blisters to the Ankles, if the Gout used to appear principally in the Feet; or to the Arms, if the Hands were usually affected.

If the Patient is extremely ill, a Cupping Glass should be apply'd to the Neck, or to that Part of the Head where the Lambdoidal and Sagittal Sutures meet, if the back Part of the Head is most affected; or, if the fore Part of the Head, to the Place where the Sagittal and Coronal meet.

But if none of these Applications are thought necessary for the Head, it should at least be shaved, and rubb'd well, in order to relax the Skin; and a Cumin Plaister should be worn upon it, in order to increase the Perspiration of the Part.

But if the Disorder still continues, it will be serviceable to make use of such Errhines as draw the Serum from the Nose, without making the Patient sneeze, which in this Case is dangerous.

The Patient should frequently chew in his Mouth acrid Plants, which cause a great Discharge of Saliva: For this Purpose,

Take of the Shavings of Horse-radish, and bruis'd Mustard-seed, each half a Dram; Powder of Pellitory of Spain, one Dram: Mix up with Honey, and put the Whole in a Piece of Muslin. This the Patient must squeeze between his Teeth, and discharge the Spittle as 'tis generated in his Mouth.

Mean time, whilst these Evacuations are making, the Patient should frequently take a Dose of Spirit of Sal Volatile Oleosum; or Spirit of Hartshorn succinated, with a Cephalic Julap; or a Dose of Pills should be taken twice or three times a Day, made of the *Pulvis ad Guttetam* and Castor, reduced to a Mass fit for Pills, with Oil of Amber, and a Solution of *Asa-fetida*.

These raise the Spirits, at the same time that they contribute to expel the Gout; but should never be used without plentiful Evacuations preceding.

If these Remedies are not sufficient to bring the Gout to the Extremities, we must proceed to the most stimulating Cataplasms.

As soon as any Tumor or Pain appears in the Extremities, we must endeavour to keep it there; and hinder a Retrocession. To this End, a Blister must be apply'd to the Part, which must be kept running a considerable time by Mellilot, mix'd with Cantharides, if necessary. Mean time let the Part be kept extremely warm, with Flannel and Woollen Rollers; and let the Foot, if that Part is affected, be kept all Day in a declining Position.

Violent Frictions of the Extremities, apply'd twice or thrice a Day, are of the utmost Importance.

The Gout appearing in the Extremities is the most happy Circumstance that can happen; and then, and not till then, some gentle Podagragogues may be given, that is, when we perceive the Course of the *gouty* Matter to be alter'd, and there is no longer any Danger of driving it more forcibly upon the Head.

The Countess of Kent's Powder, in the Quantity of a Scruple, every six or eight Hours, is a proper Medicine in this Case. And to this may be added, once a Day, or, in a phlegmatic Constitution, twice, five Grains of *Alcohol Martis*.

But if by any means the Gout should be repell'd from the Extremities, or the Head should suddenly grow worse, these Podagragogues must immediately be left off, and recourse must be had to stimulating topical Applications, and the above-mention'd Medicines, which contribute gently to raise the Spirits.

During the Use of these Remedies, let the Patient's Diet be extremely low; let him live, for Example, on Chicken-broth, Gruel, or Panada, with Currans or Raisins: Chocolate may sometimes be allow'd. Instead of small Beer let the Patient drink Cyder, Wine and Water, and Infusion of Tea, or Sage, or of Clove-gilly-flowers.

Nothing is more dangerous than full Meals, especially in the Evening.

As to Stools, let the Patient be kept in a moderate way; for too many may invite the Gout to the Intestines, and Constiveness oppresses the Head.

By way of Prevention, nothing is more serviceable than Scapulary Issues, Country Air, and purging Spring and Autumn, and bleeding in the Beginning of October, in strong Constitutions.

But the best Preservative is to keep the Gout to regular Fits.

There is another Sort of the *Arthritic Apoplexy*, which Musgrave calls Symptomatic, whose Cause is in the Stomach and Intestines. This, he says, must be cur'd by Vomiting and Purging, by Medicines exciting the Spirits, and which expel the Gout.

The ARTHRITIC PALSY.

The *Arthritic Matter*, sometimes falling upon the Origins of the Nerves, causes a Palsy of the respective Parts to which they belong; and that more particularly in such *gouty* Constitutions as incline to a Plethora.

A moist and fenny Air, a sedentary Life, a bad Regimen, a frequent Use of Opiates, and of Spirituous Liquors, immoderate Venery, Cold, too frequent Use of warm Medicines in hot and bilious Constitutions, or whatever hinders the Gout from falling upon the Extremities, or repels it when there, are the usual Causes of an *Arthritic Palsy*.

The Nerves of the Tongue are sometimes affected, and then the Patient loses the Use of his Speech, or can utter but half Words confusedly.

If that Branch of the *Par Vagus* that belongs to the Stomach is affected, the Patient loses his Appetite and Digestion, and has an Aversion to all Aliment; insomuch that he daily wastes, and insensibly becomes tabid.

This Case Musgrave says he has known happen in *Arthritic* Constitutions, where there has been also a Plethora; and from these Causes first an *Apoplexy*; then a *Palsy*.

When an *Arthritic Palsy* happens in bilious Constitutions, especially when it follows a bilious Colic, the Patient loses his Appetite, his Flesh wastes, the Skin does not perspire, but is dry, and of an icteritious Colour, as are particularly the Whites of the Eyes.

Sometimes one Side only, or one Member, is affected, as the Tongue in particular: Sometimes the Distemper is accompany'd with convulsive Motions, and 'tis sometimes without: Sometimes the Palsy is imperfect, and only renders the Parts it seizes on unwieldy, and unfit for Motion; sometimes 'tis perfect, and renders them entirely useless and immoveable.

This Disorder is very difficult to be cured, especially when it succeeds an *Apoplexy*; and, if the *Apoplexy* returns, 'tis generally fatal; however, if a right Method of Cure is pursued, the Patient sometimes recovers, beyond all Expectation.

If the Pulse is full, and the Patient inclin'd to a Plethora, begin the Cure by Bleeding, either in the Arms or Jugular Vein, or by Cupping, with Scarification upon the Back.

A few Hours after Bleeding give a Clyster. Purging is perpetually useful; but the Purges should be of the stimulating Kind, capable of exagitating the Blood, and removing the Gout to the Extremities.

As soon as ever an *Arthritic Palsy* seizes the Patient, apply to the Joint, which used to be most affected with the Gout, the Apoplectic Cataplasms of Bates, Fuller's Cataplasms of Horse-radish, or some other equally stimulating.

As soon as the Tendency of the *gouty* Matter is chang'd from the Head towards the Extremities, and not before, the Patient may take some gentle Podagragogues, as Gascoign's Powder, or the Purple Powder, twice or three-times a Day, with a Draught of a Cephalic Julap.

As soon as any Tumor appears in the Extremities, apply to it a Vesicatory.

'Tis proper also, in this Disorder, to apply an Epispastic to the Neck; and to the Head, after shaving, the Cumin Plaister, or some other drawing Plaister; but not till after general Evacuations.

Gargarisms, which cause a great Discharge of Saliva, must be used; and a very thin Diet must be injoin'd.

Mean while, let the Patient take, from time to time, a Dose of volatile Spirits, Tincture of Castor, or of Amber, in a Draught of a Cephalic Julap, or an Infusion of Rosemary or Sage.

When the *gouty* Matter is much fix'd upon the Nerves, 'tis necessary to attenuate it by Decoctions of Guaiacum, and of the Wood and Bark of Sassafras, by Preparations of Steel, by Frictions, Baths, Embrocations, proper Cloathing, Liniments, Cerats, and Plaisters, as in a genuine Palsy.

Musgrave recommends a Decoction of the Bark, with Chalybeates, as a Thing he has known of great Service.

Musgrave also directs us to examine diligently, whether the Patient is hot or cold; whether the *gouty* Poison is accompany'd with a Viscidity of the Blood, or not; or whether 'tis join'd with a Redundancy of Bile, as in the Case of an *Arthritic Palsy*, immediately following a bilious Colic, of which he gives an Instance.

In the last-mention'd Cases, warm Medicines, taken in Quantities, for any time, make the Patient unquiet, feverish, and deprive him of Sleep; nor is he, in the least, rais'd or made stronger by their Use; but, on the contrary, much weaken'd and disturb'd.

In such Cases, therefore, the Author recommends *German Spaw*, or *Bristol Water*, as Things of great Efficacy, if drank fresh; and, he says, other Chalybeate Waters may have the same good Effects: And if Chalybeates are added to these at proper Times, and in proper Doses, he says, the Cure of such Disorders is perform'd very agreeably, and with great Certainty.

By way of Prevention, nothing has so good an Effect, as procuring regular Fits of the *Gout*; for the more the Extremities are in Pain, the less the nervous System is affected.

Therefore, as soon as there are any Signs of the *Gout* abounding in the Blood, if nothing contra-indicates, let the Patient take a Draftic Purge; and afterwards, twice or three times a Day, five Grains of *Alcohol Martis*. A few Days after, apply some stimulating Topic to the Joints, in order to invite the *Gout* thither.

Mean time, the Patient must never be suffer'd to be coftive. He must also keep Issues perpetually running in the Arms, or upon the Back.

IRREGULAR ARTHRITIC PAINS in the BODY; ARTHRITIC OPHTHALMY, ERYSIPELAS, and ACHORS.

'Tis common enough for a *gouty* Person to feel wandering Pains in the Back, Loins, Scapulæ, Sternum, and external Parts of the Head, which affect him for some time, and then remove elsewhere; insomuch that these Pains are frequently mistaken for a Rheumatism. But sometimes these Pains remain a considerable Time in the same Part, and give the Patient a great deal of Uneasiness; and this happens frequently in the Loins, affecting the Patient as if he had the Stone in his Kidneys. The Seat of the *gouty* Matter upon this Occasion is the Spina Dorſi, and its Membranes; and it seldom happens but in Constitutions worn out with Age and the *Gout*, and not able to throw out a regular Fit.

The *Gout* will also fall sometimes upon the Tunica Adnata of the Eye, and cause an *Ophthalmia*, which immediately vanishes as soon as a regular Fit of the *Gout* appears in the Extremities.

Musgrave relates, that he knew an old *gouty* Patient, who had the superior Palpebra in very great Pain for a whole Month and more, which disappear'd upon a Fit of the *Gout* immediately following.

The same Author says he has known an Erysipelas terminate in the *Gout*; from whence he infers, that it was caus'd by the Arthritic Matter.

In some Arthritic Constitutions, when the Fits are too mild and interrupted, the *gouty* Matter is evacuated by the Ears, and in others by Achors only, without any Appearance of it in the Joints.

In all these Cases, the Danger is much less than when the *gouty* Matter fixes upon the internal Parts, and affects any of the Viscera; and they are attended with these Advantages, that they very seldom recede, and fall upon the Viscera; but are very often transferred to the Extremities, and cause a regular Fit.

The same Method of Cure is requir'd in all these *gouty* Disorders.

The first Step to be taken therefore, if they are violent, is to bleed; and after that to give an Aloetic, or some other Draftic Purge, that the Arthritic Matter may in part be evacuated, and in part be removed to the Extremities.

After these general Evacuations, *Musgrave* advises to do no more, unless the Pain is very violent; and in this Case, the Patient may endeavour to evacuate the Arthritic Matter, or to remove it to the Joints, by Sweating; and to this End let him be well cover'd with Bed-cloaths; or let him take Spirit of Hartshorn, Venice-treacle with Gascoign's Powder, the Pulvis ruber Exoniensis, or some such Cordial with Rosemary Posset-drink.

These Cardiacs are proper in fixed or wandering Pains, or in an Erysipelas.

If an *Ophthalmia* should grow worse after Evacuations, *Musgrave* advises the following Collyrium:

Take the White of an Egg, beat it, dilute it in Rose-water, and add some Grains of Camphire; make into a Collyrium, a few Drops of which must be put into the Eyes every Morning, and let a Linen Cloth soaked in it be apply'd to the Eyelids twice or thrice a Day. Lapis Calaminaris, or Lapis Tutie, may very properly be added to the Collyrium, provided they are duly prepared.

As for the above-mentioned Achors, they are to be treated in the same manner as others, which are not from a *gouty* Cause; but *Musgrave* says they are so safe, and even useful, that he would not advise any Attempt to procure a Pain in the Extremities upon this Account.

AN ARTHRITIC EPIPHORA, and TOOTH-ACH.

Joh. Steph. Strobelbergerus wrote a Treatise *De Podagra Dentium*.

Sometimes the *gouty* Humour falls upon the Glands in the Orbits of the Eyes, and causes a Discharge of sharp Serum from them:

And sometimes upon the Gums and Membranes which surround the Roots of the Teeth, and causes violent Pain. These sometimes happen after the *Gout* has been repell'd from the Extremities, and sometimes end in a regular Fit.

If these Disorders become considerable, bleed in the Jugular Vein rather than in the Arm: Then give a Draftic Purge the next Morning. After this, lay an Epispastic to the Neck; and when that is taken off, apply some stimulating Ointment to the vesicated Part, in order to continue the Discharge.

But if, notwithstanding these Remedies, the *Gout* continues in the Part, we must proceed to use those Medicines which force it, and those Topics which draw it to the Extremities.

In an Epiphora, *Musgrave* recommends Woman's Milk, which he advises to be put into the Eye; or a Collyrium of the Mucilage of Flea-bane and Quince-seeds made with Rose-water, or Plantain-water, with the white Troches of Rhafes.

In case of Pain in the Teeth, the same Author advises a Gargism, that will cause a Discharge of Saliva.

If 'tis absolutely necessary to pull out the Tooth; the same Author advises to gargle the Mouth with Spring-water, Honey of Mercury, and common Salt; and after this he directs that the Tooth should be put into its Place again, which he says will become more useful for having been drawn.

MISCELLANEOUS OBSERVATIONS.

When the *Gout* seizes upon any of the Viscera; or other Part, it exactly imitates the genuine Distemper which the Part is subject to, so as to be distinguished from it with Difficulty.

The *Gout* seldom destroys any body without becoming first anomalous.

People are frequently for a long time in a bad State of Health, and complain of Pains in the Shoulders, Breast, Back, and Loins, like those of the Rheumatism; sometimes of Disorders in the Head, like Hysterics, and at other times of Disorders that seem to be Scorbutical; all which at last terminate in the *Gout*.

Musgrave calls that *Gout Symptomatic*, which derives its Origin, and proceeds from some other Distemper, as the Rheumatism, Venereal Disease, Dropsy, or Scurvy.

Having given an Account of the Treatment due to the Regular, and the several Species of the Anomalous *Gout*, it remains that I say something with respect to the Causes of this obstinate and excruciating Distemper.

Sydenham, as we see above, and after him *Boerhaave*, and most Authors who have written intelligibly on the Subject of the *Gout*, are of Opinion, that its original Cause is Indigestion. And yet this Disease, when not hereditary, generally attacks those whose Constitutions are robust and good, whose Appetites are keen, and who have at least the Appearance of digesting their Aliment very regularly. Hence it may be asked, How it happens, that such People have the *Gout*, whilst others, who are of a weak Habit, whose digestive Organs are lax and unbrac'd, and whose Digestions are manifestly performed with less Vigour, should be so fortunate as to escape it.

In order to reconcile these seeming Contradictions, and give a clearer Idea of the *Gout*, than most People seem to have form'd, two Things are principally necessary to be adverted to.

The first is, That there is in animal Bodies a decreasing Series of Vessels destin'd to convey Juices to the several Parts. Physicians know what I mean by a decreasing Series of Vessels; but that I may not be mistaken by others, I shall explain it farther.

Suppose, then, the Vessels whose Diameters are largest, are destin'd to convey the red Globules of the Blood, (and together with these, all the other Parts of the circulating Fluid) which are either reconvey'd to the Heart by correspondent Veins, when they arrive at Vessels whose Diameters are too small to receive them; or, perhaps, being divided into several Parts, till at last they become transparent, circulate forward in the next Series of Vessels, which we may conceive adapted to convey Serum. The next may possibly be capable of receiving Lymph; the next a Fluid still finer, till at last the most minute Vessels in the Body may convey a Fluid consisting of finer Particles than we can form any Idea of, as not being the Objects of our Senses.

That this is in some measure the Case, is certain, because, if red Globules of Blood were to circulate in the Humours or transparent Membranes of the Eye, Vision could not be performed; as we find it is not, when thro' an *Error Loci*, as *Boerhaave* very properly calls it, such Particles get into the Vessels of the Parts not adapted naturally to receive them.

Thus, also, if a Part furnish'd with Vessels which convey these red Globules is wounded, red Blood is extravasated; but wound a Tendon, and nothing but a fine Lymph or Ichor shall be discharged.

The second Thing I would have attended to is, that a great deal of Earth resides in the circulating Fluid, which I believe nobody

nobody will dispute. It will be of some Importance in our present Inquiry to trace this Earth from its Source, the Ground to its Entrance into the Blood, after having observ'd, that human Bodies, as well as those of other Animals, are nourish'd either by Vegetables, or by Animals, which gain their Sustainance from the Soil.

In the Ashes of all Vegetables we find a great Quantity of pure Virgin Earth, which, when perfectly freed from the adhering Salts, is neither capable of being alter'd by Fire, nor dissolv'd by Water; and yet, without such a Solution, it is inconceivable how this Earth could pass thro' the extremely minute Pores of the Roots, circulate in the Sap, and contribute to the Formation of the Vegetable. It is therefore highly probable, that this Solution is brought about by some means, which it is not our Business at present to inquire into: But, for Information in this Particular, see the Article *ACETUM*.

When Vegetables are taken into the Stomachs of Animals, the Earth which they contain, or at least a Part of it, must necessarily undergo a second Solution, otherwise it could not enter the minute Orifices of the lacteal Vessels, circulate with the Fluids, and ultimately be converted by the vital Powers into Nourishment for the solid Parts of Animals: And that it does actually enter the Lacteals, circulate with the Fluids, and is converted into Nourishment, is certain, because we find a great Quantity of this Earth both in all the Solids and Fluids of Animals, which is not convey'd thither by Magic.

If Animal Substances are taken by way of Aliment, the contain'd Earth must undergo a third Solution, perhaps more difficult to be brought about than the former two, as the Parts of Animals cohere more strongly than those of such young Vegetables, as are generally us'd in Food.

This Solution of the Earth in Animal and Vegetable Substances, is made by the Powers of Digestion; and if these are vigorous, and perform their Duties regularly, the Mass of Blood is supply'd with fresh Chyle, suited to perform all the Offices requir'd by the Animal Economy.

But if the Powers of Digestion are defective, this Solution is imperfect in proportion; inasmuch that if the Aliment be scarcely dissolved at all, it is either discharg'd by Vomit, or passes off by Stool little alter'd, as it happens in a *Lientery*.

Again, let us suppose the Bile viscid and unactive, and consequently incapable of completing, by its saponaceous Quality, the Solution begun in the Stomach; so that the Aliment is not comminuted sufficiently to supply Chyle fine enough to circulate thro' the Lungs; in this Case, Difficulty of Breathing will be the Consequence, as it happens in a *Chlorosis* (*Green-sickness*); and as in this Case the Chyle is farther deprived in a great measure of the Action of the Lungs, which was necessary to comminute it, and convert it into good Blood, the Blood hence form'd is too gross to circulate thro' the Glands; and the superfluous Water, which ought to be carry'd off by the proper Emunctories, remains in the Mass; and hence Obstructions in the Glands, and Dropsies.

It would, perhaps, be somewhat difficult to trace the Aliment thro' all the different Degrees of Solution, and account for all the various Disorders caus'd by the Stagnation thereof in the different Series of Vessels. It suffices for my present Purpose, that whenever any Particles of the Blood, that is, of the dissolved Aliment, arrive at a Series of Vessels, whose Diameters are less than their own, they must there stagnate, unless they are capable of being divided into smaller Particles.

Now, with respect to the *Gout*, let us suppose a Man in full Vigour, who eats and drinks with Appetite, and by the Help of due Exercise preserves a Tone and Elasticity in the Organs of Digestion, sufficient to dissolve his Aliment effectually. Suppose also this Person on a sudden leaves off, either in part or totally, his habitual Exercise, and that his Appetite does not diminish in proportion to the Powers of Digestion. It may happen in this Case, that the Aliment may be sufficiently comminuted for most of the Purposes of the Animal Economy, whilst the Earth is not so perfectly dissolved as to circulate freely thro' the remote Series of Vessels, which convey Juices to the exanguious Parts, or Parts which are nourish'd by Lymph, Ichor, or some finer Fluid; such are the Tendons, Ligaments, and nervous Membranes. When, therefore, the partially dissolv'd Portions of Earth arrive at very remote Vessels, whose Diameters are smaller than their own, they there stagnate, being hard and incapable of farther Division, and distend the extremely sensible nervous Fibres; being also impell'd by the succeeding Fluid, they are driven against, cut and tear the nervous Fibres, and are productive of that excessive Pain, which *gouty* People are too sensible of in the Paroxysms of that Disorder.

When a sufficient Quantity of this obstructing Earth has, in repeated Fits of the *Gout*, been fix'd upon the Part, the Tendons and Ligaments grow stiff and immovable; and by Degrees the obstructing Matter works thro' the Integuments, and appears in its proper and original Form, that of *Earth* or *Chalk*.

If this obstructing Matter should be repell'd, or hinder'd from fixing on the Extremities, by Design or Accident, it may be impell'd upon the nervous Membranes of the more noble Organs, and cause the Disorders peculiar to each respective Part, in the manner specify'd above.

Hence we may understand the Reason why the *Gout* has been in all Ages esteem'd incurable; that is, because the Cause resides in very remote Vessels, in a great Degree out of the Sphere of the Operation of Medicines.

Hence also, according to the System of *Sydenham*, if the digestive Organs are strengthen'd by warm Aromatics, the Force of the Circulation is increased, and the *gouty* Matter is impell'd with greater Force upon the Extremities, and consequently with a greater Degree of Pain. On the contrary, if the Disease is treated with cooling Remedies, the digestive Organs are relax'd, and a Foundation is laid for a greater Store of the *Arthritic* Matter.

That this short Theory of the *Gout* may not appear utterly barren, I must farther remark, that alkaline Salts are the only Substances known in Nature, which afford a Menstruum capable of dissolving Earth. Thus alkaline Salts of all Kinds dispose the Earth to a Solution sufficient for a subsequent Vegetation, and promote remarkably the Fertility of the Soil.

It is therefore in alkaline Salts, that a Remedy for the *Gout* must be sought for; and if any one can render those sufficiently penetrating, to reach into the remote Series of Vessels, where the material Cause of the *Gout* resides, and to attenuate it in such a manner, as to make it capable of perspiring thro' the Pores of the Part affected, he will be able not only to cure a present Fit, but to weed it so far out of the Constitution, as to render it very little, if at all, troublesome for the future.

I must not omit taking Notice of a Topic for the *Gout*, of which I had an Account from a Gentleman of Honour and Fortune, which gave me much Pleasure, as he had us'd it himself for many Years with great Success, and recommended it to many of his Friends, who had found much Relief from the Use of it.

The Receipt is thus:

Take an Earthen Pot, capable of containing five Gallons; fill it full of Elder-flowers full ripe, and clean pick'd, which, as they putrify, will sink down; continue filling it every Day as long as any Flowers are left upon the Trees; then put in three Pints of common Vinegar, and half a Pound of Bay Salt; then stop it quite close, and set it in the Sun for two Months, stirring it every Day with a Stick; then stop it close, and set it in a Cellar. If it breeds Worms, stir it with a little Salt, and mix them together. Apply it every twelve Hours to the Part afflicted with the *Gout*. It must be laid on cold. If too dry, put some Vinegar to it. It must be laid upon the Part of the Feet affected, just when the Violence of the Fit is over, half an Inch thick.

It is remarkable, that this Cataplasim makes the Part perspire excessively, inasmuch that almost every Pore discharges a limpid Liquor.

If apply'd in the Manner, and at the Time above directed, that is, when the Excess of Pain begins to abate, it removes all that Pain and Lameness, which otherwise afflict the Patient for many Weeks, and sometimes Months, as the Gentleman who communicated this assures me from his own Experience.

If we examine into the Nature of this Composition, we shall find it very likely to perform all that is attributed to it.

The Ingredients are *Vinegar*, *Salt*, and *Elder-flowers*.

The Nature and Properties of Vinegar are sufficiently explained under the Article *Acetum*. As to *Salt*, I must refer my Reader to the Article *SAL*, after having taken Notice, that it contains an extremely penetrating acid Spirit, and an alkaline Earth.

It is not material to our present Purpose, what Properties Elder-flowers are endowed with, or what medicinal Virtues they possess, when in a natural State; because these Flowers, when put into the Pot, putrefy, sink down, turn to a sort of foetid Pulp, lose all the native Virtues of the Plant, and acquire new ones very different from the former. Thus it has been shewn under the Article *ALCALI*, that putrefy'd Vegetables yield by Distillation a volatile, urinous Spirit, and Salt not to be distinguished from Spirit of Hartshorn, or any other animal Spirit or Salt; whereas before Putrefaction no such Spirit could by any Art whatever be procured from them.

By the Mixture therefore of Elder-flowers putrefy'd into an oily Pulp, and abounding with a volatile alkaline Salt, together with Vinegar and Salt, both which are impregnated with a most penetrating Acid, a third Substance is formed very different from the several Ingredients which enter the Composition; for the Acid of the Vinegar acts upon the alkaline Salts of the putrify'd Vegetable; and these again upon the Acid, so as to destroy each

each other, and by their Union to form a *neutral* Body, somewhat like the *Tartarus Regeneratus*, otherwise called *Terra Foliata Tartari*. But as the Salt used in preparing the *Tartarus Regeneratus* is fixed, and that of the putrefy'd Elder-flowers is volatile, the Mixture resulting from the Union of the latter with Vinegar, must of the two be the most penetrating.

It is now well known, that neutral Substances are extremely saponaceous, and resolvent; and that they will act as a Menstruum upon Substances, especially those which are earthy, which neither Alcalis nor Acids will touch. It is probably such a Menstruum as this, which originally dissolves the Earth in the Soil, and prepares it for the Purposes of Vegetation. And we have some Reason to believe, that the neutral Composition, which is our present Subject, penetrates to the obstructing Matter which forms the Paroxysm of the Gout, resolves it, and renders it capable of perspiring through the Pores of the Skin. And I make no doubt, but that whenever a Method can be discovered of conveying alkaline Salts to the remotest Series of Vessels, cloath'd or neutraliz'd in such a manner, that their caustic Quality shall do no Injury to the fine Vessels, the Gout will be as easily and effectually cured, as any other Distemper.

ARTHRODIA, ἀρθρώδια, from ἀρθρῶν, to articulate. A Species of Articulation. See ARTICULATIO.

ARTHRON, ἄρθρον, a Joint.

ARTHROSIS, ἀρθρωσις, from ἀρθρῶν, to articulate. The same as ARTICULATIO, which see.

ARTIA, ἀρτία, ἀρτίη, according to some, is taken in the same general Sense as ἀρτηρία; others, as Erotian observes, limit it to the Aspera Artery.

ARTICOCA, ARTICOCALUS, Artichoke. The same as CINARA, which see.

ARTICULARIS MORBUS. The same as ARTHRITIS, which see.

ARTICULATIO, ἄρθρωσις, Articulation.

The Bones cannot serve the Purposes they are design'd for, except the several Pieces are fitly adjusted, and then kept together in different Ways. The most antient Osteologists (speaking only of the perfect Bones of an Adult) call'd the first of these *Articulation*, and the other *Symphysis*.

Articulation, thus understood, is of two Kinds, one moveable, by which the Bones are allow'd a certain Degree of Motion; the other immoveable, by which they are fixed together without Motion. The first is commonly call'd *Diarthrosis*; that is, (according to the Expression of Carolus Stephanus, an antient Physician of the Faculty of Paris) an *Articulation* separated; the other *Synarthrosis*, or an *Articulation* conjoined.

In the *Diarthrosis*, or moveable *Articulation*, the Pieces are really separate; and the Parts in which they touch, are each of them cover'd by a smooth Cartilage, by means of which they easily slide upon one another. In the *Synarthrosis*, or immoveable *Articulation*, the Pieces are joined together in such a manner, as that the Parts in which they touch have something particular on their Surface; and cannot slide upon each other.

There is still another Species of *Articulation*, which cannot well be reduced to either of the two former, because it partakes of both; and therefore I think it necessary to establish a third Kind, by the Name of *Amphiarthrosis*, which agrees better to this Sort, than to the other *Articulations*, to which it has sometimes been apply'd.

DIARTHROSIS.

Diarthrosis is either manifest with large Motion, or obscure with small Motion. Each of these again is of two Kinds, one *indeterminate*, or with Motion many different Ways, as that of the Os Humeri upon the Scapula, or of the Os Femoris on the Os Innominatum; the other *alternative*, or with Motion confin'd to two opposite Sides, as that of the Ulna on the Os Humeri, and of the two last Phalanges of the Fingers on the first and second.

A Bone is said to be moveable many different Ways, when it can be turn'd upwards and downwards, forwards and backwards, to the Right and to the Left, and quite round.

The Motion quite round is made either on a Pivot, that is, about an Axis, or in the manner of a Sling, where the Bone describes a sort of Cone, or the Figure of a Funnel, one End of it moving in a very small Space, the other in a large Circle.

The first of these round Motions is termed *Rotation*, by Anatomists; the other is only a Combination of several Motions upwards, downwards, &c. and it must be remarked, that *Rotation* is not to be met with in all the *Articulations* for Motion many different ways; for Example, the *Articulation* of the first Phalanges of the Fingers with the Metacarpal Bones does not admit of it.

Moreover this *indeterminate Diarthrosis* is of two Kinds; one *orbicular* or *globular*, the other *flat* or *planiform*.

The *orbicular Diarthrosis* is when the round End of one Bone moves in the Cavity of another, more or less proportionable to it, as the Head of the Os Femoris in the Acetabulum of the Os Innominatum; or when the Cavity in one Bone moves upon

an Eminence in another, as the Bases of the first Phalanges on the Heads of the metacarpal Bones.

The planiform *Diarthrosis* is when the articulated Bones slip upon one another, much in the same manner as when we rub the Palm of one Hand against the other: This *Articulation* is found in the Bones of the Carpus and Tarsus, and in the oblique Processes of the Vertebrae.

The Antients call'd the first of these two Kinds of *Articulation*, *Enarthrosis*; the other *Arthrodia*. Some modern French Writers seem to comprehend both under the Word *Genou*, a Term borrowed from Workmen, who probably first ignorantly took it from the human Body, to apply it to their Instruments. I own, that this Term, as used and explained by them, agrees well enough to all the Degrees of the *orbicular Diarthrosis*; but there are undoubtedly many *Articulations* of the other Kind so very flat, that a skilful Workman would not allow them the Name of *Genou*.

The *alternative* or *reciprocal Diarthrosis* bears some Resemblance to a Hinge; and for that Reason the antient Greeks termed it *Ginglymus*, which signifies the same thing; and has accordingly been translated in some modern Languages. It is called by Mechanics *Charnall*.

It has been divided into several Kinds; but, properly speaking, I think there can be but two. The first is that which is confin'd to *Flexion* and *Extension*; and as in one of these Motions the two Bones always make an Angle, I term it an *angular Ginglymus*. This is exactly the same with the Motion of a Hinge. The second Kind is adapted only to small Turns toward each Side, or to small lateral Rotations, in the Language of Anatomists; and therefore I term it a *lateral Ginglymus*. In each Kind several Differences are to be taken notice of.

In the *angular Ginglymus* either each Bone partly receives, and partly is received by the other, there being reciprocal Eminences and Cavities in each, as in the *Articulation* of the Os Humeri with the Ulna; or there are only several Eminences in one Bone, received into the same Number of Cavities in the other, as in the *Articulation* of the Os Femoris with the Tibia.

The *lateral Ginglymus* is either single, as in the *Articulation* of the first Vertebra of the Neck, with the Apophysis Denti-formis of the second; or double, that is, in two different Parts of the Bone, as in the *Articulation* of the Ulna with the Radius.

It must in general be observed, concerning these kinds of *Articulations*, that some of them are more perfect and close than others; and that they are not all confin'd to *Flexion* and *Extension*, or to the reciprocal Turns already explained, as we shall afterward see.

The *obscure Diarthrosis*, or that which admits only of small Motions, is also of different Kinds. Examples thereof are found in the *Articulations* of the Bones of the Carpus and Metacarpus, and of the Fibula with the Tibia.

This *Articulation* was formerly called doubtful and neutral, and by some *Amphiarthrosis*, while others reduced it to *Synarthrosis*. The first of these Names might pass; the rest are improper.

SYNARTHROSIS.

Synarthrosis, or the *Articulation* of Bones so join'd together as to remain fixed in their Situation, is of two Kinds; one is made by Ingrailing; and the other in the same manner as a Nail or Pin is fixed in Wood. The first may again be subdivided into a deep and more superficial Kind. The deep Kind is observable in the *Articulations* of the broad Bones. The Antients term'd it Suture, because of some Resemblance it bears to a coarse Seam, as is seen in the upper Bones of the Skull. It is made by Jags, Notches, and Holes in each of the articulated Bones, by which they are mutually indented, much after the same manner as what is called Dovetailing by the Joiners. By the Antients it was called Unguis, probably because the indented Pieces are rounded like Nails.

The other Kind is that which is observed in Bones joined together by more extended Surfaces, in which no Indentation appears outwardly. This the Antients termed *Harmonia*, and the *Articulations* of some of the Bones of the upper Jaw were given as Examples of it. But though they describe it as running in a single Line, they did not mean this in a strict Sense, but only that the Joint was like that of two rough Boards without Grooves. They have expressly told us, that some small Inequalities might be observed in these Joints; and some of them have used the Terms of *Suture* and *Harmonia* indifferently.

Suture differs very much from *Harmonia*. In the first, the Jaggings and Notches are very considerable, and the Indentation is made likewise by small lateral Eminences therein; so that the Bones thus join'd cannot be separated without breaking a great many of these Jags, and their little Eminences; whereas those that are joined by *Harmonia*, may easily be parted without breaking any thing, or at most but very little.

Harmonia differs from *Suture*, in that the Inequalities therein are very small, their Union is superficial, and there is no Appearance

pearance of them on the Surface of the Bones; the Joint there representing only a kind of Line, more or less irregular.

The other Kind of *Synarthrosis*, an Example of which we have in the *Articulation* of the Teeth, is called *Gomphosis*, a Greek Term still retained.

AMPHIARTHROSIS.

The third general Kind of *Articulation* partakes of both the former two, the moveable and immovable; and for that Reason I have termed it *Amphiarthrosis*, or the mixt *Articulation*; as resembling *Diarthrosis* in being moveable, and *Synarthrosis* in its *Connexion*.

The Pieces which compose it have not a particular Cartilage belonging to each of them, as in the *Diarthrosis*; but they are both united to a common Cartilage, which being more or less pliable, allows them certain Degrees of Flexibility, though they cannot slide upon each other, such is the *Connexion* of the first Rib with the Sternum, and of the Bodies of the Vertebrae with each other.

SYMPHYSIS.

Having examined the *Articulation* of Bones, we come now to consider their Union or *Connexion*, properly so called, which the Antients named *Symphysis*, taking this Term in an improper or large Sense, when they apply'd it to the *Connexion* of Bones; but in its proper Meaning they used it only to signify *Offification*.

The Authors who say, that the Antients took *Symphysis* for a Species of *Articulation*, misunderstand them; neither are they more in the right, who advance that the Antients looked upon *Articulation* and *Symphysis* as opposite to each other. If they speak of the most early Antiquity, both these Propositions are false.

In the first Place, the Antients do not confound *Articulation* with *Symphysis*, but plainly distinguish them, taking *Articulation* for the simple setting of Bones together, independently of their being connected, or kept together. In the second Place, they do not look upon these two as Opposites, that is, where they talk of *Articulation*, they do not exclude *Symphysis*; because their Writings clearly shew, that in order to compose the Sceleton, they thought it necessary to bring them both in together.

The Words of *Galen* alone are sufficient to prove this. In general he tells us, "That the Sceleton is a regular Disposition of all the Bones connected together." And afterwards, "That their Composition is by *Articulation* and *Symphysis*;" "that *Articulation* consists in the Bones being naturally rank'd," " *Symphysis* in their being naturally connected." In fine, after having enumerated all the Differences of *Articulation*, he declares in plain Terms, that by *Symphysis*, or the Union of Bones, he understands not only that, by which two or more Pieces become one by Age, but also that, by which the Bones are naturally united and connected together in different ways. Of these he reckons three, (as his Predecessors had done) by Cartilage, Ligament, and Flesh. The first Kind of *Symphysis* they called *Synchondrosis*; the second, *Synneurosis*; and the third, *Syffarcofis*. He likewise takes Notice, that his Predecessors did not take the Word *Synneurosis* so far in a literal Sense, as if it signify'd the Union of Bones, by means of Nerves; but that they were accustomed to call both Ligaments and Tendons by the Name of Nerves, though they were very well apprised of the Distinction of these three things.

The Distinction of *Symphysis* into that without a Medium, and that with a Medium, can have no Place here; for the first, of which the lower Jaw is cited as an Example, belongs not to the *Connexion* of Bones, but to their Formation while imperfect; and therefore may be called *Symphysis* of *Offification*; and the other *Symphysis* of *Articulation*.

In another Sense, however, this Division may still be made use of in this manner: All the Pieces which compose the bony Fabric are naturally connected and united together. This Union or *Connexion*, which, with the Antients, I term *Symphysis*, is either without or with a Medium.

Symphysis, without a Medium, is where the articulated Bones support themselves in their Situation, without any other Assistance than that of their Conformation only; thus the parietal Bones are mutually fixed by their Indentations, and so give us at once an Example of *Articulation* and *Symphysis*. In the same manner the Bones in the Basis of the Scull are supported by those which make the convex Part of it. In a natural State however, none of these Pieces touch one another immediately, but are separated by Membranes which run in between them.

The *Connexion* or *Symphysis* of Bones, with a Medium, is of three Kinds, cartilaginous, ligamentary, and fleshy or muscular, that is, as the Antients termed them, by *Synchondrosis*, *Synneurosis*, and *Syffarcofis*.

Synchondrosis, or the cartilaginous *Symphysis*, is either moveable, as in that by which the Bodies of the Vertebrae are kept together, on which joins the first Rib to the Sternum; or immovable, as that of the *Ossa Pubis*, in an ordinary State. The

Symphysis of *Offification* is different from this, and the Union of *Epiphyses* belongs to that, rather than to the *Symphysis* of *Articulation*.

Synneurosis, or the ligamentary *Symphysis*, is found in all the Joints designed for Motion.

Syffarcofis, or the muscular *Symphysis*, is as real as the two former, and may be said to be much more general, because it accompanies and strengthens the others, and supplies what is wanting in them. The *Connexion* of the *Ossa Humeri* with the Scapula is a sufficient Proof of this; for the Strength and Security of that Joint is owing more to the Muscles, than to the Ligaments. *Winslow's Anatomy*.

ARTICULI Plantarum are those Parts of Plants which swell into Nodes, or Joints, which usually send forth Branches: *Blancard*.

ARTICULUS, ἀρθρον. A Joint, or *Connexion* of Bones adapted for the Performance of Motion. *Blancard*.

ARTIFEX, δημιουργός, *Hippoc.* τεχνίτης, *Galen*. An Artist. What the Word signifies in general, is well known; but it is often appropriated to the Physician, who exercises the Art of Medicine from rational Principles confirmed by Experience. Sometimes the Chymists and Spagirists take the Liberty to apply the Terms to one another. *Castellus*.

ARTIFICIALE. Whatever is made or prepared either of the native Stone of Cinnabar itself, or from the Vein of Cinnabar. *Rulandus*.

ARTIOS, ἀρτίος. Sound, whole, perfect, complete in all its Parts, unhurt, *Hesych*. Ἀρτίως, the Adverb, signifies wholly, perfectly, ἀρμόδιως, that is, coherently, and fitly, as *Hesychius* expounds the Word. Ἀρτίως also signifies the same as ἀπαρτίως, ἀπαρτίσμενος, and ἀρετῶς, Adverbs importing Exactness, Adequateness, Exquiteness, in which Sense it is used by *Hippocrates* in his Aphorisms, and *Lib. de Humoribus*.

Ἀρτίοι οἱ σπόνδυλοι ἐντὸς ἀλλήλοις, "the Vertebrae are within-side even with each other." *Lib. de Art. et Mochl*.

Ἀρτίαι ἡμέραι, with respect to Crises, are even Days, to which *Hippocrates* opposes περιαι, odd, as ἀρτίος ἀριθμὸς καὶ περιαιός is an even and an odd Number. So *Lib. 1. Epid.* τὰ δὲ παροξυνόμενα ἐν ἀρίστοι, κρινέται ἐν ἀρίστοι ὅν δ' οὐ παροξυσμοὶ ἐν περιαιῇσι, κρινέται ἐν περιαιῇσι. "If the Paroxysms happen on even Days, the Crisis will be on an even Day; but if they molest the Patient on odd Days, the Crisis will in like manner fall out on an odd Day." Again, *Lib. eodem*, ἐστὶ δ' ἡ πρώτη κρίσις τῶν περιόδων ἐν ταῖς ἀρίστοις κρινέσθω δ'. "Of those periodical Fevers which come to a Crisis on an even Day, the first critical Day is the fourth."

ARTIPHYES, ἀρτίφυες, from ἀρτί, just now, and εἶναι, to produce, signifies new-born; but **ARTIPHYES**, ἀρτίανες, from ἀρτίος, whole, and οὖν, is complete. Thus in *Hippocrates*, περὶ ἐκτεταμένῃ ἀρτίφυῖς ἀριθμὸς καὶ τέλεις is a complete and perfect Number.

ARTISCUS, ἀρτίσκος, from ἀρτί, Bread, a Loaf, from its being in the Figure of a little Loaf, signifies in general a Troche of any Kind; but specially, and κατ' ἐξοχήν, *Artisci* are Troches prepared of Vipers Flesh. *Castellus*.

ARTISTOMA, ἀρτίσμομα, in *Hippocrates*, περὶ τῶν ἐν νεφράῃ τραυμάτων, is expounded by *Galen* in his *Exegesis*, πανταχόθεν ὁμαλὰ, "plain and smooth on all Sides." **ARTISTOMOS**, ἀρτίσμομος, in another Sense, is one who pronounces the Words of any Language perfectly and entirely without Mutilation.

ARTIPOCHROS COLOR, ἀρτίποχρος χροίη, in *Hippocrates*, περὶ τῶν ἐντὸς παθόν, is a palish and yellowish Colour, which attends a Disorder of the Spleen.

ARTIZOA, ἀρτίζωα, from ζῶν, Life, signifies short-lived, and is expounded by *Galen* and *Hesychius* ὀλιγοχρόνια, "enduring but a little Time." *Hippoc.* περὶ ἐπικυνήσι, ταῦτα τὰ παιδία ἀρτίζωα, "these Children are but short-lived."

ARTOCREAS, ἀρτίκρεας, from ἀρτί, Bread, and κρέας, Flesh. The same as **PASTÆTUM**. A sort of Pasty.

ARTOMELI, ἀρτίμελι, from ἀρτί, Bread, and μέλι, Honey. A Cataplasm made of Bread and Honey. *Blancard*.

ARTOPTA, ἀρτίπτη, a Vessel to bake a Pye or Pudding in, metaphorically apply'd to such Women as have easy Labour. *Castellus*.

ARTOPTICIUS PANIS, from ἀρτί, Bread, and πτήναι, to toast. Toasted Bread. *Blancard*.

ARTOS, ἀρτί, Bread. Ἀρτί, in *Hippocrates*, περὶ γυναικείης φύσεως, is a Mass of farinaceous and other Substances inclosed in a Linen Cloth, and apply'd warm as a Fomentation to the Uterus. Of ἀρτί, as it signifies Bread, there are many Sorts to be found in *Hippocrates*, as

Ἀρτί ἀζύμη, from α Negative, and ζύμη, Ferment, or Leaven; unleavened Bread; this nourishes most, and affords the least Excrement. *Lib. 2. περὶ διαίτης*.

Ἀρτί ἀνίσχυρῆτος ἢ ἀνίσχυρος, from ἀνός, mere, very, and πυρός, Wheat. Bread made of Meal, where the Bran is not separated from the Flour, but the whole Corn goes into the Loaf. This is drying, and easily passes off. *Lib. περὶ τῶν ἐπὶ τὸς παθόν*.

Ἀρτοποιία, from *dis*, twice, and *πῦρ*, the Fire. Bread twice baked, or that has twice proved the Fire. It is prescribed in the Dropsy. Ἀρτοποιία μὲν χρῆσθαι πυρὶν ἐπὶ τῷ, ἢ τῶν σκληρῶν διαπύριτον. "Let him use wheaten Bread toasted, or hard Bread twice baked." *Lib. prædict.* This is also called *disarthos*, and dries powerfully.

Ἀρτοποιία, from *κρύπω*, to hide. Bread baked under the Embers, called by the Romans *Panis Subcineritius*. This, according to *Galen*, was the worst of all Bread, being the driest, and least nourishing. *Lib. 2. περὶ διαίτης*, and *Lib. 2. περὶ γυναικ.*

Ἀρτοποιία, from *ἐστῆναι*, to toast. Toasted Bread, which is very drying, and prescribed by *Hippocrates* in a Dysentery, *Lib. 7. Epid.* and *Lib. περὶ τῶν ἐν ὅσῳ παθόντων*, where, in one Place, it is call'd *ἄρτος ἐστῆναι ἐωλός*, "stale toasted Bread;" and *Lib. περὶ ἀρχ. ἰητρ.* *ἄρτος ἐστῆναι ἢ ἐνωμός*, "toasted or crude Bread," are opposed one to another.

Ἀρτοποιία, from *ἐχάεσθαι*, a Crust; Bread broil'd on the Hearth, or a Gridiron; whence some call it *Panis focalis*, *focarius*, or *craticularis*, from *Focus*, a Hearth or Fire-place, and *Craticula*, a Gridiron. This is a very bad sort of Bread, in *Galen's* Opinion, because the Outside is burnt to a Crust, while the Inside remains crude. It easily passes off, but hurts the Stomach. According to *Hippocrates*, *Lib. 2. περὶ διαίτης*, such Bread (ὡς ἐχάεσθαι ἄρτος) is less nutritive than what is baked in an Oven, but more drying, because more scorched by the Fire.

Ἀρτοποιία, from *ζύμην*, Leaven. Leaven'd Bread, what is a little fermented. This Sort is light, has an easy Passage, nourishes little, and is easily digested. *Hippocr. Lib. 2. περὶ διαίτης*.

Ἀρτοποιία, from *ὀψός*, an Oven. Bread baked in an Oven. This is very nourishing, because very little burnt. *Hippocr. Lib. prædict.*

Ἀρτοποιία καθάρως, pure Bread; that is, Bread made of fine Flour. This is opposed to *συνκομιζόμενος* (see below) and *ἀύσπετος*; (see before) in several Treatises of *Hippocrates*. Opposite to this may also be reckon'd *ἄρτος ῥυπαρός*, and *ἀχυρώδης*, from *ῥύπος*, Filth, and *ἀχυρῶν*, Chaff; impure Bread, and chaffy Bread; and also what is call'd *πιτυρώδης*, and *πιτυεύς*, from *πίτυς*, Bran, branny Bread; for, says *Galen*, *Lib. 2. de Cur. ad Glauc.* as in fine or pure Bread we have the Meal, not as Nature made it, but cleansed from the Bran; so in the coarse branny Sort the finest Flour is taken out.

Ἀρτοποιία κλιβανίτης, (from *κλίβανος*, a little moveable Oven, made of Earth, Iron, Copper, or any other convenient Matter) Bread baked in a portable Oven, by some call'd *Panis Testuarius*, from *Testus*, the Vessel in which it was baked. This sort of Bread, according to *Hippocrates*, *Lib. 2. & 3. περὶ διαίτης*, is very dry, but not very nourishing. In *Galen's* Opinion, *Lib. 1. de Alim. Facult.* it is the best, with respect to its way of Preparation and Dressing; and *Diphilus*, in *Athenæus*, *Lib. 3.* extols it as having all good Qualities, and being preferable to all other Kinds; for it is grateful to the Stomach, generates good Juice, is easily digested, readily distributed, and neither binds the Belly, nor distends it with Inflations.

Ἀρτοποιία, or *ὀβελίτης*, from *ὀβελός*, a Spit. Bread spitted and roasted. It is moderately nutritive, drying, and is not much burnt. *Hippocr. Lib. 2. περὶ διαίτης*; where it is also call'd *ὀβελίτης*. In *Athenæus*, *Lib. 3.* it is said to be call'd *ὀβελίτης ἄρτος*, ὅτι ὅτε ὀβελῷ πιπτερόμεται, ὡς ἐν τῇ Ἀλεξανδρίᾳ, ἢ ὅτι ἐν ὀβελίοις ὀπίζεται. "Either because it was sold for an Obolus, as in Alexandria, or because it was roasted on Spits."

Ἀρτοποιία ἐκ πυρῶν, Bread of Wheat. It is very nourishing, and yields but little Excrement. *Lib. 2. περὶ διαίτης*, & *Lib. περὶ ἀρχαίων ἰητρ.*

Ἀρτοποιία ἐκ πυρῶν ἀπλίστων ἢ ἐπὶ τῷ πύρῳ, (from *πλίσσω*, to pull off the Rind or Bark, or cleanse from Husks) Bread made of Wheat husk'd, or unhusk'd; that is, cleansed or uncleansed. *Lib. περὶ ἀρχαίων ἰητρ.* Bread ἐκ πυρῶν ἀπλίστων seems to be the same as the *πυρῶδης*, "branny," which has not been cleansed from the Bran. There is also *πύρρον ἄρτος ὀπτός*, ἢ τῶν σκληρῶν πυρῶν. "Wheaten Bread toasted, or made of harden'd Wheat," which was prescribed in Dropsies, *Lib. περὶ τῶν ἐν ὅσῳ παθόντων*.

Ἀρτοποιία πυρῶν ἀλάντων πρὸ χυλῶ ἢ πύρρον ἐζυμώμενος, Bread of *Sitavian* Wheat, (a sort of Wheat that comes to Perfection in three Months) fermented with the Juice of Bran; *Lib. 3. περὶ διαίτης*. This easily passes thro' the Body.

Ἀρτοποιία σεμιδάλιτης, from *σεμιδάλις*, fine Flour. Bread made of fine Flour. This was powerfully nutritive, tho' less than what was made of *Alica* or *Siligo*, and but little of it pass'd thro' the Body, *Lib. 2. περὶ διαίτης*. *Galen*, as well as *Celsus* and *Paulus*, tells us, that this kind of Bread affords most Nourishment, next to what is made of *Siligo* (see below); and *Phibition*, in *Athenæus*, will have it more strengthening than Bread made of *Alica*.

Ἀρτοποιία συγκομιζόμενος, from *συνκομιζω*, to collect or bring together. Bread made of all the Parts of the Corn taken together. This is drying, and easy of Passage, *Lib. 2. & 3. περὶ διαίτης*. This is opposed to *καθάρως*, "pure," *Lib. de Rat. Viâ. in*

Morb. acut. and *Lib. περὶ ἀρχ. ἰητρ.* *Galen*, in his *Exegesis*, expounds *συνκομιζόμενος ἄρτος*, by *ῥυπαρὸν διὰ τὸ πᾶσι ἀμα τὰ ἀλευρὰ συγκομιζέσθαι, καὶ μὴ διακρίνεσθαι*. "Coarse, because all Parts of the Meal were thrown together without Distinction."

Ἀρτοποιία ἐκ χιόνος ἢ χονδρῆς, from *χιόνος*, *Alica*, Bread made of *Alica*. It is extremely nourishing, and but little of it passes off as excrementitious, *Lib. 2. περὶ διαίτης*.

Ἀρτοποιία ἐωλός, stale Bread. It is drying, not very nutritive, and attracts Phlegm, *Lib. περὶ τῶν ἐν ὅσῳ παθόντων*. It is call'd by *Celsus*, *Lib. 1. Cap. 3. Panis Hesternus*.

There are other Distinctions of Bread in *Hippocrates*, as τῷ χυλῷ περυσμένῳ, Bread kneaded and macerated in the Juice of Wheat: This is very nutritive, light, and easy of Passage, *Lib. 2. περὶ διαίτης*. Ἀρτοποιία πολλῷ ὕδατι περυσμένῳ, ἢ ἀφύρῳ, Bread work'd up with a great deal of Water, or not work'd at all, *Lib. περὶ ἀρχ. ἰητρ.* Ἀρτοποιία μεγίστη, Bread in large Loaves: Such Bread is more nourishing than what is in smaller Loaves, because less burnt and dry'd, *Lib. 2. περὶ διαίτης*. Ἀρτοποιία θερμὴ, hot Bread, which dries the Body; Ἀρτοποιία ψυχρὴ, cold Bread, which is less drying than the former, but nourishes little, and in some measure emaciates, *Lib. 2. περὶ διαίτης*.

Besides the foremention'd Sorts there was a more modern kind of Bread in Use among the Romans, which was made of *Siligo*, the finest and purest Flour, of which *Pliny* says, *Siliginem proprie dixerim Tritici Delicias; Candor est, & sine virtute, & sine Pondere*: "Siligo may properly be call'd the delicious Part of the Wheat; it is Whiteness, without Virtue or Weight," *Lib. 18. Cap. 8.* And *Galen*, speaking of the different sorts of Bread, has these Words: "Ὁ μὲν καθάρως ἄρτος καλεῖται σιλιγνίτης, ὁ δ' ἐξ ἑξῆς σεμιδάλιτης, ἀλλ' ἢ μὲν σεμιδάλις Ἑλληνικὸν τε καὶ παλαιόν, σιλιγνίς δ' ἔχ' Ἑλληνικόν, ἐτέρας δ' αὖτις ἐνομαζέμεν ἐκ ἔχω." "The finest Bread is call'd Silignites; the next in Fineness, Semidalites; now Semidalis is an old Greek Word, but Silignis is not Greek, and I have no other Name for it." *Silignis* is plainly coin'd from the Latin *Siligo*. He goes on to compare the different kinds of Bread, with respect to Nutrition, as follows: *Τετταράτῳ δ' ὁ σιλιγνίτης αὐτῶν, ἐξ ἑξῆς ὁ σεμιδάλιτης, καὶ τρίτῳ δ' ὁ μέσος καὶ συγκομιζόμενος, ὁ δ' αὐτοπυρέτης, ἐξ ὧν τετταρτὸς ἐστὶ τῶν ῥυπαρῶν ἔιδῳ, ὡς ἐχάεσθαι ὁ πύρρον, ὅς δ' καὶ ἀτετταρτῶν ἐστὶ*. "The most nutritive of these sorts of Bread is the Silignites; the next, in that respect, is the Semidalites; the third is a middle Kind, call'd also *Syncomistos* and *Autopyrites*; the fourth is a kind of black and coarse Bread, the worst Sort of which is the *Pityrias*, which also affords the least Nourishment." *Galen. de Alim. Fac. Lib. 1. Cap. 2.*

ARTUS, τὰ κῶλα. The extreme and most compacted Parts of the Body, as the Hands and Feet, *Castellus*. According to others, they are the Members which extend themselves from the Trunk, and are divided into Joints. *Castellus. Blanchard.*

ARTYMA, ἄρτυμα, from *ἀρτύνω*, to season, or prepare. The same as *CONDIMENTUM*, which see.

ARUBUS, Crude Butter. *Johnson.*

ARVINA, ἄρβινος, εἶδος. The same as *ADEPS*, which see.

ARUM, Offic. J. B. 2. 783. Chab. 258. Raii Hist. 2. 1208. Synop. 3. 266. Dill. Cat. Giff. 56. *Arum vulgare*, Ger. Emac. 834. Merc. Bot. 21. Phyt. Brit. 11. *Arum vulgare maculatum*, & non maculatum, Park. Theat. 372. *Arum vulgare maculatum & sine maculis*, Mer. Pin. 11. *Arum maculatum maculis candidis vel nigris*, & non maculatum, C. B. Pin. 195. Tourn. Inst. 158. Elem. Bot. 130. Hist. Oxon. 3. 542. Rupp. Flor. Jen. 203. Boerh. Ind. A. 2. 74. Buxb. 26. CUCKOW-PINT. Dale. Or. WAKE-ROBIN.

Arum, among the Syrians, is call'd *Lupba*. It shoots forth Leaves like those of the *Dracunculus*, but smaller, and not spotted: The Stalk is a Span long, reddish, and shaped like a Pestle, on the Top of which grows a yellowish Fruit. The Root is white, much like that of the *Dracunculus*; and, being boil'd, loses so much of its Acrimony as to become eatable. The Leaves are pickled for Food, and, being left to dry of themselves, are boil'd and eaten.

The Root, Seed, and Leaves, have the same Virtues as those of the *Dracunculus*; besides which, the Root is apply'd as a Cataplasm, with Cow-dung, to the Parts affected with the Gout. It is preserved like the Root of the *Dracunculus*, and is commonly so little acrimonious as to be eatable. *Dioscorides, Lib. 2. Cap. 197.*

The Roots of *Wake-Robin* are roundish and tuberous, about as big as a Walnut, of a white Colour on the Inside, sending from the Sides several white Strings, by which it is fix'd in the Earth: The Leaves are long and large, of a shining-green Colour, in Shape like the Head of a Spear, or a barb'd Arrow; in some Plants they are full of black Spots. From among the Leaves arises a round Stalk, having, at the upper Part, a long Skin or Husk, closed at Bottom, and open at the Top; of a greenish Colour on the Outside, and purplish within; in which is inclosed a long naked purplish cylindrical *Pistillum*, encompass'd on the lower Part with a Circle of Chives standing

standing above the Rudiments of the Berries; which, after the Pistillum and its Covering are fallen off, grow to be large round Berries, of a yellow-red Colour, full of Pulp, each containing one round Seed. The whole Plant, Root, Leaves, and Seed, are very hot and biting, inflaming the Mouth and Throat for a long time. It grows every-where in Hedges and dry Ditches, and flowers in May, and the Berries are ripe in July.

This Herb is call'd *Aron*, *Jarus*, *Pes Vituli*, *Barba Aronis*, *Sacerdotis Virile*, *Serpentaria Minor*, *Dracontia Minor*, *Alim-mum*. The Root has a pungent Taste like Ginger, which burns the Tongue. But 'tis said, that in the Fields about *Cyrene* there is an *Arum* found which eats like a Turnep, and is entirely void of Acrimony. It is gather'd in the Month of March, and, when dry, is principally used in the Shops of Apothecaries. It is of a hot and drying Nature, dissolves and liquifies the coagulated Humours of the Body, is an excellent Antiscorbutic, and opens and dissolves internal Obstructions, especially in Dropsical Cafes. It purifies and sweetens the Blood when impregnated with saline Particles, opens the Breast, and facilitates Expectoration in Disorders of the Breast, and Coughs; for Instance,

Take of the best fresh Arum-root, half an Ounce; boil it in White Wine till it becomes soft, and make it into a Linctus, with Syrup of Hyssop.

It relieves old Coughs, and is good for Consumptions, especially when it is often moisten'd, and afterwards dry'd, with Tincture of the Flowers of Daisy and wild Poppy; *Joh. de Muralt. in Hipp. Helvet. P. 653. Ephem. N. C. Dec. 2. Ann. 5. Obs. 180. Dieuches*, according to *Pliny, L. 24. N. H. C. 16.* gave the Powder of it, mix'd with Meal, and baked in Bread, to those who were afflicted with Coughs, heavy Sighs, or an *Orthopnea*, or a Spitting of purulent Matter. It promotes Urine, and cleanses the Urinary Vessels, and the Matrix. It promotes the Menfes when obstructed, warms the Stomach when cold, excites the Appetite, and strengthens the Digestion. *Hartman, in Prax. Chym. Helmont. Pharmac. ac Dispens. Modern. N. 46.* says, that it cures Ruptures; as also long and tedious Fevers. *Vid. Dan. Milii Pharm. Spagir. L. 2. C. 10. Pet. Laurenberg. Appar. Plant. L. 2. C. 6.* and is very good in Hysterical and Epileptic Cafes. *Gregor. Horstius*, with the Root of it alone, recover'd a *Hessian* Girl of five Years old, who had been entirely deprived of the Use of her Speech for almost a whole Year, *L. 3. Obs. Med. 24.* The same is related by *J. Hotnung, in Cista. Med. Epist. 132.* The Root is also an excellent Medicine against the Plague and Poisons, *Plin. l. 1. H. Trag. L. 2. Hist. Plant. C. de Aro. Jo. Bruyer. de re Cib. L. 8. C. 6. Tarqu. Schnelleberg. Tr. de 20 Herbis Pestilentibus veneno adversantibus*, who styled this Plant the *Miracle of Nature*, on account of its remarkable Efficacy against the Plague; *M. Unzer. Antidot. Pestilent. L. 2.* The Root when fresh, if boil'd, warms and corroborates the Stomach, strengthens the Appetite, purges the Breast, and is good for Rheumatic Disorders, and the Vertigo; as also for Stiffness of the Limbs, Swellings, and fetid Wounds. The Herb itself, boil'd with Victuals, makes People lean. The Leaves, when fresh, as also the Powder of the Root, cure inveterate Ulcers, Fistulas, fetid Cancers, and the Bites of venomous Animals, if they are apply'd to them: *Tragus* says, that for pestilential Swellings he knew no Herb more efficacious, than the Leaves of *Arum*, apply'd green to them. *Georg. a Turre* has observ'd, more than once, from undeniable Experience, that Burns are heal'd by its Leaves when apply'd to them, and frequently renew'd; *De Hist. Plant. L. 2. C. 244.* In order to cure Ulcers and Wounds, some People make an excellent Ointment of its Root, reduced to Powder, and boil'd with Butter made in the Month of May. *El. Beynon*, that tender-hearted Samaritan, commended the Root of *Arum*, mix'd with Flowers of Sulphur, as one of the most efficacious Remedies in a Phthisis; *Jo. Dolaeus, Encyclopad. Med. L. 2. C. 4.* See also *El. Beynon, P. M. 23.* The Juice, express'd from the bruised Root, is good for a Polypus of the Nose, if put up the Nostrils on a little Cotton. The Foetuses of all Animals in Nature are expell'd by *Arum*, says *Pliny*. Many reduce the Root to a Powder, and apply it to the Part affected by the Gout, *Crat. L. 2. Conf. 26.* The Water distill'd from its green Leaves in Spring, is an admirable Remedy for the Scurvy; *Tb. Willis, Tr. de Scorbuto. C. 7.* It is also good for Maniacs, and such as are melancholy. Many distil, from the whole Substance of this Herb, a Water, which they give to those who labour under Ruptures. This Water is also good against the Plague, purifies old Wounds and Ulcers, takes Spots off the Face, whitens the Skin, and destroys the Wrinkles of the Face. Several People inspissate the Juice of the Root at the Sun, and, when they want to use it, dissolve it in Rose-water, with which they wash their Faces. Country Girls, when its Kernels are ripe, use them for a Varnish, to give a purple Colour to their Cheeks, which they rub heartily with them, almost to the Loss of the Epidermis or Scarf-skin, *Georg. a Turre, L. C.* The *Tragea*

Stomachialis of *Birckmanus*, made of Arum-root, describ'd by *Quercetan, Pharm. Restit. L. 2. C. 20.* is known in the Shops of some foreign Apothecaries. This Medicine warms cold Stomachs, promotes Digestion, procures an Appetite, prevents the Vertigo, removes Obstructions of the Liver, Spleen, and Mesentery; and is good for those who labour under Hypochondriac Disorders, Melancholy proceeding from Flatulencies, or the Scurvy. It is also serviceable in the Chlorosis in Girls, Cachexies, Swellings of the Belly, beginning Dropsies, Quartan, and other protracted and intermitting Fevers, and other Disorders caused by gross and corrupt Matter in the Stomach. It is also given for the Stone. In Apothecaries Shops there was formerly prepar'd, from its Root, a particular farinaceous white Substance or Powder, call'd by Chymists *Faecula*, from the Latin Word *Faeces*, because that Substance separates, of its own Accord, from the rest of the Liquor, and subsides to the Bottom of the Vessel. It operates in the same manner with the Root, tho' more mildly; for which Reason 'tis successfully used among the Pectoral Tinctures and Powders, employ'd to dissipate Phlegm, and glutinous Humours, and facilitate Expectoration. It also removes inveterate Obstructions, and is an efficacious Remedy in Quartan Fevers, Cachexies, and Scurvies. *J. Const. de Rebecqu. Atr. Medicin. Helvet. P. M. 242. Jo. Otto. Helbig. in Ephem. N. C. Dec. 1. An. 9. & 10. Obs. 194.* says, that, among the Indians, the Root of *Arum*, boil'd, is used instead of Bread.

PULVIS RADICUM ARI COMPOSITUS: Compound Powder of Arum-root.

Take of the Root of spotted Arum, two Ounces; of the common Acorus-root, and Saxifrage Pimpinell, each one Ounce; of Crabs-eyes, half an Ounce; of Cinnamon, three Drams; of Salt of Wormwood, one Dram; and let them be made into a Powder. *N. B.* The Arum-root is always to be fresh added to it.

This is but lately introduced into the Dispensatory; and here is left out the Salt of Juniper, which was order'd in the preceding, because it is a thing not usually made, and answers no Intention; but what is provided for by the Salt of Wormwood; but this makes it necessary to be kept close from the Air, because it will else grow moist, and spoil the Medicine; tho' the principal Necessity of so keeping it, is to preserve the Pungency and Volatility of the Ingredients, which otherwise would soon exhale. And for the same Reason also, it is now directed to mix the *Arum* Root always fresh, as it is used; because that is the chief Ingredient, and soonest spoil'd by keeping. *Quincy's London Dispensatory.*

Ray enumerates the following Species in his Chapter of *Arum*:

1. *Arum*, *J. B. Vulgare*, *Ger. Vulgare maculatum* & *non maculatum*, *Park. Arum 2. & 3. frue maculatum Maculis candidis vel nigris, & vulgare non maculatum*, *C. B.*
2. *Arum venis-albis*, *C. B. Magnum rotundiore folio*, *Park. Majus Veronense*, *Lob.*
3. *Arum Byzantinum*, *Clus. J. B. C. B. Park. Dracontium minus*, *Ger. quoad Icon.*
4. *Arum montanum*, *Alpin. Exot.*
5. *Arum maximum Aegyptiacum*, *quod vulgo Colocasia*, *C. B. Ar. Aegypt. rotunda & longa Radice, vulgo Colocasia dicta*, *Park. Colocasia*, *Clus. J. B. Aegyptiacum*, *Ger.*

The Root of this, as well as the whole Plant, is acrimonious like the common *Arum*, but in a milder Degree, and is therefore used in Food, and for other Purposes. In *Egypt*, *Syria*, and other Eastern Countries, it is eaten as commonly as Turneps in *Germany*; and is very much coveted by the Turkish and African Slaves at *Naples*. *Bontius* writes, that it is of a venomous Nature, and requires three Days Maceration in Water, to render it eatable.

6. *Dracunculus aquaticus*, *Ger. J. B. Noster aquaticus*, *Park. Palustris frue radice arundinacea Plinii*, *C. B.*
7. *Arum orientale*, *Ardabar dictum Zanon*, *Hist. Bot. Cap. 12.*
8. *Arum Indicum*, *Rumphal. Dictum Zanon*, *Hist. Bot. Cap. 92.*
9. *Arisarum latifolium*, *Park. Ger. Latifolium quibusdam*, *J. B. Latifolium alterum*, *C. B. Item latifolium majus ejusdem.*

THE BROAD-LEAVED FRIERS-COWL.

10. *Arisarum angustifolium*, *J. B. Ger. Longifolium*, *Park. Angustifolium Dioscoridis forte*, *C. B.*

ARUNDO, the Reed. Of this Dale takes Notice of several Species: The first is the

Arundo, *Offic. Arundo vallisoria*, *Ger. 32. Emac. 36. Raii Hist. 2. 1275. Synop. 3. 401. Mer. Pin. 11. Arundo vulgaris palustris*, *J. B. 2. 485. Hist. Oxon. 3. 218. Harundo

Harundo vulgaris *sive* *vallatoria*, Park. Theat. 1208. *Arundo*, *Harundo*, *Calamus*, Chab. 193. COMMON REED. Dale.

The Reed has thick, knotty, join'd Roots, which spread and increase much, running obliquely in the Earth: The Stalks grow to be above the Height of a Man, hollow, and with several Joints; at each of which grow long narrow Grass-like Leaves, rough and hard; and on their Tops a large husky Spike or Panicle, of a brownish-red Colour, full of a soft, downy Substance, hanging down the Head, without any visible Seed. The Stalks die away every Winter. The Reed grows by River-sides, and in Marshes.

ARUNDO DONAX, Offic. Park. Theat. 1208. *Arundo* *Cypria*, Ger. 32. Emac. 36. *Arundo sativa*, *seu* *Donax Dioscoridis*, Raii Hist. 2. 1275. C. B. Pin. 17. Tourn. Inst. 526. Elem. Bot. 419. Hist. The Medicinal Virtues of these are said to be alike, which, according to *Bartholomæus Zorn*, are as follows:

Its Root attracts any Matter lodg'd in Wounds, if it is reduced to Powder, with Wine, and apply'd to the Wound; or if it is taken fresh, and reduced to Powder, with an Onion; or if the Powder of it is mix'd with Honey, it produces the same Effect, *Oribas. de Morb. Cur. L. 3. C. 32*. It also removes the Pains arising from Dislocations of the Limbs, and carries off Pains in the Hips. When bruised, and apply'd to any Part that aches, it is of wonderful Service, *Hier. Mercurial. Med. Pract. L. 4. C. 2*. If it is boil'd in any Lixivium, and the Head frequently wash'd therewith, it causes the Hair to grow; and cures scald Heads. *Julius Cæsar Claudinus, Ep. Vincenzo Tanar. fol. 88*. says, that the Root of the *Arundo* produced the same Effect in Rheumatisms and Catarrhs, with the *Peruvian* Bark. It is also good for those who labour under Consumptions. *Actius* says, it is of a drying and warming Nature, and is therefore of Service to dropical Patients, *Serm. 10. c. 32*. See also *Ephem. N. C. Dec. 3. An. 3. Obs. 159*. It brings Apostems to Suppuration, *Lev. Lemn. de Herb. Biblic. c. 27*. The green Leaves, cut and apply'd, carry off the Wild-fire and *Erysipelas*. Poor People boil the Flowers in Water, or in Beer, which they mix with Honey, and drink, after having filtrated it, in order to cure Coughs, Oppressions of the Breast, and Consumptions. The Antients made Flutes, and other musical Instruments, of the *Arundo*.

ARUNDO SCRIPTORIA, Offic. Ger. 34. Emac. 37. J. B. 2. 487. Raii Hist. 2. 1276. Hist. Oxon. 3. 219. *Arundo scriptoria atro-rubens*, C. B. Pin. 17. Theat. 273. Tourn. Inst. 526. *Harundo minor* *sive* *Elegia*, Park. Theat. 1211. WRITING REED. Dale.

I do not find any Medicinal Virtues attributed to it.

ARUNDO TABAXIFERA, Offic. *Arundo Mambu*, Pison. Mant. Arom. 186. Raii Hist. 2. 1315. *Arundo Indica maxima arborea cortice spinoso Hermannii*, Syen. in not. Hort. Mal. C. Comm. Flo. Mal. 36. *Arundo arbor Tabaxifera*, C. B. Theat. 285. *Arundo arbor in qua humor lacteus gignitur, qui Tabaxir Avicennæ & Arabibus dicitur*, C. B. Pin. 18. Hist. Oxon. 3. 219. *Arundo arborea Mambu vel Bambu dicta*, Pluk. Almag. 53. *Canna ingens Mambu vel Bambu dicta*, Park. Theat. 1630. *Tabaxir sive Mambu arbor*, J. B. 1. 222. *Mambu arbor, Tabaxir Garcie & Acoftæ*, Chab. 67. *Bambu & Bambæ*, Nienhou. Leg. 91. Ily. Hort. Mal. 1. 25. Tab. 16. THE BAMBU CANE. Dale.

Piso writes, that the young Bambou-canes are full of a light, spongy, and liquid medullary Substance, (not so much stuffed as the common Sugar-canes) which the common sort of People greedily suck, on account of its grateful Taste. The young Shoots, which are very succulent and favoury, are much valued in *India*, by Strangers as well as the Natives, as being the Base of that famous Composition call'd *ACHAR*, which is imported into *Europe*, and accounted a Delicacy among those of nice Palates: And I myself, says he, have more than once tasted it with Pleasure. But when these Canes are grown tall and old, the contain'd Liqueur is alter'd in Substance, Colour, Savour, and Efficacy; and by degrees is protruded forth, and coagulated, near the Joint, by the Heat of the Sun, and harden'd like a white Pumice-stone: Soon after it loses its native Sweetness, acquiring a peculiar Savour, much like that of burnt Ivory, with a little Astringency, and is call'd by the Natives *SUCAR MAMBU* (the *Tabaxir* of *Garcias* and *Acoftæ*); which the lighter, whiter, and smoother it is, the greater is the Value set upon it; and the more uneven its Surface, and the more of an Ash-colour, the worse it is accounted.

The *Tabaxir* is very fit for Medicinal Purposes, eagerly sought after by the *Persians* and *Arabians*, and purchased at its Weight in Gold or Silver. The *Indians* use it for Wounds of the *Testes* and *Penis*. It is also said to be efficacious in Choleric Affections, and the Dysentery. *Garcias* writes, that it is proper to be used in burning Heats, internal and external, and in bilious Fevers and Dysenteries; but especially in bilious Fluxions, the Strangury, and bloody Urine. The Decoction of

the Leaves and Bark, being drank, purges Wounds of Blood retain'd in them; and is proper for Women in Childbed, to cleanse the Uterus after the Birth: These Canes, cut off and burnt in the Fire, yield a most fertile kind of Ashes; in burning they make loud Cracks with as great a Noise as the Explosion of an hundred Guns; for the Air, which is stopp'd in by means of the Joints, being rarefy'd, and wanting more Space, bursts its Inclosure on all Sides, and makes its Way out by Violence: They grow in the Sand of the Sea-shores. Raii Hist. Plant.

The *Gramen Arundinaceum*, Reed Grass, enumerated amongst the Reeds by Dale, agrees in Virtues with the common Reed: See CALAMUS.

ARYSTER, ἀρύστηρ, from ἀρύω, to draw out: A sort of Vessel mentioned by *Hippocrates*, Lib. περί γυναικῶν; to which he opposes ἀγγεῖον μέγα, a large Vessel. *Foesius*.

ARYTÆNOIDES, ἀρυτæνοειδής, from ἀρύττω, a Funnel; and εἶδος, Shape. An Epithet of two Cartilages, which, together with others, constitute the Head of the Larynx. It is also apply'd to some Muscles of the Larynx. *Castellus. Blancard. See LARYNX*.

ARYTHMUS, or ARRHYTHMUS, ἀρυθμός ἢ ἀρρυθμός (from a Negative, and ῥυθμός, properly signifying a Modulation or Modification of Time and Sound in Music, but used to express Order and Harmony in other Things). An Epithet apply'd by *Galen* to a Pulse not modulated according to Nature. It is opposed, he says, not to *Enrythmus* (ἐνρυθμός) "modulated," for every Pulse is modulated after some manner or other, but to *Eurythmus*, (εὐρυθμός) "justly modulated;" so that *Enrythmus* is a common Genus to *Arythmus* and *Eurythmus*. A *Pulsus Eurythmus* is but one, and indivisible; but a *Pulsus Arythmus* is of three Kinds, as *Pararythmus*, *Heterorythmus*, and *Ecrythmus*. To shew what these are by an Example: Every Age has its natural Pulse, which, as long as it keeps its due Rhythmus, or Modulation of Time and Force, is call'd *Eurythmus*; but if it in any way transgresses, it is a *Pulsus Arythmus*. If it transgresses into a Modulation proper to the next Age, it is *Pararythmus*; if it changes to a Pulse proper for any other Age, it is call'd *Heterorythmus*; but if it passes into a Modulation proper to no Age at all, it is then a *Pulsus Ecrythmus*. The same Judgment is to be form'd of Natures, Seasons of the Year, Places, and all other Things; for all have their determinate Rhythmus, and, if this be corrupted, they pass into one or other of the three Classes of the *Arythmi* before-mention'd. *Galen. de Diff. Puls. Lib. 1. Cap. 9*.

AS, ASSARIUM, ἀσάριον, μῶν, sometimes means a particular Weight, in which Sense the Roman *As* is the same as the *Libra*, or Roman Pound, consisting of twelve Ounces. Sometimes it signifies a Roman Coin, which was of different Matter and Weight, according to the different Ages of the Commonwealth; therefore *Varro* derives the Word *As* from *Æs*, because this Piece of Money was first made of Copper of a Pound Weight; and *As*, *Æs*, *Pondo*, and *Mina*, among antient Authors, generally pass for the same. It is also used to signify an Integer, divisible into twelve Parts, whence comes our Word *Ace*, or *Unit*; and, for this Reason, some will have *As* deriv'd from the *Doric* αἰς for *eis*, one. In *Galen*, *de Ponderibus & Mensuris*, the ἀσάριον is the Weight of two Drams.

ASA DULCIS, the same as BENZOINUM, which see.

ASA FÆTIDA. See SILPHIUM.

ASABON, Soap. *Rulandus. Johnson*.

ASÆSTUS, ἀσάυς. See CALCARIUS LAPIS, and CALX.

ASAGEN, Dragon's-blood. *Rulandus. Johnson*.

ASAGI, Vitriol, or Atramentum Rubrum, calcin'd Vitriol. *Rulandus. Johnson*.

ASAMAR, ASAGAR, ASINGAR, Verdigrise. *Johns*.

ASAMAZ, Vitriol. *Rulandus. Johnson*.

ASAPEOS, ἀσάπιος, in *Hippocrates*, Lib. de Rat. Viâ, in *Morb. acut.* signifies the same, according to *Galen*, as ἀσπίλιος, that is, without Concoction. *Foesius*.

ASAPES, ἀσάπης, unconcocted; otherwise express'd by *Aseptus*, ἀσπής, (from a Negative, and σήπω, to corrupt, putrefy) unputrefy'd, according to the Notion of the Antients, confounding Concoction with Putrefaction. *Castellus*.

ASAPHATUM is a sort of *Serpigo*, *Impetigo*, or intercutaneous Itch, generated in the Pores like Worms: If the Skin be press'd, they come forth like oblong Threads, with a black Head. *Johnson*.

ASAPHEIS, ἀσάφης, (from a Negative, and σάφης, clear, open) in *Hippocrates*, in *Prorrh. & Coac.* are such Patients as do not utter their Words in a clear manner. This Defect is occasion'd, as *Galen* says, *Comm. 2. in Prorrh.* ἢτοι διὰ τὴν τῶν διαλεκτικῶν ὀργάνων βλάβην, ἢ ἐκ τῆς τῶν νεύρων κακώσεως ἔχον, ἢ διὰ τὴν διαβολὴν αὐτῶν, "either by some Hurt, which the Organs of Speech have contracted from a Disorder of the "Nerves, or else by a Delirium." In the same Sense we are to understand ἀσάφης γλώσσα, Lib. 7. *Epid.* of a muffled hesitating Tongue, that has no plain Utterance; and ἀσάφεια, in the same Book, means such a Confusedness of Voice as proceeds from an Indisposition of the Vocal Organs. *Ἀσάφης παρρησιότης, in Lib.*

Lib. 1. Prorrh. means a dubious kind of Delirium, which can hardly be discover'd by the Attendants, or even by the Physician. The Patient lies at Rest, like one in a Slumber, sometimes with his Eyes shut, as if betaking himself to Sleep, sometimes with them open, and his Hands thrown about, and employ'd in searching and groping here-and-there: Now, because he lies quiet, and does not cry out, nor start up in his Bed, like other phrenetic Patients, his Phrensy or Delirium is said to be *ασαρις*, "obscure or dubious;" and, being join'd with a Coma in the Beginning, is to be accounted very dangerous. This is the Substance of *Galen's* Comment on the Place.

ASARABACCA, the same as ASARUM, which see.

ASARCON, *ασακον*, from *α* Negative, and *σαρξ*, Flesh, strictly signifies void of all Flesh; but is comparatively applied by *Aristot.* to the Head, in respect of the Middle and Lower Belly, compared with which it has but little Flesh.

ASARINA, a Species of ASARUM, which see.

ASARITES, *ασαριτης*, from *ασαρον*, *Asarum*, *δινω*, Wine, being understood, is Wine of *Asarum*, which is made by putting six Pints of Must to three Ounces of *Asarum*. This Wine is diuretic, and good for those who are afflicted with the Dropsy or Yellow Jaundice, a distemper'd Liver, or the Sciatica. *Dioscorides*, *Lib. 5. Cap. 68.*

ASARUM, *Offic. Ger. 688. Emac. 836. C. B. 197. J. B. 3. 548. Chab. 510. Raii Hist. 1. 207. Tourn. Inst. 501. Boerh. Ind. A. 2. 95. Dill. Cat. 36. Buxb. 28. Asarum vulgare, Park. 266. Asarum vulgare rotundifolium, Hist. Oxon. 3. 511. Nardus rustica, Hoff. Flo. Altorff. ASSARABACCA.*

ASARUM is by some called *Wild Nard*; it has Leaves like Ivy, but much thicker, and rounder. The Flower grows in the Middle of the Leaves near the Root, and is of a blue Colour, resembling that of Henbane, and inclosing a Seed like a Grape-stone. The Roots are numerous, jointed, slender, running obliquely, resembling those of Dogs-grass, but much slenderer, of a fragrant Smell, and taste very hot and biting upon the Tongue.

The Roots are heating, diuretic, and emetic, and are good in a Dropsy, or inveterate Sciatica; they also provoke the Menstrues; six Drams thereof, taken in Hydromel, purge like White Hellebore. They are also an Ingredient in Ointments.

ASARUM grows plentifully on shady Hills, and in the Countries of *Pontus*, *Phrygia*, *Illyricum*, and the Territories of the *Vestines* in *Italy*. *Dioscorides*, *Lib. 1. Cap. 9.*

It is called *Asaron*, as *Pliny* says, because it is not worn in Garlands. It has the Virtues of *Nard*. They dig it when it shoots forth Leaves, and dry it; it very soon grows mouldy.

The Root of *Asarabacca* consists of a great Number of slender Strings, of an aromatic Scent when dry. The Leaves are smooth, and of a Sea-green Colour; of a thick firm Substance, of a roundish Shape, somewhat hollowed in, next the Foot-stalk, resembling a Kidney; among these arise the Flowers on short Stalks, in form of Cups, or brownish green Husks, divided at Top into three Parts, and containing Seed like Grape-kernels. It is planted with us in Gardens, and flowers in June. But the dried Roots are brought from *Leghorn*.

Asarum, according to *Pliny*, [*Lib. 12. Cap. 13. & Lib. 21. Cap. 6.*] takes its Name from the Greek Word *ασαω*, to adorn, and the privative Particle *α*, without, because it was not used by the Antients in adorning their Crowns and Garlands. It is also called the *Nardus Montana*, *Sanguis Martis Mogorum*, and *Nardus Sylvestris*, and *Rustica*, from its Smell and Virtues, resembling those of the *Nard*. The greatest Virtue is lodged in the Root, which is aromatic, very strong, and burns the Tongue like Ginger. But, according to *Georgius a Turre*, [*De Hist. Plant. Lib. 2. Cap. 23.*] it scarce retains its original Nature and Qualities above a Year. *Helmont* [*De Mag. Vuln. Cur. p. m. 479.*] affirms, that it vomits, and sometimes purges very strongly. *Dioscorides* says, that an Infusion of six Drams of its Root purges like Hellebore. It nevertheless loses a great deal of its emetic Quality by being boiled in Water.

Helmont, in *Pharm. & Dispens. Modern. Sect. 46. Heurn. Meth. ad Praxin, Lib. 2. Mich. Etmuller. Oper. Med. Tom. 2. p. m. 15.* The English affirm from their Experience, that the Powder of *Asarum*, boiled in Wine, purges; and that, when boiled in Water, it excites a Discharge of Urine. It removes Obstructions of the Liver and Spleen, purges the Body of all malignant Humours, strongly promotes the Menstrues, and expels the After-birth, and the Fœtus, when dead. *M. Ruland. in Thef. Med. a C. Reyger. Ed. p. 77.* says, that a Decoction of *Asarum* Root, infallibly promotes the Monthly Discharges, and expels the Secundines, and dead Fœtus. It dissolves the thick and viscid Matter lodged in the Lungs. See *Joh. Freytag. Auror. Med. Lib. 2. Cap. 31. Gu. Rolfinc. Lib. de Purg. Veget. Sect. 1. Art. 4. Cap. 3.* It is of great Service in the Jaundice, Dropsies, Pains of the Limbs, Gout and Fevers; and is the great Panacea of such as are afflicted with Quartan Agues. See *Simon Pauli in Quadr. Bot. Class. 2. Matth. in Diosc. Lib. 3. Cap. 42. Alex. Pedemont. Secret. Lib. 1. J. Steph. Strubelberg. Rem. Singul. pro Cur. Febr. intr. p. 28. & 29. Resin. Lentil.*

Miscell. Med. Pr. p. 13. p. 197. G. H. Velsch. Chil. 1. Exot. Cur. & Obs. 664. It is principally used by the Country People in what they call a *Fever-cake*, in order to remove Fevers. *Petr. Bayrus, Lib. 12. Pr. Cap. 6.* says it is of wonderful Efficacy in the Jaundice. *Jo. Soph. Kozak, Tr. de Sale, Sect. 14. Cap. 6.* affirms, that by its means he has restored many, who laboured under the Jaundice, to perfect Health. *G. Rondelet, Meth. Cur. Morb. Lib. 3. Cap. 82.* affirms, that in many Instances, he found a Decoction of it to cure Sciatic Pains of long Standing. See also *Joh. Ruel. de Natur. Stirp. Lib. 2. Cap. 8.* In the City of *Dresden* there was one *Lotichius*, Physician to the Court, who mixed the Root of this Herb almost with every Medicine he prescribed. See *Joh. Michael Not. in Joh. Schrod. Pharm. Med. Chym. p. 608. & 624. Frid. Hoffmann. Clav. Pharm. Schrod. Lib. 4. Sect. 4.* Women with Child ought carefully to abstain from this Root, because it is very hurtful to the Fœtus; though *Fernelius, Lib. 5. M. M. C. 13.* informs us, that it may be given to Women in that Condition without any Danger. Its Leaves reduced to a Powder, and applied to the Pulse, occasion Sleep, and cure Fevers. *B. Mortagnan Consil. 191.* affirms, that a Plaster made of the Leaves of *Asarum*, and applied to the Region of the Kidneys, wonderfully cleanses the renal and urinary Ducts. If the Head is washed with any Lixivium, in which its Root and Leaves have been boiled, it fortifies the Brain and Memory, tinges the Hair black, and prevents its falling off. Its Root reduced to a Powder, and applied to old and foul Wounds, cleanses and cures them. If its Root is cut, and steeped in Rose-water, the Liquor removes Stains and Blotches in the Face. *Forest. Lib. 31. Obs. 3. in Schol. & Lib. 4. Obs. Chir. 11.* When Hares, and other wild Beasts are indisposed, they eat this Herb, and find a Cure in it. The Antients, observing this, did for that very Reason mix this Herb with Salt, and give it to their Sheep, their Oxen, and Cows, in order to prevent a Putrefaction of their Flesh. When Horses will not eat their Food, some People mix the Root of this Herb with Oats, upon which the Horses begin to eat, and are rendered sprightly. Some Women put its Leaves into new-drawn Milk, imagining that by their means it will produce more Cream than it would otherwise have done. This Herb was also by the Antients accounted good against Witchcraft.

Joh. Fernelius, Lib. 7. Meth. Med. has a Composition, which he calls *Diasarum*; and which he at first prepared with a View to vomit. This Composition, says *Hor. Aug. [Epist. Med. Tom. 1. p. 207.]* when exhibited at certain Intervals, proves a safe and agreeable Vomit to Persons of all Ages and Sexes, and even to Women big with Child; and with this very View it is prepared in many foreign Shops, where we also find the Extract of *Asarum*, called also the *Coagulum Asari*, which is excellent in Disorders proceeding from Melancholy, cures the Jaundice and Falling Sickness, excites a Discharge of Urine, promotes the Monthly Evacuations, kills Worms, and cures Fevers, especially those of the Quartan Kind. *Hartmann. Prax. Chym. de Vomitor. Sennert. Instit. Lib. 5. p. 3. Sect. 3. Cap. 9. Collectan. Chymic. Leydens. Cap. 48. Joh. Helf. Jungken. Corpus Pharm. Chym. Med. Sect. 3. Cap. 12.* Many from its Leaves and Root distil a Water, which they prescribe for Oppressions of the Breast, the Jaundice, the Dropsy, Tertian and Quartan Agues. It must also be good for Disorders of the Eyes. *Joh. Camer. Hort. Med. p. 22.* A Conserve made of its Leaves fortifies the Memory and Hearing. *Croll. Tr. de Sign. intr. rer. Marc. Ant. Zimar. Antr. Magico-Med. Part. 2. p. 113. H. Petrus Nofol. Harm. Tom. 1. Dissert. 11. Sect. 52.*

The Juice of *Asarum* has of late obtained great Reputation as a Vomit in Maniacal Cases. The *Pharmacopœia Pauperum* gives the following Form:

AN EMETIC DRAUGHT.

Take of the Juice of *Asarabacca*, six Drams, or an Ounce; of Oxymel of Squills, half an Ounce; Carduus-water, two Ounces; mix into a Draught.

This is a very strong Emetic, and is much used at *Bedlam*, amongst the Maniacs; for it will operate when neither Crocus, nor any of the common Mercurial Emetics, will move them. And it has been confirmed by all Experience, that such Patients are much more difficult to be wrought upon than any others, either by Cathartics or Emetics; insomuch that they will bear enough at a Dose for six or ten ordinary Persons; their Fibres, and all the Parts of the Brain, most administering to Sensation, being extremely clogged with viscid Humours, which this Medicine is very powerful in draining off; and upon the same Account likewise it is of good Service as a Sternutatory; for it greatly drains the Head by the powerful Twitches and Vellications it gives to the Fibres of the Nose, and Parts adjacent.

Asarum Virginianum, Serpentaria nigra, Offic. Asarum Virginianum folio cordato Cyclaminis more maculato, Hist. Oxon. 3. 511. Asarum Virginianum Pistoleticie foliis subrotundis Cy-

clamini more maculatis, Pluk. Almag. 53. Phytog. 78. Raii Hist. 3. 129. *Asarum Cyclamini folio Virginianum*, Banif. MSS. Cat. *Serpentaria major Officinatum*, Bobart. BLACK SNAKEWEED.

This is the *Asarum* of Virginia, with Leaves of *Pistolochia*, spotted like Sow-bread, *Plukenet's Phytographia*, Tab. 78. Fig. and the Roots of it are brought over among the true *Serpentaria Virginiana*, and are used promiscuously with them, being accounted of the same Diaphoretic and Alexipharmic Nature. *Miller's Bot. Off.*

ASBESTUS, ἀσβέστης, from a Negative, and σβέννυμι, to extinguish; unextinguished, as *σβέννυμι* ἀσβέστης, Quick-lime. But this Word is often put substantively, for Quick-lime, without the Addition of τίτανος, Lime. For its other Signification, see AMIANTUS.

ASBO, ἄσβος, the Name of an unknown Animal, whose Fat, among others, is prescribed as an Ingredient in a Plaster for the Pleurisy. *Myrepsus de Emplastris*, Cap. 79.

ASCALABOTES, ἀσκαλαβώτης, and καλώς, a kind of Lizard, mentioned by *Galen*, 11. de Simp. Fac. and Lib. de Theriac. ad Pis. Cap. 9. For a Description of it, see ALDROVANDUS.

ASCALONIA, ASCALONITIS, a Species of CΕΡΑ, Onion, which see.

ASCARDAMYCTES, ἀσκαρδαμύκτης, from a Negative, and σκαρδαμύκω, to wink; in *Lib. 2. de Epidem. Sect. 6.* is one who keeps his Eyes long fixed and immoveable without Twinkling.

ASCARIDES, ἀσκαρίδες, (from ἀσκαρίζω, the same as σκαρίζω, to leap, palpitate, move, as ἄσκαρις, and σαρῖς, ἄσκαρυς, and σάχρυς, in *Hippocrates*, are the same thing) are expounded by *Galen*, in his *Exegesis*, to be ἐλμίνθες ἰσχυαὶ καὶ μικροὶ ἐν τῷ ἀπενδυμένῳ ἐντέρω γεννώμεναι, "small slender Worms bred in the Intestinum Rectum;" and *Paulus*, Lib. 4. Cap. 58. καὶ ἀσκαρίδες εἰδὸς εἰσὶν ἐλμίνθων σκόληξιν παρὰ πλῆθος, συνίστασθαι περὶ τὰ ἔσχατα τῷ ἀπενδυμένῳ, καὶ τὰ πρῶτα τῷ σφιγνίσθῳ, ἐμφέρεσθαι τῶν τόπων τῶν κνησίων ἰσχυρῶν. "The Ascarides are a kind of Worms much like the Scolex, which lodge about the Extremity of the Intestinum Rectum, and Beginning of the Sphincter, and excite a vehement Itching in those Parts;" or, according to *Aetnarius*, *Metb. Med. Lib. 1. Cap. 21.* are ἀεὶ ἐρεθίζουσαι καὶ γαργαλίζουσαι τὸν κάρυον, "molesting the Patient with a continual Irritation and Titillation."

The Signs of these Worms, called *Ascarides*, are a continual Itching in the Fundament, which sometimes causes fainting Fits and Swoonings; this Itching proceeds from the Motion of these Worms, and the quick Sense of the Part where they lie; for we must not believe with *Mercurialis*, and some others, that the great Guts have only a dull sort of Feeling, feeling that the Torments of the Colic, which are felt in the Colon, and Pains in the Intestinum Rectum, caused by the Wind inclosed therein, are a good Proof to the contrary.

REMEDIES against the ASCARIDES.

The *Ascarides* are a Worm difficult to be expell'd, and that for several Reasons: The first is, because those Creatures are remote from the Stomach, so that Remedies lose their Virtue before they can come where the Worms are. The second is, because the *Ascarides* are wrapt up in viscous Humours, which hinder the Operation of Medicines. The third is, because these Worms ascend sometimes into the Cæcum. Now that Gut being like the Bottom of a Sack, the *Ascarides* keep themselves, as it were, intrenched in that Place. However it be, 'tis better to attack them below; and for that Reason there is no better Remedy, than to put up into the Fundament a Suppository of Cotton dipped into Ox's Gall, or in Aloes dissolved. One thing which I prescribed with Success to several Patients, was, to put up into the Fundament a little Piece of Lard tied to a String, if left there for some time; and after that, if drawn back, it will be full of Worms. Instead of Lard, you may use old Flesh salted. Clysters of the Decoction of Gentian are wonderful against the *Ascarides*. You may add to the Gentian, Birthwort, Succory, Tansy, Arfe-smart, Orach, and make a Decoction of it in Water and White-wine: When it is done, you may add a little of the Confection of Hiera.

For Children you may use the following Clyster;

Take Mallows and Violet-leaves, of each a Handful; Colewort-leaves, one or two Handfuls; Coriander and Fenel- Seeds, of each two Drams; Flowers of Chamomile, and the Lesser Centaury, of each a little Handful: Make a Decoction of the Whole in Milk, and dissolve in the strained Liquor an Ounce of Honey, and two Drams of the Confection of Hiera.

Hippocrates advises, for the expelling of the *Ascarides*, to take Agnus-castus-feed, to bruise it well with a little Ox-gall, and then to mix the Whole with a little Oil of Cedar, and

make a Suppository of it with a little greasy Wool. *Andry.* See LUMBRICI and VERMES.

ASCELES, ἀσκέλης, from a Neg. and σκέλω, a Leg. Without Legs. *Galen de Hippoc. & Plat. Diet. Lib. 4. Cap. 4.*

ASCENDENTIA, Ascending; spoken of the Signs or Constellations of the Firmament of Heaven, and especially of the Sidereal Spirits. *Castellus* from *Dornæus* in *Dist. Par.*

ASCENSUS MORBI, the Ascent of a Disease, is the same as the *Augmentum* or Increase of the same. See AUGMENTUM. *Ascensus* also, or *Ascensio*, signifies a manner of chymical Sublimation and Distillation, oppos'd to *Descensus*. See AQUA.

ASCESIS, ἀσκήσις, from ἀσκέω, to exercise. The same as EXERCITATIO, which see.

ASCETES, ἀσκητής. The same as *Athleta*; or *Athletes*, a Wrestler. Thus ἀσκητέων, in *Erotian* on *Hippocrates*, is expounded by ἀθλητέων; for *Ascetæ*, he says, are called by the *Attics*, *Athletæ*.

ASCHEMON, ἀσχήμων, from a Neg. and σχῆμα, a Form, or Figure; deformed; ἀσχημονέσθην σκέλω, a more deformed Leg, *Hipp. Lib. de Artic.*

ASCHIA, *Thymallus*, *Offic. Thymallus*, *Schrod. 5. 333.* *Salv. de Aquat. 81.* *Jonf. de Pisc. 81.* *Aldrov. de Pisc. 593.* *Charlt. de Pisc. 36.* *Raii Ichth. 187.* *Ejussd. Synop. Pisc. 62.* *Bellon. de Aquat. 182.* *Thymallus*, seu *Thymus*, *Gefn. de Aquat. 978.* *Thymus*, *Rondel. de Pisc. 2. 187.* THE GRAYLING, or UMBER.

This Fish resides in rapid, shallow, and stony Streams, and is esteem'd excellent Food. The Part us'd in Medicine is the Fat, which is said to take away Specks and Pearls from the Eye: Melted in the Sun, and mix'd with Honey, it takes away Freckles, and Marks left by the Small-pox. *Dale.*

ASCIA, σκεπάριον ἢ σκεπάρνιον, properly an Ax, or Hatchet, but, by a Metaphor, taken from the Figure, used to signify a sort of simple Bandage, which is described by *Galen*, *Com. 2. in Lib. de Art.* The *Ascia* is a sort of Bandage, that declines a little from the Transverse. And, on *Hippocr. ἐν τῷ κατ' ἰσθ.* he tells us, that *Hippocrates* calls the Bandage which declines but a little, *Ascia*, and what considerably declines, *Sime*. Now an *Ascia*, he says, is a Carpenter's Tool, which towards its Extremity, by which it cuts the Wood, is gently incurvated, and shelves away like a Rock. But *Erotian* seems to give us the clearest Idea of it, from *Asclepiades*, ἐν τῷ ἰσθ. as follows; ἐστὶ γὰρ ὁ σκεπάριον, ὅταν ὁ ἐπίδεσμος ἐπιβάλλων αὐτὸς εὐθείᾳ, καὶ χιλιόμενον, κλάσιν τινα ποιῇ καὶ γανίαν, διὸν ὅταν ὀρθόλωσῃ ἐπιδέσθῃ. "The *Ascia* is, when the Fillet, after one Revolution, runs into the Figure of the Letter χ, making a Break and Angle, as in the Rectoblique Bandage." This agrees with that of *Hippocrates de Fract. ἐπιδέσιον γὰρ ἐστὶ αὐτὴ ποικιλωτάτη, καὶ πλείους μὲν σκεπάρνιος ἔχουσα* "This Bandage has the greatest Variety, and a Multitude of *Ascia*;" and in the same Sense is σκεπαρνίδιον used. *Lib. de Fract.*

ASCITES, ἀσκίτης, from ἀσκή, a Bottle, because it distends the Belly in Form of a Bottle. A Species of Dropsy. See HYDROPS.

ASCITICUS, ἀσκίτικος, one who labours under an *Ascites*. *Blancard.*

ASCLEPIADÆ.

The Descendants of *Æsculapius*, called *Asclepiadæ*, have been said to preserve Medicine in their Family without any Interruption; but of this we should have a more distinct and accurate Knowledge, if we had the Writings of *Eratosthenes*, *Pherecydes*, *Apollodorus*, *Arius* of *Tarsus*, and *Polyanthus* of *Cyrene*, who took care to write the History of these Descendants of *Æsculapius*; but though the Works of these Authors are lost, yet we have the Names, at least, of some of the *Asclepiadæ* preserved, as appears from the Catalogue of the Predecessors of *Hippocrates*, who called himself the Eighteenth Descendant of *Æsculapius*. Now the Genealogy of *Hippocrates* is still entire, and stands thus:

That *Hippocrates*, whose Writings are handed down to us, was the Son of *Heraclides*, who was the Son of another *Hippocrates*, the Son of *Gnosidicus*, the Son of *Nebrus*, the Son of *Sostratus* the III. the Son of *Theodore* the Second, the Son of *Cleomytides* the II. the Son of *Crysamis* the II. the Son of *Sostratus* the II. the Son of *Theodore* the First, the Son of *Crysamis* the First, the Son of *Cleomytides* the First, the Son of *Dardan*, the Son of *Sostratus* the First, the Son of *Hippolochus*, the Son of *Podalirius*, who was the Son of *Æsculapius*. *Stephanus Byzantinus* ascribes two more Sons to *Gnosidicus*, besides him already mentioned; one of whom was called *Ænius*, and the other *Podalirius*. *Nebrus*, the Father of *Gnosidicus*, had also another Son, whose Name was *Chrysus*.

This Genealogy may possibly be thought fabulous; but, granting that there was some Error, or something of a fictitious Nature, in this Succession of the *Asclepiadæ*, 'tis, at least, certain, that several Branches of the *Æsculapian* Family were known, besides that of *Hippocrates*, before his Time; and that the particular Branch of it, from which that Physician sprung, was distinguished by the Name of the *Asclepiadæ Nebrides*, or the

the Descendants of *Nebrus*, who had become particularly famous in Physic, and of whose Skill the Priestests of *Apollo* had, in one of her Responses, given a very great Character, as *Stephanus Byzantinus* observes.

There were still more Branches of the *Asclepiadae* spread up and down in different Parts, and they had even established three famous Schools, one at *Rhodes*, which failed first by the Extinction of that Branch of the Successors of *Æsculapius*; and this probably happened, long before the Days of *Hippocrates*, since he makes no Mention of it, as he does of that of *Cnidos*, which was the Third, and that of *Cos*, which was the Second. These two last flourished at the same Time with the School of *Italy*, of which were *Pythagoras*, *Empedocles*, and other Philosophers, who cultivated Physic, though at the same time the *Greek* Schools were much more antient. As these were the only three Schools which made any Noise, so they had a mutual Emulation, and were for ever contending for the greatest Improvements in Physic. *Galen*, however, gives the Preference to that at *Cos*, as having produced the greatest Number of famous Disciples, among whom was *Hippocrates*. That of *Cnidos* was ranked in the second Place, and that of *Italy* in the third.

Herodotus lib. i. also speaks of a School of Physicians at *Cyrene*, where *Æsculapius* had a Temple, in which the Service was different from that practis'd in *Greece*; which may lay a Foundation for suspecting, that in that Nation there might have been *Asclepiadae*, of a different Sort from the others.

The same Historian in the above-quoted Book also mentions a Medicinal School at *Crotone*, the native Country of *Democedes* the famous Physician, who was contemporary with *Pythagoras*. This Physician, according to *Herodotus*, being banish'd by the Cruelty of his Father *Calliphon*, arriv'd first at *Ægina*, and afterwards at *Athens*, where he was had in great Esteem. From thence he went to *Samos*, where he had an Opportunity of attending *Polycrates* King of that Island; and the good Fortune to cure him of a very terrible Disorder, for which he receiv'd two Talents of Gold. Some time after, being taken Prisoner by the *Persians*, he concealed his Profession, but was at last discover'd, and compell'd to employ his Skill for the Relief of *Darius*, who was rack'd with Pain in Consequence of a Dislocation of one of his *Ancles*. He had also for his Patient Queen *Atossa*, Wife to the same King, for a Cancer in her Breast. The Historian adds, that having been successful in both these Cures, *Democedes* receiv'd very rich Presents, and acquir'd so great a Share of the King's Favour, that he was invited to eat at his own Table. But finding an Opportunity of returning into *Greece*, on account of a Promise he had made to act in Quality of a Spy, he remained in it altogether, despising all the Honours they had paid him in *Persia*, and laughing at those who had given him a Commission to betray his native Country. He was afterwards marry'd to a Daughter of the famous *Milo* his Countryman.

We know no other memorable Circumstances relating to the Physic of *Democedes*, or that of the other Physicians of *Crotone*: Neither have we any thing of Importance to say concerning the School of *Rhodes*. As for that of *Italy*, 'tis possible *Polycletes* might belong to it, since he was Physician to *Phalaris* the Tyrant of *Agrigentum*, the Town of *Sicily*, in which that School was.

We may judge of the Method follow'd in the School of *Cnidos*, by some Hints of *Hippocrates* relating to that Affair. "Those, says he, [*De Ratione Viæ in Acutis*, Lib. i.] who have compiled the *Cnidian Sentences*, have very well described what Patients suffer under every Disease; how some Symptoms of their Disorders happen; and, in a word, all that any Person ignorant of Physic could write, after inquiring of Patients what their several Ailments were; but they have forgot most of what a Physician ought to know, without hearing the Report of the Patient."

The same Author besides observes, that the *Cnidians* used very few Medicines; for *Elaterium*, which is a Purgative extract from the wild Cucumber, Milk, and Whey, made up almost the Whole of their *Materia Medica*. From what *Hippocrates* here says, we may gather, that these Physicians were content with giving an Enumeration, or exact Description, of the Symptoms attending Diseases, without giving themselves the Trouble to inquire into their Causes, or prognosticate their Events; we may also gather from what he says, that they only used a very small Number of Medicines, the Virtues of which they and their Predecessors had discover'd by Experience.

These two Observations are sufficient to convince us, that the *Cnidians* were little more than Empirics, or, at least, that they did not value themselves on the Accuracy and Justness of their Theories. The farthest they went in this Way, was sometimes to reason from *Analogy*, or a Comparison of Diseases and Remedies, as we may see by the Example *Galen* gives us of it in these Words: "The *Cnidians*, says he, attempted to cure Abscesses of the Lungs in this manner: As they had observed, that a Cough occasions a Discharge of any

"Matter in the Lungs, they pull'd the Tongues of those who labour'd under Abscesses of the Lungs, without their Lips, and endeavour'd to convey some Drops of Water into the *Aspera Arteria*, with a View to excite a violent Cough, which in their Opinion made them discharge all the Pus contain'd in their Breasts."

As for the Physicians of *Cos*, it may be also said of them, if the *Prænotiones Coacæ*, found among the Works of *Hippocrates*, are only a Collection of Observations made by these Physicians, as many of the Antients believed, that they were not great Reasoners; and we plainly perceive, that they were not at the Pains to account for their Prognostics. *Hippocrates* was of the Number of these Physicians, and we know of no more of them, except his Predecessors, whom we have already mentioned.

What we have said proves, that what *Pliny* and *Celsus* have advanced, is not absolutely true, when they said, that we had no Accounts of Physic during the Interval they have mention'd; and still less true, that Physic only began with Philosophy, as *Celsus* affirms; unless he means rational Physic, or that which is employ'd in investigating the hidden Causes of Diseases, and accounting for the Operations of Medicines. This sort of Physic had, indeed, little Existence in the World, before the Arts and Sciences came to be cultivated.

It may possibly be thought, that I forget one Circumstance, which not only does a great deal of Honour to the *Asclepiadae*, but intirely overthrows what *Celsus* and *Pliny* have advanced; and even what I myself affirmed, when I said that the *Asclepiadae* were little more than Empirics; and that is, that they were look'd upon as great Anatomists. *Galen*, 'tis true, was of this Opinion: "At the Time, says he, when Physic was confin'd to the Family of the *Asclepiadae*, the Fathers taught their Children Anatomy, and from their Infancy trained them up to the Dissection of Animals; so that this Branch of Knowledge passing from Father to Son, like a manual Tradition, as it were, it was to no Purpose to write down the Manner in which these Dissections were performed, since it was as impossible they should forget it, as that they should forget the Letters of the Alphabet, which they learned almost at the same Time."

There are still some other Passages of this Author, from which we perceive, that he believed, that the *Asclepiadae* were perfect Masters of Anatomy. But to his Authority we may oppose that of an antient Commentator upon *Plato*, who asserts that the Philosopher *Alcmaeon* was the first who dissected an Animal; which destroys what *Galen* affirms of the *Asclepiadae*, at least, of such of them as came before *Alcmaeon*, who are the Persons of whom we now speak; as for those who came after him, they were either contemporary with *Hippocrates*, or succeeded him. But though the Testimony of *Hippocrates*, in this Case, were not to be depended on, yet we may conclude from the small Progress they had in his Days made in Anatomy, that till then the Bodies of Animals had been very superficially inquired into; which is quite the Reverse of what *Galen* says, when he affirms, that *Anatomy was in its Perfection in the Days of the Asclepiadae*.

I would not by all this insinuate, that the *Asclepiadae* were entirely ignorant of the Parts of the human Body, since without such a Knowledge they could neither practise Physic in general, nor Surgery in particular; which, by the way, they understood better than any other Branch of the Business. But the Knowledge they had in Anatomy was in a great measure owing to what they observed in the killing of Beasts, and in their Sacrifices. They were also very industrious in improving themselves in *Anatomy*, if at any time they found in the Fields human Bones stript of their Flesh by wild Beasts, or wasted by Time; or when they found the Bodies of Travellers killed by Robbers, or those of Soldiers killed in Battle. It is also possible, that the *Asclepiadae* might have got acquainted with the Improvements of the *Egyptians*, who embalmed their Dead for Preservation. But their chief and principal Scene of Improvement was in the Practice of Surgery, where in the Cure of Wounds, Ulcers, Tumors, Fractures, and Dislocations, they had an Opportunity of discovering in the Living, what they wanted sufficient Opportunities of finding in the Dead. *Le Clerc*.

ASCLEPIADES.

Though the Descendants of *Æsculapius* were called the *Asclepiadae*, that is, the Children of *Asclepius*, which is the Greek Name of *Æsculapius*; yet there was a Physician of the Name of *Asclepiades*, who was not of that Family.

This Physician was in great Reputation at *Rome*, during the Life of *Mithridates*, that is, towards the Middle of the Thirtieth Century, according to the Testimony of *Pliny*, from which I conclude, that this Author contradicts himself, when he says, in the same Chapter, that Physic was not known in *Rome*, till after *Pompey's* Victory over *Mithridates*. *Archagathus*, a Greek Physician, came to *Rome* about an hundred Years before; where, on his first Appearance, he was well received; but his Profession was afterwards brought into Disgrace. Now in

in all Probability, this *Asclepiades* was one of the first who re-established its Character and Reputation. This Physician [according to *Pliny*, *Lib. 26. Cap. 3.*] was a Native of *Prusa* in *Bithynia*, but happened at last to settle in *Rome*, in Imitation of a great many other *Greeks*, who had now begun to establish themselves in this Capital of the World, hoping there to acquire greater Riches than in their own Country. Upon his first Appearance in *Rome*, he taught Rhetoric; but not finding his Expectations answered by that Profession, he resolved to try whether that of Physician would not be more fortunate to him; and though, according to *Pliny*, he had at that time no Knowledge of the Business, yet he imagined, that by the Brightness of his Genius, he should soon surmount the Disadvantages arising from his not having been regularly bred to Medicine.

The Method this Physician used to establish his Character was, to run directly counter to the Practice of *Archagathus*, who had been condemned for his Cruelty; and to decry not only his Method, but also a great Part of the Medicines daily recommended by other Physicians. The Practice of *Asclepiades* consisted principally, [according to *Pliny*, *Lib. 26. Cap. 3.*] in throwing the Patient into a Sweat, by means of warm Coverings, or by exposing him to the Heat of the Fire, or the Rays of the Sun. *Asclepiades* also condemned the ancient Manner of curing Quinsies by thrusting an Instrument forcibly down the Throat, in order to clear the Passage. But of all other things, he made the highest Remonstrances against Vomits, which, in these Days, were frequently used; and even against Purgatives, which he looked upon as hurtful to the Stomach.

At the same time that *Asclepiades* condemned and decried the above Medicines, he substituted in their room very mild ones, saying, *Tuto, celeriter & jucunde, id Votum est*: But adds *Celsus*, *Lib. 3. Cap. 4.* *Sed fere periculosa esse nimia & Festinatio & Voluptas solet*. It were to be wished, that Diseases could be cured surely, soon, and agreeably; but Attempts to cure too suddenly, or by means of too agreeable Medicines, are generally attended with Danger.

The superstitious Methods of curing Diseases; or the Magical Remedies, of which, before the Arrival of *Asclepiades*, they were so fond, which *Cato* himself had on some Occasions used, but which were beginning to be in Discredit, contributed not a little to the favourable and ready Reception of this new Physic of *Asclepiades*. This Observation *Pliny* makes in the Beginning of his twenty-sixth Book, where he uses these Words: *The Vanity of Magic was a Circumstance of more Use to him than any thing else*. One *Doringius*, a German Author, *de Medicina & Medicis*, not adverting that these Words of *Pliny* had a Relation to what he had said in the Beginning of the foregoing Chapter, explains this Passage, as if *Pliny* had intended to say, that *Asclepiades* had, in a particular manner, used Magic in his Practice of Physic, which is quite the Reverse of what *Pliny* thought, and inconsistent with the Character of *Asclepiades*, who was an Epicurean.

"Till the Days of *Asclepiades*, says *Pliny*, Antiquity stood it well out. In vain did *Herophilus* advance his refined Speculations; neither he, nor any of a like Character, were followed universally; and considerable Remains of ancient Physic as yet supported themselves, with all the Authority they had ever acquired. But this second *Æsculapius*, having reduced all the Learning of a Physician to the Knowledge or Investigation of the Causes of Diseases, Physic, which at first was an Art founded on Experience, became conjectural, and entirely changed its Face."

What easily gained a Party to *Asclepiades*, to the Prejudice of ancient Physic, and made People relish his Reasoning, was, his using very mild and gentle Remedies, which *Pliny* reduces to five: Abstinence from Food; Abstinence from Wine on certain Occasions; Frictions; Walking; and Gestation. As People saw, that they could easily submit themselves to these, they judged the Physic of *Asclepiades* so much the better for its being easily practised. Besides, being very eloquent, and a great Philosopher, he attracted the Esteem almost of all Mankind, and was looked on as one sent from Heaven.

Pliny adds, that this Physician had the Art of gaining the Affections of People by certain Stratagems peculiar to himself; such as promising his Patients Wine, and actually giving them some on proper Occasions, and allowing them to drink cold Water, in order to refresh themselves. And as he had been among the first who used this Remedy, he took a certain Pleasure in being called *δοσι-ψυχες*, or *The Giver of cold Water*. Wine, in the mean time, contributed no less to the Establishment of his Reputation. *Apuleius* says, that *Asclepiades* was the first of the Physicians, who prescribed Wine for the Relief of his Patients; and the same Author afterwards tells a Story of a Man being restored to Life by *Asclepiades*, after he was thought dead, and ready to be interred. He does not indeed mention his using Wine upon that Occasion; but from what he had before said, one may infer, that the Miracle was wrought by means of that Liquor, though the Author ascribes the Recovery of the Man to certain Medicines which *Asclepiades* gave him.

This Physician also contrived, almost every Day, some new Invention to please and humour his Patients: He ordered them to be laid in penile Beds, which were a Species of Cradles shaked, in order to lull the Patients to sleep; or mitigate their Pains. He also invented an hundred new Sorts of Baths, some of which were penile.

This is, according to *Pliny*, the Character of *Asclepiades*; but as that Author is suspected of Partiality in characterising, we shall inquire what Sentiments others entertained concerning this Physician.

We find then, that almost all the Antients give a favourable Character of *Asclepiades*: *Apuleius* styles him *The Prince*, or *First of Physicians*, after *Hippocrates*. He is also by *Scribonius Largus* [in *Epistol. ad Callistum*] called, *A very great Author in Physic*. And *Sextus Empiricus*, *Adversus Mathematicos*, *Lib. 7.* calls him *A Physician inferior to none*. *Celsus* also had him in great Esteem. Another Proof of the great Reputation he had acquired, was his being desired by *Mithridates* to assume the Character of his Physician. But a Circumstance of all others the most advantageous to his Character is, his having been the Physician and intimate Friend of *Cicero*, as he himself testifies, [*De Oratore*, *Lib. 1.*] and at the same time seems to pay a great Deference to his Eloquence, which proves that this Physician did not quit the Profession of Rhetorician for want of a Capacity.

Galen, who declares himself against the Practice of *Asclepiades*, yet owns him to be very eloquent, but upbraids him with being a Sophist, and having a Practice of contradicting every one he had any thing to do with. *Cælius Aurelianus*, *Acutor*, *Lib. 1. Cap. 15.* charges him with the same Fault. When *Asclepiades*, says he, was called to a Patient who had another Physician, he condemned all the Medicines that Physician had ordered, and approved of others which he had not mentioned, as if the same Medicines, which, when ordered by others, were noxious, became safe and salutary, when prescribed by him. The Author last quoted, draws this Consequence from a Passage in one of the Books of *Asclepiades*, where, in speaking of the Cure of a Phrensy, he says, that if a Person labouring under that Distemper should fall into his Hands, before having come through those of any other Physician, or used any other Medicine, that in that Case he would use external Applications of strong-scented Substances, such as Castor, Hogs-senel, Rue, and Vinegar, or the Liquor in which these Substances had been infused; and that he would afterwards order him a Clyster to relieve the obstructed Parts; but, said he, if another Physician has before dealt with the Patient, all Cataplasms, Oils, and strong-scented Medicines, must be discharged in the very Beginning of the Cure, and the Patient must be removed from a dark Place to a clear and open Light. 'Tis possible, *Asclepiades* might not have followed this Practice from a Principle of Envy or Contradiction, as *Cælius Aurelianus* insinuates, but from a quite different Motive. As the same Disease may sometimes be cured by different Methods, he might possibly believe, that Success, on some Occasions, might attend a Change of the Method of Cure, from what it was in the Infancy of the Disease, or the passing from the Use of cold to hot Medicines, and from hot to cold. As a Proof, that *Asclepiades* entertained this Notion, he calls the Cure here mentioned, bold and extraordinary, not to be undertaken but in desperate Cases.

Pieces of Practice like this undoubtedly made People who were ignorant of the true Principle upon which *Asclepiades* acted, conclude, that he was an errant Quack. This is the Idea which *Pliny* seems to entertain of this famous Physician, in what he has hitherto advanced concerning him; and we can have no Reason to doubt, that this was his real Sentiment, if we consider the finishing Stroke of these Encomiums, which he pretends to bestow upon him [in *Lib. 7. Cap. 37.*]. "*Asclepiades*, says he, having bid a Defiance to Fortune, by saying, he consented not to be esteemed a Physician, if ever he was attacked by any Disease whatever, remained victorious in this Point; for he died in an extreme old Age, and that by an accidental Fall from a Stair-case." It is not probable, that a Man of so philosophical a Turn as *Asclepiades* was, would have talked in so ridiculous and foolish a manner.

We should be better able to form a Judgment of the Sentiments of *Asclepiades*, if his Writings had reached our Hands; but they are lost, as well as a great many other valuable Pieces of Antiquity, which would have undoubtedly given us Satisfaction with regard to a great many things, of which we must now be contented to remain ignorant. Tho' *Asclepiades* might not, possibly, have been a Model for the Direction of Practice, yet there would have been a certain Pleasure in reading his Works, since 'tis to be presumed they were beautifully written; and if they had not been a Standard for Physicians, they would have, at least, proved an Amusement for Philosophers, and served to illustrate the Doctrines of *Epicurus*, *Lucretius*, and *Democritus*. As the Reputation of this *Asclepiades* was very great, both during his Life, and after his Death, so he had a great Number of Disciples and Followers.

Among other antient Authors, who wrote on the Composition of Medicines, there were two called *Asclepiades*; but both different from the *Asclepiades* above-mentioned; for they are both quoted by *Galen*; and that Author observes, that they both lived after *Andromachus*, who was Physician to *Nero*.

The *Asclepiades* most frequently quoted by *Galen*, and whom he ordinarily calls by the single Name of *Asclepiades*, was more particularly distinguished by the Surname of *Pharmacion*, as *Galen* informs us; and this Surname denoted the principal Business of this Physician, which was the Composition of Medicines, by the *Greeks* called *Pharmaca*.

This *Asclepiades*, whom the learned Mr. *Di Capoa* confounds with the first-mentioned *Asclepiades*, wrote ten Books, five upon Medicines to be used externally; and five other upon such as were to be used internally. *Galen* says, he wrote very well, and ranks him among the best Authors who had handled that Subject. He even praises him in a particular manner, for his Exactness in describing the *Modus Faciendi*, or the precise Method one ought to take in making the Compositions he described. He also commends him for his Exactness in determining the Qualities of these Medicines, and the particular Manner in which they were to be used. The following is an Example of the Exactness of *Asclepiades*, and of the Advantages attending it:

The PLAISTER of ASCLEPIADES for CHIRONIAN ULCERS; and others of difficult Cure.

- “ Take of Verdigrise, one Ounce; of Wax, half a Pound;
- “ of the Resin of the Larch-tree, [*Venice Turpentine*]
- “ half an Ounce. The Wax and Resin must be melted;
- “ and after pounding the Verdigrise, add it to them; then
- “ stir the Whole.”

The way of using it is this: Spread a little of this Plaister upon as much Leather as will cover the Ulcer; place round it some Medicine for preventing Inflammation, and let your Plaister lie on for three Days. Then wash the Part affected gently; wash also and soften the old Plaister, and apply it again to the Ulcer; continue this Method every three Days till the Cicatrix is formed.

Galen, who gives us an Account of this Method, after approving of it, tries to account for its Success, by a certain Relation the Plaister acquires to the Body of the Patient, by means of its long Stay upon the Ulcer. But this may be the more rationally accounted for in another way, which is, that by rarely raising the Plaister, or allowing it to remain on the Ulcer for three Days, the Cicatrix has more Time to form itself, and the Flesh is more commodiously nourished, because the Ulcer is by that means less frequently exposed to the Air, which, by introducing some foreign Substance into the Wound, breaks the Fibres which began to unite themselves, and form Flesh and Skin. Besides, the Motion excited in the Ulcer, or Part affected, by the taking away, and again applying, the Plaister, interrupts the Formation of the Cicatrix, by breaking and putting out of Order the Fibres, which, in such a Case, are very tender. In short, the renewing the Plaister, for the same Reason, retards the Cicatrix, because a fresh Plaister has always more Force and Penetration, than one which has been used before. There are a great many more *Asclepiades*; but as their Characters have nothing very remarkable in them, and as the Accounts we have of them, are involved in such Obscurity and Perplexity, as can never be surmounted by the greatest Industry, we shall say no more concerning them. *Le Clerc*.

ASCLEPIAS, a Plant thus distinguished:

- Asclepias*, Diof. *Vincetoxicum Hirundinaria*, Offic. Chab. 119. *Asclepias flore albo*, Ger. 731. Emac. 898. Park. Theat. 387. C. B. Pin. 303. Raii Hist. 2. 1091. Hist. Oxon. 3. 611. Tourn. Inst. 94. Elem. Bot. 80. Boerh. Ind. A. 312. *Asclepias sive Vincetoxicum multis, floribus albicantibus*, J. B. 2. 138. *Apocynum Asclepias dictum*, Par. Bat. 43. *Vincetoxicon*, Rupp. Flor. Jen. 20. Buxb. 336. SWALLOW-WORT. Dale.

ASCLEPIAS runs up with long Shoots, on which are long Leaves like those of Ivy. The Roots are numerous, slender, and sweet-scented; the Flower of a strong Smell, the Seed like that of the *Securidaca* (Hatchet-vetch). It grows in the Mountains.

The Roots, drank in Wine, give Relief under the Gripes, and the Bites of venomous Animals. The Leaves, applied as a Cataplasm, are good in malignant Diseases of the Breasts and Uterus. *Dioscorides*, Lib. 3. Cap. 106.

The Roots of Swallow-wort are small and stringy, spreading very much in the Ground; and sending up many tough Stalks, about a Foot and half, or two Foot high, hardly able to support themselves; having at every Joint two Leaves, set opposite to one another, on very short Foot-stalks, which are round at the Base, an Inch and an half broad in the widest Part, and about three Inches long, growing narrower and sharp-pointed; on the Tops of the Stalks come forth small Bunches, of five-leaved Star-fashion white Flowers; each of which, in warm

Countries, where it is natural, is succeeded by two long slender Pods, containing small flat Seeds, lying among a silky Down. It grows with us only in Gardens, and flowers in June.

The Root, which is the only Part used, and that not very often, is accounted a mighty Counter-poison, both against the bad Effects of *Apocynum*, and other poisonous Herbs, and against the Bites and Stings of venomous Creatures: It is also helpful against malignant pestilential Fevers, which it carries off by Sweat; it is good likewise against the Dropsy and Jaundice. *Miller's Bot. Off.*

The Roots of Swallow-wort are bitter, acrid, and give a faint and red Colour to the blue Paper; the Leaves taste a little saltish, and give the same Paper a fainter red Colour, which makes me believe the Salt of this Plant is, in some measure, like the Oxyfal Diaphoreticum of *Angelus Sala*, a fixed Salt, a little too much impregnated with Acid; but in the Swallow-wort, it is involved in a great deal of Sulphur and Earth: Thus it is no wonder, that this Plant should be sudorific and detensive. *Tragus* affirms, that the Wine in which a Pound of its Roots has been macerated, and boiled to the Consumption of a Third-part, powerfully provokes Sweat, and gives Ease to those who are troubled with the Dropsy: The Decoction of this Plant renders the Humours volatile, and works both by Urine and Transpiration. This Decoction is preferable to that of *Scorzonera*, in malignant Fevers, and the Plague. For the Suppression of the Menses, put one Ounce of the Root of Swallow-wort in a Pint of boiling Water; strain the Infusion, and give three Glasses of it to drink every Day, with the Syrup of Mugwort, or the Cachectic Aperitive Syrup of M. *Charras*, which is also very good for the Biting of a mad Dog. The Extract of its Roots and Leaves, from half a Dram to a Dram and an half, has the same Effect. The Herb, applied as a Cataplasm, dissolves the Tumors of the Breasts; the Powder of the Leaves and Root cleanses Ulcers, as well as that of Birthwort. *Martyn's Tornesfort*.

ASCLEPIOS, ἀσκληπίος, the Name of a dry Smegma, described by *P. Aeginet. Lib. 7. Cap. 13.* and of a Troche in *Aetius, Tet. 4. Serm. 2. Cap. 50.* also of a Collyrium in *Galen, de C. M. S. L. Lib. 4. Cap. 7.* from *Scribonius*, which is also called *Athenippum*.

ASCLITES, a corrupt Word, used by Mistake, instead of *Asclites*, by *Paracelsus* and *Avicenna*. *Castellus*.

ASCOMA, ἀσκάμα, from ἀσκά, a Bottle: The Eminence of the Pubes at Years of Maturity, most properly in the Female. *Ruffus Ephesius*.

ASCOS, ἀσός, a Bottle. Ἀσὸς σούριον, (from σούριον, Leather) was a Leather Bottle filled with some Matter, as hot Water, or Oil, for the Fomentation and Warming of a diseased Part, and prescribed by *Hippocrates, Lib. 2. de Morb.* to be applied to the Forehead for easing Pains of the Head. He uses also the *Ascus* inflated with Wind, for restoring a gibbous Affection of the Spinal Vertebrae, and a Luxation of the Os Femoris, *Lib. de Artic.* *Galen*, in his *Exegesis*, expounds ἀσός by ἀσκαμίδις, ὅτις ἐστὶν ἀσκαμίδις καὶ φανερὸν ὅτι ἀσκαμίδις, “ Earthen Pots, called also *Pyriati*, and *Phaci*,” (*Lentils*) that is, Vessels of a lenticular Figure, used in Fomentations. *Celsus, Lib. 2. Cap. 17.* speaking of Fomentations, says, *Quintiam calido Oleo replentur Utriculi, & in Vasa fistilia ad Similitudinem, quas Lenticulas vocant, Aqua conjicitur.* “ More-over, Bottles are filled with hot Oil, and Water is put into “ Earthen Vessels, from their Figure called *Lentils*.” *Galen* seems to confound the *Utriculi* with the *Vasa fistilia*. Fomentations by these Earthen Vessels, and *Utriculi*, or little Leather Bottles, and Bags, are also prescribed by *Hippocrates, Lib. 2. de Morb.* and Fomentations with the ἀσσοί, or *Utriculi*, *Lib. 7. Epid. and Lib. de Rat. Viti. in Acut.* for a *Tetanus*.

ASCYRUM, Offic. Ger. 434. Emac. 542. Raii Hist. 2. 1019. Merc. Bot. 1. 21. Phyt. Brit. 12. Mer. Pin. 11. *Ascyrum vulgare*, Park. Theat. 574. *Hypericum Ascyron dictum*, Chab. 445. *Hypericum Ascyron dictum, caule quadrangulo*, J. B. 3. 382. Raii Synop. 3. 344. Tourn. Inst. 255. Elem. Bot. 222. Boerh. Ind. A. 241. Dill. Cat. Giff. 171. Rupp. Flor. Jen. 99. Buxb. 163. *Hypericum seu Androsæmum Ascyrum dictum, caule quadrangulo glabro*, Hist. Oxon. 2. 471. SAINT PETER'S WORT.

It grows in watery Places, and flowers in July and August. The Herb, the Flowers, and the Seed, are in Use; the Herb and Flowers having the same Virtues as *Hypericum*, or *St. John's Wort*. The Seed is useful in the Sciatica, and purges bilious Humours by Stool. Dale.

ASCYRUM, otherwise called *Ascyroides*, and *Androsæmum*, is a Species of *Hypericum*, but of a different Bigness, having larger Branches, and being more shrubby, or fuller of Shoots, with fine scarlet Leaves. It bears a purple Flower, and a Seed like that of *Hypericum*, which smells like Rosin, and stains the Fingers of those who handle it with a bloody Colour, whence it took the Name of *Androsæmum*.

The Seeds drank (to the Quantity of two Drams, according to Pliny) in a Pint of Hydromel, is good for the Sciatica, for it purges Bile plentifully; but the Dose ought to be continued till Health

Health is restored. It is also effectual against Burnings, if used in a Cataplasm. *Dioscorides, Lib. 3. Cap. 172.*

ASDENIGI, AZEDEGINI, the Blood-stone. *Johns.*

ASE, ASSE, *αση, ασση*, in *Hippocrates*, sometimes signifies a Loathing of Food, or Nausea, from a Conflux of Humours to the Stomach. So in *Aph. 61. Lib. 5.* if a Woman miss her Menfes, and no Shiverings or Fever succeed, *ασαι δ' αψη προσπίπτει*, "but a Loathing comes upon her," she has conceived. In *Lib. 7. Epid. αση πει την καρδιαν*, is, "an Anxiety about the Heart (Mouth of the Stomach)." *Asen* is also very often used by the same Author to express an Anxiety with a Restlessness and Jactation; and such Patients are called *ασωδες*, though they be free from a Nausea; for, as *Galen, Comm. 2. in Prorrh.* writes, sick Persons are *ασωδες*, on two Accounts; first when the Strength is so unable to support the Body, that the Patient can bear to lie in no Posture; and, secondly, when the Mouth of the Stomach is vellicated by corrupt Humours. The former Case is very dangerous, and the latter attended with a Nausea. So *ασωδες πυρετοι*, in several Places of *Hippocrates*, signifies such Fevers as are attended with great Jactations and Anxieties.

ASEB, Alum. *Rulandus, Johnson.*

ASED, *Leo. Ibidem.*

ASEDENIGI, the Lapis Hæmatitis, Bloodstone.

ASEF, ALBASEF, Arabic Words for HYDROA, which see. *Blancard.*

ASEGEN, Dragons-blood. *Rulandus, Johnson.*

ASELLI, the same as MILLEPEDES, which see.

ASELLUS, Offic. *Jonf. de Pisc. 1.* *Asellus major*, *Charit. de Pisc. 2. Schonf. Ichth. 38.* *Asellus major vulgaris*, *Raii Synop. Pisc. 53.* *Asellus major vulgaris*, *Belgis Cabellau, Ejusd. Ichth. 165.* *Asellus*, *Merluccius*, *Cabellau*, *Mer. Pin. 184.* *Gefn. de Aquat. 84.* *Morhua vulgaris*, (*maxima Asellorum Species*) *Bellon. de Pisc. 118.* *Morhua vel Molva altera*, *Aldrov. de Pisc. 289.* *Molva*, *Rondel. de Pisc. 1. 280.* *Molva vel Morhua altera minor Rondeletii*, *Gefn. de Aquat. 88.* THE COD-FISH, or KEELING. *Dale.*

You are to chuse that which is white, tender, fresh, and well tasted.

It is nourishing enough, and is a tolerable good Food.

Salt Cod is not near so well tasted as that which is fresh, neither is it so easy of Digestion, but harder and tougher. You are to steep it in Water before it is eaten; for, without that, it will heat much, and make you very dry.

It contains much Oil and volatile Salt.

It agrees at all times with any Age and Constitution.

REMARKS.

The Cod is a Sea Fish well known. It is much used for Food. When it is fresh and new, it produces good Juice; and is nourishing, because it contains a great Quantity of oily and balsamic Parts; but when it has been salted, and is too old, it is not so well tasted, nor so easy of Digestion; not only because the Bay-salt hath fixed and sunk down its more volatile Parts, and such as excite an agreeable Taste; but also because that being introduced into the Pores of the Fish, it makes it more solid, compact, and hard.

The Pickle of Cod is of a dissolving and drying Nature; when outwardly applied: They also use it among other things in Clysters; for it is laxative, because it contains much Salt, irritates the Intestinal Glands, and forces more Liquor out of them than before.

The Stock-fish used in France, and other Parts, is not so good as salted and dried Cod: Some pretend otherwise, and will have it to be the Melwel, called in Latin, *Molva major*: Be it as it will, Stock-fish is no good Food; because it is hard, tough, and not easily digested: However, there are many People that make a Ragou of it.

The Pickle of Melwel has the same Virtues as that of Cod. *Lemery on Foods.*

The ASELLUS MARINUS is the same as MERBANGIUS, which see.

ASEMOS, *ασμος*, from a Negative, and *σημα*, a Sign; is an Epithet, applied to Events that fall out contrary to all Appearance, and without any manifest Cause. Thus the Adverb *ασμως*, in *Hippocrates*, is expounded by *Ætius*, *αδωγος*, or *παροξυσμος*. Thus, *Lib. 2. Epid. οσθα ασμως απαντιζεται, δυσχεστα*, "whatever Symptoms disappear unaccountably, or without the critical Signs, shew a bad Crisis;" and in his *Prorrh.* *τα ελθοντα ασμως πασησαστα δαυασην σημαινει*, "bad Symptoms, alleviated and mitigated for no Reason; and without the Signs of a Crisis, signify Death;" and again, *τα ασμως πασησαστα φιλυποσσορα*, "Mitigations, or Remissions, without the usual Signs which accompany a Crisis, foretel a Return of the Disease," which is often quoted by *Galen*, as in the Beginning of his *Lib. πει νεωσιμων ημερων*, and these are the most celebrated Axioms in the whole Doctrine of Crises. *Asmos* *εσθην επδεμαστα*, "Tubercles appeared without Significations," is explained in *Galen, Comm. 2. in Prorrh.* by *χωρις σημειων, ητοι εκλεισσεως, η πεφωσ,* "without any Signs

"either of Excretion or Concoction; and *ασμως πασησαστα*, before-mentioned, is expounded by *Erotian*, *τα χωρις παρηγοσ επικλειας εις το βελιον αποκλινοστα*, "Things changing for the better, without any manifest Assistance or Means."

Asmia *πνευμαστα*, in *Lib. 6. Epid.* is a small and scarcely sensible Respiration; and *ασμια κατ'α πλευρον αλγυμαστα*, is a slight and insignificant Pain in the Side.

ASENEC, the Son. *Ruland. Johnson.*

ASEPH, Plumous Alum. *Iidem.*

ASEPTA, *ασηστα*, from a Negative, and *σηπω*, to putrefy. Unputrefy'd; but *ασηστα*, in *Hippoc. Lib. πει πασων*, is expounded by *Galen, Com. ad Aph. 1. Lib. 6. απηστα*, "unconcocted;" and he tells us, that it was usual with the Antients *ασηστα καταν' απερ ημεσ απηστα λεγομεν*, "to call those things unputrefy'd, which we say are unconcocted." Thus, *Lib. 3. πει διαιτης, ασηστον διαχωρημα*, is a crude or unputrefy'd Stool; as *σεσηπος διαχωρημα. ibid.* is a putrefy'd or concocted one. And *Galen, Lib. 1. de Loc. Affect. Cap. 3.* has the following Expression from *Erasistratus*: *Τα γιγαστα, η τα σισαμα, η παστα τα διαχωριμενα πασάσασ ασηστα τε η αμελεβηστα*. "The Stones of Grapes, and Sesamum, and all other Matters which pass off by Stool, quite unputrefy'd, (unconcocted) and unchang'd."

ASERON, *ασηρον*, from *αση*, Molestation, Uneasiness. Troublesome, uneasy, noxious. *Hipp. Lib. de Fract. ασηρον εδ' εις πους την ιγνυνν πρεσβαλλόμενον*. "It might create Uneasiness, if apply'd to the Ham," speaking of a Chirurgical Cradle. Again, *ibid. ην τε ασηρον η*, "if it be hurtful," that is, the Bone be hurtful to the Flesh. And, *Lib. de Artic.* you have *ασηρον φερμα*, "an uneasy Burden," speaking of a Bandage apply'd to a fractur'd Nose. In the foremention'd Places *ασηρον* is expounded by *Erotian* *ασησ ποιησιν*, "causing Molestation and Uneasiness."

ASIGI. The same as ASINGAR, which see.

ASILUS, *Οεστрус, Τάβανος, υσες, μυωφ*. An Insect with one Pair of Wings, which carries its Sting in its Mouth, and is describ'd by *Aldrovandus*. *Pliny* calls *Astus* the Fly that infests Cattle, and tells us, from the Magi, that the Worms out of which these Flies were bred; were used, before their Wings budded, as an Amulet against Fevers. *Pliny, Lib. 11. Cap. 28. and Lib. 30. Cap. 11.*

ASIMION, *ασιμιον*. The Name of an Ingredient in *Myrepsus, Antidot. 465.* of which his Translator and Commentator *Fuchsius* ingenuously confesses himself ignorant. *Myrepsus.*

ASINEOS, ASINES, *ασινεος, ασινος*, from a Negative, and *σινος*, Hurt, Mischief. Without Harm or Damage. *Lib. 1. & 2. Epid.*

ASINGAR, ASUGAR, ASMIAR, ASIGI, Verdegrise. *Rulandus.*

ASINUS, Offic. *Schrod. 5. 269.* *Mer. Pin. 166.* *Schw. Quad. 61.* *Raii Synop. A. 63.* *Aldrov. de Quad. 295.* *Jonf. de Quad. 12.* *Charlt. Exer. 4.* *Gefn. de Quad. 1.* THE ASS. *Dale.*

The Ass is an Animal too well known to require a Description. It has the Misfortune to be much less esteem'd in our Days, than amongst the Antients; who paid it a very great Respect, as we may infer from a great Number of Passages in the Greek Writers.

Mr. Baxter is of Opinion, that the *Anchialus* mention'd by *Martial*, as something sacred amongst the Jews; and by which he insinuates that they swear, means an Ass, *Rudens Deus*. For why, says he, may it not be said *Ανχιου*, *Anchiel*, that is, *Rudens Deus*, or *Ουβηος*; in the same Form as *Ανριου*, *Ariel*, *Leoninus Deus*, or *Λεονιδεος*; We know the old Reproach in *Tertullian*, *DEUS CHRISTIANORUM ONOCHOERITES* (for so it should be read); whence *Patronius*:

*Judeus licet et portinum Numen adoret,
Et cilli summas advocet Auriculas.*

Epiphanius also speaking of the *Gnostics*: *Φασι δ' τον [θεον] Σαββαθ οι μεν ονε μοσων εχεν, οι δ' χοιρα*. "They say, that the [God] Sabacch has the Form of an Ass; others say of a Swine." It appears also from *Plutarch*, in *Iside*, that the Ass and Swine, among the Egyptians, were both sacred to *Typhon*; and even that this *Typhon* begat *Hierosolymus* and *Judeus*. 'Tis probable therefore, that the antient Jews spared Asses and Swine out of Contradiction to the Egyptians, by whom they were slaughter'd as opposite Deities. *Baxter's Glossarium.*

ASSES DUNG.

We have known, says *Aetius*, the Juice of Asses Dung highly beneficial in a Dysentery, especially if the Beast has been fed upon the Mountains, or has had an astringent Pasture. If the Juice be insufficient, let the Dung be moisten'd with the Juice of Plantain, which must afterwards be express'd and infused. *Aetius, Tetrab. 3. Serm. 1. Cap. 45.*

It is also recommended for stopping Hemorrhages.

ASSES

ASP

ASSES HOOF.

The Hoofs of Asses calcin'd, and drank every Day, are said to cure the Epilepsy; and, mix'd and work'd with Oil, to discuss strumous Swellings: Also the Ashes of the same, well-beaten in Woman's Milk, and reduced to a Collyrium, are supposed to deterge Cicatrices in the Eyes, if rubb'd thereon, together with Milk. *Actius, Tetrab. 1. Serm. 2. Cap. 157.*

It is also recommended for healing Chilblains, Chaps in the Skin, for discussing Apoftemations, and for expelling the dead Foetus, and in Hysterical Cases.

ASSES FLESH.

Next, inferior to the Flesh of Stags, which is itself of bad Juice, hard, and difficult of Digestion, is the Flesh of wild Asses; but that of tame Asses, especially when they are old, tho' eaten by some, is of very bad Juice, difficult of Concoction, quite foreign to the Stomach, and ungrateful to the Palate. *Oribas. Med. Coll. Lib. 2. Cap. 28.*

The Flesh of Animals which have solid Hoofs, is most vile Food; but of these the best and lightest (as they say who have travell'd over Asia) is the Flesh of wild Asses. *Ibid. Cap. 68.*

The Blood of an Ass is said to be sudorific; and that of a young Ass to cure the Jaundice.

Asses Milk is very nourishing and abstergent, and is therefore esteem'd good in a Consumption, in Disorders of the Stomach, Abscesses of the Kidneys, the Stone in the Bladder, and Arthritic Pains. It is esteem'd gently cathartic, and was frequently directed by Hippocrates as a Purge, in large Quantities. As a Topic, it makes the Gums firm, eases Arthritic Pains, and gives the Face an agreeable Whiteness, if wash'd with it. See LAC.

The Urine of an Ass is a powerful Remedy, as is said, in Disorders of the Kidneys; cures the Itch; takes away Warts, and callous Excrescences; and relieves in Atrophies, and Palfseys of the Limbs, and Pains of the Gout. *Dale from Schroder.*

ASJOGAM, *H. M. Part. 5. Tab. 59. Arbor Indica Folii aduersis, flore flavescente tetrapetalo odorato, Fructu nondum comperto.*

It is a Tree of a moderate Bigness, about fifteen Feet high, and grows in the Kingdom of Malabar in the East-Indies.

The express'd Juice of the Leaves, mix'd with Cumin-seed pulveriz'd, is said to cure the Colic; and the Powder of the Leaves, taken with Sugar and yellow Sanders, to amend and purge the Blood. *Ray Hist. Plant. 1786.*

ASIRACUS, ἀσίρακος. A Species of Locusts, call'd also Onoi, ὄνοι, in Dioscorides, Lib. 2. Cap. 57. See LOCUSTA.

ASITOI, ἀσίτοι, from a Negative, and ὄσιος, Food, are those who abstain from Food. In *Aph. 32. Lib. 2.* they are call'd ἀσίτουρες, who, in *Aph. 8.* of the same Book, are said to be τερὸν μὴ λαμβάνουτες, "such as receive no Aliment," as ἀσίτουεν is oppos'd to εὐστρέφειν, which is express'd by τερὸν λαμβάνειν, "to take Food," in the same Aphorism. This is according to the usual Way of speaking among the Greeks; for, as Galen says, *Com. ad Aph. 8. Lib. 2.* λέγουσιν οὕτως ἐπὶ μὴ λαμβάνειν μὲν τερὸν τὰς ἀνορέζουσας, λαμβάνειν δὲ τὰς ἐρεγομένους τε καὶ τρεφόμενους ἀχρεὶ κόπον "It is usual with us to say of "those who have no Appetite, that they receive no Aliment; "and of those who hunger and feed to Satiety, that they receive Aliment." Hence it comes, that ἀσίτοι signifies the same as ἀπόσιτοι, "such as have an Aversion to Food;" and Galen, on *Aph. 32. Lib. 2.* expounds ἀσίτουρες by ἀποσίτους and ἀνορέζουσας. And ἀσίτη also means the same as ἀποσίτη.

ASITIA, ἀσίτη, from a Negative, and ὄσιος, Aliment. See ANOREXIA and APOSITIA.

ASIUS Lapis. See ASSIUS.

ASMAGA, a mixing of certain Metals together. *Rulandus. Johnson.*

ASMUM, Weight. *Johnson.*

ASODES, ἀσώδης. See ASE.

ASOPER, Soot. *Rulandus.*

ASPALATHUS. *Lignum Aspalathi, & Rhodium, Offic. Rhodium Lignum, Schrod. 4. 137. Geoff. Tract. 313. Radix Rhodina, Lignum Rhodium, Mont. Exot. 7. Aspalathus, Ind. Med. 15. ROSE-WOOD, or RHODIUM.*

Aspalathus, which some call *Erysisceptrum*, is a woody Shrub thick set with Thorns. It grows by the Danube, and in Nisyrus, Syria, and Rhodes. The Perfumers use it to thicken their Ointments. What is good is ponderous and reddish, or purplish, when stript of the Bark, close, sweet-scented, [of the Smell of Castor, *Pliny*] and bitterish to the Taste. There is another Species of it, which is white, ligneous, and has no Smell, and this is less valued.

It is of a heating Quality, join'd with an Astringency; for which Reason a Decoction thereof, in Wine gargariz'd, is good for Aphthæ, and to wash spreading Ulcers, and other Impurities in the Pudenda, and also the Ozaena. Mix'd in a Pessary, it expels the Foetus. The Decoction thereof, drank,

ASP

stops a Looseness, and throwing up of Blood; and relieves under Difficulty of Urine and Inflation. *Dioscorides, Lib. 1. Cap. 19.*

The *Aspalathus* grows in Egypt and Cyprus: It is a white Thorn, of the Bigness of a moderate Tree, and has a Flower like a Rose: The Root is used in Ointments. It is of a smaller Growth, but equally thorny, in Nisyrus and Rhodes. They call it also *Erysisceptrum*, *Sceptrum*, *Adipsatheon*, *Dipsacon*, and *Diacheton*. *Pliny, Lib. 12. Cap. 24. & Lib. 24. Cap. 13.*

The Tree which bears this Wood, is believed, by *Herman* and others, to be a *Cytisus*. It is brought us from the *Morea*, where it grows, being very resinous, and of a pleasant Smell, resembling that of Roses. The *Hollanders*, being in Quest of some Ships which perish'd on the Coast of *New-Holland*, in the thirty-third or thirty-fourth Degree of Southern Latitude, found on that Coast a great Quantity of this Wood. It is also much esteem'd in China, where its Infusion in Water is believ'd to cure or prevent many Diseases. An essential Oil is got from it, which has so much the Smell of Roses, as to be often substituted for their essential Oil; but the Smell of the first Kind is never so strong as that of the other. This Oil is sometimes used by Barbers, to make their Water smell agreeably. When the Antients term'd this Wood *Lignum Rhodium*, we know not whether they intended to express, that it grows in the Island of *Rhodes*, or smells like a Rose. *Geoffroy.*

ASPALTUM, for ASPHALTUM, which see. *Rulandus. Johnson.*

ASPARAGUS, Offic. Park. Parad. 503. *Raii Hist. 1. 683. Synop. 3. 267. Ασπάργος, Dioscorides. Asparagus sativus, Ger. 953. Emac. 1110. Mer. Pin. 11. Asparagus sativa, C. B. Pin. 489. Tourn. Inst. 300. Elem. Bot. 249. Boerh. Ind. A. 2. 65. Rupp. Flor. Jen. 126. Asparagus hortensis & pratensis, J. B. 3. 725. Asparagus frve Aspharagus, Chab. 550. Asparagus domesticus, Hist. Oxon. 2. 3. Asparagus vulgaris, Merc. Bot. 1. 21. Phyt. Brit. 12. SPARROW-GRASS.*

The Root of *Asparagus*, corruptly call'd *Sparrow-grass*, has a Head thick and spongy, shooting out, all round, long cylindrical Shoots, about the Thickness of a large Goose-quill, with few or no Fibres. From the Roots, in the Spring, arise many greenish-yellow Stalks, with brittle scaly Tops, bigger or less, according to the Difference of their Culture; which, as the Summer comes on, arise higher, and open into numerous Branches, cover'd with Leaves, as fine as Fenel, but very short, and encompassing the Stalk Star-fashion; among these grow small greenish six-leaved Flowers, one of which is follow'd by a round Berry, green at first, and, when ripe, of a shining-red Colour, in which are hard tough Seeds.

Asparagus is found wild in some Parts of England, near the Sea-coast; as in Cornwall, near the Lizard-point; about Bristol, and other Places; but the best is cultivated in Gardens.

The Root is one of the five opening Roots.

The Top of the Plant, or first Bud, is a Species of Food highly esteem'd by every body. *Augustus* made very much use of it, as *Suetonius* informs us in that Emperor's Life. *Erasmus* also, in his *Adagia*, tells us the same thing. It is very grateful to the Stomach, especially if eaten in the Beginning of Dinner. It procures Appetite, and tho' the Quantity of Nourishment it affords is not a great deal, 'tis still more than other Pot-herbs yield, especially if it is well digested, as *Galen* informs us, *Lib. Aliment. Cap. 59.* If 'tis eaten before Dinner, it refreshes and opens the Liver, Spleen, and Kidneys, puts the Body in an agreeable State, and excites a Discharge of the Urine, which it renders fetid and ill-smell'd, *Rod. a Fonseca, Tom. 1. Consil. Med. p. 599. Carol. Rayger. in Schol. ad Obs. Med. 61.* It is of admirable Service to those who labour under Suppressions of Urine, or the Gravel. It is excellent for those who are scorbutic or dropical: It augments the Seminal Secretions, and proves a Stimulus to Veneris. It is also of singular Efficacy in Disorders of the Eyes, *Plin. Lib. 2. Cap. 10.* But it is very hurtful to such as labour under the Gout, *Crat. Lib. 7. Conf. 21.* 'Tis also prejudicial to those who have weak Stomachs. *C. Hoffman [Lib. 5. Instit. Med. C. 12. Sect. 1.]* says, he knew Instances of their being thrown up undigested next Day, even tho' they had been very well prepar'd, especially by Women with Child. Their frequent and immoderate Use renders Women barren, *Ephem. N. C. Dec. 2. Ann. 5. App. p. 67. Claud. Deodat. Panth. Hygiast. L. 2. C. 22. Querc. in Diat. Polyhist. S. 3. C. 2. Got. Maebius, Epit. Instit. Med. L. 4. Part. 2. C. 3. Cbr. Fr. Paullin. Libr. Sing. de Jalapa. L. 2. P. 3. C. 23. & Cent. 3. Obs. Med. Phyl. 58.* The Root is principally in Use in the Shops, which is of a sweet and agreeable Taste, and is one of the five opening Roots; for which Reason 'tis used in those Disorders which proceed from Constipation. It in a remarkable manner purges the Breast, the Liver, Spleen, and Kidneys; and is esteem'd good for the Jaundice, Dropsy, and Consumption. *Theod. Tabernamontanus* gives us the Preparation of a Wine from the *Asparagus*, which performs Wonders in Cases of the Stone in the Bladder or Kidneys. See also *Gualt. Charlet. de Lithias. p. 170.* If the Root

Root is put upon a Tooth that aches violently, it causes it to come out without Pain, according to *Ant. Mizald. Cent. 7. Memorab. Aph. 34. Schenck. Obs. Med. L. 1.* Its red Grains, when dry'd and reduced to a Powder, cure Dyenteries and Fluxes.

Asparagus sylvestris, Diosc. *Asparagus pratensis*, J. B. 3. 725. Chab. 550. *Asparagus sylvestris, tenuissimo folio*, C. B. Pin. 490. Tourn. Inf. 300. Elem. Bot. 249. Boerh. Ind. A. 2. 65. Bot. Monsp. 30. WILD SPARROW-GRASS.

This only differs from the preceding by Culture. Dale.

Its Root is sweetish and glutinous, like that of the common *Sparagus*; it gives hardly any Tincture of Red to the blue Paper, which makes it probable, that its Salt resembles the vitriolated Tartar, dissolved in a great deal of Phlegm, thickened with some Earth and Sulphur, by which the Root is an Aperitive, a little temper'd. *Martyn's Tournefort.*

Asparagus petraea, Corruca, Offic. *Asparagus petraea*, Ger. 953. Emac. 1110. *Asparagus petraeus, five Corruca*, Raii Hist. 1. 683. Hist. Oxon. 2. 3. *Asparagus petraeus, five Corruca aculeata*, Park. Theat. 454. *Asparagus foliis acutis*, C. B. Pin. 490. Tourn. Inf. 300. Elem. Bot. 249. *Asparagus spinosus Corruca dictus*, Rupp. Flor. Jen. 126. *Corruca*, J. B. 3. 726. *Corruca five Asparagus sylvestris*, Chab. 550. ROCK SPARROW-GRASS.

The young Shoots and Roots of these are used in the same Intentions, as those of the *Asparagus sativus*.

ASPASIA, the Name of a constrictive Medicine for the *Pudenda muliebria*. It consisted only of Wool, moistened with an Infusion of unripe Galls. *Castellus.*

ASPER, a sort of small River-fish found in the *Rhone*. It takes the Name from the Roughness of the Scales and Jaws. It is good to eat, and is esteem'd aperitive.

The common People inquire frequently for Oil of *Asper* at the Chymists, which they use, as is pretended, to catch Fish. It is probably Oil of Ospray which they mean; for a Fable has, for time immemorial, prevail'd amongst the Vulgar, that the Ospray drops, as he flies on the Surface of the Water, something into it, which allures the Fish to it, that he may take them. Hence the Oil of this Bird has been esteem'd to have the same Effect. As there is no such thing as this Oil, the Chymists oblige their Customers with Oil of Box, or some other fetid Oil.

ASPERA ARTERIA. See ARTERIA, and PULMONES.

ASPERATA. See ASPERUM.

ASPERELLA. The same as ASPRELLA, which see.

ASPERGULA ASPERUGO. See ASPERULA.

ASPERIFOLIUS, of *Asper*, rough, and *Folium*, a Leaf. *Asperifolius* is an Epithet for such Plants as are rough-leaved, having their Leaves placed alternately, or without any certain Order, on their Stalks. They have a monopetalous Flower, cut or divided into five: After every Flower there succeed commonly four Seeds, such as Bugloss, Borage, Comfrey, Hound's-tongue, &c. *Miller's Dictionary.*

ASPERISIO, *πείσχυμα, παύσις, παύσις, παύσις*. Sprinkling is a well-known Application of some medicinal Liquid, or pulveriz'd Matter, in a thin superficial Way, or by small Portions. *Scrib. Larg. N° 46. 207. & alibi.* Hence such Medicines as are administer'd by way of Sprinkling, or Asperision, are call'd, in *Greek*, *σπινδισμα*, and in *Latin* *Aspergines*. *Castellus. Blancard.*

ASPERULA. *Asperula odorata*, *Aspergula*, *Asperula*, Offic. *Asperula odorata*, S. Paul. 25. *Asperula*, Ger. 966. Emac. 1124. Raii Hist. 1. 483. Synop. 3. 224. *Asperula aut Asperula odorata*, Park. Theat. 563. *Asperula seu Rubeola montana odorata*, C. B. Pin. 334. *Asperula odorata flore albo*, Boerh. Ind. A. 149. Hist. Oxon. 3. 331. *Asperula sylvatica*, Rupp. Flor. Jen. 4. *Rubus accedens Asperula quibusdam, five Hepatica stellaris*, J. B. 3. 718. Chab. 548. *Aparine latifolia humilior montana*, Tourn. Inf. 114. Elem. Bot. 93. Buxb. 23. *Matrifylva Trago*, Volck. 281. *Hepatica stellata*, Chom. 501. WOOD-ROOF. Dale.

The Stalks of Woodroof seldom grow above a Foot high, square and slender, and but little branch'd; having seven or eight long green Leaves growing in a Circle at every Joint, broader than Clivers, but with little or no Roughness: The Flowers grow on the Tops of the Stalk, in small Umbels, of little single-leaved white Flowers, cut into four Segments, of a sweet Smell; each of which is succeeded by two round roughish Seeds, less than those of Clivers. The Root is small, slender, and creeping in the upper Crust of the Earth. It grows in Woods and Copfes, and flowers in May.

Woodroof is esteem'd to be a good Hepatic, and useful against Inflammations of the Liver, and Obstructions of the Gall-bladder, and the Jaundice: The *Germans* put it into their Wine, as we do *Borage* and *Burnet*, as a great Cordial, and Comforter of the Spirits. The green Herb, bruised, is apply'd by some Country Folks to hot Tumors and Inflammations, and to fresh Cuts. *Miller's Bot. Off.*

ASPERUM, *τεχνη*, rough, is an Epithet apply'd to a Body of an uneven Superficies, grating to the Touch, which Property is call'd *Asperitas*, or *Aspritudo*, *τεχνη*, Roughness. In *Scribanus Largus* we read *Asprum* for *Asperum*, by a Syncope, N° 180. Every rough Body is uneven, says *Galen*; but, on the contrary, every uneven Body is not rough. Roughness or Asperity, according to the same Author, is occasion'd from Constriction, or too great Dryness, or from Acrimony. *Gal. Comment. in Lib. 1. Hipp. de Morb. vulg. & Lib. de Ptisana, C. 5.*

Asperata quæ levent; simple Medicines smoothing Asperities enumerated by *Celsus*, are, Spodium, Ebony, Gum Arabic, the White of an Egg, Gum Tragacanth. *Celsus, Lib. 5. Cap. 13.*

ASPHALATUS. The same as ASPALATHUS, which see.

ASPHALEIA, *ἀσφάλεια*, from a Negative, and *ἀσάλλω*, to deceive. Security, Firmness; and *ἀσφαλές*, safe, secure. *Hippocr. 5. Aph. 22. & 2. Aph. 15.*

ASPHALITIS, *ἀσφαλitis*, according to *Archigenes*, a kind of Trefoil with a larger Leaf, used by the *Coronarii*; (Garland-weavers) but *Dioscorides* writes, that Trefoil was simply so call'd, *Gorræus*. *Dioscorides* makes the Name of it *ἀσφαλίσκος*, not *ἀσφαλitis*; *Lib. 3. Cap. 123. Edit. Wechel. 1598.*

Asphaltitis is also a Name given by some to the last of the Vertebrae of the Loins. *Gorræus.*

ASPHALTOS & Bitumen Judaicum, Offic. Bitumen, Calc. Mus. 174. Bitumen Judaicum, Worm. 30. Charit. Foss. 14. Aldrov. Mus. Metall. 381. Bitumen nigrum crassum, Kentm. 21. Bitumen Judaicum Asphaltum, Mont. Ind. 12. JEWS PITCH.

The Asphaltum of *Dioscorides*, and Bitumen Judaicum of the Shops, call'd *Carabe* and *Gummi Funerum* by *Serapion*, and by others *Mumia*, is a solid, brittle, ponderous Substance, of a red, blackish, or dark Colour; easily inflammable, and of a strong bituminous Smell, especially when warm, and fusible by Fire. It is found in several Parts, but the best is that which comes from *Judea*, where it is gather'd on the *Dead Sea*, call'd from thence the *Lake Asphaltites*. It is probable, that a great Quantity of this Bitumen rises from the Bottom of that Lake to the Surface of the Water. At first it is so soft, viscid, and glutinous, that it can with Difficulty be separated from any Part which it touches, but in time it grows harder than Pitch; and, from the Place where it is found, it is call'd *Carabe* of *Sodom*; *Carabe* being used often by the *Arabians* to denote any solid Bitumen, and the *Dead Sea* being the Lake where *Sodom* stood. The Names of *Gummi Funerum* and *Mumia* were given it, because the common People, among the *Egyptians*, used it in embalming and preserving dead Bodies.

The true Bitumen Judaicum is seldom brought to us; for *Dioscorides* directs us to make Choice of that which shines like Purple, and to reject the black Kind as being foul, and of small Value; but all that we see of that Kind is black; though even that, when broken in Pieces, appears, against the Light, to be of a Saffron Colour; and therefore it is possible this may be the same Kind recommended by *Dioscorides*, only boil'd to a hard Consistence in Brass Kettles, before it is sent to us.

It is of a discutient, emollient, and agglutinating Quality. It dissolves coagulated Blood, and promotes the Menstrual Discharge. It is an Ingredient in the *Venice Treacle*, and in the Embalming Powder of *Charas*. *Geoffroy.*

ASPHARAGUS. The same as ASPARAGUS, but spelt with a *ϕ* instead of a *π*, according to the *Attic Dialect*. *Blancard.*

ASPHENDAMNOS, SPHENDAMNOS. A Mountain Maple. *Blancard.*

ASPHODELUS. The Asphodel.

The Asphodel is a well known Plant, with Leaves like a large Leek, and a smooth Stalk, bearing on its Top a Flower call'd *Anthericos*. [The Translator of *Nicander* makes *Anthericos* the Fruit, and *Anthérix* the Stalk of the Asphodel. See ANTHERICOS.]

The Roots are oblong, smooth, and like an Acorn, of an acrimonious Taste, and heating Quality. Being drank, they provoke Urine and the Menes; and the Weight of a Dram taken in Wine cures Pains in the Side, Coughs, Convulsions, and Ruptures. The Quantity of a Dye eaten as Food facilitates Vomiting; and three Drams are an effectual Dose for those who are bitten by Serpents: But a Cataplasm of the Root, Leaves, and Flowers, with Wine, must at the same time be apply'd to the Place. The Root boiled in Lees of Wine makes a good Cataplasm for foul and spreading Ulcers, and for Inflammations of the Breasts or Testicles; to recent Inflammations it is apply'd with Polenta: The Juice of the Root mixed with old sweet Wine, [*παλαιὸν γλυκὺν*] Myrrh, and Saffron, and boiled all together, makes a good Medicine to anoint the Eyes. The same warm by itself, or with Frankincense, Honey, Wine, and Myrrh, is proper for purulent Ears, and cures the

Pain of the Teeth, if dropped into the opposite Ear. The Ashes of the burnt Root rubbed on an Alopecia cause new Hair to spring. Oil boiled in the Roots hollowed, and set over the Fire, is good to anoint exulcerated Chilblains, and Ambuſſions; and dropped into the Ears it eases the Pains therein. The Root abſterges the white Alphas, [*ἀλφιδον λευκὴν*] if the Part affected be firſt rubbed with a Linen Cloth, and then anointed. The Seed and Flowers drank in Wine are a moſt effectual Antidote againſt the Scolopendra and Scorpion, but diſturb the Belly. *Dioſcorides, Lib. 2. Cap. 199.*

This Aſphodel does not ſeem to be the ſame as that taken Notice of by *Hefiod*, which he repreſents as eatable, by way of Food; and joins it with the Mallows.

Aſphodelus verus albus, Offic. *Ἀσφόδελος*, *Dioſcorides*, *Aſphodelus ramosus*, Ger. 86. (*figura eſt tranſpoſita*) *Emac. 93.* *Aſphodelus albus ramosus mas*, C. B. Pin. 28. *Tourn. Inſt. 343. Elem. Bot. 286.* *Boerh. Ind. A. 2. 110.* *Aſphodelus major albus ramosus*, Park. Parad. 146. *Aſphodelus major ramosus flore albo*, J. B. 2. 625. *Chab. 221. Raii Hiſt. 2. 1191.* *Aſphodelus albus ramosus*, Hiſt. Oxon. 2. 330. WHITE ASPHODEL.

The Stalks of the white Aſphodel grow to be two or three Feet high, branched toward the Top, divided into ſeveral Spikes of ſtarry white Flowers, each being monopetalous, divided into five Parts, with a purple Line on the Back of each, and ſeveral yellow Chives in the Middle. The Leaves are long and narrow, and ſharp-pointed, hollow'd in the Middle like a Sword-blade. The Root is compoſed of a great many long, roundiſh, tuberous Glandules, growing from a ſtringy Head. It is planted with us in Gardens, its native Place being *Italy*, *Spain*, and the Southern Parts of *France*, and flowers in *May*.

The Roots of this Plant were uſed by the Antients to provoke Urine, and bring down the Menſes; but it is very rarely met with in the Practice of Phyſic. *Miller's Bot. Off.*

Aſphodelus verus luteus, haſta regia, Offic. *Aſphodelus luteus*, Ger. 87. *Emac. 94. J. B. 2. 632. Chab. 221. Raii Hiſt. 2. 1192.* *Aſphodelus luteus, & flore, & radice*, C. B. Pin. 28. *Rupp. Flor. Jen. 124. Tourn. Inſt. 344. Boerh. Ind. A. 2. 110.* *Aſphodelus luteus minor ſive Haſtula regia*, Park. Parad. 147. *Aſphodelus folio fiſtuloſo ſtriato, non ramosus, luteus, & flore, & radice*, Hiſt. Oxon. 2. 331. **KINGS SPEAR.** *Dale.*

This is a lower Plant than the former, and much leſs branch'd. The Leaves are long, hollow, and fiſtular, ſomewhat triangular; the Leaves grow in Spikes of a yellow Colour, larger than the other, of the ſame Shape and Make. The Root is compoſed of the like Clogs and Glandules, of a yellow Colour. This likewiſe is a Native of *Italy* and *Sicily*, and is planted here in Gardens, flowering in *May* and *June*.

The ſame Virtues are attributed to this, as to the former, but it is ſeldom uſed. *Miller's Bot. Off.*

Bartholomæus Zorn is more particular with reſpect to this Plant; for which Reaſon I ſhall give his Chapter upon it.

Aſphodelus, Affodilus & Haſtula regia. Aſphodelus luteus, *Dod. J. B. Chabr. Luteus & flore et radice*, C. B. *Luteus minor ſive Haſtula regia*, Park. *Folio fiſtuloſo ſtriato, non ramosus. Luteus & flore & radice*, *Moriſ. H. 2. Iphion Theophrasti, Ἀσφόδελος*, Græc. *Erizambac*, Arab. *Bernhardi Teſticulus*. Others call it *Anthericum*, which, according to the Fiction of *Lucian*; the Ghoſts of the Damn'd eat in Hell. It is an Herb well enough known in our Gardens, on account of its beautiful Flowers. It grows naturally in many Parts of *Italy*, *France*, and *Spain*. The Poet *Hefiod* makes very honourable mention of it. There are three Sorts of it, two of which are white and prickly on the Edges, but the other Species is of a yellow Colour. The Root is principally uſed, which is hot, and of a ſtrong bitter Taſte. *Fallopius, L. de Cauter. C. 10.* reckons it among the beſt of the milder Cathartics. It is of a warming, drying, opening, diſcuſſing, purgative, and cleaning Nature. It alſo excites a Diſcharge of the Urine and Menſes; is good for Spasms, cures Ruptures, Jaundice, and the Dropſy. A Decoction of the Roots of Aſphodel, uſed as common Drink, is a powerful Medicine. *Guil. Varign. Secret. Med. p. m. 131.* The Root boiled in Wine or Water, and ſufficiently tritured when dry, cleanses and cures old corroſive and fetid Wounds and Ulcers, Swellings of the Breasts and Privy-parts; as alſo bloody Ulcers, *Plin. L. 22. C. 22.* A Cataplaſm is alſo prepared of it and Pitch, for removing the Stenich of the Feet, *P. Laurenb. Floricult. L. 2. C. 7. p. 114.* If beat, and laid upon ſcrophulous Swellings, it cures them, *Foreſt. L. 3. Obſ. Chir. 11.* and heals Chilblains, whether exulcerated or not, *J. Prævoſt. in Med. Pæp. Joh. Scultet. in Armament. Chir. Obſ. 83.* The Vinegar in which the Root has been boiled, if uſed for waſhing the Body, cures the Itch, and other ſcorbutic Eruptions. Some roaſt the Root in hot Aſhes, and rub their Faces and Hands with it, in order to remove all Blotches, and purify the Skin. The Root alſo cauſes the Hair to grow faſt, and curl: See *Laurenberg. Apparât. Plantar. L. 2. C. 7.* The Root burnt to Aſhes, and

mixed with Honey, makes the Hair grow again on thoſe Parts from which it is fallen off. This Root reduced to Powder, and mixed with calcined Alum, corrodes the proud Fleſh of foul Ulcers, if apply'd to them. If a Houſe is ſmoaked with this Root, it baniſhes Mice, and proves a Poiſon to them. If its Root is put into the Water which Swine drink, it prevents their being affected with a peſtilential Leproſy; or if they are ſo, it reſtores them to their natural State. It alſo produces the ſame Effect, if they are frequently waſhed with ſuch a Water. *Florentinus.*

ASPHYXIA, ἀσφυξία, from a Negative, and σφύξω, a Pulse, from σφύζω, to leap, or beat like an Artery. A Privation of the Pulse, when no Artery ſeems to be moved, or no Motion is perceptible to the Touch. A total Privation of the Pulse indeed cannot be while the Animal is alive; but with reſpect to our Senſe of Feeling, a Privation often happens, *Galen. Lib. 1. de Præcogn. ex Pulſ.* The ſame is occaſioned two Ways, which are either a total Abolition of the Pulse of the Arteries, which is the moſt mortal of all Symptoms, or becauſe it beats ſo weakly and remiſſly, as to eſcape all Notice by the Touch. *Galen. Lib. 2. de Præſag. ex Pulſ.*

Ἀσφυξία is rendered by *Cælius Aurelianus, Cap. 3. Lib. 4. Tard. Paſſ. Pulſus Parvitas et Amputatio*, “a Smallneſs and “Amputation of the Pulse.”

Ἀσφυξία, in *Galen, Lib. 4. de Diff. Pulſ. Cap. 3.* are ſuch as are deprived of Pulse, or have no perceptible Motion of their Arteries.

ASPIC.

There is an Oil, called by the French Oil of *Aſpic*, drawn from a Plant which *C. Bauhine* calls *Lavendula latifolia*; but to which *J. Bauhine* gives the Name of *Pſeudonardus*, and the French that of *Aſpic*.

This Plant is commonly found in all Parts of *Provence*; and when it produces its Flowers, we put them, when almoſt dry, into a large Still, with a great deal of Water. After a Maceration for ſome Days, we diſtil the Whole, upon which there is carried along with the Water an Oil of a yellowiſh or amber Colour; and this is the Oil of *Aſpic*, pure and unadulterated, as it ought to be. The Flowers of this Plant are to be choſen for this Purpoſe, rather than any other of its Parts, becauſe they contain the largeſt Quantity of eſſential Oil; and indeed, upon ſtrict Obſervation, we find, that the Cup of the Flower contains almoſt all the oily Parts of the Plant.

We muſt here obſerve, that aromatic Plants generally yield but a ſmall Quantity of Oil; ſo that before the Oil can be diſtilled with ſmall Expence, a large Quantity of the Flowers muſt be eaſily procured; which is the Reaſon that in *Provence* the eſſential Oil of *Aſpic* is not only to be found in greater Abundance, but is alſo ſold cheaper, than the Oil extracted from that Plant in moſt other Parts.

But notwithstanding the Eaſineſs of extracting the Oil in thoſe Parts, where the Flowers are found in Abundance, yet the immenſe Quantity of it uſed, and the low Price paid for it, ſhew that we very rarely have it perfectly pure and unadulterated. There are ſeveral ways of adulterating this Oil, two of the leaſt fraudulent of which I myſelf have diſcovered; one is by mixing it with Spirits of Wine; and the other by adding to it Oil of Turpentine. This Oil is for the moſt part imported to us from *Provence* and *Montpelier*; but as 'tis a great deal more employed in Painting, Enameling, and Varniſhing, than in Phyſic, it does not ſo properly come under our preſent Conſideration, *Mem. de l'Acad. 1715. by Mr. Geoffroy the younger.*

ASPIDION, ἀσπίδιον, a Diminutive of ἀσπίς, a Buckler. A Name for the *Alyſſon* of *Dioſcorides*, becauſe it has ſmall round Pods reſembling a Buckler. *Blancard.*

ASPIDISCOS, ἀσπίδισκος, from ἀσπίς, a Buckler, properly ſignifies a little Buckler, or the exterior Ornaments of Bucklers; but is apply'd by Metaphor to the Sphincter Muſcle, as being in a manner the Ring of the Anus, as we are informed by *Cælius Aurelianus, Tard. Paſſ. Lib. 3. Cap. 3.*

ASPIS, ἀσπίς. The Aſp, a very poiſonous Serpent; of which *Galen, Lib. 1. de Theriac. ad Piſon. C. 8.* makes three Species, the firſt called *χερσαία*, the ſecond *χενδρία*, and the laſt *ἄσπας*, which is the moſt pernicious; for it extends its Neck, and ſuddenly ſpits its Venom upon a Perſon, as if it were endued with Reaſon to eſtimate the Diſtance. This is the Sort that is ſuppoſed to have bit Queen *Cleopatra* to Death; for after the Overthrow and Death of *Antony*, when *Auguſtus* had a Deſign to lead her away captive, to adorn his Triumph, ſhe held out her Breaſt to one of theſe Serpents, and by its Bite received a very ſpeedy Death. The Mark of this Bite is very ſmall, like the Puncture of a Needle, without a Tumor, and but a ſmall Quantity of Blood, though black in Colour, diſſils from the Wound. This is ſoon ſucceeded by a Dimneſs of Sight, and various Kinds of Pain in the Body, but very ſlight, and not without ſome Mixture of Pleaſure. Wherefore *Nicander* had Reaſon to ſay, in his Verſes, that it kills without Pain. The Colour changes to a Green and Herbaceous; there is a ſlight Gnawing at the Mouth of the Stomach; the Forehead has continual Spasms; the Eye-lids move involuntarily, as

at the Approach of Sleep; and the Patient dies in less than the third Part of a Day.

The most ready and effectual Remedy is Amputation of the affected Part, if it be one of the Extremities, and may be done; if not, let the circumjacent Flesh be speedily scarify'd, and cut away even to the Bone, that the Venom may not spread itself into the neighbouring Parts, and the rest are to be treated with Cauterics; for the Poison of this Serpent, as well as that of the Basilisk, like Bulls Blood, very soon congeals the Blood and Spirits in the Arteries. *P. Aeginet. Lib. 5. Cap. 18.*

Emplastrum ex Aspidibus. A Plaster of Asps for stumorous Swellings, and other Hardnesses, and for the Gout in the Intervals of the Paroxysms, you are taught how to prepare by *Actius, Tetrab. 4. Serm. 3. Cap. 15.*

It is probable, that anointing the injured Part with common Oil of Olives by a warm Fire, would cure the Bite of the Asp; as it does that of the Viper. See ALEIPHA, and VIPERA.

ASPENIUM, a Plant thus distinguish'd:

Asplenium Ceterach, Scolopendria, Offic. Asplenium, Scolopendrium, Ceterach, Chab. 556. Asplenium sive Ceterach, J. B. 3. 749. Ger. 978. Emac. 1140. Raii Hist. 1. 139. Synop. 45. Park. 1046. Hist. Oxon. 1. 561. Elem. Bot. 434. Tourn. Inst. 544. Ceterach officinarum, C. B. 354. SPLEEN-WORT or MILTWAST. Dale.

This is a small Plant, consisting only of Leaves, which spring from a fibrous Root. They are about three or four Inches long, hardly half an Inch broad, cut into small roundish Segments, which stand not opposite to one another, but alternately; they are of a greenish Colour on the upper Side, and brownish, and full of dusty Seed underneath, generally crumpled, or folded inward, in Shape somewhat like the Insect *Scolopendra*, whence it takes one of the Names. It grows upon old Stone Walls and Buildings, especially in the West of England.

This is one of the five Capillary Plants, having its Name from its good Effects in curing Diseases of the Spleen, taking away the Swellings thereof, and hindering its too great Largeness; whence likewise it is called Miltwast; it also opens Obstructions of the Liver, helps the Jaundice, and is very good for the Rickets in Children. *Miller's Bot. Off.*

Vitruvius gives an extraordinary Instance of the Effects of Asplenium in Crete, which is specify'd in the Extract from that Author under the Article AER.

ASPREDO *Cernua, Offic. Bellon. de Aquat. 291. Cernua fluviatilis, Gefn. de Aquat. 192. Charlt. Pisc. 39. Raii Ichth. 334. Ejsid. Synop. Pisc. 144. Mer. Pin. 190. Aspredo, Caius de Rar. Animal. 107. Aurata, Rondel. de Pisc. 1. 115. Perca fluviatilis minor, Aldrov. de Pisc. 624. Jonf. de Pisc. 108. THE RUFF.*

This Fish is common in many of our large Rivers. *Gesner* recommends a Bone found in the Head of this Fish, for the Stone in the Kidneys; and for pungent Pains about the Ribs, and in other Parts. *Dale.*

ASPRELLA: A Name which *Blancard* gives to the *Equisetum majus*, on account of its Asperity; for which it is used to polish Chests and Cupboards.

ASPRIS. A Tree, the same as the *Ægilops*, which see.

ASSA-FŒTIDA: The same as ASA-FŒTIDA. See SILPHIUM.

ASSALA. A Nutmeg. *Ruland. Johnson.*

ASSALLÆ, Worms that breed among Planks, otherwise called *Coffi, Terebrones, Termes, Thripes, Xylophagi.* *Rulandus.*

ASSANEGLI, ASANIRGLI, ASARAGI. The Powder that falls off from the Walls of Salt in the Salt Mines. *Rulandus.*

ASSANUS. A Weight among the Antients, consisting of two Drams. *Galen. de Ponderibus et Mens.*

ASSATIO, *ἀσσις*, Assation, is an artificial way of dressing Eatables, by means of an extrinsic and foreign Heat, which by its prevailing Force is effectual towards drying of the same. There are several Kinds or Modes of Assation; for either the Meat is moved near the Fire, or placed in a Vessel, put under, or but an insufficient Quantity of Moisture, and Fire with none it. To this Class belong fry'd Meats, whence Frying is a Species of Assation. Hither also may we refer *Tostio, satevont, Toasting.* Roasted and fry'd Meats, according to *Galen, Lib. 3. Alim. Fac. Cap. 2.* afford drier Aliment to the Body. The first in Greek are called *ἀσσις*, the other *σάτυρις*. *Scribonius Largus* mentions *Ova assa*, N° 221. *Assare*, in the Spagirical Language, is to dry a Thing, and put it in such a State, as to be reducible to Powder; and sometimes it is the same as to congeal. What is all red-hot both within and without, undergoes a wrong Assation. *Assare*, by way of Allegory, is called the seventh Regimen, which is that of the Moon, whose Office it is to heat and compose for the Space of twenty-five Days, and this is called the Silver Regimen. Lastly, Assation, in the Magistery of the Philosophers Stone, is a sweet and gentle Desiccation of Bodies dissolved and separated from their Menstruums by a small Fire decreasing towards the End, which sweet Desiccation is a Calcination. *Castellus.*

ASSATURA is the Animal or Piece of Meat but just removed from the Fire after Assation, and wrapped in a Cloth. They are called *Assatura suffocata*, by *Santes Ardoynus*, and reckon'd among Poisons. *Castellus.*

ASSERAC, the same as *Assis*, is a Species of *Bangué*, which is the *Assis* of the Egyptians, and differs from the Opium and Maillac of the Turks. *Castellus.*

ASSERVATIO, or CONSERVATIO, in Pharmaceutics, is repositing such Collections of Simples as are necessary for Use in proper Vessels and Places, that they may be always in Readiness. *Castellus.*

ASSIDENS *Signum, συρδεδευσις*, an assident Sign, or Symptom, that is, such a one as usually accompanies a Disease. It differs, however, from the *Pathognomonic* in this, that this last is inseparable from the Distemper, as being essential to it; but the other not so, *Gal. 3. in 3. Epid. C. 34.* For Illustration, let the Pleurisy be an Example, in which an acute Fever, a Difficulty of Respiration, Cough, and pungent Pain of the Side, are pathognomonic Symptoms; but that the Pain should extend to the Hypochondrium, or Clavicle, or that the Patient should find more Ease in lying upon the affected Side than upon the other, are no more than assident Symptoms. *Castellus.*

ASSIDUUS is used by some instead of *continuus*; thus with them *assidua Febris* is the same as *continua Febris*, and is opposed to *intermittens*. *Castellus.*

ASSIMILATIO, *ἐξομοίωσις, ὁμοίωσις*, an Assimilation. It is the Action by which the Supply of Nourishment is alter'd and assimilated to the Part nourished, *Galen. 3. de Fac. Nat. Cap. 1.* In order to this there must be first an *Appositio, προσέσθσις*, an Apposition; and then an *Agglutinatio, or Adhærentia, πρόσσθσις*, an Agglutination, or Adhesion, *Lib. 1. de F. N. C. 11.* It differs only in Name from Nutrition, *Lib. 3. de Caus. Sympt. C. 2.*

ASSIS is either the same with Opium; or Meconium; or else it is a Powder prepared of Hemp-leaves, of which, being mixed with Water, the Egyptians take five or more Boluses of the Bigness of a Chestnut, which throws them into a drunken Ecstasy for an Hour, during which they delight themselves with imaginary Scenes. *Prosp. Alpinus de Medic. Egypt. Lib. 4. Cap. 2.* The Turks also call it *Asserac*. See BANQUE.

ASSISTENTES, or *Assites glandulosi*. The same as PARASTATÆ, which see.

ASSITRA. A Tree in the East-Indies, the same as MANDARU, which see. *Raii Hist. Plant. 1751.*

ASSIUS LAPIS, *ἄσσιος λίθος*, Diof.

Lapis Assius, Offic. Matth. 1380. Aldrov. Mus. Metall. 692. Assus vel Assius Lapis, quem etiam Sarcophagum vocant, Worm. Aq. Charlt. Foss. 21. Sarcophagus, sive Assius Lapis, De Laet. 133. Sarcophagus, & Assus seu Assius Lapis, Boet. 403. ASSIAN STONES. Dale.

This is so called from *ἄσσιος*, a City of Troas in the Lesser Asia, where it was found. The Assian Stone is of a tephrous, soft, friable, and loose Substance. Something grows upon it like very fine Meal, such as we see sticking upon the Walls of Mills. They call it the Flower of the Assian Rock: It is of subtle Parts, and consumes Flesh that is too soft and fluid by Colliquation without Mordacity. The Stone on which it grows has the same Virtue, but weaker; for the Flower is not only colliquative, digestive, and preservative like Salt, but performs all this without any remarkably corrosive Quality. It has somewhat of Saltiness to the Taste, which makes it conjectur'd to be a Dew arising from the Sea, which is condensed by the Rock, and dry'd by the Sun. *Galen de Simp. Med. Fac. Lib. 9.*

The Assian Stone, says *Dioscorides*, ought to be of the Colour of the Pumice-stone, spongy, and light, and also friable, with intercurrent yellow Veins from the Top to the Bottom: Its Flower is a yellowish and saltish Substance, on the Surface of the Stone, of a thin Contexture, some white, some of the Colour of the Pumice-stone, inclining to yellow; it tastes somewhat biting upon the Tongue.

Both the Stone and the Flower have an astringent and gently colliquative Virtue, and, being mixed with Resin of Turpentine or Tar, discuss Tubercles; but the Flower is esteem'd most effectual, and is, indeed, when dry'd, an extraordinary Remedy for inveterate Ulcers, which are difficult to be cicatrized, and represses carnosus Excrescences. Mixed with Honey it absterses foul and virulent Ulcers; it deterges also and incurs Ulcers which are hollow, and mixed with Cerate restrains the spreading Kind. It is made into a Cataplasim with Bean-meal for the Gout, and for splenetic Disorders with Vinegar and Quick-lime. The Flower made into an Eclegma with Honey is good in a Phthisis. Vessels are made of the Stone, in which gouty Persons put their Feet when they bathe, and find Relief thereby. Coffins are made of the same, for the speedy Consumption of dead Bodies; and Persons of a very fleshy and gross Habit are extenuated by sprinkling the Flower instead of Nitre in their Baths. If any one thinks fit to wash the

the Stone or Flower, he must do it as he washes *Cadmia*. *Di-ascorides*, *Lib. 5. Cap. 142*.

About *Affes*, a City of *Troas*, grows a Stone which consumes all Bodies; they call it *Sarcophagus* [from *σάρξ*, Flesh, and *φάγω*, to devour]. *Pliny*, *Lib. 2. Cap. 96*. Dead Bodies inter'd in it are found to be consum'd within forty Days, Bones and all, except the Teeth. *Idem*, *Lib. 36. Cap. 17*.

ASSOS, Alum. *Rulandus*.

ASSUETUDO, the same as CONSUETUDO.

ASSUMTIO, *ἀρσίλησις*, *ἀρσίζεα*, a Reception. The Word is apply'd to every thing, whether Aliment or Medicine, which is communicated by the Mouth to the Body, not excepting Air itself. *Castellus*.

ASTACUS, Offic. *Gesn. de Aquat. 91. Rondel. de Aquat. 1. 538. Astacus verus*, *Aldrov. Exang. 112. Astacus marinus communis*, *Jonf. Exang. 13. Astacus marinus*, *Mer. Pin. 191. Charlt. Exer. 55. Schonef. Ichth. 23. THE LOB-STER. Dale*.

This Fish is too well known to require a Description. The Shell calcin'd, and drank in Wine, is said to break and carry off stony Concretions in the Kidneys; and it is likely enough to have some Effect in such Cases, because the Shells of Fish calcin'd are a sort of Lime, and the Salts of Lime are the grand Dissolvents of stony Concretions. It is now well known, that whatever good Effects *Mrs. Stevens's* Medicine for the Stone may have, are owing to the Salts of Lime.

Lobsters as a Food are highly calefcent, and of consequence must be very proper Food, when an acid Acrimony prevails in the Stomach, and general Habit; but the contrary in case of a Tendency to an alkaline Putrefaction. They are esteem'd very nourishing, and good in a Consumption. See ALIMENTA.

ASTACUS FLUVIATILIS, Offic. *Rondel. de Pisc. 2. 210. Schonef. Ichth. 20. Gesn. Aquat. 104. Mer. Pin. 192. Charlt. Exer. 56. Aldrov. de Exang. 129. Jonf. Exang. 15. Cammarus*, *Bellon. de Pisc. 355. Cancer*, *Schrod. 5. 325. The CRAWFISH, or CREVIS*.

They are found in Rivers, and the Parts of them used in Pharmacy are, the *Flesh*, and what we call the *Lapilli*, or *Oculi Cancrorum*, known by the Name of *Crab's-eyes*. In their Head, according to some, or rather in their Stomach, are found two white Stones, as large as a Pea, of a kind of lenticular or orbicular Form, but compress'd, and somewhat hollow on one Side, whereas the other is convex, and dispos'd in *Laminae*. These Stones are of an earthy Taste. We frequently meet with a counterfeit Species of this Commodity prepar'd of a whitish Earth, and made up in the same Form; but this fictitious Kind is easily distinguished by breaking them; since they want those *Laminae* which are always found in the convex Part of natural and genuine *Crab's-eyes*. The *Flesh* of this Animal is cooling, moistening, and adapted to nourish such as labour under Atrophies. The *Stones* or *Eyes* are cooling, drying, abstergent, and discutient; they resolve tartarous Concretions, and coagulated Blood, and are possess'd of a lithontriptic Quality; for which Reason they are often prescrib'd in nephritic Pains, Pleurifies, Asthmas, and Colics; they are also proper for cleansing the Teeth. The Shell is possess'd of the same Virtues with the Stones, and is besides of Service in curing such Itches in Children as arise from saline Humours, and in carrying off the Paroxysms of intermittent Fevers. *Schrod.*

ASTAPHIS, *ἀσταψίς*, in the *Attic* Dialect, for *σάπης*, a Raisin.

ASTARZOF. The Name of an Ointment in *Paracelsus*, consisting of one Ounce of Litharge wash'd, one Ounce and a half of Spenniola, with three Ounces each of the Juices of House-leek, and Water-lily. He gives also the same Name to a Mixture of two Ounces of Rose-water with an Ounce of Camphire. These he uses in the Cure of a *Formica*. *Paracels. de Apostem. Cap. 38*.

ASTCHACHILLOS is a Name given by *Paracelsus* to a malignant gangrenous Ulcer, which begins at the Juncures of the Feet, and ascends up the Legs to the Knees. When there is a Redness, he says, above the Juncures at the Root of the Heel, and the Ulceration occupies a large Surface, making its way by many little Ulcers up the Leg towards the Knee, you may venture to say there will be an *Astchachilos*, which I also call *Araneus*. *Id. ibid. Cap. 18*.

ASTEION, *ἀσείων*, from *ἀστυ*, a City, in the same Sense as *Urbanus* comes from *Urbs*. Good, laudable, civil, polite, In *Hippoc. Lib. de Alim. ἀσείων* is oppos'd to *βλαβερός*, hurtful; and soon after to *ελαφρός*, bad, corrupt. In *Hipp. Epist. ad Democ. ἀσείων* ἐλλεβορμῆς, *ἀσείων* τὰ σώματα are such as enjoy a good State of Body. *ἀσείων*, in the same Author, signifies civil, polite, laudable, and is commonly oppos'd to *ἀγέων*, rude, barbarous, malignant. *ἀσείων*, according to *Varinus*, signifies τὸ χαλεπὸν καὶ τὸ δεξιὸν, καὶ δαύματ' ἀξίον, δαυμάσιον, σπυδαῖον καὶ αἰδέσιμον, "graceful and handsome, worthy of Admiration, honourable, just, and venerable."

ASTERES THALATTII, *ἀστέρες θαλάσσιοι*, (from *θάλασσα*, or *θάλαττα*, the Sea, *Star-fish*) are prescribed, together with Cabbage and scented Wine, by *Hippocrates*, *Lib. 2. περι*

γυναικ. in the Hysteric Passion; and for Hysterical Pains, Lib. 2. περι γυναικ. 900.

The *Stella Marina* is very small in Bulk; its Inside is *Flesh*, but its Outside a pretty hard Callus. They say it is of so fiery a Nature, that it scorches every thing it touches, and digests all its Food in an Instant. *Plin. Lib. 9. Cap. 60*.

ASTERGES, *ἀστέργης*, from *ἀστυ* and *σέργω*, properly, to love with a natural Affection. Inhuman, unnatural, severe; in *Hippoc. ἀστέριον*, it signifies hard, dense, compact, and is oppos'd to *ἀραιός*, *μαλακός*, rare, soft; as τὸ ὃ ἀστέριον ἐκ ἀντὶ τοῦ ἀστέριον, πυκνὸν τε ἐστὶ καὶ ἀστέριον. "But the Male does not receive any [Moisture]" being dense and compact."

ASTER ATTICUS, *Ἀστὴρ Ἀττικὸς*, *Dioscorides Inguinalis. After Atticus*, Offic. *After Atticus*, *Ger. 392. Emac. 486. Raii Hist. 1. 338. After Atticus luteus verus*, *Park. 128. After luteus, foliis ad florem rigidis*, *C. B. 266. Chrysanthemum conyzoides, foliis circa florem rigidis*, *Hist. Oxon. 3. 18. Chrysanthemum Asteris facie, foliis ad florem rigidis*, *Herm. Cat. Asteriscus annuus foliis ad florem rigidis*, *El. Bot. 398. Tourn. Inst. 497. Boerh. Ind. A. 164. Aët. Reg. Par. An. 1710. 382. GOLDEN STARWORT. Dale*.

The *After Atticus* [by some called *Bubonium*, *Oribasius*] is a ligneous Stalk, which has a purple or yellow Flower on its Top, divided round about, like that of Chamomile, with radiated Leaves like a Star. The Leaves about the Stalk are oblong and hairy.

Made into a Cataplasm it is effectually apply'd in hot Disorders of the Stomach, Inflammations of the Eyes, Buboës, and falling down of the Anus. They say that the purple Part of the Flower drank in Water cures the Quinsy, and frees Children from the Epilepsy; and being apply'd while it is yet moist and recent, by way of Cataplasm, is proper for inflammatory Buboës. If the Flower, when it is dry, be crott by the Left Hand of the Patient, and ty'd about the Bubo, it takes off the Pain. *Dioscor. Lib. 2. Cap. 120*.

After by some is called *Bubonium*, because it is a present Remedy for a Bubo. It also relieves the *Sciatica*, being ty'd on the Part. *Pliny, Lib. 27. Cap. 5*.

After is also the Name of a Medicine invented by *Andromachus*, against Distillations, and various Sorts of Pains. *Gal. de Comp. Med. Sec. Loc. Lib. 7. Cap. 5*.

The lower Leaves of this *After* are about four or five Inches long, and about an Inch broad at the End, which is round-pointed, and growing narrower towards the Root; the Stalk is downy and hairy, about a Foot and a half high, with the like Leaves, but smaller, set on it without Order: Toward the Top it is divided into three or four Branches, at the End of which grows a yellow Flower like a Marigold, but with a broader Thrum, and narrower Petals: Close under each Flower grow six or seven stiff roundish Leaves, in form of a Star, whence it takes its Name; the Seed is oblong, thin, and flat; of a blackish Colour: The Root is small and fibrous, perishing every Year. It grows in *Italy*, *Spain*, and the Southern Parts of *France*, and also in *Greece*. *Millar's Bot. Off.*

This Plant is found in the Gardens of Botanists, and flowers in *May*. Its Leaves are only used, which are of a vulnerary Nature, tho' rarely prescribed in Practice. The Leaves and the Herb itself are of Service in preternatural Commotions, and Heats of the Stomach, Inflammations of the Eyes, the falling down of the Fundament, and Tumors in the Groins. The Water distill'd from its Flowers, if drunk, is of Service in Quinsys, and the epileptic Fits of Children. *Dale*.

There are several other Plants called by the Name of *After*, which are Species of *CONYZA*, which see.

The *Helenium*, or *Enula Campana*, is also call'd *ASTER OMNIUM MAXIMUM*.

ASTERIA GEMMA, Offic. *Asteria, aut Solis Gemma*, *Boet. 226. The BASTARD OPAL, or STAR-GEM. Dale*.

This Gem is transparent like Crystal, but of a harder Nature. 'Tis thought to be a Species of the *Opal*, but neither the one nor the other are now kept in the Shops. If carried about with one, 'tis thought to procure Sleep, and prevent frightful Dreams. *Boet.*

ASTERIAS, *ἀστέριος*, *ἀστέριος*, *ἀστέριος*, *ἀστέριος*, from *ἀστυ*, a Star. The same as *ASTROITES*, which see.

ASTERION. The same, according to *Blancard*, as *ASTER* before.

ASTERISCUS, of *After*, or *Starwort*, which it is very like, except that the Seeds are not papous, but chanell'd. *YELLOW STARWORT*.

The Cup of the Flower is stellated with little Leaves, which are extended beyond the Petals of the Flower in Length.

This Plant having no *English* Name, I have call'd it *YELLOW STARWORT*, altho' it is very different in its Character from that Plant; the Seeds of this being plain, and for the most part border'd round the Edges, having no Down adhering to them, and the Flowers being furrounded with a foliaceous Calyx.

There are several Species of this Plant cultivated in curious Botanic Gardens; but in England we have but three Sorts, which are preserved for their Beauty.

1. *Asteriscus annuus, foliis ad florem rigidis*, Tourn. THE ANNUAL ASTERISCUS, WITH STIFF LEAVES AND FLOWERS.

2. *Asteriscus annuus Lusitanicus odoratus*, Boerh. THE PORTUGAL SWEET-SMELLING ANNUAL ASTERISCUS.

3. *Asteriscus maritimus perennis patulus*, Tourn. THE MARITIME PERENNIAL DWARF ASTERISCUS. *Miller's Dictionary*.

ASTERITES. A Flint Stone to strike Fire with. *Rolandus*.

ASTEROIDES. BASTARD STARWORT.

The Characters are;

It hath a compound radiated Flower, whose Disk is composed of many Florets which are Hermaphrodite, and of Semi-florets which are Female, and rest upon the Embryos, which are all included in a scaly Empalement. These Embryos afterwards become Seed, for the most part oblong.

The Species are;

1. *Asteroides Alpina, foliis folio*, Tourn. Cor. BASTARD STARWORT OF THE ALPS, WITH A WILLOW-LEAF.

2. *Asteroides orientalis, petaloidis folio, flore maximo*, Tourn. Cor. ORIENTAL BASTARD STARWORT, WITH A BUTTER-BUR-LEAF, AND A LARGE FLOWER.

3. *Asteroides Americana minor annua*, Vaill. LESSER AMERICAN BASTARD ANNUAL STARWORT. *Miller's Suppl.*

ASTHENES, ἀσθενής, from α Neg. and σθένος, Strength. Weak, infirm. The Difference between ἀσθενής and ἀδυνάμειος lies in this, that the former signifies one weak by Nature, and prone to Sickness, but the other denotes a Person actually sick. *Hip. Lib. ασελ ἀρχ. ιδλ. ἐνύστατα ὃ τὸ ἀδυνάμειος ἐστὶν ὁ ἀσθενής, ἐστὶ ὃ ἀδυνάμειος ὁ ἀσθενής*. "The weak Person is next to the sick, but the sick Person is the weaker." *Asθενής* is also apply'd to *diadema*, *Lib. 6. Epid. Aph. 16. Sect. 4.* which must mean, according to *Galen*, a weak or low Regimen of Diet, or such as renders a Person weak. By a weak Diet also may be understood such as yields but little Nutriment. So *Lib. 6. Epid. Sect. 5. Aph. 20.* τὰ ἀδυνάμειος ὀρτία are such Food as nourish little; and so *Galen* explains the Place, as on the contrary strong Food is such as contains much Nourishment. In the same Sense must we take ἀδυνάμειος πρὸς τὴν ψυχὴν, *Lib. de Rat. Viā. in Morb. acut.* very weak Pufan, for such as affords but very little Nutriment; or, as *Galen* expounds it, ὃ ἀδυνάμειος αὐτῆς, ἥτοι διότι βραχύνει τὴν ἐν τῷ σώματι δυνάμειον, ἀδυνάμειος ἐστὶν, ἢ διότι ποτὶς αὐτὴν ἔχει σφοδρῶς, ὥς ἥτοι ὅτι νύκτωρ ἢ ἐν γυμνασμίᾳ, καὶ ἀπὸ τοῦ ὅτι τὸ ἐν τῷ σώματι. "By its Weakness we are to understand, either that it affords but slender Nourishment to the Body, or that it possesses no vehement Quality, by which it may offend the Nerves, or subvert the Reason, as Vinegar or Wine."

ASTHMA, see DYSPNOEA.

ASTITES. The same as PARASTATÆ, which see.

ASTOMOS, ἀστος, from α Neg. and σμα, a Mouth. Without a Mouth. This can be apply'd to nothing but Monsters. For the Fable of *Pliny*, which gives an Account of an Indian People who live by Exhalations only, and have no Mouths, is utterly extravagant and puerile.

ASTRABES, ἀστράβης, from α Neg. and στρέβης, distorted, undistorted. *As γένυες ἀστράβητος*, the Jaws undistorted. *Hippocrates de Articulis*.

ASTRAGALOIDES, BASTARD MILK-VETCH.

The Characters are;

It hath a papilionaceous Flower, out of whose Empalement rises the Pointal, which afterwards becomes a Pod, shaped almost like a Boat, and full of Kidney-shaped Seeds.

We have but one Sort of this Plant, which is;

Astragaloides Lusitana, *Inst. R. H.* PORTUGAL BASTARD MILK-VETCH. *Miller's Dist. Vol. 2.*

ASTRAGALUS. The Name of a Bone in the Foot, and of a Plant.

According to the natural Situation of the Foot, and its Connexion with the Leg, the *Astragalus* is the superior and first Bone of it. This Bone may be divided into two Portions, one large and posterior, which is, as it were, the Body of the Bone; and one small and anterior, which is an Apophysis, or the anterior Portion.

The Body or posterior Portion has four Sides, one superior, two lateral, and one inferior. The upper Side is the largest, cover'd all over with a Cartilage cylindrically convex from below backward, with a Depression running thro' the Middle of its Breadth, which represents half a Pulley, and is continuous with the two lateral cartilaginous Sides, of which the external is broader than the other. This upper Side is articulated with the lower Side of the Basis of the Tibia, the internal lateral Side with the inner Ankle, and the external lateral Side with

the outer Ankle. Below the internal lateral Side there is a great Depression without Cartilage, and several other Inequalities.

The lower Side is likewise cartilaginous and obliquely concave for its Articulation with the Os Calcis. At the very lowest and posterior Part of the Body of the *Astragalus*, on the Edge of the lower Side, is a small, oblique, smooth Notch or Chancel for the Passage of Tendons.

The Apophysis or anterior Part of the *Astragalus* is distinguished from the Body by a small Depression on the upper Part, and on the lower, by a long, oblique, unequal Notch, very broad toward the Outside. The anterior Side of this Apophysis is all cartilaginous, and obliquely convex, for its Articulation with the Os Scaphoides. The lower Side, likewise cartilaginous, is parted in two, and articulated with the Os Calcis; being distinguished from the lower Side of the Body of the Bone by the long oblique Notch already mentioned. Besides these two cartilaginous Sides, there is a third below the anterior, towards the inner Part, which in the Skeleton touches nothing. *Winflow's Anatomy*.

ASTRAGALUS. The Plant called by this Name is thus distinguished:

Astragalus, *Offic. Astragalus Dioscoridis quibusdam*, J. B. 2. 341. Chab. 153. *Astragalus Dioscoridis, vulgò Christianæ radix*, *Rauwolf*. *An Astragalus Syriacus*, J. B. 2. 140. Ger. 1058. Emac. 1238. Park. Theat. 1085. *Astragalus Syriacus bifurcus*, C. B. Pin. 351. *Astragalus Syriacus, Onobrychis peregrina quibusdam*, Chab. 151. *Astragalus argenteus*, Wheel. Itin. THE SILK VETCH OF DIOSCORIDES.

The *Astragalus* is a small trailing Shrub, with Leaves and Branches like those of Chiches, and small purple Flowers. The Root is round, and of a good Size like a Radish, with solid, black, [*Pliny* says red] and very hard Appendices, which are entangled within one another like Horns, and of an astringent Taste. It grows in windy and shady Places, [in rocky and sunny Places, *Pliny*] and where much Snow falls. There is great Plenty of it at *Memphis* [*Pheneum*, according to *Pliny*, *Galen*, and *Oribasius*] in *Arcadia*.

The Root drank in Wine stops a Looseness, and provokes Urine; dry'd to a Powder, it is with good Effect sprinkled on old Ulcers, and stops Bleeding; but it is difficult to cut on account of its Solidity. *Dioscorides, Lib. 4. Cap. 62.*

Its Root is sweetish, astringent, and gives a deep Tincture of Red to the blue Paper; the Leaves give it hardly any; they are bitter, and smell like Elder, which shews that the fetid Oil is found in greater Quantity in the Leaves, and that it involves the acrid Salt and Earth. This Plant is not in Use; Nevertheless, a Night's Infusion of it in Wine is given with Success for Retention of Urine, and for the Gravel by some Herbarists at *Paris*. *Martyn's Tournesfort*.

Dale observes, that the Description of the *Astragalus* in *Dioscorides* is so short and imperfect, that to this very Day it remains doubtful to what Plant it belongs, some ascribing it to one, some to another. But whatever others may think, says he, I chuse to refer it with *Rauwolf* to the above-mentioned.

ASTRANTIA. A Name for Masterwort. See IMPERATORIA.

But there is another Plant also called *Astrantia*, which is thus distinguished by Authors.

Astrantia nigra, *Offic. Ger. 828. Raii Hist. 1. 475. Astrantia*, *Rivin. Irr. Pent. Buxb. 33. Astrantia major*, *Mor. Umb. 7. Elem. Bot. 263. Rupp. Flor. Jen. 226. Astrantia nigra major*, *Hist. Oxon. 3. 279. Astrantia major, corona floris purpurascens*, *Tourn. Inst. 314. Boerh. Ind. A. 73. Astrantia nigra seu Veratrum nigrum Dioscoridis*, *Ger. Emac. 978. Helleborus niger, Sanicula folio, major*, C. B. Pin. 186. Park. Theat. 213. *Sanicula femina quibusdam, aliis Helleborus niger*, J. B. 3. 638. Chomel. 567. BLACK MASTERWORT.

This Plant is cultivated in the Gardens of Botanists, and flowers in July. Its black and fibrous Roots are only used. It is said to purge melancholic Humours; and *Dodonæus* thinks that it resembles the *Veratrum nigrum* of *Dioscorides*, both in its Form and Qualities. *Hildanus* prescribes it for the Cure of a scirrhus Spleen. *Dale*.

ASTRAPE, ἀστραπή, Lightning. It is reckon'd by *Galen* amongst the Procatartetic Causes of an Epilepsy. *Castel*.

ASTRICTA. An Epithet very frequently apply'd to *Alvus*, the Belly: It implies Costiveness, and is oppos'd to *Soluta*, loose.

ASTRICTORIA. The same as ASTRINGENTIA.

ASTRINGENTIA. Astringents.

I shall here principally consider Astringent Remedies taken by the Mouth; for Astringent Topics come more properly under the Article *Styptica*.

Astringents are very proper to restore a Tone and Elasticity to the animal Fibres, when debilitated by Diseases, Intemperance, or Accident. But these are very seldom proper without a previous Attenuation of the Juices, and a Course of

Deobstruent Medicines; because Obstructions are more firmly riveted, and the viscid Juices circulate with more Difficulty, when the Diameters of the Vessels are contracted by Astringents.

Among the several Classes of corroborative Medicines, that of *Astringents* is none of the least considerable and important. The several Substances which come under this Denomination are also by the *Latins* styl'd *Vulnerary*, and by the *Greeks* *Traumatic Medicines*. Their Virtues in general consist in a certain fix'd and gently constrictive Principle, by means of which they brace up the Parts and Fibres that are too much relaxed, corroborate those which are weakened, and consolidate and agglutinate such as are corroded and wounded. The principal Medicines belonging to this Class are; the Roots of Avena, Tormentil, Bistort, the greater Consound, Cinquefoil, Plantain, and Rhapontic. The *Herbs* Periwinkle, Sanicle, Wintersgreen, the greater Consound, Bugle, Saracens Consound, Gooseberries, Agrimony, St. John's Wort, with its Flowers; Yarrow with its Tops, Horse-tail, Paul's Betony, Strawberries, Vervain, Moufe-ear, Tree Germander, all sorts of Plantain, Oak-leaves, Jerusalem Oak, Baum; Mint, Betony, and Lamium, or the Dead Nettle; the *Flowers* of Roses and Balauftines; the *Peruvian Bark*, that of Pomgranates; and of the Root of the *Egyptian Thorn*; the *Juice* of the *Egyptian Thorn*, Japan Earth, Dragon's-blood, Hurtle-berries, and Quinces; of *Spices*, the Nutmeg; of *Mineral Substances*, the Bloodstone, Alum, and all Species of Earths and Marles; of *Chymical Preparations*, the Chalybeate Flowers of Sal Ammoniac, and the Chalybeate Liquor prepar'd from the *Caput Mortuum* of the Chalybeate Flowers of that Salt; of *Officinal Preparations*, the Traumatic Essence of *Wedelius*.

The several Substances now mention'd operate by means of a considerably fix'd terrestrial Principle, in Conjunction with an Acid: And as, by constricting the too much relax'd Fibres, they free them from a Congestion and Stagnation of Humours; so, by bringing them into a nearer Contact with each other, they promote their Consolidation and Coalescence. But this constrictive Virtue is not equally strong and powerful in all the Substances we have mention'd; for in the Tormentil-root, in the Bistort-root, and its Extract, in the Balauftine-flowers, the Pomgranate-bark, the Oak-leaves, the Alum, the Chalybeate Liquor, the Juice and Bark of the *Egyptian Thorn*, the Quinces, and dry'd Hurtle-berries, this astringent Quality is much stronger than in what we commonly call the vulnerary Herbs, which consisting of a subtile, earthy, and alkaline Principle, intermix'd with Particles of a sulphureous, balsamic, and somewhat fix'd Nature, operate more safely and mildly, and are of singular Use and Advantage in the Practice of Physic. But that these *Vulneraries*, as well as the stronger and more powerful Astringents, contain a Principle of a subtile, dissolvable, and earthy Nature, is plain from this, that rich Infusions of them, upon the Admixture of Vitriol of Mars, or even of any Chalybeate Liquor whatever, become black, and assume an inky Colour, just as they would do by the Addition of Galls.

If Skill and uncommon Caution are requisite in the Use of any Medicines whatever, they are certainly so in the Administration of *Astringents*; for since not only the Soundness of the Body in general, and of its several Parts, but also Life itself, is maintain'd and preserv'd by the perpetual, progressive, and circulatory Motion of sufficiently attenuated and fluid Humours thro' the Compages of the Body, which is almost quite vascular, and composed of inconceivably minute and slender Ducts; and since, at the same time, such are the Natures and Properties of *Astringents* as to inspissate our Fluids, when mix'd with them, and brace up the Pores and Ducts of our Solids; 'tis therefore obvious to every one, that Remedies of this Class must be unfriendly to the very Natures, and vital Motions, of animal Bodies; for which Reason they are not so safe and secure as some may imagine, unless when used with the utmost Care and Circumspection: For daily Experience convinces us, that Medicines of an astringent Quality, rashly and unskilfully apply'd for stopping Hæmorrhages or Fluxes, produce numberless fatal Consequences, and generally bring on slow Fevers, Cachexies, cedematous Swellings, spasmodic Disorders, Colics, and hypochondriacal Indispositions: For this very Reason, we are carefully to guard against the imprudent and immoderate Use of the *Peruvian Bark*; for carrying off the Paroxysms of intermittent Fevers; since by its violent Astringency the viscid, bilious, and salival *Sordes*, lodged in the *Primæ Viæ*, and which ought to be discharged, are so much the longer shut up and retain'd, by which means a still more formidable Disorder is sometimes brought on.

If Necessity should, at any time, call for the Use of Astringents of this Nature, they are not to be administer'd all at once, but successively in gentle Doses, and in Conjunction with a sufficient Quantity of some proper Liquid; prescribing at the same time a due Degree of Exercise for the Patient, which I always do, when I either order the *Peruvian Bark*, or any Medicines whatever of the Chalybeate Kind.

'Tis highly unsafe and dangerous to repress excessive Vomit-

ings, Discharges of bloody Urine, Hæmorrhages of the Nose, Uterus, or Anus, and Spittings of Blood, by means of Astringents; since the Patients are always sure to suffer by such a Practice, unless the Spasms, on which these Discharges of Blood for the most part depend, as much as Effects do upon their immediate Causes, are first sooth'd, the violent and impetuous Motions of the Fluids check'd, and the exorbitant and preternatural Affluence of Humours derived to other Parts.

The Traumatic or Vulnerary Herbs, and Decoctions of them, are of very singular and uncommon Service, not only in Wounds, Erosions, and Solutions of Continuity, but also in some Diseases of a chronical and violent Nature; such as a Phthisis, Scurvy, Cachexy, and Disorders arising from the Stone, when these Indispositions draw their Origins from the Tone of the Viscera and Glands being weaken'd, or from a preternatural Stagnation of the Juices. But we ought, at all times, carefully to avoid using them in Cases where there is too great an Obstruction of the Vessels, a Constriction of the Fibres, or in a Phthisis, when the Lungs are full of hard Tumors and Tubercles. However, in other Cases, Infusions of vulnerary and gently astringent Medicines, are of singular Service, and produce excellent Effects; especially in preventing fabulous and stony Concretions in the Kidneys, which, for the most part, arise from these Organs being too much relax'd or ulcerated. Upon this Subject I would recommend *Hencherus's Dissertation, concerning the Use of Astringents in the Stone*. This Intention is also very well answer'd by Infusions of Yarrow and its Tops, of Paul's Betony, Ground-ivy, Strawberries, Agrimony, and the Bark of the *Egyptian Thorn*-root. In involuntary Discharges of the Urine, arising from too great a Relaxation of the Sphincter Muscle of the Bladder, whether in Children or in Adults, I have found Infusions of this Nature produce very happy Effects; applying externally, at the same time, rectify'd Spirits of Wine.

In Cases where the external Parts are hurt or wounded, well rectify'd Spirit of Wine proves, by itself, a noble and efficacious Vulnerary; since it puts a speedy Stop to Defluxions of the Blood and Humours, and is of singular Service where the more sensible nervous and tendinous Parts have suffer'd by too great an Effusion of Blood; for spirituous Liquors not only coagulate the Juices of the human Body, as we find by making the Experiment upon Blood and Lymph, but also, by removing the superfluous Humidity, render the Fibres tense and rigid, and, by bracing them more strongly up, prevent Stagnations of the Blood, and carry off Pains and Inflammations. Nor is the spirituous Water, call'd *L' Eau d'Arquebuse*, or *Aqua Sclopetaria*, used in our own Days, a despicable Vulnerary, since 'tis prepar'd, by Distillation in *Balneo Mariæ*, from some of the best vulnerary Herbs, and *Rhenish Wine*: But its Virtues and Efficacy are to be ascrib'd to the Spirit and the Wine, rather than to the Herbs, whose Virtues are lodged in a fix'd earthy Principle, which does not come over the Helm of the Still. *Hoffman. Lemery directs the Aqua Sclopetaria to be made with White Wine. See AQUA.*

The Simples commonly term'd *Astringents*, principally abound with rough, earthy, or saline Particles, and are of a heavy compact Texture, which, at first View, forbids them to be meddled with by Distillation. In Tincture likewise, with a spirituous Menstruum, they are very unsuitable; because their superior Gravities and Bulks will not suffer them to unite with, and be suspended in, such Liquors.

In Decoction, indeed, many *Astringents* may be retain'd with Efficacy, especially those of a saline and styptic Nature, as Alum, Galls, and Oak-bark; but few others can be thus order'd to Advantage, because they are too heavy for Suspension in an aqueous Fluid.

There is somewhat, 'tis true, peculiar in the *Peruvian Bark*, that fits it for this Management, beyond any other Simple of the same Class: Its Particles are so very fine and light, when broken in the Mortar, that a great deal would be lost, were it not for a Mixture of somewhat moist and oily to keep it from flying away, which is commonly practis'd with Almonds, or somewhat of a like Nature; but this is certainly prejudicial to the medicinal Intention of this Drug. But in Decoction, with an aqueous Vehicle, this finer Part is not only saved, but likewise all that is most subtile therein is suspended in the Liquor, the grosser Parts only falling to the Bottom, as is very manifest from the Thickness of such Decoctions. So that, in ordering of this by Decoction, there is only obtain'd the finest of its Substance, which cannot be procur'd any other way; a thing very different from what is commonly expected by this Process; for here the Ingredient is in some measure dissolved, and intimately united with the Liquor. Doubtless, in the Management of this Drug by Decoction, somewhat more is obtain'd than can be got by simple Tincture, especially where such Ingredients are added, that, by boiling, give a thicker Consistence to the Water; because then a much greater Quantity of the Bark will remain suspended therein. Thus, some order a small Portion of Storax or Benjamin to be boil'd herewith, which not only enables the Liquor to hold up more of the Bark, but

but gives also thereunto such a Warmth and Scent, as is very grateful to a Stomach weaken'd and pall'd by a Fever and Medicines.

The usual Distrust therefore of the Bark, in this Form, is ill-grounded, because it depends upon a Supposition, that it is not this way given in Substance; whereas it is not only thus given in Substance, but also with greater Advantages than can by any other means be come at. For when it is given in the finest Powder that can possibly be obtain'd from the Mortar and Sieve, it is yet too coarse for a weaken'd Constitution, and therefore frequently, by its Stimulus, brings on a Diarrhoea; whereas this way it is too fine to give any such Disturbance in the first Passages, and not only strains, by the common Course of Circulation, much farther, but gives a more uniform and general Contraction to the debilitated and relax'd Fibres. Those who try it this way also, seldom find so many Relapses as are customary, after some Days, with the coarser Powder.

A very considerable Addition may be made to the medicinal Virtues of most of this Class in Decoction, by a Mixture of Acids, because they greatly improve any astringent of styptic Quality; and whosoever tries this, with the Bark in particular, will experience its Success in most Intentions for which it is ever used, but especially in that of a Styptic in Hæmorrhages; in which Case also an Addition of red Roses, at the latter End of the Decoction, is not only of Service, but also helps agreeably to disguise the Medicine.

One Caution ought by no means to be here omitted, concerning this Form, with the Simples of this Class. It is a very common way, in the Shops, to clarify their Decoctions with the White of an Egg, to render them more beautiful to the Eye; but where their Virtues are expected from any thing glutinous, gross, or earthy, such Procedure quite destroys the Intention, because those Parts are entangled with the Egg, and rise up with it in the Scum; and for this Reason it is, that almost all Syrups made from Decoctions are good for nothing, because in their Clarifications they are robb'd of their Virtues.

There are, indeed, some Official Syrups from Materials of this Division, as the Syrup of Mint, that of Myrtles, and some few others; but the Neglect they are under in common Practice, shews what Service is to be had from them: They may, perhaps, serve as weak Auxiliaries, to things of more Efficacy, in sweetening them, or reducing them into some convenient Forms, as Boles, Electuaries, or the like; but no further are they to be trusted.

In extemporaneous Electuaries likewise, things of this Texture are very suitable, and some, which require but small Quantities for a Dose, come well enough in Pills; but they are contrived into Official Electuaries with great Disadvantage, because of their long Continuance in a moist Form; and more especially with Honey or Syrups, which are much inclin'd to ferment; and this subjects them to such Changes as quite destroy their medicinal Virtues; for that Hardness or Rigidity, wherein their Astringency consists, softens, and, as it were, rots, with continual Moisture. Thus the Confection of *Præcæstorius*, which is a Composition wholly selected out of this Class, grows extremely bad by Age, and will in time change from a warm, rough Astringency, into an almost tasteless, soft, slippery Mixture. This Alteration, indeed, is much hasten'd by the *Cassa Ligneæ*, and *Gum Arabicæ*. For this Reason many Shops preserve the Species for this Electuary dry; as also those for the Confection of Hyacinth, tho' the College have now thought fit to reject the latter Composition. All the Simples, therefore, of this Denomination, are with the greatest Advantage kept in dry Powders, for extemporaneous Occasions. *Quincy's Prælect. Pharmacæut.*

ASTRION, ἀστρον. The same as **ASTRAGALUS**.

ASTROBLES, ἀστροβλή, or ἀστροβλήτης, from ἀστρον, a Star, and βάλλω, to strike. Planet-struck, blasted. This is properly spoken of Plants; but is sometimes apply'd to human Bodies, and then signifies *Apoplectic*, and sometimes *Sphacelated*. Hence,

ASTROBOLISMOS, ἀστροβολισμός, Sideration, or Blasting of Trees. But this is also sometimes apply'd to the Body, as in Sphacelations and Apoplexies.

ASTROCYNOLÓGIA, from ἀστρον, a Star, κύων, a Dog, and λόγος, a Dissertation, or Treatise. The Name of a Treatise written on the Subject of the Dog-days.

ASTROITES, seu *stellaris lapis*, Offic. Cod. Med. 16. *Astroites primus*, Boet. 298. *Astroites quartus*, Plot. Hist. Nat. Ox. p. 88. Tab. 2. Fig. 7. Lithog. Brit. N^o. 163. Charlt. Foss. 28. Worm. 67. Schw. 366. Mer. Pin. 211. *Stellaris lapis*, De Laet. 97. Aldrov. Mus. Metall. 872. *Stellaris lapis primus*, Gesn. de Lap. 35. **STAR-STONE**.

This Stone is porous, moderately hard, and white, and as big sometimes as a Man's Head. It is found in some Quarries in England and Germany. It is esteem'd antipeffilential, and is said to destroy Worms in Children.

ASTROLOGIA, from ἀστρον, a Star, and λόγος, a Word. Astrology. See **ASTRONOMIA**.

ASTRONOMIA, from ἀστρον, a Star, and νόμος, Law; Astronomy.

No Part of natural Knowledge has more employ'd the Thoughts of the Learned, than the Influence of the Stars upon human Bodies; and, indeed, no one, who has but a moderate Acquaintance with polite Learning, can be ignorant of the Disputes and Controversies started on this Subject by the Physicians and Philosophers of our own Age. Some deny and explode an Influx of the Stars altogether; but at the same time admit and patronize the Influence and Efficacy of the Sun upon terrestrial Bodies. They who embrace this Opinion, assert, that the Planets and fix'd Stars are removed at such an immense Distance from our Globe, that the very Light they diffuse can have no Influence upon it, much less that they themselves can produce any Effects upon such Bodies as are contain'd in it. The Sun, on the other hand, is, according to them, the only Body whose benign Influence extends to our Earth, and whose kindly Warmth rears up the vast Variety of Plants, and cherishes the several Species of Animals, with which it abounds; for they will by no means allow, that the Planets produce any sensible or manifest Effects upon any Parts of this our Habitation. But tho' I absolutely deny, that the Fates, the Morals, and the Fortunes of Men depend upon the Stars alone, I nevertheless affirm, that these have a very surprising and remarkable Influence upon the several Bodies on our Earth. This Opinion has been embraced by many of the Moderns, but more especially by the *Literati* of England, whose Industry, in clearing up this Point, deserves to be crown'd with all the Encomiums that are due to profound Learning, and a disinterested Love of Truth; for these Gentlemen have, with a great deal of Judgment, maintain'd the Influence of the Stars, not only with regard to the Phenomena of *Meteors*, but also with regard to the human Body, consider'd as subject to Diseases and Disorders. Nor, indeed, could this Doctrine be unknown to the Antients, who ascrib'd a great deal to the Stars, and even carried the Point so far, as to deduce the immediate Causes of the several Accidents and Revolutions of Life from them. In short, they were so prepossess'd in Favour of this Notion, that they accounted for Health and Diseases, the Tempers and Dispositions of Men, and, which is still more, the Fates of Kingdoms, and the Origins of Wars, from the Influences of the heavenly Bodies. As this is the Case, it must be a Task no less curious and pleasant, than useful and profitable, to inquire, whether there really is such an Influx of the Stars upon terrestrial Bodies, how far it extends, and what Notions Truth and Fact will authorize us to entertain concerning it; and this is what I at present design.

Astronomy, then, or a Knowledge of the Stars, has all along, even from the earliest Ages, been highly esteem'd, and had in the greatest Honour. It is at first said to have been invented by the *Egyptians*, and by them transmitted to other Nations, where it met with a favourable Reception, and many zealous Votaries. And, indeed, the Reasons are plain why the earlier Ages paid such an uncommon Veneration to this Science, since they were sufficiently apprised of the numberless Advantages which accrue to Mankind from the Stars and heavenly Bodies: For Astronomy acquaints us with the various, but still regular, Courses of different Stars, and discovers their Positions, Motions, and Conjunctions; which are not only glaring Instances of the amazing Grandeur and Extent of the universal System, but also irrefragable Proofs of the Skill and Wisdom of its adorable Author. Besides, all sublunary Bodies partake of the benign Influence of the Stars, which by their genial Rays diffuse a certain Life and Vigour to them. By observing the Stars we are enabled to discover the Situations of different Seas and Countries, to ascertain the Distances of Places, and measure out Time into the several Divisions of Years, Months, and Days. By means of the heavenly Bodies timorous Mortals were taught to despise the Fury of the Waves; and the daring *Phœnicians*, trusting to their Skill in *Astronomy*, first ventur'd to sail upon the Main, and trust their Lives to Ships, render'd less dangerous by their Knowledge of this Science. By this we are also enabled not only to account for, but also to foretel and calculate the several Eclipses of the Sun and Moon, with the greatest Exactness and Precision. 'Tis not therefore to be doubted, but the different Situations and Positions of the Stars vary the State of the Weather, and the Seasons of the Year, and consequently induce various Changes both upon Vegetables and Animals. For this very Reason, 'tis necessary every Physician should be acquainted with *Astronomy*, that he may be enabled to account for epidemical Distempers: But let it be remember'd, that, when I require *Astronomy* in a Physician, I do not mean that Mock-science below all Regard, which, with a great deal of *superstitious Solemnity*, and no Truth at all, predicts the Fortunes, the Distempers, and the Deaths of People, by drawing what we call their *Horoscope*, or inquiring into the Positions and Aspects of the Stars at the Hour of their Nativity. Those trifling Mortals, who apply their Minds to this diminutive Study, lose their Labour in an egregious manner; since they cultivate and adore a Science, (pardon the Name)

Name) which has neither *speculative Truth*, nor *Use in human Life*, to recommend it. They might indeed, with my Leave, reverence it as highly as they would, provided the Dignity of genuine and real *Astronomy* was not brought into Disgrace by their Folly and Impertinence: But I find myself animated with a just Indignation, when I reflect, that this *predicting Art* has, in some measure, deprived *Astronomy* of that Esteem and Veneration which were once so justly paid it. I frankly own, that the Stars, considered as remote Causes, may contribute somewhat even in Things of this Nature; but I can never, at the same time, admit, that any such Occurrences can possibly be predicted from them alone: For this Reason many of the Antients not only mentioned this Practice as an Abuse, but severely censured it as such. Of these the most noted is *Albertus*, who, considering the Time in which he liv'd; is deservedly esteemed a great Man. This Author, in his Book *de Mineral. Tract. 3. C. 3.* has these Words, "Many," says he, "who pretend to foretel Things from the Stars, are often found to be wrong in their Predictions; and by their Lyes bring *Astronomy*, which is a valuable and useful Science, into Contempt and Disgrace." *Averrhoes* is of the same Opinion; for in the *Cantica Avicennae* he uses these Words: "The Art of Astrology is ill founded, and its Principles are for the most part false." *Apollonius* also is, by *Philostratus*, represented as giving his Suffrage in our Favour. "As for my Share," says he, "I think the Power of predicting Events from the Stars, and the Art of Divination in general, are Things placed beyond the Reach of the human Faculties; neither do I know, that any Mortal is a real Master of them." No less intolerable is the Insolence of those who distinguish Days into *lucky* and *unlucky*; and with that View compose annual Calendars. These infallible Prophets, with a happy Clause of Reservation, which bears, *If God please*, pronounce like so many Oracles, that such and such Days shall be lucky, and such and such others the Reverse; and what crowns the Farce is, that their Knowledge and Skill in this way extend to the most ridiculous and inconsiderable things in Life; for, in the Books of this worthy Class of Mortals, you may be informed which Days are most lucky for putting on a new Suit of Cloaths; and which most proper for counting your Money. From these Magazines you may learn, which Days you ought to choose for selling, and which for making Purchases. These Treasures of useful Knowledge will also direct you to the very Day on which you ought to cut your Hair, or shave your Beard. Here their matchless Impudence does not stop, but boldly incroaches on the sacred Province of Physic, by fixing some Days as particularly proper for Venesection, Purging, and the Exhibition of other Medicines. *Langius*, who was Master at once of the Simplicity and Learning of the Antients, in *Ep. 35. p. 1.* on this Occasion falls into this rapturous Exclamation, *O Flagris dignum Facinus, quo innumeros perdunt agros!* "O blackest of Crimes, and worthy of the severest Chastisement, since by it Numbers of Patients are destroyed!"

But tho' we reject the superstitious Fables of Astrologers, as impertinent and idle, yet we must beware of running into the opposite Extreme, and utterly denying all Influence and Efficacy of the Stars. If we should, our Conduct would be highly impious, and throw a manifest Reflection upon the Wisdom and Skill of that Being who formed the vast and harmonious Frame of Nature; for we cannot possibly suppose, that the spacious Canopy of Heaven was thus bespangled with radiant Orbs, and adorned with twinkling Stars, for no other End than to direct our Steps by their Light, feast our Eyes by their Splendor, or gratify the noble Excursions of our Fancies by the Immensity of their Number. We ought rather to conclude, that the adorable Author of Nature designed them for dispensing Blessings of a higher and more important Nature to the human Species. The surprising Number, the vast Bulk, and the regular Motions, of the heavenly Bodies, struck the Antients with such an awful Veneration for them, that they paid them a divine Homage, erected Altars for their Worship, and in short neglected no Circumstance by which they could testify an unfeigned, but impious and ill-founded Regard for the Stars. They were well apprised of the Efficacy of these Bodies, and thoroughly convinced, that they imparted Life and Vigour almost to every sublunary Object. For this Reason 'tis the less to be wondered, that the ancient Physicians consulted the Stars so much in the Cure of Diseases, and rely'd so firmly on the Observations they made from them. But though their Diligence in this respect calls for due Encomiums at our Hands, yet their Fate is to be lamented; because their want of due Experience, and proper Observations, left them in the Dark, as to the real Manner in which the Stars operate on terrestrial Bodies. The Nature and Extent of this Influx or Operation is what I now intend to handle, and that in such a manner, as to separate Truth from Falshood, and distinguish between what is useful, and what is trifling. For this Purpose it seems necessary, that I not only confirm my Opinion by the Authorities of the

Learned, but also give it the more noble and weighty Sanction of Reason and Argument.

'Tis therefore my Opinion, that not only the Sun and Moon, but also the other Stars, the Planets more especially, operate upon terrestrial Bodies; and that immediately by the Æther and Atmosphere, these, being influenced and changed by the Stars, must of Consequence induce various Changes and Alterations, not only on vegetable, but also on animal Bodies. Thus 'tis past all Dispute, as I shall afterwards endeavour to shew, that the Stars are capable of exciting various Storms, Winds, and Commotions in the Atmosphere; from which Circumstance we may easily conceive the Possibility of their inducing Alterations, and exciting Commotions, in our Bodies. Hence any one, who allows himself to think, must plainly see, that Astronomy is not only an Ornament, but also a real and genuine Advantage, to a Physician.

I shall now collect the most noted Passages of the divine *Hippocrates*, which have a Tendency either to illustrate the Truth, or prove the Importance, of this Doctrine. The first of these is that elegant Passage in his Book *de Aere, Locis, et Aquis*: "If," says he, "any one diligently observes the Changes of the Seasons, and the Manner in which the Risings and Settings of the Stars happen, he will by this means be qualified to foresee the State of the Weather throughout the Year." And in another Treatise he affirms, in as many Words, "That no one ought to commit the Care of his Health to him who is ignorant of Astronomy, because such a one cannot be a well-qualified Physician." And again, in his Book *de Aere, Loc. & Aquis*, "Tis," says he, "absolutely necessary we should consider the Risings of the Stars, especially of the Dog-star, Arcturus, and the Pleiades, since, at these very Seasons, Diseases are most skilfully prognosticated; and those which will prove mortal, best distinguished from those milder ones, which will either entirely quit the Patient, or pass into Disorders of some other Form and Nature." On the Whole, *Anatomy* is the Right Eye of Medicine, and a Knowledge of the Stars its Left. And the Physician who is ignorant of Astronomy, says *Albo Hazen Halii Filius Avenragel*, "is like a blind Man, who, groping for his Way without a Staff, stumbles hither and thither at random; or like an infatuated and irresolute Fool, who is guided in his Conduct by false and delusive Appearances of Good and Evil."

That the heavenly Bodies operate on our Atmosphere, is also asserted by the divine *Hippocrates* in that memorable Passage of his Book *de Flatibus*, where he uses these Words: "All the intermediate Space between the Heavens and our Earth is filled with Spirit; and indeed the Efficacy and Virtues of the Sun, Moon, and Stars, are imparted to us by means of this Spirit." By the Spirit, or *πνεῦμα*, in this Passage, he without Doubt understands the Winds, the Æther, and the Atmosphere. But *Galen, Lib. 2. Prorrheticor.* beautifully demonstrates the Influx of the Stars upon terrestrial Bodies in these Words: "If," says he, "the mutual Aspects of the Stars had no Influence on things below; and if the Sun alone, that glorious Source of Light and Life, should only be allowed to act upon our Earth, then the four Seasons of the Year would invariably preserve the same Appearances and Temperature, since the Sun performs the same Course in one Year that he does in another. But the Seasons of the Year are not, in Consequence of this, invariably of the same Nature and Temperature. The Stars must therefore concur in producing their different Qualities in different Years." But I shall now have recourse to the Suggestions of Experience, and from them deduce the Power and Efficacy of the Stars in raising Storms, exciting Tempests, and modulating the State of the Weather in general. And here 'tis particularly to be remembered, that we are not so much to regard the several Aspects of the Moon with respect to the Planets, as the mutual Aspects of the Planets with regard to each other; though the Moon is not at the same time to be entirely overlook'd and disregarded in this Affair. *Cook and Goad*, two celebrated *English* Philosophers, have very judiciously made the same Observation; and indeed repeated Experience has confirmed me in the full Persuasion of it.

When *Saturn* has an Aspect to any Planet, except the Sun, whether he is in Conjunction with that Planet, or in Opposition to it; whether his Aspect with regard to it be sextile, trine, or quartile, he compresses the Air, and excites cold Winds, which for the most part blow from the North. Hence in the Winter Season he produces keen and intense Frosts, and renders the Nights serene and clear; and in the Spring Season, especially in the Month of *May*, such Aspects usher in a sudden and unexpected Cold, which proves hurtful to Plants, especially those of the exotic Kind, or such as are not the natural Produce of our own Soil; when, on the other hand, *Saturn* is in Conjunction with *Venus*, we may expect cold Rains, accompanied with Westerly and Northerly Winds.

Jupiter concurring in any of the forementioned Aspects with another Planet, is generally observed to excite Winds, especially

in the Spring and Autumn; and it rarely happens, that loud and boisterous Winds blow, but *Jupiter* has at that very Season an Aspect to some of the rest of the Planets, which favours the Production thereof. Among the Rain-producing Planets, *Venus* is the principal, especially when she is in Conjunction with *Mercury*, *Saturn*, or *Jupiter*. The principal Planets which exhilarate the Face of Nature with serene Weather, and convey a genial Warmth to our Atmosphere, are the *Sun* and *Mars*, especially in the Summer Season, and when they happen to be in Conjunction with each other. They also produce the same Effect, though in a milder Degree, when they are in Conjunction with *Jupiter* and *Mercury*.

Mercury produces such inconstant Weather, that by his Influence Showers, serene Weather, and cloudy lowering Skies, mutually succeed each other, frequently in one and the same Day. He excites Winds when in Conjunction with *Jupiter*, and Rains when joined to *Venus*. 'Tis also to be observed, that the Operations of these Planets vary very widely, according to the different Situation of the Sun, and the various Seasons of the Year: For in the Winter Season *Saturn* excites far more nipping Colds than in the Summer. *Sat* and *Mars* also produce fainter and weaker Heats in the Winter, than in the Summer Season. *Jupiter* and *Mercury* exert their Force and Influence more powerfully in producing Winds in the Spring and Autumn, than in the Summer. But of all the Seasons of the Year, none has the Misfortune to be rendered so disagreeable and pernicious by stormy and inconstant Weather, as the Autumn; for which Reason it is a very dangerous Season, and puts an End to the Lives of many, by the great Variety of too sensible Changes induced on the State of the Air and Weather; since about Noon the Air is hot, and in the Evenings, Nights, and Mornings, very cold.

'Twill not on this Occasion be improper to inquire how far the Moon contributes either to increase or diminish the Force and Influence of the Planets; for 'tis plain, from many accurate Observations, that the Full Moon so surprisingly imparts her Light to the other Planets, as in a remarkable Manner to increase and heighten their Influence and Efficacy. And, what is still more wonderful, her Influence upon them is so considerable, that they sometimes anticipate it two or three Days before the Aspect becomes perfect and complete. Besides, the Power and Influence of the Moon is sufficiently demonstrated by this Circumstance, that under all her Quadratures the State of the Air is not only affected, but undergoes very considerable Changes. For this Reason the Antients, by way of Eminence, styled her the *Mistress of the Weather*, because by her Means they were able to account for the Seasons, and their various Changes. Every one also knows how sensibly the State of the Weather is altered by the various Changes of the Moon; so that, according as the New Moon approaches, the Weather we enjoy'd during the Old is proportionably banish'd, and a different State of Weather gradually comes in. If the Curious desire farther Satisfaction in this Particular, they may consult the learned *Cook's Meteorology*, and *Goad's Meteorological Treatise*. 'Tis past all Dispute, as that excellent Astronomer *Kepler* has observed, that the Aspects of the Planets induce a very sensible Change on Meteors, and are of very considerable Influence in exciting Storms and Tempests; the Degrees and precise Times of which it were to be wish'd we could more accurately predict and determine: But we want a sufficient Number of Observations for that Purpose. How difficult it is to form an infallible Judgment in Matters of this Nature, may be gathered from this, that the preceding Aspects produce very considerable Alterations and Changes in those that follow them. To this may be added the Situation of the Place, the Nature of the Effluvia, and the Climate itself, which, upon an accurate Calculation, will be found to produce Changes no less considerable.

Experience itself, the surest Guide to Truth and Knowledge, evidently demonstrates to us, that the Aspects of the Stars have a surprising Influence, not only on Meteors, but also on our Bodies. This is sufficiently proved by the Vernal Equinox, and the Summer Solstice, about which Seasons the Force and Violence of Intermitting Fevers are either considerably weakened, or totally eradicated and destroyed. And, upon the Approach of the Summer Solstice, obstinate Quartan Fevers, which are generally produced by the Autumn, and are for the most part unconquerable at other Seasons, do of their own Accord remit, and easily yield to the Force and Efficacy of Medicines. It is also confirmed by undeniable Experience, that, about the Vernal and Autumnal Equinoxes, the Humours of our Bodies are in greater Commotions than at other Times. At these Seasons also the Motion of the Blood is more unequal than at others; for which Reason large and frequent Hemorrhages then happen to those who are subject to them. These Seasons are principally hurtful to old Men, who, in Consequence of them, are troubled with hemorrhoidal Discharges, or at least with the Efforts of Nature to throw the Blood off by the Mouths of these Veins. And if these Excretions are not duly carried on, especially in those of tender and delicate Constitutions, various Disorders arising from Spasms, together with Pains in the Abdomen, and

about the Parts destin'd for the Evacuation of Blood, are by that means brought on. These Seasons are no less dangerous to those whose Circulations are languid, and who are advanced in Years, who at these Times have Reason to be afraid of various Stagnations and Infarctions in these Parts. For this Reason they have both Theory and Experience on their Side; who before the Equinoxes carefully recommend and injoin Venesection to People of plethoric Habits, and such as are subject to Effusions of Blood; for by this means the most effectual Method is taken to prevent the Disorder; and the Effusion of Blood, which otherwise seemed ready to make its Appearance, is both quickly and safely warded off. If the Blood discovers a Tendency to discharge itself by the hemorrhoidal Veins, Venesection in the Foot is most proper. If on the other hand it is inclined to come away by the Lungs and Nostrils, a Vein is most advantageously opened in the Arm.

The Equinoxes are particularly prejudicial to Phthical and Hectic Patients, and such as languish under slow Disorders. If at these Seasons chronical Disorders happen, they generally terminate in the Death of the Patient, or in a welcome Recovery; but it rarely happens, that Patients labouring under Diseases of this Nature survive the Equinoxes, but for the most part fall unavoidably Victims to the Force of the Disease with which they struggled.

During the Winter Solstice, Nature is in her weakest State, the Body languishes, and becomes less fit for Secretion and Excretion, than at other Times. For this Reason those who at this Time are seized with acute Disorders, are in imminent Danger, and frequently die. At this Season also the smallest Error committed with regard to Regimen, and the Non-naturals, is attended with fatal Consequences, and often lays too sure a Foundation for Diseases. The learned *Sanctorius*, in his *Treatise de Medicina Statica*, well observes, that, about the Winter Solstice, we perspire a Pound less than at other Times. By which Observation he plainly demonstrates, that at this Season the Perspiration is defective, the Motion of the Blood languid, and the Force of the moving Fibres weakened and impaired. For this very Reason the divine *Hippocrates*, in his *Book de Aere, Locis, & Aquis*, discards the Use of Medicines about any of the Solstices, in these Words: "But we are above all things to have a Regard to the more remarkable Changes of the Seasons, especially the Solstices, on which Occasions we must neither exhibit purging Medicines; *καθαρον*, without urgent Necessity, apply Cauteries, nor make Incisions on the Belly and adjacent Parts, 'till ten Days or more, but never fewer, after the Solstice."

I now come to speak of the Force and Influence of the Sun upon terrestrial Bodies; and indeed of this we have not the least Reason to doubt, since the Point is plainly proved by the different Seasons of the Year, and their several Changes and Alterations. The sensible Changes produced in our Bodies by the different Seasons of Spring, Summer, Autumn, and Winter, are Circumstances too plain and obvious to stand in Need of a long and tedious Proof. Each of these Seasons has Diseases proper and peculiar to itself, as Experience teaches us, and as *Hippocrates* strenuously inculcates in all the Aphorisms of his third Section, but more fully and particularly in the nineteenth, where he uses these Words: "Diseases, indeed, of every Kind, happen at all Seasons; but some Disorders more readily appear at certain particular Times, than at others: Thus Madness, Disorders arising from black Bile, Epilepsies, Effusions of Blood, Quinsies, Heaviness, Hoarseness, Coughs, Leprosies, Tetters, ulcerated Pustules, Tubercles, and Disorders of the Joints, are more frequent in the Spring than in any other Season." And in the succeeding Aphorisms he enumerates the Disorders peculiar to each Season. In the twenty-first he musters up those peculiar to the Summer; in the twenty-second, those which rage in the Autumn; and in the twenty-third, he gives a Catalogue of the several Disorders which harass Mankind in the Winter Season.

'Tis a Circumstance particularly worthy of our Regard, - that more People die in *March*, than in any other Month of the Year, except *October*, whose Influences prove equally fatal; and destroy a no less considerable Number. This is owing to nothing else but the Inequality and Inconstancy of the State of the Air during these Months; for at these Seasons an intense and nipping Cold sometimes prevails; sometimes, soon after, the opposite Extreme of Heat succeeds: Besides, the State of the Atmosphere is on these Occasions highly corrupted, and impregnated with noxious Exhalations, which being too gross and weighty to be carried up, remain near the Surface of our Earth, and produce numberless Disorders and Diseases. Hence the Body, not being able to bear the Intemperature of the Air, is suddenly thrown into various Disorders, and the Tone of the Fibres is miserably weakened; for the Strength and Elasticity of the Fibres bear a direct Proportion to the State of the Air. The Circulation of the Fluids, on the other hand, bears a direct Proportion to the Elasticity and Tone of the Fibres; and, in fine, such as the Circulation is, such will the several Excretions

be. Since then at these Seasons the Secretions are faint and Languid, the Humours must of Consequence become impure, stagnate in different Parts, and produce various Disorders; for either, by stuffing up the Vessels, they dispose some to slow and chronical Disorders, or, by distending them by their too great Quantity in others of more robust and hardy Constitutions, they excite spasmodic Contractions, which usher in Hemorrhages, a Species of Disorder more frequent at these, than at any other Seasons.

The Influence of the Sun, though great in several Instances, is yet most remarkable in this, that Diseases either remit, or resume their Vigour according to its Course. Thus 'tis plain from Fact and Experience, that the Exacerbations of continued Fevers happen about the Rising of the Sun, and that the Paroxysms of Tertian Fevers generally seize the Patient about Noon. The Paroxysms of Quartan Fevers, on the other hand, generally happen in the Afternoon; and Catarrhal Fevers, for the most part, exert their highest Violence towards the Evening. The same holds true in Defluxions, heavy Pains, and Tumors, which generally afflict People most in the Evening.

The Moon also produces very considerable Changes and Alterations in morbid Constitutions. We shall therefore first consider the Effects of her being eclipsed, a Phenomenon of which the Valetudinary and Indisposed are too, too sensible. To this Purpose, *Joan. Matth. Faber, in Append. Dec. 2. Ann. 8vo. p. 49.* relates the following Fact: "A Gentleman, says he, of more than ordinary Distinction, and naturally of a melancholic Habit, became sad, morose and pensive, the Day before the Eclipse; but at the very Time of the Eclipse, he, like a Mad-man, with a Sword in his Hand, ran furiously, not only up and down his own House, but also those of his Neighbours, and the adjoining Streets, not only wounding Men, but also breaking Chairs, Doors, and whatever came in his Way." The illustrious *Ramazzini* has made a very curious and important Observation concerning the Constitution of the Years 1692. and 1693. which is, that after the Full Moon, and much more at the Change, the Petechial Fever, which raged in these Years, became more fierce and violent; whereas it assumed a milder Nature, and a more favourable Set of Symptoms, upon the Approach of the New Moon, but generally killed the Patients upon the Access of an Eclipse.

The Quadratures of the Moon also induce very remarkable Changes and Alterations upon languid and valetudinary Constitutions: Thus Epileptic Fits, in some, return on stated Days and Hours, that is, when the Moon returns to a certain Point of Quadrature, and at the New and Full Moons. And the inspired Penmen themselves [*Matthew, Cap. 4. Ver. 24 and 47.*] styled the Maniacs, and such as were subject to Epileptic Fits, *Σελυιαζόμενοι*, for no other Reason, but because they were in a peculiar manner affected by the Changes of the Moon. A certain Baron of *Limburg* had a young Man for his Servant, who, at every Full Moon, used to thrust his Head out a Window when it shined, and twist his Neck like a Serpent, till, being seized with a kind of Ecstasy, he dropped down, and remained for some time motionless. *Observ. Rumleri 66. ap. Velsch. Curat. & Observat. Cent. I* myself know several, who about the Full Moon are often subject to Head-achs, and Cardialgias, arising from the Stone. That, about or after the Full Moon, many have been seized with Apoplectic Fits, the learned *Wessfer*, in his *Dissertation de Apoplexia, p. 3. & seq.* has sufficiently confirmed by many Instances.

How great the Influence of the Moon upon the Female Sex is, may be plainly deduced from this, that the New and Full Moons carry on and support those Monthly Discharges on which their Health depends; hence this Discharge is, by way of Distinction, styled the *Lunar Tribute*, because the more remarkable Changes of the Full and New Moon rarely happen, without ushering in the Menstrual Evacuations of such Women as are blessed with Health, and Soundness of Constitution.

This Influence of the Moon upon Bodies induced the more superstitious of the Antients to pay it an uncommon Adoration, and foolishly address her for fruitful Seasons in their public Prayers. The *Roman Women* imagined, that it was very serviceable to them in bringing their Children into the World; for this Reason they paid a religious Veneration to *Lucina*, or the Moon, thinking by this means to render her propitious at their Deliveries. The Moon seems to have been invoked by Women in Labour, for this Reason principally, that her peculiar Office consists in dilating the Apertures, and enlarging the Passages of the Body; a Circumstance, as Women well know, of no small Importance in ushering a Child into the World. See *Macrob. Saturnal. Lib. 7. Cap. 16.*

At the Full Moon, scrophulous Tumors, as also those of the Belly, and glandular Parts, become larger than at other times, but subside, and become gradually less, in proportion as the Moon decreases. To this Purpose, the learned *Maurit. Hoffman* [*Dec. 11. An. 6. Observ. 161. Misc. Curios.*] relates the following Story: "A Girl, says he, of fourteen Years of Age, and the Daughter of an Epileptic Mother, had her Belly gra-

"dually swelled as the Moon increased, and as gradually rendered less, and reduced to its natural State, as it decreased. "She was also racked with the most violent and intense Pains, "during the Time her Belly was thus distended." *Aulus Gellius, Noct. Attic. Lib. 20. Cap. 8.* in like manner informs us, that Oysters, and all Shell-fish in general, become gradually large as the Moon increases; and as gradually waste away, and become less, as it decreases, and becomes old. He also informs us, that other Animals are enlarged and diminished, according to the various Changes of the Moon; and *Hippocrates* is of Opinion, that most Women generally conceive about the Full Moon.

R. Bennet, whose Industry cannot be enough admired, has [*in Theatro Tabidorum, p. 98. & 99.*] observed, that during the first Quadratures of the Moon, or when it begins to arch itself into Horns, and more especially on the Nights preceding the New Moon, those Diseases which arise from a saline Matter, are exasperated: For the same Reason, Aches, Itches, and all the various Species of exanthematous Eruptions, do, on these Occasions, exert their highest Rage, to the no small Uneasiness of the Patients; whereas in the last Quadratures of the Moon, and when it is become quite full, Water and Humours are accumulated in the Body, as is plainly proved from those Diseases which arise from a vitiated Serum. For this Reason Coryzas, Lethargies, Asthmas, Palies, Cachexies, and all Diseases arising from a corrupted State of the Lymph, rage more at these Seasons than at others.

Galen [*in Lib. 3. Proorrh.*] has written beautifully on the Influence the Moon has on the human Body; and how much terrestrial Bodies are subject to its Impressions, is too much felt by those who are troubled with Arthritic or Venereal Defluxions; for, according as the Moon bears an Aspect to temperate or intemperate Planets, it accordingly procures Days of Ease and Rest, or the Reverse, to such Patients. Its monthly Motion not only produces sensible Alterations in the human Body, but its diurnal Course has also a manifest Influence upon it. This Fact has been observed by many, but is by none more distinctly talked of, than *Carolus Piso*, in these Words [*Hist. Natural. Lib. 1. p. 24.*]: "The State of the Sick plainly proves, that "Diseases are heightened, and Pains increased, in those six "Hours, during which the Tide flows; and that the Sym- "ptoms are again remitted in the six Hours, during which the "Flood ebbs. This Fact holds in chronical as well as acute "Disorders; but more especially in such as draw their Ori- "gins from Defluxions, and too great a Fulness of the Vessels. "It is also known, that when high Tides, and Swells of the "Sea, happen about the Full Moon, some People are valetu- "dinary; and that most People die during the Ebb of the "Tide." This judicious Author asserts, that these Phæno- mena, in a great measure, depend upon the powerful Influence of the Stars, and the occult Qualities of the Sea and Heavens.

I need not here mention the surprising Influences of the Moon, on the Fruitfulness, Increase, and Decrease of Plants, since the Experience of Botanists and Husbandmen places that Truth in a Light too strong not to be perceived. However, among other Instances concurring to prove this Point, it is observed, that after the New Moon Trees are transplanted with the greatest Prospect of their proving fruitful. Upon this Occasion I must also take Notice of this Difference, that Trees grafted when the Moon is in the Full, bear Fruit sooner than others; but their Fruit is less, and more stony. Those Trees, on the other hand, which are planted about the New Moon, bear later; but make amends for this by the Beauty and Quantity of their Fruit.

All Plants, which are valued for their Flowers, are most properly committed to the Earth, when the Moon is in the Full; those, on the other hand, whose Roots we intend for Service, are most seasonably planted during the Decrease of the Moon. Wood also cut at the Full Moon, rots sooner, and is less proper for building, than that which is cut whilst it decreases. This is confirmed by repeated Experience, and is taken Notice of by *Macrobius* in these Words: [*Saturn. Lib. 7. Cap. ult.*]: "Wood cut either when the Moon is already in the Full, or "when it is increasing, is entirely improper for building, since "it is softened by the too great Quantity of Juice in it; and "Farmers take care to reap when the Moon is on the Decrease, "that by that means their Corn may prove dry." The same Author, in the above-cited Part, affirms, that Flesh carried in the Night-time, whilst the New Moon shines, becomes putrid and rotten, sooner than other Flesh. He there inquires at Length into the Cause of this Phænomenon, and ascribes it to the moist and humid Nature of the Moon.

Without saying any thing more on the Influences of the Moon, I now proceed to consider those Powers and Virtues which both antient and modern Astronomers have observed the other Planets to have upon the human Body, especially when in a weak and sickly State. And first, *Mars* and *Saturn* are thought to produce none of the most benign Effects; for when either in Conjunction with each other, or with any of the rest of the Planets, they have in all Ages been believed to produce various

various Diseases, and Commotions of the Blood and Humours. *Jupiter* and *Venus*, on the other hand, are thought to be more benign Planets; and many Authors have affirm'd, that during their Conjunction the Body acquires new Strength, and Diseases are brought to terminate happily. *Mercury*, again, has always been thought a Planet of an indifferent Nature, and to assume the Qualities of the Planet with which he happens to be in Conjunction. That this Planet is principally instrumental in promoting the Diseases which arise from Serum, has with very good Reason been believed.

But more particularly, they believed certain Conjunctions to be either benign or malignant; thus they rightly enough imagined, that the mutual Aspect of *Sol* and *Jupiter* was subservient to the Cure of chronical Diseases, such as the Hypochondriac Disorder and Scurvy. Besides, under this Aspect they recommended Venesection, the Use of Purgatives, and other Medicines. The Aspects also of *Jupiter* and *Venus*, *Sol* and *Mercury*, as also of *Jupiter* and *Mercury*, are said to be salutary to phthical and hectic Patients, as also to such as labour under burning and inflammatory Fevers; favourable Crises are also said to happen under this last-mentioned Aspect. The Aspects of *Mars* and *Mercury*, on the other hand, as also of *Mars* and *Jupiter*, are bad, since they not only excite Inflammations, Spittings of Blood, and burning Fevers, but also portend the worst under these Disorders.

The Aspect of *Sol* and *Mercury* is favourable to those Disorders which arise from Phlegm and Serum. But the Conjunction of *Mars* and *Sol* is thought to excite Commotions in the yellow Bile, and by that means to bring on Inflammations of the Stomach, Fauces, and Brain. When *Mars* is in Aspect with *Mercury*, then People are disposed to the Gout, and to Pains, especially such as arise from Phlegm, and a too great Abundance of Humours. The Aspect of *Mars* and *Saturn* is said to be prejudicial to choleric and melancholic People; it also excites Cardialgias, Cephalalgias, Phrensies, and provokes the Mind to Wrath, and throws it into preternatural Commotions. The Conjunction of *Saturn* and *Venus* portends Danger to Women big with Child. It also excites Coughs, Coryzas, Gouts, Head-achs, Palsies, and is thought to be in a particular manner hurtful to Children. The Aspects of *Venus* and *Mars* are inauspicious to Women big with Child, and such as are in Labour; and are for that Reason principally to be dreaded by them.

The Aspects of *Saturn* and *Jupiter*, as also of *Saturn* and *Mars*, are the inauspicious Forerunners of terrible Calamities to Mortals; for acute epidemical, and even contagious Disorders, follow the Conjunctions of these Planets. The baleful Effects of the Aspects of these Stars are sufficiently shewn from the violent Fevers, which after them have often raged with implacable Fury almost over all Europe. *Matth. Zeisius*, in *Orat. de Caus. & Period. Pestil. Morb.* has shewn, from many Observations, that the Aspects of these Planets generally threaten us with an imminent Danger of a Plague. Thus he says, that in the Year 1127. a Plague raged with such irresistible Violence, that the World was like to have been unpeopled by it, and that the Astronomers assigned the Conjunction of *Saturn* with *Jupiter*, as its principal Cause. *Boccace*, and *Guido de Cauliaco*, have, in their Writings, informed us, that the Aspect of *Jupiter*, *Saturn*, and *Mars*, was the Cause of the Plague which raged in the Year 1348. And *Marsilius Picinus*, the greatest Philosopher of his Age, assigns the Eclipses of the Sun and Moon, and the Conjunction of *Saturn* and *Mars*, as the Cause of that which raged in the Year 1478. Thus also the learned *Caspar Bartholine*, Professor at *Tubingen* in Germany, from the Conjunction of *Saturn* and *Mars*, in the Year 1628. after a hot Autumn, and mild Winter, in a public Oration there delivered, predicted the Plague, which for some ensuing Years raged almost over all Europe. Thus also *D. Paulus de Sorbaci*, Physician to the Emperor, accurately predicted the Plague at *Vienna*, from a Conjunction of the same Planets. To these we may add, what *Daniel Sennertus*, *Lib. 3. Part. 2. Sect. 2. Cap. 7.* has observed, concerning the Epidemic Dysentery which happened in his own Time, in the Years 1624. and 1637. in Consequence of the same Position of these Stars.

How much almost all the Antients ascribed to the Moon, and the various Positions of the Planets, with regard to critical Days, is every-where to be discovered in their Works. Nor is it entirely without Reason, though at the same time they seem to deserve some Animadversion even on this Head, that they ascribe so much, and trust so far, to the Moon, in constituting critical Days, exclusively of the State of the Distemper, and Condition of the peccant Matter; for, besides what has been already said upon the Head, 'tis agreed upon by the *Literati*, that her Aspects with the rest of the Planets are of the utmost Importance. To this Purpose, I shall now quote a memorable Passage of *Eichstadius*, concerning critical Days, *Lib. 2. Eph. 11.* "If, says he, the Moon, in the Beginning of an acute Distemper, should happen to have no Aspect with the other Planets, but should in the Progress of the Disease come within the Influence of some baleful Planet, either by Con-

junction, Opposition, or Quartile Aspect; or if, in the Beginning of the Disease, she should be exposed to the Influence of malignant Planets, and, in its future Course, also come into malignant Aspects, you shall then see deep Tragedies acted, dangerous Perturbations and Commotions excited in the Body, and very often Crises, which prove mortal. We are not therefore, says the learned Astronomer *Mæbius*, in *Epist. Inst. Med. Lib. 3. p. 3. Cap. 8.* only to consider the Moon, but also the Force and Virtues of the other Planets, whose Influences she shall happen to receive."

As to the Method and Form of Practice, and the proper Seasons of exhibiting Medicines, the Antients also carefully consulted the Stars; for that Purgatives, or Venesections, used rashly, and without absolute Necessity, for the most part, produce bad Consequences at the Solstices and Equinoxes, the Eclipses of the Sun or Moon, or upon the actual Presence or Approach of a baleful Planet, for Instance, of *Saturn* with *Mars*, and their Conjunction with the Moon at the Hour in which these are used, is not only found from Experience, but fully demonstrated by that skilful Physician *Frederic Hoffman* senior. *Hippocrates*, in the Passage above quoted, absolutely discards the Use of Medicines about the Summer Solstices. Every Surgeon may observe a Fact, concerning which *Lev. Lemnius* has given a Caution, which is, that Wounds inflicted during the Conjunctions or Oppositions of the Luminaries, are more difficultly and slowly cured than Wounds received at other times. In all strumous Cases, Medicines exhibited during the Decrease of the Moon are more efficacious, than if used at other times. Patients who are afflicted with Epilepsies, or labour under Disorders of the Nerves or Head, ought at every Change of the Moon to use nervous, cephalic, and epileptic Medicines, from which they will find no small Relief. In Cases where the Intestines are racked with Worms, the Use of Anthelmintics is most successfully prescribed in the Decrease of the Moon. At that Time also Blood is most advantageously taken away; and this Practice is universally and religiously observed by the Inhabitants of *Switzerland*, who are uncommonly fond of this Operation. The Physician, who endeavours to promote the suppressed Menfes, will find his Intentions most effectually answered by prescribing the Use of Emmenagogues about the New and Full Moons. Three or four small bulbous Roots of Garlick are successfully taken by those who labour under the Stone, every Week, on the Days immediately preceding the Four Quadratures of the Moon. See *Frid. Hoffman. Clav. Pharmaceut. Schroed. p. 406.* In like manner, when large Evacuations by Stool are intended, the Design is best and most safely carried on three or four Days after or before the Full Moon.

Having thus given an Account of the Sentiments of some of the most learned of the antient Physicians, with regard to the Influence of the Stars on the human Body, it now remains, that I give my own Opinion in this Point. And, to be as brief as possible, I declare at once, that I am for keeping a due and proper Medium; I neither attribute too much to the Stars, nor absolutely deny their Influence and Operations, but am for making a due and just Distinction between rational and well-founded Astronomy, and that which is superstitious, fabulous, and empirical. It is not indeed to be denied, that upon this Head some of the Antients have advanced things, which are not only superstitious and fabulous, but, which is worse, directly repugnant to Reason, and inconsistent with a Divine Providence; for who, that is not forsaken of his Reason, and deprived of his Senses, can approve of their running to so intolerable a Length of Madness, as to determine the Morals, the Fortunes, the Diseases, and Deaths of Men, from them? Who, on the other hand, can help lamenting, that the Part of Astronomy, which relates to Meteors, should have been hitherto so little cultivated, as, in a manner, to remain imperfect, dubious, and even destitute of a due and proper Foundation? And, upon this Occasion, I cannot help condemning the want of Accuracy in our Almanacks, which boldly predict certain States of the Weather, but the Events rarely agree with the Predictions. By this unlucky Circumstance, several, not only of the modern Physicians, but Philosophers, have been induced to run into the opposite Extreme, and utterly deny every the least Degree of Influence or Virtue to belong to any of the Stars, or heavenly Bodies, except the Sun. As an Argument for their Opinion, they advance the immense Distance at which they are removed from us. But certainly this Distance is not so great as to cut off and destroy their Influence upon our Globe; for, if it does not hinder the Influx of the Light upon our Eyes, it cannot, *a fortiori*, prevent its Action upon our Atmosphere, since it is interposed between us and them. Besides, Who can be so miserably hoodwinked, as not plainly to perceive and confess, that the wonderfully regular Motions of these Planets, their regular Progressions, and stated Conjunctions, were by Heaven, whose Designs are always vast in themselves, and beneficent to Mortals, intended to answer some noble and important Purposes? Nor indeed can the so

surprising

surprising Variety of Weather and Seasons be easily accounted for upon any other Hypothesis than the different Operations and Influences of the Stars, in Consequence of their various Situations and Positions. The Effects, 'tis true, of the Sun, are so evidently felt, that the Man must be somewhat more than Sceptic, who can deny them; but yet its Influences are by no means sufficient to account for so surprising a Diversity of Seasons; for we frequently find one Winter mild and gentle, another excessively cold and inclement; one Autumn dry, another rainy; one Summer the Ground is refreshed with frequent gentle Showers, and in another it is parched with continual scorching Heat. The Winds also do not always retain the same Qualities, nor blow from the same Quarter; but alter both, accordingly as they are influenced by the Stars. Those which blow from the North, are ordinarily accompanied with a piercing Cold; yet, which is surprising, they sometimes lay aside their Inclemency, and are observed for a considerable time to blow in a mild and gentle manner. And Easterly Winds, which generally bring Rains, are sometimes also attended with clear and serene Weather.

But this Influence of the heavenly Bodies is placed beyond the Reach of Uncertainty or Doubt, when we consider, that the State of the Air is very much altered under the Aspect of two Planets. Though indeed we cannot predict and determine this Change in the State of the Air with that Accuracy and Exactness we could wish, yet we justly assert the Fact, since Experience adds her sacred and uncontrollable Sanction to it. I cannot, on this Occasion, forbear commending the Industry which Mr. Cook, an *Englishman*, and Mr. Schlitters, have used in this Affair, who, after long and accurate Observation, at last found every particular Change of the Air to be produced by the Situation of the Planets. I myself, for ten Years, carefully made meteorological and barometrical *Ephemerides*; and every Day frequently observed the Weather, the Changes of the Winds, and the Height of the Mercury in the Barometer. During the Course of these Observations, I can, without transgressing the Bounds of Truth, affirm, that the Aspects of the Planets, especially the superior ones *Saturn* and *Jupiter*, as also of *Mars*, whether with each other, or with other Planets, are invariably followed with certain and unavoidable Commotions of the Air, especially if several of these Aspects should happen at one and the same time.

There is no Occasion for proving by a long Train of Arguments and Observations, that Changes of the Weather happen about the Quadratures of the Moon, since that Fact is well enough known to the meanest and most ignorant of the Country People. But the Influence of the Moon on our Globe is, in my Opinion, remarkably confirmed by the Flux and Reflux of the Sea, a Phenomenon ascribed to the Changes of the Moon by the concurring Suffrage of all who know any thing of true Philosophy.

There is, then, an Influx of the Stars upon our Earth, and that too so sensible and manifest, that it cannot be denied by any one, who allows himself to observe the Alterations produced in Vegetables and Animals, by the Positions and Phases of the Moon. And I could heartily wish, that this Branch of Learning were more carefully cultivated and improved by a sufficient Number of Observations made in different Places at one and the same time, lest, for want of these, the Good to be expected from Researches of this Nature should be stifled in its Infancy. This may be best prevented by a sufficient Number of accurate Observations made in different Places at one and the same time, not only on the State of the Weather and Air, but also on the Winds, the Height of the Mercury in the Barometer, and the Degrees of Heat and Cold in the Thermometer. For this End, our new-invented Thermometer is well calculated, by which, though but one Machine, we not only discover the least Changes of Heat and Cold, but also the precise Proportion in which they are in the Air, without any Influence from the Weight of the Air, which is not the Case with other unscaled Thermometers.

If, then, the Stars have an Influence on our Earth, as they undoubtedly have, it will be no difficult Task to shew, that our Bodies must be subjected to very considerable Changes and Alterations in Consequence of such an Influence; for he must be utterly ignorant both of Physic and Philosophy, who is unacquainted with the Force and Action of the Air upon our Bodies. The Air is of all the other Elements most necessary to us; by its means, Respiration, in which Life immediately consists, is performed. By it the *Anima Materialis*, as it is called, is nourished and supported; and by it that divine and heavenly Part of our Composition, called the *Soul*, is kept united with our Bodies. The Air acting by its Elasticity on our Bodies, and their Humours, is deservedly celebrated as the *productive Cause* of the Motion of the *Fibræ Motrices* of the several Muscles. The Air conveys a due Strength and Tone to the Solids, which maintain and carry on the Circulation of the Blood. The Air by its Weight and Pressure preserves the several Humours of our Bodies in a due *Equilibrium*, lest, being expanded by their

too quick and intense Motions, they should interrupt the necessary *Systole*, or Contraction of the Vessels. In fine, a Change of the Air is by *Hippocrates* [*Lib. de Flat.*] affirmed to be the Cause of the most terrible Distempers. Witness *Epidemical Diseases*, by which such a Number of Mortals are hurried into the other World, and which arise from no other Cause, than the Malignity of the Air; for the Circulation of the Blood, *cæteris paribus*, bears a direct Proportion to the State of the Air; and Health bears a direct Proportion to the Circulation of the Blood. A serene and temperate Air contributes to carry on the animal Functions with Ease and Tranquillity, and renders the Body sound and vigorous. A gross and dense Air, on the other hand, renders it weak and languid, by injuring the Excretions: Hence, the Tone of the Fibres being impaired, the due Motion and Circulation of the Blood is disordered and disturbed.

For this Reason the great *Hippocrates*, every-where in his Writings, insists upon the Air and its Properties. And, which is still more, from a diligent Observation of the preceding Season, he so accurately predicts the Constitution of the ensuing Year, and the Diseases that will rage during it, that his Predictions seem to carry something of a divine and infallible Nature in them. His incomparable Book *de Aere, Locis, & Aquis*, as also that *de Flatibus*, are well worth the Perusal of those who want Satisfaction on this Head; since his Industry, and extensive Skill, of which he has given numberless other Proofs, no-where appear more conspicuously, than in these Performances; for he was the first who raised this Doctrine, as it were, from a State of Non-existence, and exalted it to a Branch of Physic, which is not only curious in itself, but beneficial to Mankind. And it were to be wished, that more had trod in his Steps, and used their highest Care and Industry to enrich this Branch of Learning with a sufficient Store of accurate and well-made Observations. The Words of this divine Author, in his Book *de Humoribus*, contain an Observation of such Importance to Physic and Mankind, that they richly deserve to be written in Characters of Gold. Such as the *Weather and Seasons are, such will the Diseases and Constitutions arising from them be*. If the Weather is seasonable and natural, Diseases which readily arrive at a Crisis are produc'd. And the Diseases peculiar to particular Seasons are subject to Alterations from the Variety of these Seasons.

From what has been said, every one must plainly perceive, that since the Situations and Positions of the Stars induce Changes and Alterations on our Atmosphere, they must of consequence affect our Bodies with various Changes. Nor is it to be doubted but they act on our Minds, and variously affect the Genius and Dispositions of Men; for every judicious and skilful Physician is well apprised, that the Temperament and Motion of the Blood give a particular Turn to the Mind, the Morals, and the Genius. But that the *Soundness of the Body* depends upon the Air, which is influenc'd and acted upon by the Stars, is a Point already so clear and undeniable, that it stands in need of no Proof. And, indeed, I am inclin'd to think, that the Antients were by this induced, not only to ascribe to the Stars an Influence over the Body and the Mind, but also from them superstitiously to predict the Fates of Men, and the lucky and unlucky Events of Things. In this they were wrong, and their Error is justly censurable as superstitious and trifling.

But though, by reason of our limited and shallow Capacities, we cannot comprehend the real and actual Manner in which this Influx is performed, yet this Circumstance ought not to shake and invalidate a Fact, to which Experience gives her daily Suffrage; for how many Phenomena are there, both in Medicine and Natural Philosophy, for which we cannot account, but which, at the same time, leave no room in our Minds for Doubt, *Scepticism*, and Uncertainty? Besides, 'tis a Maxim in Philosophy as just as 'tis old, *That from our Ignorance of the Modus, or, as the Greeks express it, from the τὸ τί πῶς, or Manner of Existence, to the τὸ ὅτι, or real Existence, there arises no just Conclusion*. But it seems worth while to make, at least an Attempt to remove this Doubt. The Manner, then, in which this Influx is made, seems to be by *Rarefaction, Compression, and Direction of Motion in this or that Line*.

Thus *Saturn* seems to act upon our Bodies, and the Atmosphere, by compressing the Air, and giving its Parts a rectilinear Direction in their Motion, by which means Cold and Winds are produced. *Sol* and *Mars*, if we may indulge Conjecture in a Point so little subjected to our Senses, produce a vertical and intestine Motion in the Particles of the Air, the natural Consequence of which is Heat. But *Venus* and the *Moon*, by rendering the Air lighter, lay a Foundation for Store of Vapours being raised, and are therefore found to occasion rainy Weather. The Moon at her Quadratures rarefies the Air too much. Hence our Bodies and Juices become turgid, and our Transpiration is too great. At New Moon again, or an Eclipse of the Moon, the State of the Air is compressed, a Circumstance which excites various Disorders.

The most noble of all the Planets, and that which most contributes to the Support of the Body, is the *Sun*, whose Efficacy in the Preservation of Health is so conspicuous, that the Antients ascribed a Power of curing Diseases to it; because they observed, that the gentle and temperate Heat of the Sun had a Tendency to remove and carry off all Distempers; for *Apollo*, the God who presides over Physic, is the same as the Sun. For this Reason he was, according to *Macrobius*, styled *Sospitalis ac Medicus Deus*, The God who procures the Safety, and protects the Health of Mankind; and had also Divine Worship paid it by the Heathens on this Account.

The Conjunction of *Sol* with *Jupiter*, of *Jupiter* with *Venus*, as also the Aspect of *Jupiter* and *Mercury*, are particularly beneficial in removing those Disorders which arise from Spasms, and spasmodic Constrictions of the Fibres. For this Reason they are propitious Planets to hypochondriac, hysterical, phthical, and inflammatory Disorders; for, by rendering the Atmosphere light, they relax the Tone of the Fibres, and promote the Transpiration of the impure and recrementitious *Sordes* lodg'd in the Body. For this very Reason also, under the Conjunction of *Sol* and *Jupiter*, all Attempts to restore and preserve Health, whether by Venesection, Purgatives, or other Remedies, are most proper.

The Aspect of *Sol* and *Mercury* is of Service to phlegmatic Disorders, and such as draw their Origins from Serum. The same Effect is also produced by the Aspect of *Sol* and *Mars*, which, on the other hand, is prejudicial and hurtful to the Choleric, whilst it too much increases the intestine Motion of the Blood, and by that means produces bilious and hot Diseases, especially Hemorrhages. The Conjunction of *Mars* and *Mercury* produces almost the same Effects.

The Aspect of *Venus* and *Saturn*, by compressing the Air, renders the Fibres tense, blocks up the Pores, and prepares and disposes the Body to Spasms, Rheumatisms, Fevers, Coughs, Coryzas, and Abortions. The Aspect of *Mars* and *Saturn*, by throwing the Blood into internal Commotions, and obstructing external Perspiration, disposes to Anger, and excites unbridled Passions. The same Aspect promotes the Diseases arising from Bile, and for that very Reason uses to pave an easy Road to Putrefaction and the Plague. The long-continued Aspect of *Venus* and *Mercury*, by rendering the Atmosphere lighter than it ought to be, disposes to Ulcers, putrid Diseases, Worms, *Aphthæ*, and catarrhus Fevers. The Aspect also of *Saturn* and *Jupiter* produces a Train of fatal and melancholy Effects; for the Aspect of *Jupiter* rarefies the Humours, whereas that of *Saturn*, by an external Pressure upon the Body, hinders Perspiration.

I have already said, that, during the Increase of the Moon, Tumors were enlarged; and this happens for no other Reason than this, that the Moon, not only by her Rarefaction, but her Humidity, relaxes the Tone of the solid Parts: Hence Perspiration is interrupted, and an Accumulation of Humours, Blood, and Serum, ensues. But, upon the Decrease of the Moon, the Perspiration acquires new Force and Strength, by which means the Tone and Elasticity of the Fibres are restored and augmented. For this Reason People at this Season receive the most considerable Advantage from the Use of Medicines; for then Evacuations of all Kinds, and Venesection, that great Preservative, are more proper, and more beneficial to the Constitution than at other Times.

That we ought to abstain from the stronger Purgatives during the *Solstices*, is evident from this, that, during the Summer Solstice, the Strength is dejected, and the Spirits languid, in consequence of the violent Heat. The Winter Solstice, on the other hand, is always accompany'd with the greatest Imbecillity, and Nature is then at her lowest Ebb. Since also the Equinoxes, in consequence of their Humidity, relax the Fibres, they must of course retain within the Body the Humours, whose Expulsion and Elimination are attempted. For this very Reason, if about the Equinoxes the more Draftic Purgatives are used, it readily happens, that the Humours, being by their Violence forcibly driven to particular Parts, excite dangerous and fatal Stagnations; for which Reason the Physician is at these Seasons to be particularly careful never to prescribe these strong Purgatives, but rather make Choice of the mild and gently operating Laxatives. In the Decrease of the Moon, such Medicines as are designed against Worms and Tumors, are most properly used; because at that Time Nature being in her most flourishing State, increases their Operations, and proves an excellent Assistant to them; and the more powerfully Medicines are assisted by the concurring Forces of Nature, the more speedy and successful their Operations will be, and *vice versa*.

But it is above all things to be remember'd, that the Influence of the Stars is to be rank'd among those Causes of Diseases only, which affect our Bodies, whether in a sound or valetudinary State, in a remote and secondary manner; for the Stars only dispose to particular Disorders, and particular States of the Body and Fibres; but they are not the proximate and immediate Causes producing the Disorders themselves.

The Maxim of the Antients relating to this Particular is very just, when they say, that the Stars indeed *inclin'd*, but could not *necessitate*. In order to produce a necessary Effect, a proximate and immediate Cause is necessarily requir'd; but, in order to produce any Effect, many remote Causes must concur. It must also be remember'd, that the Stars act upon our Bodies not *secundum modum activitatis*, or merely by their own Virtue and Energy; but *secundum modum Receptivitatis*, or according to the State and Disposition of the Objects on which they act. This Observation is on this Occasion so much the more carefully to be adverted to, as it ought to be fixed and riveted in the Mind, with regard to all morbid Causes whatsoever, the Effects of Diseases, and the Operations of Medicines. For this Reason we observe, that all Bodies are not affected in the same manner by the Stars, but the same Effect which proves beneficial to one, sometimes proves hurtful, and injurious to another. Lastly, 'tis not to be forgotten, that the Influences of the Stars are most conspicuous and perceptible in valetudinary and infirm Constitutions; for these, in consequence of their lax and spongy Habit of Body, and the too languid Motion of their Blood, are in a particular manner expos'd to the baleful Influences they diffuse, whereas those of a more hardy and athletic Make, are not easily injur'd by them.

In the last Place, this is to be duly remember'd, and carefully adverted to, That, in Cases of URGENT NECESSITY, neither the Position of the Stars, nor the State of the Atmosphere, are to be regarded; for no Physician ought to recede from what he thinks a rational Practice in acute Diseases, because the Aspects and Positions of the Stars are bad, according to the Advice of that skilful Physician *Levinus Lemnius*.

Thus in a Quinsy, Pleurisy, and Inflammations, we are to disregard the Stars, but have immediate recourse to Venesection: For as the skilful Pilot, on the Prospect of an approaching Tempest, loses no Time, but struggles for Life and Safety against Wind and Tide, till, by a prudent Management of his Sails and Oars, he has brought his Ship to a secure Station, where she may be shelter'd from the Violence of the raging Winds and Billows; just so the skilful Physician, neglecting the Stars, and their Influence, has recourse, as soon as possible, to such Medicines as remove the Violence of the Distemper, and place the Patient beyond its Reach. *Hoffman*.

ASTRUM, ἀστρον. The same as ἀστήρ, a Star.

Astrum, with the Chymists, signifies that Virtue and Power which accrue to Things from their Preparation: Thus the *Astrum* of Sulphur is its Kindling, by which it is changed into a most excellent Oil; and the *Astrum* of Salt is its Resolution into Water or Oil, by which, in like manner, it acquires greater Strength. The *Astrum* of Mercury is its Sublimation, by which it acquires a wonderful Force and Power, of more Extent and Subtlety than it was endu'd with by Nature. It is otherwise called *Alcol*, *Quinta Essentia*, *Extractum*, *Sperma*, &c. *Ruland. Johnston*. There is also the *Astrum Solis vel Auri*, *Lunæ*, &c. *Astrum ex Igne* is burning like Fire, and making a vehement Impression. *Diæ. Paracelsum*.

Astrum is also a Name given to certain Medicines, as Troches, or those in the Figure of little round Cakes, impress'd with an Asterisk. Hence we read in *Galen*, *Lib. 8. de C. M. S. L. Cap. 3.* and in other Places, of the invincible, somniferous, anodyne *Aster*. And with some Chymists a Remedy bears that Name, not so much on account of the Impression, as its extraordinary, and, I may say, *Astral* Virtues; for Example, the *Astrum* of Serpents.

ASTUR, in *Aldrovand. Ornithol.* is the same as ACCIPITER.

ASUB. The Galaxy. *Ruland. Johnston*.

ASULCL Lapis Lazuli. *Idem*.

ASUOLI Ink, Soot. *Idem*.

ASYMPHOROS, ἀσύνφορος, from a Neg. and σύνφορος, a Calamity, Misfortune; not detrimental or dangerous. Thus *Lib. 1. περί διατρῆς καὶ ἐν βρογχίτις ἐλεγχμονίς καὶ ἀσύνφορος μαινοῖται*, "after a short Inflammation, which was no way dangerous, they grow mad."

ASYMPHYTON, ἀσύνφυτον, from a Neg. and σύνφυσος, concrete, coalescent, in *Hippoc. Lib. περί τέχνης*, signifies whatever is disjoint'd by Nature, and not continuous.

AYSMTOTON, ἀσύνπιπτον, from a Neg. and σύνπιπτος, of συμπιπτεῖν, to subside, to be compressed, or contracted. Uncompressed, uncontracted. *Ἀσύνπιπτον*, in *Hippoc. Lib. περί χυμῶν*, denotes what is not contracted or compressed thro' Dryness. In *Gal. L. 1. ad Glauco. ἀσύνπιπτος ἢ πᾶσα ἐξ ἧς τὸ σώμασι*, "the whole Habit of the Body keeps up without sinking," was before expressed by ἐστὶ ὁ τὸ σώμασι ὀγκοῦ συμπιπτικῶν, "nor was the Bulk of the Body sunk or contracted." Thus *σύνπιπτος*, *Lib. περί χυμῶν*, signifies a Sinking or Contraction of the outward Limits of the Body; and *Aph. 3. Lib. 1. συμπίπτοντες* are called κενώσεις, Evacuations, importing such Compressions to be the subsiding of the Vessels upon Evacuation.

ASYNETHES, ἀσυνήθης, from a Neg. and συνήθης, customary; uncustomed. *Hippoc. Lib. 2. Aph. 49, 50.*

ATAC, Talc, or Nitre. *Ruland. Johnson.*

ATACTOS, ἀτάκτος, from a Neg. and τάξις, Order, Disorderly, irregularly. An Adverb often used by *Hippocrates*, in Conjunction with ἀπλάττειν, "after a wandering manner." Thus, for Instance, *Lib. 1. Ep. πῦρα ὃ πάσαν ἀτάκτως καὶ ἀπλάττειν ἐγένετο*, "all had Shiverings in a vague and irregular manner."

ATA MARAM, H. M. *Pomifera Indica, Fructu conoide squamoso viridi.* The same as AHATE DE PANUCHO RECHI, which see.

ATANOR. A Pot perforated. *Ruland. Johnson.*

ATARACTOPŒSIA, ἀταρακτοπνοσία, from a Negat. ταρακτός, troubled, and ποίω, to do. The performing an Action with an undisturbed and intrepid Mind, becoming a Physician. *Hippoc. περὶ εὐχρη.*

ATAxia, ἀταξία, from a Neg. and τάξις, Order. Irregularity. In a special Sense it signifies the Disorderliness and Irregularity in Crises and Paroxysms of Fevers, *Hippoc. Lib. 1. & 3. Ep.* A Pulse is said to be ἀτάκτος, irregular, when it observes no Order in the Time or Tone of the Strokes; and an erratic Fever is called ἀτάκτος, or ἀτυπός, which keeps no certain Character or Order in its Periods.

ATAXMIR. An Arabic Word in *Albucasis*, signifying the Method of treating an Eye when preternatural Hairs grow under the natural ones on the Eyelids, and incommode the Eye. *Castellus.*

ATEBRAS, uncus aquinus, that is, a Subliming Vessel. *Rulandus.*

ATECHNIA, ἀτεχνία, from a Negative, and τέχνη, an Art. Want of Art. Τέλο γὰρ ἐργασίης ἀτεχνίαν εἶναι, ὅτι μήτε ὀρθὸν ἐστὶ μὴδ' ἐν, μήτε ἐκ ὀρθόν. "I assert that to be void of Art, in which there is nothing right, and nothing wrong." *Hippoc. περὶ τέχνης.*

ATENES, ἀτενής, fix'd, immoveable, rigid. Thus ἀτενές ὄμμα is a fix'd and immoveable Eye, a rigid Aspect. *Galen, Comm. 3. in Protrhet.* explains it by δεσνός, bold, vehement, a fierce and wild Aspect, which portends a Phrensy. Ἀτενές ἐκλάμπουσιν ὀφθαλμοί, "the Eyes are fix'd, and shine," which is a Sign of a Delirium. Ἀτενίζοντα ὄμματα, Eyes fix'd, intent, looking earnestly. *Lib. 5. & 7. Epid.*

ATER SUCCUS, or ATRA BILIS, are sometimes used to express the Black Bile, Melancholy. See BILIS, and MELANCHOLIA.

ATERAMNA, ἀτέρευμα, in the following Passage of *Hippocrates, Lib. de Aere, Locis, & Aquis, δια τὰ ὕδατα ὄντα σκληρὰ τε καὶ ἀτέρευμα, καὶ ψυχρὰ*, is expounded by *Galen* in his *Exegesis*, by τὰ δυσκαίεργα καὶ σκληρὰ, "difficult of Concoction, and hard;" in which Sense the Place quoted will be render'd, "because the Waters are hard, and difficult of Concoction, and cold." The same Author, *Com. 4. in Lib. 6. Epid.* writes, that some of the Antients call'd bad Waters ἀτέρευμα, and ἀτέρευμα. And in another Place, *Comm. eodem*, he tells us, that Rain-water was better than what fell with Hurricanes, which could neither be digested nor alter'd, but was like the Water of some Fountains which the Antients call'd ἀτέρευμα. These Words import as much as untameable, indigestible.

Ἀτέρευτοι κοιλίαι, *Lib. de Aere, Locis, & Aquis*, are hard, dry, stubborn Bellies, not lubricous or mollify'd, and opposed to εὐεργετοι, "such as are more fluid, or loose." Ἀτέρευτοι, in the same Treatise, is expounded, by *Erotian, δυσμετέλλαις*, "difficult of Alteration." Ἀτέρευμα there also signifies Crudity, and Difficulty of Concoction; but when transferr'd to the Mind, it denotes an untractable Nature, a refractory Disposition, and rough and unciviliz'd Manners, incapable of being polish'd or soften'd. *Hippoc. ἐν παρρηγελίαις τῆς γῆς, ὃ πρὸς τοὺς ἰατροὺς, ἡδελφισμένον ἰστέος ἰστέου πῖσις ἢ ἀτέρευμα;* "The true Physician will undoubtedly perform his Office with Honour and Confidence, rather than by hard and rough Treatment."

ATERES, ἀτηρής, from ἄτη, Loss, Mischief. Noxious, detrimental. *Hippoc. Lib. de Aere, Locis, & Aquis: Εἰ μέντοι, ποταμοὶ μὲν μὴ εἴσιν, τὰ δὲ ὕδατα κρυαῖά τε καὶ σάσιμα εἶναι, καὶ ὁδὸν ἀνάγκη τὰ τοιαῦτα τῆς γαστρὸς ἀτρεῖα εἶναι καὶ σπληνός.* "But if there be no Rivers, and they drink of stinking and stagnating Springs, such Waters must of necessity be pernicious to the Belly and Spleen."

ATHANASIA, from a Negative, and θάνατος, Death (Immortality). An Antidote which *Galen* describes in the eighth Book of his Topics, as a Medicine for Infirmities of the Liver, the Gravel, and the Yellow Jaundice. It is thus prepared:

Take of Saffron, two Drams; Cinnamon, one Dram; Spikenard, two Drams; Cassia, Myrrh, Juncus odoratus, of each one Dram: Make them into an Electuary with Honey. Taken to the Quantity of a Grecian Bean, it provokes Sweat plentifully.

There is another Antidote of this Name, which *Paulus, Lib. 7.* ascribes to *Oribasius*, which takes in all the Ingredients of the former, but varies the Proportions, with an Addition of Opium; which, he says, is a Lenitive of Pain, and proper for the Pleurisy, and would have it supply the Place of *Philonium*.

Ἀθανασία signifies also the Collyrium ἀθανάτων, describ'd by *Actius, Lib. 7. περὶ ὧν ἀδύπτων καὶ λευκῶν κολλυρίων*, that is, of white and mild Collyriums. *Goræus.*

Athanasia is also a Name given to many Compositions in some foreign Dispensatories, one of which is in the *Augustan*.

Athanasia, according to *Blancard*, is a Name for TANCETUM, which see.

ATHANATOS, according to the last-named Author, is the LYCHNIS CORONARIA, which see.

ATHANOR. This is, by *Lemery*, deriv'd from *Tannaron*, an Arabic Word, which signifies a Furnace.

It is a sort of Furnace, contrived in such a manner as to keep up an equal and gentle Heat for any Length of Time, by only supplying it every twenty-four, or sometimes every forty-eight Hours, with a proper Quantity of Coals. It is very useful in Operations where a long-continued gentle Heat is required.

ATHARA. See ATHERA.

ATHARES, ἀθαρής, from a Negative, and θέρω, to corrupt. Uncorrupted. This is an Epithet sometimes apply'd to a Virgin; and sometimes to Iron, with regard to its Hardness, Incorruptibility, or Invincibility.

ATHELXIS, ἀθελξις, from ἀθελγμαι, to suck, or drain by Milking. Suction, or that Attraction which is perform'd by sucking or milking. The Verb ἀθελγμαι is used by *Hippocrates, περὶ χυμῶν*, and ἀθελξις, in the Treatise περὶ ἀρθρῶν but the best Copies, as *Foesius* says, for ἀθελξις, read ἀλθεξις, which he himself approves, and renders *Sanatio*, a Cure.

ATHENA, ἀθίνα, is a Plaster commended by *Asclepiades*, and describ'd by *Oribasius, Actius*, and *Paulus*. It is thus made:

Take of Cadmia, twenty Drams; of burnt Brass, Bark of Pomgranate, Galls, long and round Birthwort, Sal Ammoniac, Squama Aëris, round and scissile Alum, Orris, Misy, Chalcanthum, Chalcitis, Verdegrise, Aloes, Myrrh, Frankincense, Gum Ammoniac, Galbanum, each thirty Drams; of Wax, Pitch, each one hundred, or, as others, two hundred Drams; of Colophony, four hundred Drams; of Oil, six Ounces.

This is *Oribasius's* Receipt; but *Asclepiades* prescribes

Twelve Drams of Aloes, as many of Myrrh, and sixteen Drams of Gum Ammoniac: Pound the dry Ingredients for several Days together in the Summer's Sun; then melt those which are liquifiable, and incorporate them with the others.

It is very effectual in Wounds of the Head and Nerves, and is reckon'd by *Paulus* among the ἐμψία φάρμακα, Remedies spread upon Lint or Linen, and thus introduced into Wounds or Ulcers.

ATHENÆUS.

Athenæus was the first Founder of the Pneumatic Sect, and a Native of Attalia. There were several Towns of this Name; but it is most likely, that the Attalia which gave Birth to this Physician was a City of Cilicia, because *Cælius Aurelianus [Acutor. Lib. 2. Cap. 1.]* mentions one Athenæus of Tarsus, who is probably the same; for Tarsus being also a City of the Province of Cilicia, Cælius might have, very probably, put the one for the other.

This Physician appear'd after *Themison*, as we may gather from a Passage of *Galen*, where he says, that one *Magnus*, a Follower of *Athenæus*, had compos'd a Book, intitled, *Things discover'd since the Time of Themison*. 'Tis very probable, that *Magnus* compos'd this Book with no other View than to give an Account of the Innovations his Master had made in Physic. The Silence of *Celsus* and *Pliny*, with regard to *Athenæus*, are also a Proof, that he did not live, or at least was not known, in their Days; since 'tis probable, that, having mention'd other Innovators in Physic, they would not have forgotten him. It is indeed possible, that *Athenæus* might not have made his Appearance in the World in the Time of *Celsus*, who lived under *Augustus* and *Tiberius*: But as for *Pliny*, if we consider, first, that there were about fifty Years between him and *Archigenes*, the former having written under the Emperors *Nero* and *Vespasian*, and the latter, at the farthest, under *Adrian*; and secondly, that *Archigenes* was the Disciple of *Agathinus*, who again was the Disciple of *Athenæus*; we shall find, that this last must have lived at least fifty Years after *Archigenes*, and consequently must have been contemporary with *Pliny*. If this Representation is just, as we may suppose *Pliny* to be a little older than *Athenæus*, and to write before him, we have no Reason to be surpris'd, that *Athenæus* is not mention'd by him.

As for the Philosophical Opinions of *Athenæus*, he did not believe, [*Galen. Introduct. seu Medicus, Cap. 9.*] that the Fire, the Air, the Water, and the Earth, were true Elements; for he only gave the Name of Elements to the primary Qualities of these Bodies, that is, to Heat, Cold, Humidity, and Dryness; the two former of which were, according to him, efficient, and the two latter material Causes. *Athenæus* added a fifth Element, which he call'd *Spirit*: He imagin'd, that this *Spirit* penetrated all Bodies, and preserved them in their natural State. This Sentiment he borrow'd from the *Stoics*; and 'twas probably this which induced *Galen* to call *Chrysippus* the *Stoick*, the *Father of the Pneumatic Sect*.

This Opinion is also hinted at by *Virgil*, [*Æneidos, Lib. 6.*] in these Words:

*Principio Cælum, ac Terras, Camposq; liquentes,
Lucentemq; Globum Lunæ, Titaniaq; astra,
Spiritus intus alit: totamq; infusa per Artus
Mens agitat Molem, & magno se corpore miscet.*

Athenæus, applying this System to Physic, would have all Diseases to proceed from the *Spirit* suffering, or receiving the first Assault, *τοῦτο πρῶτον ἀσθενεῖ*, that is, *πρῶτον ἀσθενεῖ* [*Galen. Introduct. Cap. 9.*]. But as the Works of this Physician have not reach'd us, we know not particularly what he meant by this *Spirit*, nor what he understood by its suffering: Only from his Definition of the Pulse we may conclude, that he believed the *Spirit* to be a Substance capable of Dilatation and Contraction. "The Pulse," said he, is no more than a Motion produced by "the natural and involuntary Dilatation of the Spirit contained in the Arteries and Heart; which Spirit, moving of its own Accord, moves at the same time the Heart and Arteries."

This is all we know concerning the Sentiments of *Athenæus*, except some things relating to Anatomy, in which he follow'd *Aristotle*. *Galen* [*de Different. Puls. Lib. 4. Cap. 4.*] observes, that none of the Physicians of these Days had written so universally on Physic as *Athenæus*; but of all he wrote we have nothing remaining, except two or three Chapters in the Collections of *Oribasius*, from which we learn nothing that can explain this Opinion relating to the *Spirit*, much less any thing that can discover its Use with regard to the Practice of Physic.

ATHENATORIUM, a thick Glass Cover, which is in the *Theatrum Chymicum, Vol. 3. p. 33.* directed to be luted to a Cucurbit, when the Alembic is taken off, in a particular Process there describ'd.

ATHENIONIS CATAPOTIUM. The Name of a Pill in *Celsus, Lib. 5. Cap. 25.* which is recommended against a Cough. It consists of Myrrh, Pepper, Castor, and Opium.

ATHENIPPON. The Name of a Collyrium, describ'd by *Scribonius Largus, 26.* which is also call'd *Diasmyrnes*, said to be useful in some Distempers of the Eyes.

ATHENIPPON PANCHRESTON, *ἀθηνιππον πανχρηστον*, a Collyrium in *Galen, Lib. 7.* *ἡ δὲ νάρξ τοῦτος*, quite different from that of *Scribonius Largus*; whence it appears, that the Name *Athenippion* was common to many Collyria.

ATHER, *ἀθήρ*, as *Galen* says, signifies, in *Hippocrates*, both the prickly Part or Beard of Barley, as in *Lib. 2. de Morbis*, and also the Top of that Part in the Point of an Arrow, which is called the *πύργος*, Beard, as in *Lib. 5.* *ἡ ἐνιδρυμὸν*.

ATHERA, *ἀθήρα*, or *Athara*, as it is read in *Pliny, Lib. 22. Cap. 25.* signifies a thin sort of Pulticula, or Pap, fit to be supp'd: It is made of Wheat, or Zea, ground and reduced to a very fine Flour, and is proper for Infants. *Dioscorides, Lib. 2. C. 114.* tells us, that it is a forbile Liquor, made of very fine Flour of Zea, and may be used by way of Cataplasim. The Term is received among the *Greeks*, tho' *Pliny* says it has an Egyptian Original. *Goræus*.

ATHERINA, a small Fish mention'd by *Aldrovandus*, which is very full of Bones, but otherwise very good Food, as being easy of Digestion, and supplying good Juices.

ATHEROMA, *ἀθήρωμα*, is a colourless Tumor, void of Pain, containing, in a membranous Coat, Matter like Pap, called *ἀθήρα*, intermix'd sometimes with hard and stony Corpuscles, and others like the Scrapings of Sulphur, and now-and-then like chew'd Bones of Chickens. *Leonidas* writes, that he sometimes met with things like Hairs inclosed within a very gross Humour; and *Philoxenus*, that he found Animals lodged in the Humour, which were like Gnats or small Flies.

An *ἀθήρωμα*, then, is oblong, imminent, hard, not easily impress'd by the Fingers, nor, after Impression, hasty to restore itself; which Marks distinguish it from the Meliceris, which is more round, low, wide, soft, and easily gives Way to the Touch, and as soon returns. *Goræus*. See TUMOR.

ATHLETICUS, *ἀθλητικὸς ἔξυς*, *Athletica Habitudo*, an Athletic Habit of Body; so the Antients call'd that State of Body which was full, fleshy, and robust; for such was the Appearance of the *Athleta*, or Wrestlers. They were not of this Constitution by Nature, but acquir'd it by the closest Application to the Gymnastic Art. Their principal View in this Study

was to take such Care of their Bodies, as that they might be well fortify'd with much and solid Flesh, and have their Veins full of the best and most fibrous Blood. Nor did they only aim at Strength, but Bulk and Ponderosity, the better to overbear and foil their Adversary. For this End, it was necessary to use much Food and Exercise: The first was of such a Nature, as not easily to be dissolved and dissipated, such as Beef, Pork, Bread, and Cheese; and what, says *Galen*, is extoll'd by all, the finest Wheat-flour, with Cheese-cakes, and other Dainties made thereof, which he, in his fifth Book of the Preservation of Health, mentions as provided for Wrestlers, to increase their Strength and Vigour. Their Bread was anciently, by a peculiar Name, call'd *Colipbium*, *ἀπὸ τοῦ κόλου καὶ ἰσίου*, from Firmness of Limbs. They observed no Time or Order in Eating or Drinking, that they might the better be enabled to bear all Changes. 1. They indulged themselves in Sleep and Gluttony, and roll'd in the Dust and Dirt: As to all honest and necessary Offices of Life, they were quite indisposed and useless. They who, by such Methods, had acquir'd this Habit of Body, were accounted excellent *Athleta*, Wrestlers, and the Habit itself was call'd *ἀθλητικὴ ἔξυς*, an *Athletic Habit*. But it grew to a Custom in time to call every corpulent and robust State of Body by this Name, tho' not procur'd by the Athletic Art. Hence, in *Plautus*, *pugilice, pancratice, & athletice valere*, is put for *optime & firmissime*; and in *Celsus, Lib. 4. Cap. 6.* an Athletic Diet is put for a strong one, and such as is accommodated to repair the bodily Forces, as *Budæus* has observed in his Notes on the *Pandectæ*. But this Athletic Habit is censur'd by *Hippocrates* as preternatural, and not so good as a healthful one; for it is in continual Danger from the Fulness of the Vessels. Therefore it ought to be accounted *neutral* rather than *healthful*, because of the imminent Danger that attends it, except it be soon solved by a *κρηταρσία*, an Evacuation, or Emptying of the Vessels. On other Accounts, as *Galen* writes, *Comment. in Aphor. 3. Lib. 1.* it is faultless, because *Athleta* abound with good Humours, and are in full Strength of Body; and, in his Book *de Atra Bile*, he owns their Blood to be very good. *Goræus*. See GYMNASTICA.

ATHLIPTOS, *ἀθλιπτός*, from a Negative, and *δύσβα*, to press. Uncompress'd. *Ἀθλιπτός ἐμβολή*, as *Galen* says, is an Expression used by some to signify the Approach of a feverish Paroxysm without Compressions. This kind of Fever, he says, at the very Beginning of the Fit, immediately raises the Pulse in Greatness and Swiftmess, and does not make its Approaches, as is usual with other Sorts, by Shakings and Shiverings, a Coldness of the extreme Parts, or outward Superficies, with a Vellication, Gravation, or Compression of the Stomach, and a small slow Pulse; for one or more of these Symptoms attend the Access of a Paroxysm, and soon after sometimes succeeds a Vomiting, which is a plain Indication of a Conflux of vicious Humours to the Stomach; and the Blood, retiring from the whole Superficies inward to the Viscera, must occasion Compressions, Obstructions, and Distensions of the principal Arteries. A Fever that does not make its Attack on the Patient by any of these Methods, is said to make an *ἀθλιπτός ἐμβολή*, "an Attack without Compressions." *Galen. de Præfag. et Puls. Book 3. Chap. 7.*

ATHONOR. The same as *ATHANOR*.

ATHORECTOS, *ἀθόρεκτος*, not drunk. Sober.

ATHRIX, *ἀθήριξ*, from a Negative, and *δείξ*, a Hair, Smooth, without Hair.

ATHROESMA, *ἀθροισμα*, from *ἀθροῖς*, collected together. This is a Term in frequent Use among the Physicians of the Empiric Sect. It signifies the entire Collection of all their Observations.

ATHROOS, *ἀθροός*, an Adjective, or Athroon, *ἀθροῖς*, an Adverb, in Medicinal Authors, imports copious, accumulated, or sudden, and is the Reverse to *by degrees*. It is apply'd to the Secretions, Nutrition, and other things.

ATHYMIA, from a Negative, and *θυμός*, Courage. Pusillanimity. In Medicinal Authors it usually signifies that Dejectedness, Despondency, and Despair, which frequently occur in the Course of Distempers, especially in some Constitutions.

ATINCAR, or **ATINKAR**, Borax. *Rulandus. Johnson.*

ATTITARA, the *Brasilian* Name for the *Palma humilis spinosa*. *Raii Hist. Plant.*

ATLAS. The first Vertebra of the Neck, mark'd *Fig. 9.* in *Table 8.* is call'd Atlas, because it supports the Head, as *Atlas* did the Globe of the Universe, according to the ancient Fable. It has neither Body, nor spinal Apophysis. The Hole or Opening in it is much larger than in the rest. It looks like an irregular bony Ring, fill'd all round with Eminences and Cavities. It may be divided into two Arches; the anterior, or largest; and posterior, or smallest.

The anterior Arch is form'd by two thick lateral Portions, and a small curve middle Part, which, with the other, makes a Notch in the anterior Part of the great Cavity of the Vertebra. The lateral Portions may be look'd upon as a Body in two Parts, without which the first Vertebra would have been too weak to sustain the Articulations.

In the Middle of the convex Side of the posterior Arch, is a Tubercle, a little pointed, larger than the anterior Tubercle, and mark'd with Muscular Impressions on each Side, and on the upper and lower Edge. This Tubercle seems to be in the Place of the spinal Apophysis.

The transverse Apophyses of the first Vertebra arise from the Middle of the Breadth of the lateral Portions, being perforated perpendicularly at their broad Origins. They are much longer than those of the five Vertebrae below them, and, contracting gradually, they terminate in an obtuse Point, which is sometimes in a manner double, and mark'd on the upper and lower Side with Muscular Impressions.

The superior articular Apophyses are larger than any other Apophyses of the same Kind in the whole Spine. Their Situation is almost horizontal, and their anterior Extremities are turn'd more inward, that is, nearer one another than the posterior: They are, in a Word, every way proportion'd to the Condyles of the Os Occipitis.

The inferior articular Apophyses are less hollow, shorter, and broader. They are inclin'd laterally from within outwards, and from above downward. They are directly under the superior Apophyses; and thus the articular and transverse Apophyses, the Holes and lateral Portions on each Side, are all in the same Line.

There is a long Notch, or kind of Groove, between each superior articular Apophysis, and the posterior Arch of the bony Ring, reaching from the Hole in the transverse Apophysis backward; in which Notch the Vertebral Blood-vessels, in the natural State, make a Turn, before they enter the great Occipital Foramen. Sometimes, tho' very rarely, there is a complete Hole in the room of this Groove. There is another Notch, but more shallow, on each Side, between this Arch and the inferior Apophyses.

In the internal Circumference of the great Hole of this Vertebra, in the Middle of the great Notch, is a Cartilaginous Impression for the Articulation of the Axis of the second Vertebra; and on each Side of that Notch, between the superior and inferior Apophyses, there is another small Impression for the Insertion of a transverse Ligament, which secures the Axis in its Place. All round this Circumference, both toward its upper and lower Edges, there are many other Inequalities or Impressions. *Winflow's Anatomy.*

ATLE, an Egyptian Name for the Tamarisk. *Blancard.*

ATMOSPHERA, the Atmosphere. The whole Body of Vapours, and Air, surrounding the Earth. See AER. It is deriv'd from

ATMOS, ἀτμός, a Vapour, or Exhalation.

ATOCIA, from a Negative, and τίτω, to bring forth Young. Sterility. *Blancard.* But ἀτοκία, in *Hippocrates*, usually signifies Women who abstain from the Means of Fecundity, that is, the Embraces of the other Sex.

ATOCIUM, a Name for the *Lychnis Sylvestris*. *Blancard.* But ATOCIUM, ἀτόκιον, also signifies a Medicine which prevents Conception.

ATOLLI, a sort of *Pap*, made of the Meal of *Mays* and Water, which the *Indians* mix with their Chocolate.

ATOLMIA, ἀτομία, from a Negative, and τέλμα, Intrepidity. Pusillanimity.

ATOMUS, ἀτομός, from a Negative; and τέμνω, to cut or divide. An Atom. A Particle of Matter so small as to admit of no farther Division.

Cælius Aurelianus, *Acut. Lib. 1. C. 14.* giving an Account of the Philosophy of *Asclepiades*, says, it was his Opinion, that the *Primordia* of all Things were *Atoms*, which were not the Objects of our Senses, but were only perceptible by the Understanding. These *Atoms*, according to him, had of themselves no Qualities at all; for he asserted, that the Qualities of the Bodies which they compose depended upon the Order, Figure, Number, and Grandeur of many of these Particles join'd together: And when he was ask'd, How it happen'd, that Bodies possess'd several Qualities, since the *Atoms*, of which they were composed, possess'd none at all; he answer'd, That these Qualities depended upon the Order, Figure, Number, and Bulk of several of these *Atoms* united and join'd together; and, for illustrating his Opinion, drew a Simile from Silver, which is white when in the Lump, but black when filed down; and from the Horns of Goats, which are black when entire, and white when rasp'd down.

From this Account of the Philosophical Sentiments of *Asclepiades*, we plainly see, that they were somewhat different from those of *Epicurus* or *Democritus*, tho' all the three acknowledged *Atoms*; for the *Atoms* of *Asclepiades* were divisible, whereas those of *Democritus* and *Epicurus* were supposed incapable of being divided. I am of Opinion, that *Cælius Aurelianus*, by *Atoms*, means no more than the ὄγκοι, or *Molecules* of *Galen*. *Epicurus* acknowledged *Molecules* as well as *Asclepiades*; and *Lucretius*, who was contemporary with *Asclepiades*, also mentions something of the same Nature: But then *Epicurus* and *Lucretius* do not look upon *Molecules* as the first and constituent Principles of Bodies, but only as the first Ef-

fects produced by an Assemblage of *Atoms*; which, according to them, were the true and genuine Principles: Whereas *Asclepiades*, according to the Account of *Cælius Aurelianus*, seems to mean *Molecules* by his *Atoms*; tho', at the same time, he gives the Name of *Atoms* to the *Molecules* themselves. But we have some Reason to think, that this Author did not thoroughly understand *Asclepiades*, if we reflect upon a Passage of *Galen*, *de Theriac. ad Pison. Cap. 11.* where he says, "That *Asclepiades*, adhering to the Sentiments of *Democritus* and *Epicurus*, with regard to the Principles of Bodies, had only changed the former Names of Things, calling *Atoms* *Molecules*, and a *Vacuum* Pores." But *Galen* himself (*de Hippocrat. & Platon. Decret. Lib. 5. C. 3.*) establishes a formal Difference between the Sentiment of *Asclepiades* and that of *Democritus* or *Epicurus*, in these Words: "Whether, says he, the Bodies of Animals are composed of *Molecules* and Pores, as *Asclepiades* believed, or of small indissoluble Particles, as *Epicurus* imagin'd." The former of the above-cited Books is suspected not to be written by *Galen*; but the latter has undoubtedly him for its Author. The Author of that Book call'd the *Introduction*, *Cap. 9.* which is falsely ascrib'd to *Galen*, informs us, that the Elements of Bodies were, according to *Asclepiades*, ὄγκοι θεαυροί, or *Molecules*, or small brittle Masses; and that it was probably this Brittleness which distinguish'd *Asclepiades*'s Principles of Bodies from those of *Epicurus*, which were indissoluble and indivisible. The Principles of *Descartes* seem, in some Things, to agree with those of *Asclepiades*; and those of *Gassendi* with those of *Epicurus*. *Le Clerc.*

ATONIA, ἀτονία, from a Negative, and τένω, to stretch. Relaxation, Laxity, Debility, or Distemperature. This Word was much in Use among the Physicians of the Methodic Sect, who ascribed the Causes of all Distempers to Relaxation, Stricture, or a Mixture of these.

ATOPOS, ἀτοπος, from a Negative, and τόπος, a Place. It signifies absurd, or inconvenient. It is used by *Hippocrates*, *Aph. 52. Sect. 4.*

ATRA Bilis. See BILIS.

ATRACHELUS, ἀτρέχηνος, from a Negative, and τρέχηνος, the Neck; short-necked. It is used by *Galen*; and sometimes also signifies beheaded.

TRACTOS, ἀτρακτός, a Distaff, or the wooden Part of a Dart. This Word is sometimes used in *Hippocrates*.

TRACTYLIS, Offic. Ger. 1008. Emac. 1171. Raii Hist. 1. 304. *Ατρακτύλις*, Dioscorides. *Atractylis lutea*, C. B. 379. *Atractylis flore luteo*, Park. 963. *Atractylis vera, flore luteo*, J. B. 3. 83. Chab. 353. *Cnicus Atractylis lutea distus*, Hort. Lugd. Bat. 164. Tourn. Inst. 451. Boerh. Ind. A. 140. *Carduus luteus erectus reticulatus, ramis fusum referentibus*, Hist. Oxon. 3. 160. *Carduo-Cnicus Atractylis dicta*, Pluk. Almag. 82. DISTAFF-THISTLE.

The lower Leaves of this Thistle are long and narrow, deeply cut in on both Sides, somewhat hairy, and but little prickly. The Stalks also are hairy, without any Prickles; but the Leaves which grow on them are very full, being smaller, but broader in Proportion than the lower Leaves, stiffer, and not so deeply cut in. The Stalk at the upper End is divided into three or four Branches, on which stand the Flowers, inclosed in stiff hard prickly Leaves, among which grow yellow fistular Flowers in scaly Calices; after which come whitish angular Seeds, like those of *Carthamus* inclosed in Down. It grows in warm Countries, as Italy and Greece, where the Women use the Stalks for Distaffs. It flowers in Summer.

The Leaves only of this Thistle are used, and those very rarely, though some Authors affirm they have the same Virtues with those of *Carduus Benedictus*; and it is particularly commended against the Stinging of Scorpions. *Miller's Bot. Off.*

It is aperitive, sudorific, and a good Antidote against Poison, being taken in Decoction. They extract by Distillation a Water, which hath the same Virtues of the Water of the *Carduus Benedictus*. *Lemery de Drogues.*

ATRAGENE, Offic. *Viorna*, Ger. 739. Emac. 886. Mer. Pin. 125. *Viorna vulgi*, Herm. Flor. 2. 12. Merc. Bot. 1. 77. Phyt. Brit. 130. *Clematis sylvestris latifolia*, C. B. Pin. 300. Boerh. Ind. Raii Hist. 1. 620. Synop. 3. 258. *Clematis Arthragene Theophrasti quibusdam*, Chab. 116. *Flammula sepium foliis integris*, Rupp. Flor. Jen. 54. Buxb. 114. TRAVELLERS JOY.

This Plant is to be found under Hedges, and flowers in the Month of July. The Whole of the Plant is used. Its Flowers, Bark, Seeds, and Root, are of a caustic Quality.

The Bark apply'd to the Skin raises Blisters. *Dale.*

ATRAMENTUM SUTORIUM. Vitriol. Chalcantum. See VITRIOLUM.

ATRAPHRAXIS, or ATRAPHAXIS. A Name of the ATRIPLEX, which see.

ATRECEOS, ἀτρεκέως, from ἀτρεκής, true, certain, has various Significations in *Hippocrates*; for the most part, as *Erotian* says, it is put instead of ἀκριβώς, exactly, and but seldom for ἀληθώς, truly, certainly. The Word is also variously expounded by the Interpreters of *Hippocrates*. In *Bacchius* it signifies ἀληθώς, ἀνιδέως, ἀκριβώς, truly, sufficiently, exactly. In *Philinus* it is ἀκριβώς only: And *Epicles* expounds it by σαφώς, ἐπιεικρῶς, openly, sincerely, perfectly. In *Prognost.* ἡ δύναμις διὰ ὅλην ἡμέραν ἰδὲν τὴν ἀριθμῶσθαι ἀτρεκέως, "none of these (Diseases) can be exactly calculated by whole Days." In *Prorrh.* 2. ἀτρεκέως διατρώμεθα, is one who observes a certain Method of Diet, and Way of Living. And again, in the same Book, ἀτρεκέως δὲ καὶ ἐπὶ πλείον χρόνον τὰς σουλὰς αἰεὶ τῶν δεινότητων ποιέσθαι. "We must very carefully, and for a long time, be upon our Guard against the most formidable Accidents." In his Book of Fractures, ἀτρεκέως δὲ ἰδὲν, "there is nothing certain." In his Treatise περὶ ἁθρῶν, κλῆσις δὲ κατὰ γυναικῶν, ἢ μὲν ἀτρεκέως ἀποκαταστῆναι, "a Fracture of the Clavicle, if it be wholly broken off like a Stalk, that is, transversely." Here *Galen* explains ἀτρεκέως by ἀκριβώς, δὲ ὅλως, ὁλοκλήρως, exquisitely, wholly, quite, entirely.

Ἀτρεκέειν, in *Hippocrates*, signifies an Affeuration, or affirming a Thing for perfectly known and certain. Thus in his second Book of Predictions, ἀμφὶ δὲ τῶν γυμναζομένων καὶ θαλασσιπλοίων, τὰς μὲν ἀτρεκέως τὰς λεγόμενας, ὡς λέγουσιν οἱ λέγοντες, ἕτε δὲ οὐκ εἶναι, ἕτε, ἢ τις δοκεῖ, καλῶς δοκεῖν. "As for what relates to those who fatigue themselves with Labour and Exercise, there are Things asserted for certain Truths by the Relators, to which I give no Credit myself; but, however, leave every one at Liberty to believe them, if he thinks fit."

ATREMEAS, ἀτρεμέας, in *Hippocrates*, is put for ἀτρέμας, (from a Negative, and τρέμω, to tremble) placidly, quietly, remissly. Thus *Book 5. Epid.* ἐν ἀτρεμέας, that is, ἐν ἀτρέμας εἶχεν, he had no Rest, which in *Epid.* 7. is express'd and explained by ἰδὲν ἡρέμειν. Ἀτρέμας is expounded, in *Hesychius*, by ἡσυχίας, ἡσυχῇ, quietly, as ἀτρεμία is by ἡσυχία, ἀτρεμίαν by ἡσυχάζων, and ἀτρεμίαν by ἡσυχάζας. By ἀτρεμέειν, *Hippocrates* means those Parts of the Body which are at Rest; such are understood to be those Parts which are without the Articulation in two Bones which meet at the Joint, as the Parts about the Thigh and the Leg with respect to the Knee. Ἀτρεμέειν, in *Erotian* upon *Hippocrates*, is expounded by ἡρεμούνη, resting, with an Eye to that Passage in his Book of Fractures, καὶ τὰ μὴ ἀτρεμέειν ἐν τῷ τῆς στήθους σχήματι, "those (Bones) which remain not at Rest in the same Posture."

ATRESIA, ἀτρεσία, from a Negative, and τρέω or τρέω, to perforate; Imperforation.

ATRETI, ἀτρετία, imperforate. Those are called so in either Sex, whose Anus or Urethra are not perforated; and Women, whose Vaginas are closed, have also this Name in Chirurgical Writers. See **IMPERFORATIO**.

ATRICES. Small Tubercles about the Anus, which recede, and return again, especially at first. They are, by *Valesius de Taranta* reckoned among Condylomata and Fici. *Castellus*.

ATRICI. Small Sinuses in the Extremity of the Intestinum Rectum, which do not reach so far as to perforate into its Cavity.

ATRIPLEX. There are three Plants which usually go by this Name. The first is the

Atriplex, Offic. Chab. 305. *Atriplex alba hortensis*, J. B. 2. 970. Raii Hist. 1. 191. *Atriplex frut. olus aureum*, Park. Parad. 488. *Atriplex hortensis alba*, sive pallide virens, C. B. 119. Hist. Oxon. 2. 606. Tourn. Inst. 505. Boerh. Ind. A. 2. 89. *Atriplex sativa alba*, Ger. 256. Emac. 325. *Atriplex spuria hortensis candida*, Volck. 53. **WHITE ORACHE.** Dale.

Dioscorides says this Plant is also call'd *Chrysolachanon*.

This is an annual Plant arising yearly from Seed. The Leaves are triangular, but longer than broad, with two Ears, or sharp Pieces, at the End next the Stalk, covered, especially when young, with a slippery Measiness, which may be easily rubb'd off, of a palish-green Colour. The Stalk is angular and branch'd, growing about two or three Feet high, having the Leaves which grow on them somewhat longer than those below, and without Ears. On the Tops grow Spikes of herbaceous Flowers, of a greenish-yellow Colour; which are succeeded by blackish round Seed in flat Seed-vessels, of two round Leaves clapt together. The Seeds are of two Sorts, one smaller by half than the other, and blacker and more shining. There is one Species of this *Orache*, which has the Leaves, Stalks, and Seed-vessels, all of a purple Colour, differing in nothing else from the former. They are both cultivated in Gardens, being used promiscuously. *Miller's Bot. Off.*

It was by the *Greeks* called Ἀτρεφάσις, from ἀτρέως and αὔξω, because it soon grew to a great Height. There are three Species of it, the Red, the pale Green or White, and the blackish *Atriplex*. 'Tis a well known Pot-herb, and very often boiled with Cabbage; though generally 'tis more used by the Poor than the Rich and Luxurious. Yet *Ja. Joseph Joesper*

Manuduct. ad Vit. Long. p. 2. Cap. 8. informs us, that the Inhabitants of *Brabant*, the Low Countries, *France*, and *Burgundy*, esteem it so much, and use it so frequently, throughout the whole Summer Season, that there is scarcely ever a Dinner, or a Supper, in which the Garden *Atriplex* does not make a Part. It affords but little Nourishment, and is cold and moist; but the Humidity it contains is of a softening and mollifying Nature, since the Soup or Victuals among which it has been boiled, proves laxative. It is esteemed good for People of hot, choleric Constitutions, and such as are subject to Vomiting of Blood. But when eaten too plentifully, it renders the Mass of Blood watery, and brings on the Jaundice and Dropsies: For this Reason the Use of it was discarded by *Pythagoras*, as we are told by *Pliny*, L. 2. H. N. C. 20. The same Author also quotes *Dionysius* and *Diocles*, who both assert, that this Herb is very prejudicial to the Stomach, and lays a Foundation for numberless Disorders. The Herb itself, bruised and applied to the Parts in which Thorns or any other small Splinters have been plunged, extracts them, and cures the Wounds occasioned by them. When apply'd to the Navel, it dislodges and expels Worms. It is also used in mollifying Clysters, and in such Dressings as are intended to mitigate and allay Pain. Its distilled Water, mixed with Aloes, stops Hemorrhages, and cures scald Heads. The Seeds are purgative, but often operate like an Emetic. The Country People in *Lombardy* make Pies of this Herb, in Conjunction with Butter and Cheese, which they look upon as excellent Food. In *Virginia* the Inhabitants prepare a Salt from the Stalks of this Herb, which they use in Dressing their Victuals. *Barth. Zorn. Botanologia.*

Dioscorides says the Seeds cure the Jaundice, if taken in Hydromel.

Atriplex sylvestris, Offic. J. B. 2. 972. Raii Hist. 1. 197. Chab. 305. *Atriplex sylvestris altera*, C. B. 119. Ger. Emac. 326. *Atriplex sylvestris, folio sinuato, saturate virente, spica rubra*, Hist. Oxon. 2. 604. *Atriplex sylvestris vulgatio* *sinuata*, Park. 747. *Blitum Atriplex sylvestris dictum*, Raii Synop. 63. *Chenopodium folio laciniato, comâ purpurascete*, Tourn. Inst. 506. Boerh. Ind. A. 2. 90. Buxb. 69. *Chenopodium folio sinuato candicante*, Dill. Cat. 106. **WILD ORACHE.**

The Leaves and Seeds are used as Emollients like the preceding. These, either raw or boiled, are said to discuss Boils. Dale.

Atriplex olida, Offic. Ger. 258. Emac. 327. Raii Hist. 1. 198. *Atriplex foetida*, C. B. Pin. 119. Cod. Med. 16. J. B. 2. 974. Hist. Oxon. 2. 605. *Atriplex foetida & Vulvaria*, Chab. 307. *Atriplex olida, sive sylvestris foetida*, Park. Theat. 749. *Blitum foetidum Vulvaria dictum*, R. Synop. 64. *Chenopodium foetidum*, El. Bot. 406. Tourn. Inst. 506. Boerh. Ind. A. 2. 90. Dill. Cat. 106. Buxb. 68. *Atriplex Chenopodia foetida*, Hort. Monsp. 26. **STINKING ORACHE.** Dale.

The Stalks of stinking *Arrach*, or, as it is usually called, *Orris*, generally lie flat on the Ground, spreading about round the Root, striated or channelled, and of a whitish Colour; the Leaves are small and roundish, and pointed at the Ends, set alternately on the Stalks, and covered over, as is the whole Plant, with an unctuous Measiness; the Seed grows inclosed in Spikes, of small green herby Flowers; being small, black and shining. The whole Plant has a strong fetid fishy Smell: It grows upon Dunghills, and waste Places.

This is an Herb particularly appropriated to the Female Sex, being aperitive and deobstruent, and useful in uterine Disorders, good to promote the menstrual Evacuations, to expel the After-birth, and help Child-bed Purgations, to appease the Strangulation of the Womb, and take off Hysterical Fits. It is usually given in a Decoction. There is a Syrup kept in the Shops, made with the Juice of this Plant and Sugar. *Miller's Bot. Off.*

ATROPHIA, ἀτρεφία, from a Negative, and τρέφω, to nourish. An Atrophy.

Morton defines the different Species of Consumptions thus:

A Consumption in general is a Wasting of the Muscular Parts of the Body, arising from the Subtraction or Colligation of the Humours, and that either with or without a Fever, and it is either original or symptomatical.

An original Consumption is that which arises purely from a morbid Disposition of the Blood, or animal Spirits, which reside in the System of the Nerves and Fibres, and is not the Effect of any other preceding Disease; of which there are two Sorts, that is, an *Atrophy*, and a Consumption of the Lungs.

An *Atrophy* is an universal Consumption proceeding from the whole Habit of the Body, and not from any Distemper of the Lungs, or of any other Entrail, without any remarkable Fever, and is either nervous; or the Effect of Evacuations.

A nervous *Atrophy*, or Consumption, is that which owes its Original to a bad and morbid State of the Spirits, and to the Weakness or Destruction of the Tone of the Nerves; from whence, an Imbecillity, and an universal Consumption in the whole Habit of the Body, ultimately proceed from the want of a due Assimilation of the nutritious Juice; so from the Beginning

ning of the Disease there is to be found a want of Appetite, and a bad Digestion in the Stomach, from an imperfect Elaboration and Volatilization of the Chyle. Which Sort of *Atrophy* may justly be reckoned one of the fatal Symptoms of the Scurvy.

An *Atrophy* from Inanition is that which derives its Original from a preternatural Defect or Subtraction of the nutritious Juice, and that long and habitual, which differs according to the Variety of the Outlets formed in the Body either by Nature or Art, by which this precious Liquor either has or may run off, and be wasted.

A Consumption of the Lungs is an universal Wasting of the Parts of the Body, caused by some Distemper of the Lungs, as Infarctions, Swellings, Inflammations, and Exulcerations; and thence it is attended with a Cough, Difficulty of Breathing, and other Symptoms of the Breast; and accompanied with a Fever, which at first is slow and hectic, afterwards inflammatory, and at last putrid and intermitting.

A Symptomatical Consumption is that, which, though it immediately proceed from a preternatural and ill State of the Blood and Spirits, yet has a mediate Dependence upon some other preceding Disease, which impress'd that morbid Disposition on the Spirits and Humours.

A NERVOUS ATROPHY.

A Nervous *Atrophy*, or Consumption, is a Wasting of the Body, without any remarkable Fever, Cough, or Shortness of Breath; but it is attended with a Want of Appetite, and a bad Digestion, upon which there follows a languishing Weakness of Nature; and a wasting of the Flesh, every Day more and more. Which kind of Consumption I have sometimes observed in England, but most frequently amongst those that have lived in Virginia, after they have come over hither.

In the Beginning of this Disease the State of the Body appears cedematous and bloated, and, as it were, stuffed with dispirited Chyle; the Face is pale and squalid, the Stomach loaths every thing but Liquids, the Strength of the Patient declines so fast, that, before the fleshy Parts of the Body are evidently consumed, he is render'd feeble, and almost always confin'd to his Bed. The Urine also keeps not constant to any Colour, tho' for the most part it is high-colour'd, and but little in Quantity; yet it is sometimes, (as it frequently happens in Nervous Distempers) tho' seldom, pale and plentiful. But there is no considerable Fever to be discover'd either by the Pulse, or a Thirst, or Heat, how high-colour'd soever the Urine appears: So that the Pathognomonic Signs, or those which evidently manifest the Beginning of this Consumption, are, a Decrease of the Patient's Strength, and a Loss of Appetite, without any remarkable Fever, Cough, or Shortness of Breath, tho' in the Progress of the Distemper, when a Consumption of the Flesh has gradually affected the whole Habit of the Body, there is some Difficulty and Uneasiness in Breathing to be observed, as it happens to all those who are very weak.

The immediate Cause of this Distemper I apprehend to be in the System of the Nerves, and proceeding from a preternatural State of the Animal Spirits, and the Destruction of the Tone of the Nerves, whence I usually call this a Consumption in the Habit of the Body. For as the Appetite and Digestion are destroy'd, thro' the weak and infirm Tone of the Stomach, so also the Elaboration, Assimilation, and Volatilization of the nutritious Juices, are hinder'd, in the whole Habit of the Body, from the distemper'd State of the Brain and Nerves.

The Causes which dispose the Patient to this Disease, I have generally observed to be violent Passions of the Mind, the intemperate Drinking of spirituous Liquors, and an unwholesome Air, by which it is not surprising that the Tone of the Nerves, and the Temper of the Spirits, should be destroy'd.

This Distemper, like most nervous Diseases, is Chronical, but very hard to be cured, unless a Physician be called at the Beginning. At first it flatters and deceives the Patient; for which Reason it usually happens, that the Physician is consulted too late. It terminates in an Hydropical and Oedematous Swelling of the Body, especially of the lower and depending Parts: In which Case no Hopes remain of the Patient's Life, neither is there any thing more to be done for his Cure, than giving him some Ease, whereby his miserable Life may be protracted for some Days.

The CURE.

The Cure, if attempted in due Time, consists in the convenient Use of Stomach Medicines, and such as comfort and strengthen the Nerves, such as Chalybeates, antiscorbutic, cephalic, and bitter Medicines of all Sorts: For Example,

Let the Patient, if his Body be cossive, take every third or fourth Morning four Ounces of the bitter Decoction, with Sena; or every fourth Night, two Ounces of the Tinctura Sacra, or of our sacred Cephalic Tincture, made with the Species of Hiera Picra infused in Rue-water, Black Cherry-water, and strong Piony-water.

For his common Drink let him use Ale, in which a Bag of Cephalic and Antiscorbutic Ingredients has been suspended. An Hour before Dinner let him take thirty Drops of *Elixir Proprietatis* in a Draught of Wormwood White-wine. To the Region of the Stomach let there be applied the magisterial Stomach-plaister, with some Drops of the Chymical Oil of Cinnamon, and Oil of Wormwood. Or let the Stomach be fomented every Day with French Claret, in which Aromatic Bags of the Leaves of Mint, Wormwood, Cinnamon, Mace, Zedoary, Galangal, Cyperus-roots, and Calamus Aromaticus, have been boiled. If it be in the Summer, let him use the Chalybeate Waters; but if Winter, let him make Use of a Chalybeate Syrup, or our Chalybeate and Aromatic Wine, made with the Filings of Steel quenched three or four times in strong White-wine, and with Zedoary-roots, Galangal, Nutmegs, the best Cinnamon, Mace, Cubebs, Cloves bruised, and steeped in the same Wine. But for Chalybeates, I prefer *Mynsicht's* Extract before any other, which I order to be given for twenty or thirty Days, in the Form of a Bolus, or Pills. For Example:

Take of *Mynsicht's* Extract of Steel, half a Scruple; Balm of Gilead, (which in this Case is very proper and beneficial, because it is not a little grateful to the Stomach and Nerves) seven Drops; old Conserve of red Roses, a Dram: Mix them, and make them up into a Bolus, to be repeated every Day: Or if the Patient chooses to take Pills, let the Extract be made up into that Form, in the manner following:

Take of *Mynsicht's* Extract of Steel, half a Scruple; of Balm of Gilead, seven Drops; of *Haly's* Powder, six Grains; of the compound Powder of the Roots of Arum, four Grains; of Powder of Liquorice, as much as will make them into the due Consistence of Pills: Make the Mass into Pills of a middle Size; let them be gilded, and repeated once every Day.

Opobalsamum also by itself, as likewise Spirit of Hartshorn, and Spirit of Sal Ammoniac, are of Use in this Case, because they are good for the Nerves. For Example:

Let the Patient take eight or ten Drops of Opobalsamum, or Spirit of Hartshorn, in a convenient Quantity of Sugar-candy, twice a Day.

Let the Patient endeavour to divert and make his Mind cheerful by Exercise, and the Conversation of his Friends: For this Disease almost always proceeds from Sorrow and Cares. Let him also enjoy the Benefit of an open, clear, and very good Air, which very much relieves the Nerves and Spirits. And because the Stomach in this Distemper is principally affected, an agreeable Diet will be convenient; and the Stomach ought not to be too long accustomed to one Sort of Food.

Of an ATROPHY from INANITION.

To this sort of original Consumption from the whole Habit of the Body, belongs also another kind of Consumption, arising from the Impoverishment of the Blood, occasioned by the preternatural Subtraction and Loss of the nutritious Juice. Whence the whole Mass of Blood, being deprived of the nutritious and balsamic Juices, grows too hot, affording none or very little Nourishment to the muscular Parts; and hence there follows a Consumption of the whole Body, and an hectic Heat fixed in the whole Habit, without any considerable Cough, or Difficulty of Breathing, or any other remarkable Affection of the Lungs, at least, in the Beginning of the Distemper. But it must be confessed, that, in the Progress of it, the Lungs seem to be, in some measure, affected, especially where the preternatural Evacuations, which are the Cause of the Distemper, are stopped by Art without any Correction of the whole Mass of Blood, by which means it may recover a natural balsamic Nature, and such as renders it fit for Nourishment. In this Case it is not surprising, that the hot and sharp Serum of the Blood continually passing, after the Passages where it used to be evacuated are stopped, through the soft and glandulous Substance of the Lungs, at last should stuff, inflame, and in the Progress exulcerate them; whereby it comes to pass, that this Consumption, which was originally in the Habit of the Body, a little before Death ends in a Consumption of the Lungs, with a Cough, Difficulty of Breathing, and other Pathognomonic Signs of that Distemper. And therefore I have often observed, that if the Appetite and Digestion are not restored by such Medicines as have a peculiar Quality of altering the Blood, and strengthening the Stomach, so that the Mass may be supplied and filled with a sweet and balsamic Juice, the Consumption is not cured; but at last is changed from a Consumption in the Habit of the Body, to a fatal Consumption of the Lungs.

And this Consumption is indeed akin to the Nervous Consumption before-mentioned. For as in that, which proceeds from

from a preternatural State of the nervous Juice and Spirits, the nutritious Chyle which is continually carried into the Blood, is rendered less fit for the Nourishment of the Parts; and thence, as the Mass of Blood is loaded with stale and dispirited Juices, such as are unfit for Nutrition, and there being no Demand for fresh, a Loss of Appetite ensues, and a Sickness of the Stomach, and consequently a Consumption of the whole Body, and at last a fixed hectic and colliquative Heat in the solid Parts, from the Heat of the Blood and Spirits: So in this kind of Consumption, the nutritious Juices running off from the Mass of Blood with a full Stream, the muscular Parts of the Body, being thus deprived of their due Nourishment, fall into an *Atrophy*; whereupon likewise the Mass of Blood which remains, for want of new balsamic Chyle, is not only dispirited, and rendered unfit for Nourishment, but a preternatural, fixed and hectic Heat is kindled, not only in the Blood, but also in the Spirits, and all the solid Parts; whereupon there follows a Drought and want of Appetite. This kind of Consumption is that, which we are now in the first place professedly to treat of. But because the Cure of this kind of Consumption is to be altered, according to the Variety of the Evacuations, which are the Cause of it, I shall add nothing concerning the general Cure of it, but refer that to the several kinds of Evacuations, which are the Cause of this Distemper, to be spoken of under their proper Heads.

The things which cause these Consumptions, according to Morton, are

An Hæmorrhage.
A Gonorrhœa, or Fluor Albus.
Abscesses and Ulcers.

Giving Suck beyond what the Strength of the Nurfes can bear.

A Dysentery, or Diarrhœa.
A Diabetes.
A Salivation.
A Dropsy.
Profuse Sweats.

Consumptions from all these Causes will be treated of under their respective Articles.

Besides the Causes above-mentioned, this general Consumption, proceeding from Evacuations, frequently depends upon other Distempers; and therefore it may justly be called a general *Symptomatical Consumption*: As first, upon a Lientery, that is, when the Faculty of the Stomach, which makes the Chyle, is injured by a preternatural Disposition of the Spittle, and the ill Temper of the nervous Liquor: Whence it comes to pass, that the Blood and Habit of the Body (since the Food that is taken is carried down through the Intestines, and comes away as it went in, without any Alteration) cannot receive any Recruits from the Food; and from hence there necessarily follows an *Atrophy* caused by Inanition.

Many times this general Consumption proceeds from a preternatural Alteration, or Obstruction of the Gall and Pancreatic Juice, or else of the Juices, which naturally use to be separated by the small Glands, planted through the whole Duct of the Intestines, and which serve for the Separation of the excrementitious Parts of the Food from those which are nutritious. Hence the chylous Parts of the Food, which pass out of the Stomach, slipping by the small Orifices of the Lacteals, are thrust together with the Excrements by Stool; and that either white, and as such are evidently chylous from the Defect, or preternatural Disposition of the Bile, (which is the proper Menstruum for separating the Chyle) as it commonly happens in the Jaundice, together with a great Weakness of the Body, and wasting of the Flesh; or else in yellow Stools, as in the Cæliac Passion, which either is from an Obstruction of the Pancreatic Juice, and that which is separated by the Glands of the Intestines, or happens from the Depravation of the Nature of those Juices. In the first Case, the Urine is much tinged with a yellow, or Jaundice-colour; but in the latter, it is quite contrary. In both of them, the Chyle not being separated from the excrementitious Parts of the Food, the Blood is deprived of its due Recruits; upon which I have often observed, that an *Atrophy*, or Consumption, and that a very acute one, has seized the Patient.

Lastly, this general Symptomatical Consumption is sometimes caused by many and large scrophulous Kernels preternaturally situated in the Mesentery, by which (the Lacteals being straitened as with a Thread, or being compressed) the Passage of the nutritious Liquor, which is separated in the Intestines, and taken in by the Mouth of the Lacteal Vessels, into the Mass of Blood, is either totally, or in part, hindered; in which Case the Stools are large and chylous, the Belly grows hard, and is swell'd; but the Urine flows in a very little Quantity, yet keeps its natural Colour; thereupon, the Blood not being every Day replenished with fresh Chyle, the muscular Parts are deprived of their due Nourishment, and daily become thin, and at last are wasted to the degree of a Marasmus; though the Appetite at the same time be keen, and the Patient continues

always free from any thing of a Fever; an Instance of which kind I once met with in a Boy about four Years old.

All these Symptomatical Consumptions are evidently incurable, unless a particular Respect be first had to the Distempers upon which they depend; but if these are once removed by Art, this kind of Consumption ceases of its own Accord; and therefore the Cure of this Consumption is to be sought for in another Place; that is, in the Cure of those Distempers which are the Cause of it.

ATTA, ἄττα, Father, an antient *Pelasgic* Word, in another Dialect, ἄττα. Ἐπιθεγμα τιμωμένων νεώτερος πρὸς παλαιότερον, Didymus. "A Compellation of Honour given by a younger Person to an elder." We say *Atta* to an old Man, by way of Reverence, as if we called him *Avus*, "Grandfather." *Festus*. Children, in Lissping, doubled the Letters, as ἄττα, τᾶτα, τᾶττα, or τῆττα ἄττα, πάπας, πάππας, or πάππας, ἄμμα, μάμμα. The Egyptians said ἄτ, τᾶτ, and ἄθ, θᾶθ. Our Britons (Welsh) call Father and Mother by no other Names but *Tat* and *Mam*.

ATTA is also a Name for such as have an infirm Tread in their Walk, LIMPERS. "Atta, one who walks on the Fore-part of his Feet." *Isidorus*. ἄττα, ὁ τοῖς ποσὶν ἀρχόμενος πρὸς πᾶσιν, *Vet. Gloss.* that is, "who first sets his Foot to the Ground," from the Verb ἄττω, or ἄωω, to hop, or limp, which is a Contraction from ἄνωω, or ἄττω. The following Passage of *Festus* has also a Relation to this Matter: "The ἄττα, says he, are such as, on account of some Defect in their Legs or Feet, stand upon their Soles, and seem rather to touch the Ground than walk; hence *Quintius* the Poet, who was remarkable for this Defect, got the Nickname of ἄττα, which always stuck by him."

ATTAGAR, a Stone. *Rulandus*.

ATTAGEN, ἄτταγᾶς, or ἄτταγῆν, an *Asian* Partridge, commonly called a *Francolin*. The Greeks called it λαγόπτερος, (whence *Lagois* in *Horace*) *Leporipes*, or *Leporarius*, "Hare-foot," because of its downy Feet, wherein it resembled those of a Hare. *Pliny* calls it *Attigena Phrygia*. To me, ἄτταγᾶς, seems to be a *Phrygian* and *Pelasgic* Word, and to sound like ἄττα γᾶς, "the Father, or Chief, of the Country;" for this Bird was in principal Esteem for its delicious Savour. But ἄττα γᾶν, would be more like the *Phrygian*; γᾶν, or γᾶνθ, is the *Hebrew* גַּן *Gan*, the *Syriac* גַּנָּא *Ganna*, and the *Arabic* *Ginna*, which was the Name they had for their verdant Garden, or Paradise. In the same Form of speaking did the *Phrygians* call a He-goat ἄτταγᾶς, according to *Arnobius*, as being ἄττα γᾶς, "the Father of the Goats;" for the *Scythian* *Cas* is our Goat, and the *Hebrew* קֵזֶשׁ *Qesh*. Of the *Attagen* thus speaks *Martial*:

*Inter Saporess fertur Alitum primus
Ionicarum Gustus Attagenarum.*

And *Aristophanes* in *Athenæus*;

ἄτταγᾶς ἡδίστον ἐστίν ἐν Ἐπινικίῳ κρέας.

"The Flesh of an *Attagen* is the sweetest that is dressed at publick Feasts."

Horace also;

*Non Asra Avis descendat in Ventrem meum,
Non Attagen Ionicus.*

Pliny also says thus of it: *Attagen maxime Ionicus celebratur, vocalis alias, captus obmutescens, quondam existimatus inter raras Aves*: "The *Attagen* of *Ionia* is the most celebrated; it makes a Noise when at Liberty; but is mute after it is taken. Formerly it was reckoned one of the rarest Birds." Ὁ ἄτταγῆν κομιστὴς ὄρνις τῶν γὰρ ὀρνίθων ὅσοι μὲν μὴ πτερυγίζουσιν, ἀλλ' ἐπιγῆστοι, κομιστῆς. "The *Attagen* is a pulverarious Bird; for all Birds that make little Use of their Wings in flying, but keep themselves upon the Ground, are called *pulverarious*." *Athenæus* tells us, that the *Attagen* is a little bigger than a Partridge, and thus describes its Colours: Ὀλὴ καλὰ γὰρ ἐστὶν τὰ περὶ τὸ νῶτον, καὶ γὰρ τὴν χεῖρα, ὑποπυρρίζων μᾶλλον. "It is all over the Back of the Colour of a Tile, only somewhat more upon the Red."

By all these Circumstances, the *Attagen* must be the same as our Red-game, which is thus distinguished:

ATTAGEN, Offic. Aldrov. Ornith. 2. 75. Bellon. des Oyse. 241. Jonf. de Avib. 41. Gefn. de Avib. 199. *Attagen Aldrovandi*, *Francolino Italorum*, Raii Ornith. 174. Ejusd. Synop. A. 54. *Attageni Aldrovandi seu Francolino Italorum*, Will. Ornith. 125. *Lagopus altera Plinii*. An *Gallina Corylorum*, Schw. A. 277. THE GOR-COCK, MQOR-COCK, or RED-GAME.

Oribasius says, *Medic. Collect. Lib. 1. Cap. 3.* that the Flesh of this Bird is best in Autumn. And in the same Collections, *Lib. 2. Cap. 42.* he says, it is of very easy Digestion. And *Aetius* in this agrees with him.

Trallian recommends this Bird in a Phthisis; *Galen*, in Nephritic Complaints; and *Avicenna* believed it increased the Seminal Secretions.

The Inside of the Gizzard of this Bird is extremely fragrant when fresh kill'd.

The Red-game lives principally on Vegetables, and uses but little Exercise, scarcely ever being on the Wing, unless to avoid Danger: Hence it does not abound with highly exalted Salts. It is a very agreeable and wholesome Food.

ATTALUS, and ATTALICUS, are Names appropriated to some compound Medicines, mentioned by *Galen*, and transcribed from him by others.

ATTELABUS ARACHNOIDES.

ATTELABUS ARACHNOIDES (*Aldrov. Jonst.*).

This is an aquatic Insect, which partakes of the Nature of the Spider and Grasshopper: The Head resembles a Grasshopper; the Eyes are prominent. The other Parts resemble a Spider, but it has but six Feet; it swims on the Water, or creeps upon the Earth. It is Ash-coloured.

It is esteemed resolute, when externally applied. *Lemery des Drogues.*

It is a sort of Locust.

ATTENUANTIA.

Attenuating or *inciding* Medicines are of the utmost Importance in Physic, as a little Reflection upon their Natures, Qualities, and Manners of Operation, will easily convince us. To this Class belong the *Roots* of White Burnet, Arum, Sweet-flag, Asarabacca, Wild-radish, Elecampane, Succory, Florentine Orris, Solomon's-seal, Swallow-wort. The *Herbs* German Leopards-bane, Brook-lime, Scurvy-grass, Water-cresses, Indian Cresses, Dittander, Rosa Solis, Fumitory, Marsh Trefoil, the Lesser Centaury, Hyssop, Germander, Chervil, Carduus Benedictus, the Lesser Houfleeck, all the Species of Garlicks, Onions, and Leeks; Wood of Guaiacum with its Bark; of *Spices*, Pepper and Ginger; the *Seeds* of Mustard, Scurvy-grass, and Cresses; the *Gums* Ammoniac, Galbanum, Sagapenum, Opopanax, Myrrh, and Benzoin; of *Chymical and Pharmaceutical Preparations*, Mercurius Dulcis, Æthiops Mineral, Flowers of Sulphur, alkaline fixed Salts, and the Salts of Vegetables prepared by Incineration, but especially the Salts of Tartar and Wormwood; Salts also of a neutral Quality, such as the *Digestive of Sylvius*, my own aperient Salt, Sal Ammoniac, Sal Polychrestum, *Epsom* and *Sedlitz* Salts, vitriolated Tartar, the *Terra foliata Tartari*, otherwise called *Tartarus Regeneratus*, the *Arcanum Duplicatum*, a Solution of Crabs-eyes, Nitre and Sal Ammoniac. Volatile Substances also, such as the volatile Salt of Sal Ammoniac, and the urinous Spirit of Sal Ammoniac; as also Oxymel of Squills, acrid Tincture of Antimony, Essence of Gum Ammoniac, and of Guiney Pepper; Resin of Guaiacum, and the Syrups of Tobacco, Hedge Mustard, and the Fecula of Aron. Medicated Springs also belong to this Class, which, besides their diluting and aperient Natures, are also possessed of an attenuating Quality, such as the acidulated Springs of *Egra* and *Sedlitz*, and the *Caroline Waters*; as also Infusions in the Form of Tea, which in Consequence of the copious watery Principle they contain, possess a remarkably attenuating Quality, and are very efficacious in separating and disjoining coalescent Molecules; and, in the last place, to this Class of Medicines belongs sweet Whey, which, in Consequence of the sweet and subtle Salt with which it is impregnated, is of a highly deterfitive Quality, and wonderfully efficacious in opening the Excretory Ducts.

Of the above-mentioned Substances, some act upon the fluid, and others upon the solid, Parts of the human Body. Such as operate upon the Fluids by immediate Contact, are very few in Number; and indeed this Effect is only to be ascribed to watery Diluents, which are, without Doubt, of singular Efficacy in colliquating the glutinous and viscid Humours; and to alkaline, fixed, volatile, and nitrous Salts, which, if mixed with the inspissated Blood and Humours, especially when in a liquid Form, colliquate and attenuate them in so powerful a manner as to be perceptible even to the Eye. All the other attenuating Medicines mentioned, act only upon the Solids by increasing their Tone, augmenting their Strength, heightening their contractile Force, and adding to the Elasticity and systolic Motion of the Vessels, by which means they press and shake their contained Juices more forcibly, and accelerate their progressive and intestine Motions; so that the tenacious and viscid Humours, being thus frequently and forcibly carried through the minute and capillary Vessels, are by that very means divided and broken into smaller Globules; a Circumstance absolutely necessary for preserving their due Degree of Fluidity. Among those attenuating Medicines which operate upon the Solids, some produce their Effects by means of a considerably fixed and acrid Salt; such as the Roots of Arum, White Burnet, Asarabacca, Florentine Orris, and Solomon's-seal; the Herbs German Leopards-bane, Dittander, Rosa Solis; as also Pepper and Ginger, which, though of a pungent Taste, yet neither yield an acrid volatile Oil, nor a Water of an acrid Taste,

when subjected to Distillation with Water, which sufficiently proves their fixed Nature. Others again of the attenuating Medicines, which operate upon the Solids, produce their Effects by means of an acrid subtle volatile Salt, such as the Wild-radish, Elecampane, Cresses, Scurvy-grass, Mustard, and all the Species of Garlicks, Onions, and Leeks. Some *Attenuants* also operate by means of a neutral stimulating Salt, of which Kind are those neutral Salts, whose Acrimony, and irritating Quality, are not only discovered by the Taste, but also by their proving purgative or diuretic, when exhibited in pretty large Doses. Other *Attenuants* again, operate by means of an acrid Salt, impregnated with a large Quantity of sulphureous Particles, which is evidently the Case with Gum Ammoniac, Sagapenum, Opopanax, as also Guaiacum and its Resin, which, besides an acrid Salt, contain also an Oil, which they yield in great Abundance when subjected to Distillation. And, in the last place, some *Attenuants* operate by means of a subtle penetrating and metallic Salt, such as Mercury, especially Mercurius Dulcis, and Æthiops Mineral.

Attenuating and *inciding* Medicines are of very extensive Use in the Practice of Physic, and come under different Denominations, according to the different Effects they produce. Thus, when tenacious and viscid Juices not only stagnate in the Cavities of the Vessels, but obstruct the minute Ducts of the Viscera, and Emunctories, these Medicines by their *inciding* and *attenuating* Quality, discharge the Humours, and remove the Obstructions; for which Reason they may not improperly be called *Aperients*. They also deserve the Name of *Antiscorbutics*, and Sweeteners of the Blood; for since the Purity and proper Temperament of the vital Juices depend upon the due *Secretion* and *Excretion* of every thing superfluous and recrementitious in the Constitution; and since the necessary Degrees of *Secretion* and *Excretion* are intercepted by the minute Ducts of the Glands and Emunctories being blocked up by thick and viscid Juices; 'tis therefore obvious, that such Medicines as *attenuate* the inspissated Humours, and remove the Obstructions, must be Sweeteners of the Blood, and excellent Remedies against the Scurvy, in which the Humours have evidently lost their due Temperament, and are become impregnated with heterogeneous, viscid, saline, sulphureous, and acrid Particles. Now, since *attenuating* Medicines produce so great a Variety of different Effects, 'tis highly proper we should know what Species of *Attenuants* are best adapted to such and such particular Disorders.

The Intention therefore of dissolving and *attenuating* viscid Crudities in the Stomach, and *Prima Viæ*, is excellently answered, by the Roots of Arum, White Burnet, and Sweet-flag; by Pepper, Ginger, depurated Sal Ammoniac, vitriolated Tartar, *Arcanum Duplicatum*, the digestive Salt of *Sylvius*, my aperient Salt, Salt of Wormwood, the simple Spirit of Salt, or Spirit of Salt dulcified, as also the aperient Tincture of *Mæbius*. And when crude and un concocted Humours are to be evacuated by Stool, this Intention is very well answered by the neutral Salts, especially those of *Sedlitz* and *Epsom*, and the *Sal Polychrestum* exhibited in pretty large Doses, and in Conjunction with a sufficient Quantity of a watery Vehicle.

When viscid Humours, occasioning Disorders of the Breast, are to be *attenuated* and expectorated, the Intention is most effectually answered by the Roots of Elecampane, and Florentine Orris, by Rosa Solis, Hyssop, Germander, Maiden-hair, Gum Ammoniac, Myrrh, Benzoin, Sulphur, Balsam of Peru, Nitre prepared with Antimony, the *Terra foliata Tartari*, otherwise called *Tartarus Regeneratus*, Oxymel of Squills, a Solution of Crabs-eyes in distilled Vinegar, and the Syrups of Tobacco and Hedge-mustard.

When the Mass of Blood is tainted with thick and tenacious Sordes, and the Emunctories are by that means obstructed, and the Humours contaminated by a saline, sulphureous, and scorbutic *Dyscrasy*, the most efficacious of the *Attenuants* are, the Root of the Wild Radish, Scurvy-grass, Water-cresses, Indian Cresses, Dittander, Brook-lime, the lesser Centaury, Marsh Trefoil, Carduus Benedictus, Fumitory, the lesser Houfleeck, Mustard, Gum Ammoniac, Sagapenum, Myrrh; the Oil of fix'd Nitre per Deliquium, Oil of Tartar per Deliquium, a Solution of Nitre, my temperate Elixir, acrid Tincture of Antimony, Essence of the Woods, Spirit of Sal Ammoniac, Salt of Wormwood, with Citron Juice; as also the Salts of the medicated Waters of *Sedlitz* and *Egra*.

When grumous or coagulated Blood, occasioned by Blows or Contusions, is to be attenuated, and again dissolved, the Intention is admirably answer'd by the Root of Solomon's Seal; by the Herbs German Leopard's-bane and Chervil, Vinegar distill'd with Crabs-eyes, the *Terra foliata Tartari*, and Nitre prepar'd with Antimony.

In Cases where the Lymph has acquir'd a preternatural Thickness and Viscidity, especially from a Venereal Taint, the Curative Intention is best and most effectually answer'd by Guaiacum, Soapwort, acrid Tincture of Antimony, Mercurius Dulcis, and Æthiops Mineral, which, when cautiously and

add skilfully used, is of singular Efficacy in resolving and attenuating the viscid Juices impacted on the Glands and Liver. *Hoffman, Vol. I. Sect. 2. Cap. 4.*

ATTENUATIO, Attenuation. See **ATTENUANTIA**.

ATTICUS, Ἀττικός. *Attic*, of *Attica*, *Athenian*. The *Attic Honey* is frequently mention'd by Medicinal Writers as the best.

ATTICUM, Ἀττικόν, should be the Name of a Plaister, by the Use *Hippocrates* makes of it in the fourth Book of *Epidemics*, where he says, a certain Person had an Ulcer in the Leg, and anointed it with *Atticum*, Ἀττικόν. Ἀττικόν is also sometimes used as an Epithet for Ἀγνός, or χύτρος, and signifies an *Attic Vessel*.

Attic Wax is mention'd by *Scribonius Largus*.

ATTILUS. A River Fish, very common in the *Po*, not unlike the Sturgeon. The Flesh is flabby, and not very agreeable.

ATTINCAR VENERIS. The Albification of Copper, in order to transmute it into Silver.

ATTINGAT. The same as *Flos Æris*. See *Æs*.

ATTINGIR. An Earthen Box. *Rulandus*.

ATTONITUS MORBUS, An Apoplexy. See **APOPLEXIA**.

ATTRACTIO, Attraction, Drawing.

ATTRACTIVUM, Attractive. *Paracelsus* gives the following Account of his **SPECIFICUM ATTRACTIVUM**.

It attracts, says he, every thing superfluous in the Body, and draws out of it every thing of a hurtful Quality; for some attractive Specifics are in their own Natures so exquisitely calculated to operate on Flesh, that they will attract an hundred Pounds of it, in the same manner as a Loadstone does Iron. It happen'd in our own Days, that an Attractive of this Kind drew a certain Man's Lungs up into his Mouth, by which he had the Misfortune to be suffocated. Another was also so unlucky, as to have the Pupil of his Eye drawn from its natural Situation to his Nose by the same Means, after which there was never any Possibility of restoring it; for there are not only Attractives accommodated to Iron, but also to Wood, Herbs, Flesh, and Water; for I myself saw a Plaister which attracted as much Water as was sufficient to fill a Cistern; and the Water flow'd from it just as if it had fallen from the Top of some House.

In like manner, Lead, Tin, Copper, Silver, and Gold, may be attracted by certain Compositions of Attractives; and, by these very Attractives, Branches may be torn from Trees; and, which is still more surprising, a Cow may be carried up into the Air.

For this Reason we are to apply some Medicines of an attractive Quality, in order to extract from the Body every thing of a hurtful and corrupt Nature, that what is prejudicial may be separated from what is profitable. These Attractives are to be apply'd upon an Emunctory in the Part affected, or upon an Ulcer which supplies the Place of an Emunctory; or, if a Gland should present itself, it is to be open'd like an Emunctory; for I know from my own Experience, that an Attractive of this Kind has extracted and eliminated the Matter, which occasioned a Plague, in a more effectual manner than on this Occasion it may seem proper to mention. No Patient, however formidable his Distemper might have been, ever died by having this Medicine administer'd to him. The following is a Receipt for preparing this Attractive:

Take of the Quintessence of each of the Gums, one fourth Part; of Magistery, one half that Quantity; of fiery Element of Amber, one Pound; of fiery Element, Mastich and Myrrh, each one fourth Part and an half; and of Element of Scammony, ten Ounces. Of all these make a Cerate, with Wax, Gum Tragacanth, and Turpentine, to be used in the Manner above directed. *Paracels. Archidox. Lib. Sept.*

Notwithstanding the Gravity and Air of Importance which it is sometimes expected a Physician should assume, as there is no Crime, or even Indecency, in Laughing, I have inserted the preceding Paragraph from *Paracelsus*.

Attractivus is also apply'd to any Remedies to which the Faculty of drawing or attracting is attributed.

ATTRACTORIUS, Attractive; endow'd with the Power of attracting.

ATTRAHENS, is used much in the same Sense as the preceding.

ATTRITA. Galls from Attrition, or rubbing one Part against another. See **INTERTRIGO**.

ATTRITIO. A superficial Galling of the Feet, Thighs, or any other Part, by Walking, or otherwise.

Attrition is also a Word much us'd in Medicine and Philosophy, to express the rubbing two Bodies against each other, so as to wear away their Surfaces, or to excite Heat, without any Loss of Substance. Or it is in general a rubbing together.

ATTY-ALU. The Indian Name for the *Ficus Malabarica*. Vol. I.

barensis, folio oblongo acuminato, fructu vulgari amulo. Raii Hist.

ATUREB. *Rulandus* explains this, if it may be call'd an Explanation, by *Vitrum Azazeze*; but does not tell what *Azazeze* is; neither does *Castellus*.

ATYPOS, ἀτυπος; from a Neg. and τυπος; a Form; or Tenor. Erratic, irregular. It is apply'd to Diseases which have no Regularity in their Periods. It also imports a Deformity of the Limbs. But ἀτυποι, Atypoi, from a Neg. and τυπος, to strike; signifies People who, by some Defect in the Organs of Voice, cannot strike the Air so as to articulate certain Sounds.

ATZOYATL. The Mexican Name for the *Mirabilis Mexicana*, the Marvel of Mexico, which Ray says is a very different Plant from the Marvel of Peru. *Raii Hist. Plant.*

AVACCARI.

Avaccari, (*Garcia*) is a little Indian Tree, the Leaves, the Flowers, and the Fruit of which resemble Myrtle; but a great deal more astringent. It grows on Mountains; and in the Province of *Malabar*.

They esteem this very much in the Country where it grows; for inveterate Dysenteries proceeding from a cold Cause. *Lemery des Drogues*.

AVANACU. See **CADEL-AVENACU**.

AUANSIS, ἀυανός; from ἀνα, to dry. Exiccation in general, but properly of Plants thro' Age.

AUANTE, αὐαντή, or αὐαντή, derived from the same Verb as the preceding. It may be translated, the dry Disease. *Hippocrates*, in his second Book de Morbis, gives the following Account of it.

The Patient can bear neither Abstinence nor Eating. When Fasting, he has a Rumbling in his Belly, with a gnawing Pain in his Stomach, and vomits up Variety of Matters, as Bile, Saliva, Phlegm, and an acrimonious Matter; and after Vomiting seems to be a little easier. After Eating he is molested with Eructations, and an inflammatory Heat and Redness. He always fancies he has occasion to make a plentiful Stool; but, when he is upon the Seat, discharges nothing but Wind. He is afflicted with a Pain of the Head, and a Sense of Pricking as with Needles, in different Parts of his Body. His Legs seem heavy, and grow feeble and extenuated, and he becomes very weak.

In this Case, a Purge must be first given, and afterwards a Vomit; and the Head in particular ought to be purged. The Patient is to abstain from sweet, oleous, and fat Kinds of Food, and not indulge himself in Drinking. After Meals, provoke Vomiting with the Juice of *Ptisan*; and, if the Season will permit, after drinking Asses Milk, or Whey, let him take a Vomit or a Purge, as the Physician shall think most suitable to his Case. If it be Spring or Summer, let him bathe in cold Water: if it be Autumn or Winter, let him use Unctions; Walking, and moderate Exercise; but if he be too weak to bear Exercise, let him take a Journey: His Diet must be cooling and laxative; but if the Belly be costive, you are to open it with an emollient Clyster. This is a Chronic Disease, and does not forsake the Patient till Old Age, and then either takes its Farewell, or accompanies him to his Grave. *Hippocrates, apud Vesalium, Lib. 2.*

This Distemper is, by *le Clerc*, placed among those which have not preserved the Name by which *Hippocrates* called them, but which may be known by the Accidents which accompany them. This, by the Description, the above-mention'd Author takes for *Hypochondriacism*.

AVANTURINE, is a reddish or yellowish Stone, cover'd all over with Sparkles which resemble Gold, which make it look agreeable to the Sight. There are two Species of these, one natural, and the other artificial: The natural is found in many Parts of *France*, They mix it in Powder, which they put upon Paper to render it shining.

The artificial is made by Vitrification, or by mixing Sparkles of Copper with Glass, whilst it is in Fusion.

It is used by Enamellers, but I don't know; that it is employ'd in Medicine.

AVARAMO TEMO. The Name of a siliquose Tree, which grows in the *Brazils*.

The Bark is externally of a cineritious, and internally of a deep Red Colour, and is the only Part of the Plant used by the Skilful for Medicinal Purposes, tho' the same astringent Qualities are by some ascribed to its Leaves; for the Bark, which is of a bitter Taste, whether reduc'd to a Powder, or boil'd and us'd by way of Fomentation, happily cures inveterate and obstinate Ulcers, and has been found to cure Cancers themselves by means of its remarkably cleansing and drying Nature.

Besides these Purposes, 'tis also made Choice of on account of its effectually astringent Quality, for Baths design'd to strengthen and invigorate the muscular Parts of the Body, when weaken'd, or too much relax'd. Ray says it is much used by the Courtezans for contracting the Pudenda. *Raii Hist. Plant.*

AUCHEN, *αυχην*. The Neck.

AUCHMOS, *αυχμος*, from *αυω*, to dry. It imports Weather which is extremely hot, sultry, and squalid. The *Latins* translate it by *squalor*. *Hippocrates* frequently uses this Word.

AUCTIO, Augmentation, Accretion.

AUCUPALIS SORBUS, and AUCUPARIA, are Names for the Ornus, or Sorbus Sylvestris. *Blancard*.

AUDACIA, in a Medicinal Sense, is that Sort of Boldness and Audaciousness, which we meet with in Deliria and Madness. It also signifies Impudence, which *Hippocrates* advises a Physician not to be guilty of.

AUDE, *αυδη*, the Voice. See VOX.

AUDITORIUS, Auditory. Thus there is the *Meatus Auditorius*, the Auditory Passage; and *Nervus Auditorius*, the Auditory Nerve. See AURIS.

AUDITUS, the Sense of Hearing. See AURIS.

AVELLANA, Offic. *Corylus sylvestris*, Ger. 1250. Emac. 1438. Raii Hist. 2. 1379. Synop. 3. 439. Mer. Pin. 30. C. B. Pin. 418. Merc. Bot. 1. 31. Phyt. Brit. 31. Tourn. Inst. 582. Elem. Bot. 453. Boerh. Ind. A. 2. 176. Dill. Cat. Giff. 35. Buxb. 86. Rupp. Flor. Jen. 265. *Corylus seu Nux Avellana sylvestris*, J. B. 1. 269. Park. Theat. 1416. Chab. 38. *Nux Avellana sylvestris*, Jons. Dendr. 112. The HAZEL. Dale.

Miller takes Notice of six Sorts of Nuts, the first of which is the preceding mention'd by Dale, which he calls the wild Hazel-nut.

The second is the *Corylus sativa, fructu albo minore, seu vulgaris*, C. B. The SMALL-MANURED HAZEL-NUT.

The third is the *Corylus sativa, fructu rotundo maximo*, C. B. The LARGE COBNUT.

The fourth is the *Corylus sativa, fructu oblongo rubente*, C. B. The RED FILBERT.

The fifth is the *Corylus sativa, fructu oblongo rubente, pellucula alba testo*, C. B. The WHITE FILBERT.

The sixth is the *Corylus Hispanica, fructu majore anguloso*. Pluk. Alm.

The first of these Trees is common in many Woods in England, from whence the Fruit is gather'd in Plenty, and brought to London by the Country People.

The second and third Sorts are planted in Hedge-rows, in moist shady Places in Gardens; but the Fruit is much better, and in greater Quantities, when they have an open free Air, and are not suffer'd either to grow too thick, or be overhung with other Trees.

The fourth and fifth Sorts, that is, the red and white Filberts, are mostly esteem'd for their Fruit, being much sweeter, and their Shells much tenderer.

The sixth Sort is annually brought from Spain in great Plenty, and sold in London all the Winter Season, from which Nuts there have been many Trees raised in the English Gardens; but I have not yet seen whether they prove the same with the Nuts sown.

Every body knows, that the Hazel, or Nut-tree, never arises to be a Tree of any great Magnitude, shooting forth from the Root a Number of long, smooth, tough, and pliable Branches, bearing large, round, rough Leaves, indented about the Edges, before whose appearing, early in the Spring, there come forth on the Branches, a great many long, loose *Iuli* or *Catkins*. The Nuts grow two, three, or four together, on one Stalk, each cover'd with a membranous Husk, open and jagged at the Top: When ripe, the Shell is hard and brittle, having a sweet Kernel. This Tree grows every-where in the Woods and Hedges.

I know not of any great Use that is made of any Part of this Tree in Medicine. Some account the *Iuli* and Nut-shells to be restraining or binding; the Kernels are hard of Digestion, and stuffing, causing Shortness of Breath and Wheezing; tho' an Emulsion made of them with Mead is commended for an old dry Cough. *Miller's Bot. Off.*

You are to chuse such Filberts as are large, full-grown, and each having a Kernel that is almost round, reddish, full of Juice, of an excellent Taste, and not Worm-eaten.

Filberts are more nourishing than Nuts; they are by some esteem'd pectoral.

They are windy, and hard of Digestion.

They contain a middling Quantity of volatile and essential Salt, much Oil and earthy Parts.

The moderate Use of this Fruit agrees at all times with every Age and Constitution, provided there be a good Stomach.

REMARKS.

The Filbert is a Fruit well known; they are of a different Bigness, grow upon a common Shrub in Hedges and Woods, and the same is also planted in Gardens.

Filberts, as well as Nuts, contain a great Quantity of Oil, and the same is easily extracted. In the mean time, Filberts have a more agreeable Taste than Nuts, because their

Salt is not so sharp as that of Nuts, and because it is also closely united to the oily Parts.

Filberts are pectoral, and nourishing, because of their oily Parts; they are also of a binding Nature, by reason of their earthy Principles, which communicate a greater Consistence to the Liquors, and swallow up the over-abundant Moistures that loosen the solid Parts. In the mean while they are hard of Digestion, when immoderately used, because of their solid and earthy Substance.

The Husks or Covers of the Filberts are astringent, and proper for binding the Body, but provoke Urine.

They cover Filberts with Sugar, and make Comfits of them of an excellent Taste; they are commonly used for a Desert, and help Digestion. *Lemery on Foods.*

Nuts and Filberts will purge People, when taken in considerable Quantities.

The Cream of these Nuts is good in the Stone and Heat of Urine. Emulsions may be made of them. *Quercetan* gave a Dram of the Powder of Nutshells, mixed with an equal Quantity of prepared Coral, in a Glass of the Water of *Carduus Benedictus*, or Corn Poppy, in the Pleurisy. *Martyn's Tournefort.*

AVENA, Offic. *βρώμη*, *Dioscorides*. *Avena vesca*, Ger. 68. Emac. 75. Park. Theat. 1134. Mer. Pin. 13. *Avena alba*, J. B. 2. 432. Raii Hist. 2. 1253. Synop. 3. 389. Chab. 176. *Avena vulgaris*, Merc. Bot. 2. 16. Phyt. Brit. 14. *Avena vulgaris seu alba*, C. B. Pin. 23. Theat. 469. Hist. Oxon. 3. 209. Tourn. Inst. 514. Elem. Bot. 415. Boerh. Ind. A. 2. 161. Rupp. Flor. Jen. 244. Buxb. 34. OATS. Dale.

This Grain grows not to be so tall as Wheat or Rye, but it is fuller of Knots or Joints: The Leaves are like Wheat, and it bears on the Top a loose Panicle of several distinct Grains, standing on long slender Foot-stalks; the Grain is longer, slenderer, and smoother than Barley, cover'd with a loose Husk or Skin. It is sown in March or April.

Oats are restraining, and drying; and Oatmeal is of great Use both in Health and Sickness, being a wholesome and cleansing Food; Water-gruel, made thereof, being much used in all Kinds of Distempers. Oats fried, and put into a Bag, and apply'd to the Side, are good to ease pleuritic Pains; and to the Belly, help the Colic, and Pains in the Bowels. *Miller Bot. Offic.*

As for unprepared Oats, they are only used for feeding Cattle; but when reduced to what we call Oatmeal, for which Purpose the largest and best Oats must be chosen, they may be made into Cakes and Gruels, which are very agreeable, and excellent for People in Health; as also for such as labour under Pains of the Breast and Throat, especially if Sugar-candy, Conserve of Violets, Currans, or Figs, are added to them. They render the Body soluble, and evacuate the glutinous Humours, which prove offensive to it. Some affirm, that they breed Worms; which may nevertheless be prevented, by preparing them with Anise or Fenel-seed. Oatmeal Cakes cure Belly-aches and Fluxes, and are esteem'd good for such as labour under Consumptions, Impostumations, or Pains arising from the Stone. *Pliny*, L. 18. *N. H. C.* 17. informs us, that the Germans eat no other Cakes than those made of Oatmeal; and Experience teaches us, that Children brought up with it generally become very robust, and have a fresh lively Colour, *Theod. Tabern. Herbar. L. 1. Sect. 7. C. 21.* and *Joan. Gufers, Tab. Med. S. Medicin. Domest. Tab. 60.* In many Parts they make not only Bread, but Ale, of Oats; and a few Grains, eaten rough, are said to cure Heart-burns. The Bread is a coarse and hot Food, of a disagreeable Taste, hard Digestion, and a dissipating Quality, *Galen. L. 1. de Aliment. Fac. C. 14. J. Bruyer. de Re Cib. L. 5. C. 20. Claud. Deodar. Panth. Hyg. L. 2. C. 2.* It is nevertheless very good for rendering People, that are too fat and corpulent, lean, and reducing them to a more moderate Size. *Cardan. L. 8. Subtil.* affirms, that, of Oats, the *Muscovites* make an Ale, or Drink, which is of a hot Nature, and so strong, that it intoxicates sooner than the richest Wines. Oatmeal, used in Emulsions, is serviceable in Paroxysms of the Stone. Decoctions of Oats, in Conjunction with Piony-water, are good against Fevers, according to *G. H. Velsch. Chil. 1. Exot. Cur. & Obs. 643.*

Oatmeal, boil'd to a considerable Consistence in Water, and apply'd to hot Tumors and Fistulas, disposes them to heal; and if mix'd with Butter, cures scald Heads. Oats and Cumin, put into a Bag, and apply'd hot to the Belly, give Ease in the Colic, and Disorders of the Matrix, *Casp. Hoffman. in Consil. a L. Schelz. edit. L. 3. Conf. 14.* Some add Juniper and Bayberries, and Salt. 'Tis here proper to observe, that a Medicine may be prepar'd of Horse-dung, which is of admirable Use in the Colic, Jaundice, Pains arising from the Stone, acute Pains of the Sides, and in expelling the Secundines. A Poultice of Oatmeal, prepar'd with Water and Powder of Marshmallows, is of singular Use in removing Roughness and Chaps in the Nails, *Ger. Blasius, Med. Univers. part. 4. C. 3.* The

Straw

Straw of Oats is used in such Baths as are intended to ease the Pains arising from a Stone in the Kidneys. If the Hairs are washed with a Lixivium of it, it renders them of a yellowish Colour. This Straw is very good for Cows, and they eat it with Pleasure; but 'tis not so proper for Horses, since it generally gives them Pains in the Belly. If a Horse is afflicted with a Suppression of Urine, boil Oats in Wine, and give him them to be eaten pretty hot, and his Disorder will very soon be removed. When Fowls cannot lay Eggs, Women give them roasted Oats to be eaten, with a View to remove that Defect. *Barthol. Zorn, Botanolog.*

Oatmeal, made into flat Cakes, is the common Food of the ordinary People in *Scotland, Wales, Derbyshire*, and the *North of England*. But the Dough, of which these Cakes are made, is fermented generally with Barm, which takes away all Viscidities, renders it more acefcent, and consequently very proper Aliment for People who use much Exercise, and eat a great deal of Animal Food. Oatmeal unfermented, like the Meal of all farinaceous Seeds, is subject to generate Viscidities in the Stomach and Intestines; but is more proper when an Alcalescence prevails in the Constitution, than if fermented.

The famous Remedy for acute Distempers, and which has very undeservedly been the Subject of much Ridicule, I mean *Water-gruel*, is made of Oatmeal boil'd with Water. This is endow'd with the same Medicinal Virtues as the *Ptisan of Hippocrates*; and, as an Acefcent Aliment, is very good when there is a Tendency to an Alcaline Putrefaction, which is the Case in most acute Distempers. Farinaceous Vegetables, by being digested, and boil'd in Water, grow more acefcent. See that Part of the Article *ALCALI*, which specifies the Regimen proper in acute Diseases.

Dale takes Notice of another Species of Oats, which is the *AVENA NIGRA*, *Ind. Med.* 16. *Chom.* 746. *Raii Hist.* 2. 1253. *Synop.* 3. 389. *Mer. Pin.* 13. *J. B.* 2. 432. *Chab.* 176. *C. B. Pin.* 23. *Theat.* 472. *Tourn. Inst.* 514. *Elem. Bot.* 415. *Boerh. Ind. A.* 2. 161. *Hist. Oxon.* 3. 209. *Buxb.* 35. *Avena semine nigro*, *Rupp. Flor. Jen.* 244. **BLACK OATS.**

It is sown in Fields, for the Use of Horses as well as the preceding.

There are some other Species of Oats mention'd by Botanic Writers, possess'd of much the same Virtues as those above-mentioned. See *ÆGILOPS*.

AVENQUA, the *Portuguese* Name for the *Adiantum Brasiliense*, Maiden-hair of *Brasil*.

AVENZOAR, the Name of an *Arabian* Physician.

Avenzoar, tho' his Age cannot be precisely determin'd, seems to have lived after *Avicenna*; and we are sure he lived before *Averrhoes*, who more than once gives him a very high and deserved Encomium, calling him *admirable, glorious, the Treasure of all Knowledge*, and the most *Supreme* in Physic, from the Time of *Galen* to his own. He was born, or at least resided much, at *Seville*, the Capital of *Andalusia*, and the Seat then of the *Mahometan* Chaliph. He lived to 135. began to practise at 40, or, as others say, at 20; and had the Advantage of a longer Experience than almost any one ever had; for he enjoy'd perfect Health to his last Hour. He tells us himself, how he was imprison'd, and barbarously treated, by *Haly*, the King's Constable in that City; tho' it appears, by his own Account, that once, either before or after, he cured that Minister's Son of a Jaundice. He wrote a Book call'd *Thaasser*, that is, one which contain'd all Rules for Medicine and Diet in most Distempers; and this Work, indeed, shews him to have been a Man of Business and Experience. It appears too from hence, that he had the Care of an Hospital, and was employ'd often upon the *Miramamolins* Commands.

He is reckon'd, by the Generality of Writers, an Empiric; tho' I can't imagine, why they pitch'd upon him for this Character, which suits him, I think, less than any of the rest of the *Arabians*: One would naturally suspect by this, that they had never read further than his Preface, which, indeed, does contain a Collection of Receipts used by himself and others. For, not to mention that he was bred in a Physic Family, (his Father and Grandfather being both Practitioners, whom he always remembers with great Gratitude and Honour) we have his own Testimony, that he had a regular Education; and that he not only learnt what properly belongs to a Physician, but, out of a great Desire of Knowledge, every thing besides which relates to Pharmacy and Surgery. He lays it down for a Maxim, That Experience chiefly is the right Guide and Standard of a warrantable Practice, and must absolve or condemn him, and every Physician, both in this Life and the next. He expresses himself more remarkably in another Place, where he is speaking how indifferent it is to apply this or that Oil in the Case of some Tumors; and observes by the way, that the Art of Curing is so little to be attain'd to, by any logical Distinctions, or sophistical Subtleties, that long Use, assisted by a good Judgment, can only furnish out so extraordinary a Talent. For Example, says he, if any one would take it into his Head to refine, and nicely distinguish, about laxative Medicines, and pretend to find out the proportional Quantity and Quality of any

Purge, so as to square it exactly to the Constitution of the Patient, and the Nature of the Humours to be discharged; and calculate it so as not to be even a Hair over or under; such Speculations, in his Opinion, contribute very little to form a Judgment about any right Method of Cure. And here, no doubt, he had *Alkindus* in his Eye, who wrote a fanciful Treatise in this way, concerning the Doses and Qualities of Medicines.

And this Author is so little addicted to Quackery, and has so mean an Opinion of a bare Receipt, that he exclaims against the Impudence of old Women in this Point, as well as rejects the idle Superstition of Astrologers. It is a very remarkable Story he tells of himself, in a particular Case, where he was at a Loss how to proceed, and ask'd the Opinion of several other Physicians to no Purpose: At last he took a Journey to the Town where his Father lived, and desired his Advice: The old Man would give him no direct Answer, but shew'd him a Place in *Galen*, and bid him read that; if he could find out the Cure of the Distemper by it, it was very well; if he could not, he bid him never think of making any Proficiency in Physic: The Advice succeeded, so that the Patient was cured, to the Satisfaction both of the Father and the Son. And, indeed, throughout all this Work, he professes himself so much of the Dogmatical or Rational Sect, which was directly opposite to the Empirical, that he has a great deal of Reasoning about the Causes and Symptoms of Distempers; and as in his Theory he chiefly, if not only, follows *Galen*, so he quotes him, upon all Occasions, oftener than the rest of the *Arabians* do. *Freind's History of Physic.*

The Works of *Avenzoar*, or *Abhomeron Aben-Zoar*; are, **LIBER THESIR DAHALMODANA VAHALTABIR**, which imports *Rectificatio Medicationis & Regiminis*.

This was printed at *Venice*, 1496. in *Fol.* and again at the same Place, 1514. *Fol.* And in 1531. in 8vo. with the Addition of his *Antidotarium*, and the *Colliget of Averrhoes*. *Vander Linden, de Scriptis Medicis.*

AVERICH, Sulphur. *Johnson.*

AVERRHOES lived not long after *Avenzoar*; for he intimates himself, that he was acquainted with his Sons. He died at *Morocco*, *A. H.* 595. as some say, or 603. as others. He made a great Figure in Life; and his Works made him celebrated over all *Europe*, after his Death. He was a Native of *Corduba*, bred to the Law, tho' he afterwards studied Mathematics and Physic. *J. Leo* gives a long Account of his Grandfather, that he was sent by his Countrymen, who intended to revolt, to offer the Crown to the Emperor of *Morocco*; that he was by him constituted Chief of the Priests, and great Judge of the Kingdom of *Corduba*, a Post which he enjoy'd a long while, and was succeeded in it by his Son, and his Grandson. Our *Averrhoes* was famous for his Liberality and Patience, and for his continual Application to Study; and, without doubt, he was a Man of strong natural Parts, and a very subtle Reasoner. He had the Title of *Commentator* given him, from the many Volumes he wrote upon *Aristotle*, and was call'd, besides, the *Soul of Aristotle*. In Physic he wrote a Book, at the *Miramamolins* of *Morocco's* Command, which goes by the Name of *Colliget*, divided into seven Parts, containing the whole Science of Medicine, and is chiefly a Compendium, as he owns himself; of what had been said by others, with some Additions of his own. He begins with the general Rules of this Art, and so descends to Particulars; and therefore, he says, nobody will be able to understand what he wrote, but who is well versed in Logic, and natural Philosophy: Accordingly he mixes more of the *Aristotelian* Philosophy with his Theory of Physic, than the other *Arabians* do; for which Defect he finds Fault with the wise Men of *Andalusia*. And this, I suppose, he must be understood to mean, when he says, he shall use Expressions, and explain Things, which his Predecessors never did, and shall deduce every thing from the Roots of natural Science. In Anatomy, he professes he gives us nothing new; and, indeed, he here entirely copies after *Galen*. And as to the practical Part of this Work, there is scarce any thing in it but what is borrow'd; and tho' he speaks several times of his own Experience, yet he does not seem to have been much conversant in Practice, as indeed we may guess he was not, from the History of his Life. However, there is one Observation he makes, which I find no-where else, that the same Person can have the Small-pox only once. The chief Design, indeed, of this Treatise appears to be, to lay down right Notions concerning the speculative Part of Physic, in which there were, in his Time, great Disputes; and therefore, as he follows much the same Method as his Master *Aristotle* observes in the History of Animals, so one great Aim he had in writing this Book, was to reconcile the Opinions of that Philosopher with those of *Galen*, an Author who seems to have the second Place in his Esteem.

Mr. *Bayle* has collected a great many Passages out of Authors, relating to *Averrhoes*; and as he seems never to have been acquainted with the Original, he follows these Authors implicitly, who often mislead him: As where he tells us, from *Champerius*, that he was a bitter Enemy to *Avicenna*; and that, for this Reason, he avoids ever naming him, which he does in this

this Book often, and in his Metaphysical Disputations; not to mention the Comment he has writ expressly upon that Author's *Cautica*. And as to being his Enemy, as is here suggested, if we look into this very Comment, we may easily be convinced of the contrary; for he thinks this Treatise of *Avicenna* one of the best Introductions to Physic which ever appear'd; and therefore because it was concise, and sometimes wanted an Explanation, he undertook the Task himself; and to shew his Candour, even when *Avicenna* seems to lay down some wrong Positions, he explains in what Sense they should be understood, so as to be consistent with Truth; as particularly in the Doctrine about bleeding old Men, (which he distinguishes perfectly right) and the making Use of subterraneous Caverns. The last Rule particularly, he says, would not so well suit his Climate, which was the fifth, that is, *Spain*; but might be very proper for the fourth, which was hotter, and where *Avicenna* lived. What Mr. Bayle recites from Mr. Pasquier, about *Averrhoes* bleeding his Son at three Years old, is equally a Mistake; for *Averrhoes* himself tells us, that it was *Avenzoar* who used this Practice in the Case of his own Son. So where he quotes Mr. Petit for saying, that *Averrhoes* never gave any Medicine to the Sick, and that he owns as much himself, is directly contrary to what this Book will inform us; tho' I agree, that it is probable he was no very great Practitioner.

Mr. Bayle wonders why Mr. *Herbelot* is so short in his Account of this famous Author; and I should wonder why Mr. *Bayle* is so prolix upon the same Head, did I not consider, that he picks up a few odd Stories, which have been handed about, concerning his Irreligion, particularly the celebrated Saying he is charged with, *Sit anima mea cum Philosophis*; a Saying which, perhaps, there was no more ground to fasten upon *Averrhoes*, than any of those Particulars I have mention'd. This Writer has, with no little Pains, amass'd together all that he could meet with, upon this Article, in modern Authors; and, in a more emphatical manner, enlarges upon what he found quoted from the Disputations which this *Arabian* wrote against *Algazel*, a Man famous in the preceding Century, for being the Founder of a Sect call'd the *Motazelas*, and who died A. H. 503. a Piece finely written, as he tells us from *Rapin*; but, in his own Opinion, very pernicious. In this are contain'd a great many Speculations concerning the Soul, consonant to the Doctrine of *Aristotle*; amongst the rest, the Unity of the Intellect is explain'd: From which Mr. Bayle would infer, that he was a very impious Person, and one who must of course maintain the Mortality of the Soul; and consequently deny any future Rewards or Punishments. Why he should be so fond of drawing *Averrhoes* into these Opinions, I will not take the Liberty so much as to guess; only give me Leave to observe, that if he would have consulted the Author himself, instead of the Collectors he here quotes, he would have found a very different Account of his Notions: For, in one Dissertation, *Averrhoes* asserts, that the Soul is not material; and in another, that it is immortal. So usual is it with these Compilers of secret History to run into infinite Mistakes, merely because they take every thing at second-hand, and upon Trust; whereas would they have been at the Pains to go to the Fountain-head, and cast an Eye only upon the Original, their Memoirs would have been much more exact.

But, to digress no further, as there is little material in this Author, *Averrhoes*, relating to Practice, I shall not trouble you now with any further Account of him, or his Works. I shall only mention, that he takes Notice of *Alkindus*, the Author of a Treatise now extant, concerning the Proportion and Doses of Compound Medicines; and who, perhaps, might be the same with the famous *Peripatetic* of that Name, in the Reign of *Almanon*. In this Book he endeavours to reduce the Qualities of Medicines to the Rules of *Arithmetic* and *Music*; but *Averrhoes* justly thinks he refined too much, and that it is not only a Work of mere Speculation, built upon no solid Ground, that is, that of the Quality of a Medicine in the Compound increasing always in a double Proportion, but owing altogether to his mistaking the Sense of *Galen* upon the same Subject. *Freind's History of Physic*.

The Works of *Averrhoes*, are,
Collectaneorum de re Medica Sectiones tres, a *Johanne Bruyerino Campegio Latinitate donata*, Lugdun. 1537. Fol.
Averrois Opera. Venetiis apud Juntas, 1552. Fol.
His *Colliget*, and Commentaries on the *Cautica* of *Avicenna*, and some other Pieces, are extant with the Works of *Avenzoar*, Venet. 1496. Fol. and Lugduni, 1531. 8vo.
His Book *De Venenis* was printed Lugduni, 1517. 4to.
And his Commentary upon *Avicenna*, Venetiis, 1484. in Fol. and again at the same Place, 1555. Fol. *Vander Linden de Scriptis Medicis*.

AVERSIO, Aversion. It signifies the diverting a Flux of Humours from one Part to another, whether by Revulsion, Derivation, or Repulsion.

Aversio also implies a Nausea, or Inappetency; and sometimes is used to express that Recession of the Uterus from its

proper Place, which the Antients imagin'd to happen in Hysterical Disorders.

AVES, Birds. The Natures of these, consider'd as Aliment or Medicines, are express'd under their different Names.

Avis Medica, is the Peacock.

Aves, or *Aviculae Cypriz*, are perfum'd Candles, or Sticks of Wax.

Aves also is a Word made use of by some of the Enthusiastical Chymists, to express, or rather to conceal, their Meaning; in which they have effectually succeeded. *Rulandus*, for Example, thus defines the *Avis Hermetis*: *Æs Hermetis, avis volans, quia in altum evolat, & tamen iterum in terram propter nutrimenta descendit: unde nutritrix omnium est terra*.

The *High Dutch* Interpretation of the same Author is rather greater Nonsense than the *Latin*; for which Reason the Reader need not regret, that I have not translated it.

AVEVETL, and **AHOHOETL**, are Indian Names for the *Abies Mexicana*. *Raii Hist. Plant*.

AUGARES, *αυγares*, a Name of an Ingredient in a Clyster for the *Cœliac* Passion, in a Prescription given by *N. Myrepsus*, *Secl. 17. Cap. 45*. I don't know, that it has ever been discover'd what it means. The Interpreters keep the Word, and confess they do not understand it.

AUGITES, *αυγιτης*, the Name of a Gem, which *Pliny* says many People esteem to be not very different from the *Callais*. It is said to be of a pale Green, and not so valuable as a *Topaz*. *Pliny* says the *Callais* imitates the *Sapphire*, but is more white.

AUGMENTATIO, Augmentation, Increase, Accretion, Growth.

AUGMENTUM. Diseases, especially Fevers, are divided by Authors into the Beginning, the Augment or Increase, the State or *acme*, and the Decline. The *Augmentum*, therefore, is that Part of the Disease which lasts from the Beginning, or first Seizure, to the State, or till it arrives at its utmost Violence.

AUGURISTA. By the Explication which *Castellus* gives of this Word, it should signify what we call a Conjuror. A Person who pretends to shew preternatural Images in Looking-glasses, Crystals, and Water; and to foretel Events by the Singing and Flight of Birds.

AUGUSTUM, A specious Epithet given to some Medicinal Compositions by their Authors or Describers.

AVICENNA. The famous *Avicenna*, the Son of *Hali*, was born at *Bochara*, in *Chorasan*, about 980. He studied Philosophy very early; so that, if we believe *Sorfanus* his Disciple, he was Master of *Euclid*, and other mathematical Books, when he was but sixteen Years old; and soon made such Proficiency in the Study of Physic, as to become very celebrated for his Skill in that Art. The *Arabic* Writers tell this Story of his Sagacity, That he found out, by the Pulse, the Dis temper the Nephew of *Cabous* laboured under, which was Love; and that by a Stratagem he made use of, he discovered likewise the particular Object of his Passion: The Case is so parallel, that one would be apt to think, they stole this Account from what *Appian* relates of *Erasistratus*, in a like Illness of *Antiochus*, the Son of *Seleucus*. *Avicenna* lived, for the most part, at *Isfahan*; he is represented by them, as one very much addicted to his Pleasures, so that he fell into several Sorts of Distempers; and it was a Saying, they tell us, in those Times, *That all his Philosophy could not make him moral, nor all his Physic teach him, how to preserve his Health*. He died in the 58th Year of his Age, or rather, if we calculate to a Nicety, the 56th, in 1036. at *Medina*; and was buried in the City of *Hamadan*.

History tells us, that he made a very considerable Figure in the World; so that by some of his own Countrymen he is reported to have been raised up to the Dignity of *Vizir*; from whence, I suppose, some more modern Writers have fancied, that he was really a Prince; and others have given out, that he was a King; though they do not agree, whether he reigned in *Corduba*, or *Bithynia*.

This is the Account the best Historians give of the Origin and Age of *Avicenna*, though he is supposed by some, without any Ground, to have been a Spaniard, and by others an Egyptian. It is amazing, where *Neander* could pick up the Materials to furnish out such a Romance, as he has made of this Writer's Life: He tells us, very formally, that he was born at *Edeffa*, the Capital of *Commagena*, in 1145. that he went from thence to *Alexandria*, where he studied under *Rhazes*; and that afterwards he travelled into *Spain*, where he was the Disciple of *Averrhoes*, at *Corduba*. But it is no new thing in this extraordinary Author, to write as many Falsities and Contradictions, as he does Pages.

Avicenna compiled a large Work, which he called the *Canon*; and the Fame of this Book was so great throughout all *Asia*, that it was epitomiz'd and commented upon by several other *Arabians*, in the twelfth and thirteenth Centuries; and, even long before this, it began to prevail so much in *Europe*, that there

there was no other Doctrine taught in the Schools of Physic; and it happened to be the good Fortune of *Avicenna*, to continue his Empire there, till the Restoration of Learning.

One would naturally expect to find something in this Author, answerable to such a Character; but though I have very often looked into his Writings upon several Occasions, (for you won't suppose, I believe, that I have gone through him in any regular Course of Reading) I could meet with little or nothing there, but what is taken originally from *Galen*, or what at least occurs, with a very small Variation, in *Rhazes*, or *Haly Abbas*. He in general seems to be fond of multiplying the Signs of Distempers, without any Reason; a Fault too much imitated, as Errors are the easiest to be followed, by our modern Writers of Systems. He often indeed sets down some for essential Symptoms, which arise merely by Accident, and have no immediate Connexion with the primary Disease itself. And, to confess the Truth, if one would chuse an Arabic System of Physic, that of *Haly* seems to be less confused; and more intelligible, as well as more consistent, than this of *Avicenna*. *Freind's Hist. of Physic*, Vol. 2.

The Works of *Avicenna* were printed at Venice, 1596. in Folio.

The *Liber Canonis, de Medicinis Cordialibus, & Cauticis*, together with some other Pieces, were printed Venetiis, apud Juntas, 1544. & 1555. in Fol. Basiliae, apud Joh. Hervagium, 1556. in Fol. Venetiis, apud Octavo. Scotum, 1500. in 4to. Groningæ, 1649. in 12mo.

Canon Medicinæ. Venetiis, apud Juntas, 1595. & 1608. in Fol. 2 Vol. apud Vinc. Valgrifum, 1564. in Fol. 2 Vol. Ibidem, 1580. in 4to. Lovanii, apud Mempæum, 1658. in Fol. Uratislaviæ, Fol. per Petrum Kirstinum.

Libro quinque Canonis Medicinæ Aben Ali, Principis Filii Sinæ, alias corrupte Avicennæ. Arabicè nunc primum impressi. Romæ ex Typographia Medicea, 1593. in Fol.

Libellus de removendis Nocuentis, quæ accidunt in Regimine sanitatis: Tractatus de Symplo acetoso, uno cum Syraci Medici expositione in 2. & 3. partem. 4. Fen. 1. Can. Avic. & Ebenesi super 5 Can. Venetiis, apud Demitium de Tridino, 1547. in maj. Fol.

De Corde, ejusque Facultatibus, Libellus, Job. Bruyerino Campegio Interprete. Lugduni, apud Nicol. Edvardum, 1559. in 8vo.

De Animalibus, per M. Mich. Schotur ex Arabico in Latinum translatus. This is extant in Folio, without any Specification of the Time when printed, or the Place where.

Canonis Libri 3. Fen. 1. Tractatus quartus, in quo scribit de ægitudinibus Capitis, & noxâ multâ illarum in functionibus sensus, & moderaminis, sive partis rectricis, à Johanne Quinquaborræo Latinè versus, & ad fidem codicis Hebraici correctus. Parisiis, apud Martinum Juvenem, 1572. in 8vo.

Canonis Libri 3. Fen. 2. quæ est de Ægitudinibus Nervorum, à Quinquaborræo Latinè versa. Parisiis, apud Mart. Juvenem, 1570. in 8vo.

Quarti Libri Canonis Fen. prima de febribus. Patavii, 1659. in 12mo.

De Tinctura Metallorum Tractatus. Francofurt. apud Cyriacum Jacobum, 1550. in 4to.

This is thought supposititious, as is the following:

Chymicus Liber, Porta Elementorum dictus. Basiliae, apud Petrum Pernam, 1572. in 8vo.

AVICULÆ HERMETICÆ. The universal Salt, which *Sendivogius* says is to be found in the Dew, is called by this Name in the *German Ephemerides*.

AVICULARIA SYLVII, a Name for the *Speculum Veneris majus*, a Plant; called otherwise, *The greater Venus's Looking-glass*.

AVILA, is a Species of Apple produced in the Indies. It is larger than an Orange, of a considerable Size. It is of a round Figure, plump, and of a yellow Colour. It grows in those Colonies of America which belong to the Spaniards, upon a sort of Shrub, or creeping Plant, which adheres to the adjacent Trees. This Apple includes eight or ten flat orbicular Nuts, which have a small Cast of the Oval, and at one of their Extremities terminate in an obtuse Point. These Nuts, tho' joined to each other, are yet easily separable. They are convex on one Side, concave on the other, almost as large as our half Crown, half a Finger's Breadth in Thickness, covered with a moderately thick Bark, which is hard, of a woody Texture, a little rough, especially on the convex Side, and of a yellowish Colour. Under this Bark is a tender, white, and bitter Almond, which is esteemed an excellent Medicine against Poisons, and Malignity of Humours. One or two of these Almonds may be taken for a Dose. *Lemery Traité universel de Drogues Simples*.

AULOS, αὐλός, properly signifies a Pipe, or Canal, or Foramen. In *Hippocrates de Mulierum Morbis*, Lib. 2. it imports the exterior Foramen of, or Entrance into, the Vagina Uteri; as ἐναυλὸν, is the Vagina itself.

AULOS also signifies a Pipe to blow through.

VOL. I.

Aulus, in *Pliny*, is a Shell-Fish, which we call the Scallop.

AULISCOS, αὐλίσκος, is a Catheter, or a Clyster-pipe.

AVORNUS, the *ALNUS NIGRA*, is thus called by *Crescentius*.

AVOSETA.

Avoseta Italarum, seu Spinzago d'Aqua, is an aquatic Bird as large as a Pigeon; its Beak is four or five Inches long, black; turned up, and pointed at the End. Its Head is blackish, the Body white, the Feet bluish, having the Toes joined by Membranes; the Legs are long: It is found in Italy. The Fat is esteem'd very resolutive, emollient, and anodyne. *Lemery des Drogues*.

AURA.

Aurifera Gallinassa, (Jonston)

Is a Species of Raven of Mexico; which approaches the Size of a large Eagle; the Indians call it *Tropillotl*. Its Colour is black; the Beak is made like a Perroquet's; the Forehead is covered with a Skin wrinkled without Feathers: It is armed with black crooked Claws. This Bird is common in New Spain; it keeps at Night upon the Trees, and upon the Rocks; but comes in the Day near the Cities; it lives upon Ordure and Excrements. They say, that the young ones are white, but that they blacken as they grow larger. They fly in Flocks, pretty high; they make no Cry, and are of a bad Smell. They contain a great deal of volatile Salt and Oil. The Heart of this Bird, being dry'd in the Sun, is very fragrant. The Flesh, being eaten, is good for the Small-pox; the Feathers, burnt, are deterfive, vulnerary, and proper to prevent the Hair from falling off, if the Ashes are sprinkled upon the Flesh. *Lemery des Drogues*.

AURA also signifies a Vapour or Exhalation, such as those which arise from Mephitical Caves.

Helmont speaks much of the *Aura Vitalis*, which seems to mean what others call the *Flamma Vitalis*, *Vital Flame*. Both are mere Jargon, and only mean Chimæras existing no-where but in the extravagant Imaginations of those who make use of them.

AVRANCUM, Egg-shells. *Rulandus*.

AURANTIA, a Fruit-tree, thus distinguished:

Mahis Aurantia, Offic. Ger. 1279. Emac. 1463. Rati Hist. 2. 1658. *Malus Aurantia vulgaris*, Park. Theat. 1508. *Malus Aurantia major*, C. B. Pin. 436. *Aurantium*, *Mala Aurantia*, Mont. Ind. 37. *Aurantia Malus*, C. B. 1. 97. Chab. 5. *Aurantium vulgare*, Ferr. Hesp. 377. Tourn. Inst. 620. Elem. Bot. 493. Boerh. Ind. A. 239. *Mala Aurantia*, Aldrov. Dendr. 489. *Malus Aurantia vulgaris major*, Jonst. Dendr. 22. **THE ORANGE-TREE.** Dale.

This beautiful Tree grows to a pretty great Bigness in its native Places, having many Branches, the younger of which are of a greenish Colour, with several sharp Thorns growing on them; the Leaves are of a pale, yellow, green Colour, in Shape like Bay-leaves, each of which is set on a Foot-stalk in Shape of a Heart, of a pleasant fragrant Smell, when bruised: The Flowers grow on the younger Shoots among the Leaves, of a single Cup-fashioned Leaf, cut into five Parts, with several yellow Stamina in the Middle, of a fragrant odoriferous Smell; they are succeeded by large round Fruit, green at first, and of a reddish-yellow Colour, covered with a tough Skin or Peel, under which is contained the Pulp, consisting of a great Number of small Vesiculae, full of a sharp Juice, (among which lie longish round Seeds pointed at both Ends) divided by a Skin into several Cloves, or Partitions.

This Tree grows in Plenty in Italy, Spain, and Portugal; and bears Flowers and Fruit all the Year; but the Fruit is chiefly gathered in October and November.

The Juice of Oranges is used as Sauce to whet the Appetite. It is cordial and cooling, good to quench Thirst, and serviceable in burning Fevers; it is of great Use in the Scurvy, being frequently mixed among other Antiscorbutics. The Peel or Bark is cordial and stomachic, strengthens and warms the Stomach, prevents Nausea and Vomiting, and helps the Colic.

Official Preparations from Oranges are, a Water distilled from the Flowers, the *Aqua Naphæ*, Off. a Conserve of the Peel, and the same candied, and a Syrup of the Juice.

N. B. The *Sevil Orange* is only used in Physic, the *China Orange* being only eaten for Pleasure. *Miller's Bot. Off.*

This Fruit has different Names, such as the *Mala Aurantia*, *Aurantia*, *Arangia*, *Mala Aurea*, *Chrysomelea*, *Poma Anarantia*, *Aurantia* & *Nerantia*, *Orangia*, or *Aurangia*. The Poets undoubtedly meant no more by the *Golden Apples* produced in the Gardens of the *Hesperides*, than *Oranges*, which are the Fruit of this Tree. Thus *Virgil* is to be understood in this Line:

Aurea Mala decem missi: Cras altera mittam.

But some of the Fruit differ very much in Taste from others: Some are very bitter, whilst others are sweet: Others again keep, as it were, a due Medium between sweet and bitter; and this last Sort are justly preferred to the others, not with regard

regard to the Peel or Bark, which, in Heat and Dryness, surpasses that of the Lemon, but with regard to the Qualities and Agreeableness of the Juice, which is less cold than that of the Lemon. Their Virtues are the same with those of the Citron and Lemon; for which Reason, we find, in some foreign Shops, their Peel dried and preserved, a Water, a Syrup, an Essence, a Tincture, and a distilled Oil of Oranges; but particularly we find the preserved Flowers, and a Water distilled from the Flowers. Fresh Oranges, if eaten, resist Putrefaction, and prevent the Scurvy. *Bald. Ronseus, de Scorbuto*, says, he knew some who got entirely free from the Scurvy, only by the Use of Oranges, and their Peel. *L. Riverius*, in his fourth Century, *Obs. 84.* makes Mention of a Shoe-maker, who had laboured under a Quartan Ague for near half a Year, and who was at last cured by the Use of Oranges, which he cut into small Pieces, and boiled in White-wine; by taking some of which for a few Mornings, his Disorder was removed. The Juice of sweet Oranges, exhibited with Syrup of Violets, is excellent for procuring Sleep in Fevers. *Jo. Camerar. Hort. Med.* The Peel dried, reduced to a Powder, and drank in White-wine, corroborates the Stomach, helps Digestion, procures an Appetite, sweetens a stinking Breath, and is serviceable in Swellings of the Belly, Colics, Pains which succeed Child-birth, Suppressions of Urine and the Colic. See *Ephem. N. C. Dec. 3. Ann. 1. Obs. 35.* This Virtue is still stronger in the distilled Oil, four or five Drops of which are to be taken in Wine. *Domin. Panarolus, Pent. 2. Obs. 8.* says, that the Oil expressed from Orange-peel, proves a very expeditious Cure in Fevers. The Flowers preserved with Sugar are an excellent Cordial, and esteemed very good in burning and pestilential Fevers. The Water distilled from the Flowers has a very fragrant Smell, and is good in malignant and virulent Fevers; for it promotes a plentiful Diaphoresis, comforts the Heart, refreshes the vital Spirits, gives Ease in the Colic, allays Pains of the Stomach, and kills Worms. It is also applied to the Pulse with a View to comfort the Heart. It is elegantly prepared in *Italy*, where it is called *Napha* and *Angelica*. See *Remed. Lib. 1. de Mat. Med. Sect. 6. Cap. 4.* In *Spain* 'tis usually given to Women in hard Labours. It is also used with Success in Hysterical Fits, but must be mixed with Musk and Dragons-blood for answering that Intention. *R. Solenandr. Sect. 5. Consil. Med. 15. L. River. Lib. 15. Prax. Med. Cap. 6. & Cent. 1. Obs. Med. 65. 94.* The Water distilled from the Seed cures Pains arising from the Stone in the Kidneys. *Ferrar. Lib. 4. Hesper. Fol. 478.* The Leaves, by means of a chymical Preparation, yield an Oil which is excellent in Cases where the Shin-bones are laid bare. The Seed resists Poison, and kills Worms. The Leaves, if boil'd in Red-wine, and drank, put a Stop to the Catamenia.

We may here mention the Poma Sinensia, the Mala Aurantia Chinenia, or China Oranges, which are of late become well enough known, and are superior to the others in Delicousness of Taste, and bear the Name of the Country, from which they are imported to *Lisbon*, where they are now produced in considerable Quantities as well as in *Spain*. Their Juice is much better adapted to the Intentions of Physic, but must not be taken in too large Quantities, especially by those who have cold and weak Stomachs. In the Shops, they make of their Peel an Essence or Tincture, which is highly cordial and stomachic. *Barthol. Zorn. Botanolog.*

The Rind of the bitter Orange heats much.

The Juice of the sweet Orange, immoderately taken, weakens the Stomach, and causes Wind. As for the Juice of the bitter Orange, it sometimes incommodes the Stomach and Breast, by a little too rough pricking of those Parts.

The Juice of the bitter Orange contains much Phlegm and essential Salt, and a little Oil.

The Rinds of the sweet and bitter Oranges agree at all times, in all Sorts of Ages, to Persons who have a weak Stomach, and those of a phlegmatic and melancholy Constitution. As for the Juice of these Fruits it is very good in hot Weather for bilious Persons, and those whose Humours are too sharp, and too much agitated.

R E M A R K S.

Oranges are brought from several Parts: The best and the most in Esteem for a good Taste, are those which grow in hot Countries; not only because the Soil of those Places, having Store of exalted Sulphur and volatile Salts in it, communicates a great Quantity of the same to these Fruits, and gives them an agreeable Smell, but because the Heat of the Sun there digests, and more completely ripens their Juice, and gives them a more delicious Taste.

The Juice of the bitter Orange is sharp, because it contains much acid Salt in it, and because this Salt is but little embarrassed with the rosy Parts; which is the Reason it communicates almost all its Acidity to the little nervous Fibres of the Tongue. As for the Juice of the sweet Oranges, as it contains less Salt than that of the bitter one, and as this Salt is

kept under by a great Quantity of oily Parts, it is easy to be understood, that it can make but a slight Impression on the Parts it touches.

They prefer the Juice of the bitter Orange in Medicinal Use before the other, as was before observed, for cooling and moistening, and mitigating Fevers; because this Juice has more of the Acid in it, and can more easily thicken the overthinned Liquors, allay their violent Motions, and keep down those sharp Humours, that throw them into an extraordinary Fermentation. I suppose, by the bitter Orange, Lemery means the sour.

Of the ORANGE-FLOWER.

You ought to chuse such as are white, fair, of an agreeable Smell, and fresh gathered.

They cheer the Heart and Brain, promote the Menfes, strengthen the Stomach, and assist Digestion.

The immoderate Use of this hot Flower renders the Bile more sharp, and by that means may cause different Diseases.

It contains much exalted Oil, volatile Salt, and Phlegm.

The Orange-flower agrees at all times with aged, phlegmatic, and melancholy Persons; as also with those that have a weak Stomach, and do not easily digest their Food.

R E M A R K S.

The Orange-flower is used in Food and Physic; they preserve it whole, and, by distilling, extract from it a Liquor of a very pleasant Smell, and much used in Cordial, Hysterical, and Cephalic Potions. Its pleasant Smell proceeds from those Sulphurs and Salts contained therein, which are elevated with the Liquor, and mix therewith. The Orange-flower helps Digestion by its volatile Principles, which divide and attenuate the gross Parts of the Aliments. It also refreshes the Heart and Brain, and promotes the Menfes, because the same exalted Principles revive the Mass of Blood, increase the Quantity of the Spirits, and rarefy the viscous Juices which obstruct the Course of the Blood. *Lemery on Foods.*

AVRARIC, Mercury.

AURATA, a Fish, called *The Gilt-head*, or *Piscis Sacri*. According to *Athenæus*, it was esteemed very delicious Food by the Antients. It is called also *Orata*.

AUREA ALEXANDRINA, an Opiate or Antidote, invented by *Alexander*. See ALEXANDER.

AURES, the Ears. See AURIS.

AUREUS, a pompous Appellation for many Medicinal Compositions, either on account of their Costliness, Efficacy, or because Gold enters their Composition.

AUREUS RAMUS, is the Art of making Gold.

AUREUS is also a Weight equal to a Dram and an half. *Castellus.*

AURICHALCUM, Brass,

Is a Mixture of Copper and Lapis Calaminaris, which is put together in Fusion by a very vehement Fire, in a Furnace made for that Purpose.

The Discovery was made by the Alchymists, who, endeavouring to turn Brass into Gold, found the way to give it a yellow Colour. The Calaminaris Stone embarrasses the acrid Salts of the Metal to that Degree, that it makes no Impression on Liquors, as the Copper does. Besides, as the Calaminaris Stone costs but little, so the yellow Brass is cheaper than the natural. *Lemery des Drogues.*

In making of Medicines great Care must be taken, that nothing acid is put into a naked Brass Vessel, because Acids dissolve Brass, and that renders the Medicine emetic.

AURICOLLA, the Gue, or Cement of Gold. It should seem to signify the same as CHRYSOCOLLA, which see.

It is mentioned in the *Turba Philosophorum. Theatr. Chym. Vol. 5.*

AURICULÆ Cordis, the Auricles of the Heart. See COR.

AURICULA Judæ, & Fungi Sambuci, Offic. *Fungus membranaceus auriculæ referens, sive Sambucinus.* C. B. 372. Raii Hist. 1. 106. Synop. 18. *Fungus membranaceus auriculæ referens*, Hist. Oxon. 3. 642. *Fungus Auriculæ Judæ, coloris ex cineraceo nigricantis, perniciosus, in Sambuci caudice nascens*, J. B. 3. 840. *Fungus Auriculæ Judæ, coloris ex cineraceo nigricantis, perniciosus*. Chab. 588. *Fungus Sambucinus, sive Auricula Judæ*, Ger. Emac. 1481. *Fungus Sambuci, vel Auricula Judæ*, Sterb. 256. Tab. 27. H. *Fungus Sambucinus*, Park. 1320. *Agaricus Auriculæ formæ*, El. Bot. 441. Tourn. Inst. 562. Poerh. Ind. A. 14. Buxb. 7. *Agaricum Auriculæ formæ*, Mich. Nov. Gen. 124. Tab. 66. 1. *Peziza Auriculæ referens*. Dill. Cat. 195. JEWSEAR. Dale.

AURICULÆ JUDÆ, or *Jews Ears*, are a sort of Fungus, or a Species of Agaric, which is found adhering to the Trunk of the Elder-tree. This is of the Figure, and oftentimes the Size, of a Man's Ear; but they are found larger and smaller. It is of a membranous, cartilaginous, and pliant Substance, like Leather,

Leather, of a blackish-grey Colour. It contains a great deal of Oil and volatile Salt.

It is very resolute, proper for Tumors, and for Inflammations of the Throat, and other Parts, being broken and applied thereto. It should be used internally with Caution, for it is a sort of Poison. *Lemery des Drogues.*

It is directed to be boil'd in Milk, or macerated in Vinegar, in order to make a Gargle for the Throat, in a Quinsy: And sometimes it is infused in Water for the same Purpose, with other Ingredients.

Dale says it is astrigent.

AURICULA LEPORIS. See BUPLEURUM.

AURICULA MURIS, Mouse-ear. See PILOSELLA.

AURICULA URSI, Offic. *Auricula Ursi flore luteo*, Ger. 640. Emac. 784. Raii Hist. 2. 1082. Elem. Bot. 100. Tourn. Inst. 120. Boerh. Ind. A. 200. J. B. 3. 490. Chab. 492. Rupp. Flor. Jen. 14. *Auricula Ursi flore flavo*, Park. Parad. 239. *Auricula Ursi, Sanicula Alpina*, Mont. Ind. 37. *Sanicula Alpina lutea*, C. B. Pin. 242. Hist. Oxon. 2. 557. YELLOW BEARS-EARS. *Dale.*

This Herb grows in great abundance at or about *Utrecht*, in *Stiria*, *Tyrole*, *Savoy*, and *Switzerland*, about the Middles, and on the Tops, of large Mountains. It bears large thick green Leaves upon its Stalks, at whose Tops there are Flowers of different Colours. The Inhabitants of *Utrecht* call it *Primula odorata*, on account of its agreeable Smell. Tho' this Herb is not ordinarily kept in the Shops, it may nevertheless be rank'd among the Vulneraries, and is of singular Service, both for internal and external Purposes. It abounds with a mild, temperate, and glutinous Juice, which, when express'd, may be apply'd to old Wounds, with a great deal of Success: When mix'd with Ointments and Plaisters, it is of great Service in Ruptures, *Jo. Camerar. Hort. Med. p. 25.* Four or six Spoonfuls of the Water, in which the Herb has been boil'd, taken every Morning, cure Coughs and Ulcers of the Lungs. Such as go a-hunting on the large Mountains, where 'tis to be found, use its Root against Vertigos. See *Conr. Gesner. de Lunar. Herb. p. M. 34. Sennert. L. 1. Pract. p. 2. C. 4.* The Juice of the Flowers removes Spots of the Face, and beautifies the Skin; and with the same Intention some distil a Water from it. *Barthol. Zorn, Botanolog.*

AURICULARIA, Ear-wort, Marlow, or Cylonian Plant. It is a Species of Mint. See MENTHA.

AURICULARIUS, belonging to the Ear. *Auricularius Medicus* is a Physician for the Ears.

AURIGA, a sort of Bandage for the Sides, described by *Galen*.

AURIGA also signifies the fourth Lobe of the Liver. *Castellus.*

AURIGO, the Jaundice. See ICTERUS.

AURIPIGMENTUM, Offic. Matth. 1367. Ind. Med. 17. Worm. 28. Kentm. 17. Agricol. 592. *Auripigmentum luteum*, Aldrov. Mus. Metall. 353. *Arsenicum croceum Auripigmentum*, Charlt. Foss. 12. *Arsenicum flavum Auripigmentum*, Mont. Exot. 13. ORPIMENT.

The Orpiment of the Shops, *Auripigmentum* in Latin, ἀρρευινον of *Dioscorides*, ἀρερινον of *Galen*, *Naruth* of *Serapion*, *Zarnick Arfar* of the *Arabians*, and Orpiment or Orpin in French, is an Arsenical Juice, in squamous or foliaceous Glebes, like the *Lapis Specularis*, the *Squamæ*, or *Strata*, being easily separable from each other.

Orpiment is of three Kinds; one of a Gold Colour; the second of a deeper Red, or Cinnabarine Colour, mix'd with Yellow; and the third greenish and yellowish, mix'd with a large Proportion of Earth, and therefore the least valuable. These three Kinds are found in the Veins of Gold, Silver, and Copper Mines; but we know not what was the other Kind of Orpiment, mention'd by *Dioscorides*.

Orpiment is of an acrid Taste, soluble in Oil, and inflammable by Fire, emitting a thin Flame with a great deal of Smoke, smelling strongly of Sulphur or Garlick. This Smoke, if collected, turns to yellowish Flowers like Sulphur, and a red or blood-colour'd Mass remains behind; which, when cold, concretes into a hard solid *Regulus*, like Cinnabar, called by some Red Orpiment, or Realgar. If the Orpiment be kept in a subliming Vessel for a long time on the Fire, the whole Mass is raised to the upper Part of the Vessel, and there concretes into a beautiful, red, pellucid Substance like a Ruby, only a small Quantity of Metallic Earth remaining at the Bottom. The first Fumes, which come from this *Regulus*, will turn Copper white and brittle.

Orpiment therefore must consist of the same Parts as common Sulphur, with some Mineral Particles mix'd with them; or it is composed of an acid Salt, entangled in Particles of Mercury, and of a bituminous Substance. Its corrosive Quality arises from the acid *Spicula* stuck into the Particles of Mercury; but it has that Quality in a less degree than corrosive Sublimate, because of its bituminous Part. It is less inflammable than Sulphur, because the Energy of the acid Salts contain'd in it is weaken'd by the Mineral Parts; and, from its corrosive Quality, it is deservedly reckon'd among Poisons.

It was antiently used by Physicians to eat away fungous Flesh, but is now laid aside in that Intention, Chymistry having furnished us with much better Catheretics. It is used sometimes by Barbers, with a Mixture of Quick-lime, as a Depilatory, to eradicate the Hairs of any Part of the Body; but if they let it lie on too long, it corrodes the Skin. Some Physicians recommend the internal Use of Orpiment, in Substance, in a purulent Phthisis accompanied with Expectoration, and in Asthmas. The Fumes of it may likewise be received at the Mouth in the same Intentions, and the *Chinese* reckon it among the Purgative Medicines. However, I cannot think the inward Use of this Medicine in any respect allowable; for it is a strong Poison, destructive to the Nerves, and accordingly is found by Experience to bring on very terrible Symptoms, such as Spasms in the Hands and Feet, Stupors and Contractions, cold Sweats, Palpitations of the Heart, Faintings, Thirst, inward Burning, Vomiting, Belly-ach, Erosions, violent Pains, and Death itself, according to the different Doses of this Poison; and in the Bodies of such as die in this manner, the Oesophagus, Stomach, and Intestines, are found to be inflamed, corroded, and perforated in several Places.

The Antidotes for Orpiment, and all other Arsenical Substances, are whatever is able to blunt the Acrimony of these corrosive Medicines; such as Milk and Oil, drank in great Quantities, fat Broths, the Juice of Mallows or Marshmallows, Decoctions of Flea-wort, and Linseed, Marshmallow-roots, and such-like. Orpiment or Arsenic, worn about the Neck like an Amulet, cannot be so hurtful as some imagine; neither do we believe it of any Virtue in preserving against the Plague, or pestilential Diseases.

Of the *Lixivium* of Orpiment and Quick-lime is made the Sympathetic Ink, by the Effluvia of which alone, Letters written with Vinegar of Lead become visible; and the Painters use it for Gold Colours, from which Use its Name is derived. *Geoffroy.*

AURIPIGMENTUM RUBRUM, REALGAR, which see.

AURIS, the Ear.

Every one knows that the Ears are two in Number, that they are situated on the lateral Parts of the Head, and that they are the Organs of Hearing. Anatomists commonly divide or distinguish the Ear into external and internal. By the external Ear, they mean all that lies without the external Orifice of the Meatus Auditorius in the Os Temporis; and by the internal Ear, all that lies within the Cavities of that Bone, and also the Parts that bear any Relation thereto.

The greatest Part of the external Ear consists of a large Cartilage, very artificially framed, which is the Basis of all the other Parts of which this Portion of the Ear is made up. The internal Ear consists chiefly of several bony Pieces, partly form'd in the Substance of the Os Temporum, and especially in that Portion of it call'd Apophysis Petrosa, and partly separated from, but contain'd in a particular Cavity of that Bone.

The external Ear, taken all together, resembles in some degree the Shell of a Muscle, with its broad End turn'd upward, the small End downward, the convex Side next the Head, and the concave Side outward. Two Portions are distinguish'd in the external Ear, taken all together, one large and solid, call'd in Latin Pinna, which is the superior, and by much the greatest Part; the other small and soft, call'd the Lobe, which makes the lower Part. We may likewise consider two Sides in the outward Ear, one turn'd obliquely forward, and irregularly concave; the other turn'd obliquely backward, and unequally convex; for all Ears, which have not been disorder'd by binding the Head too tight in Childhood, are naturally bent forward.

The fore Side is divided into Eminences and Cavities. The Eminences are four in Number, call'd Helix, Anthelix, Tragus, and Antitragus. The Helix is the large folded Border, or Circumference of the great Portion of the Ear. The Anthelix is the large oblong Eminence, or Rising, surrounded by the Helix. The Tragus is the small anterior Protuberance below the anterior Extremity of the Helix, which, in an advanced Age, is cover'd with Hairs. The Antitragus is the posterior Tubercle, below the inferior Extremity of the Anthelix.

The Cavities on the fore Side are four in Number, the Hollow of the Helix, the Depression at the superior Extremity of the Anthelix, call'd Fossa Navicularis; the Concha, or great double Cavity, that lies under the Rising, term'd Anthelix, the upper Bottom of which is distinguish'd from the lower by a Continuation of the Helix, in form of a transverse Crista; and lastly, the Meatus of the external Ear, situated at the lower Part of the Bottom of the Concha.

The back Side of the external Ear shews only one considerable Eminence, which is a Portion of the convex Side of the Concha, the other Portion being hid by the Adhesion of the Ear to the Os Temporis. This Adhesion hinders us likewise from seeing the Hollow answering to the Crista, by which the Cavity of the Concha is divided.

I have already said, that the *external Ear* consists chiefly of a Cartilage, which is the Basis of all the other Parts. These other Parts are Ligaments, Muscles, Integuments, sebaceous and ceruminous Glands, Arteries, Veins, and Nerves; but I do not reckon among them a large Gland, call'd, by the *Greeks*, *Parotis*, because it lies very near the Ear.

The Cartilage of the *outward Ear* is nearly of the same Extent and Figure with the large solid Portion thereof, already mention'd; but it is not of the same Thickness, being cover'd by Integuments on both Sides. In the Lobe, or soft lower Portion of the *Ear*, this Cartilage is wanting. On the back Side, it shews all the Eminences and Cavities on the fore Side in an opposite Situation, with respect to each other, except the Fold of the great Circumference; and it consists only of one Piece from that Circumference all the Way to the Meatus Externus, except at the two Extremities of the folded Part of the Helix, where there are two small separate Portions connected to the great Cartilage only by the Integuments.

The cartilaginous Portion of the external Meatus Auditorius does not make a complete Circle, but rather a short Tube, in one Side of which there is a Break, and which terminates in an oblique Border, fixed to the Edge of the bony Canal by several small Inequalities, as by a kind of Ingrailing; and from this Obliquity it is that the cartilaginous Border terminates downward, in a kind of Apex or Point. The lateral Break in this Cartilage is between the upper and back Part of its Circumference, and on each Side thereof the cartilaginous Edges are rounded. There are likewise two or three other small Incisions in this Circumference, which, in regard to the Meatus, represent obliquely transverse Fissures. The anterior Fissure is in a manner quadrangular; neither are the intermediate Parts always opposite to each other, for the uppermost is a little further from the Os Temporis than the posterior.

The *external Ear* is fix'd to the Cranium, not only by the cartilaginous Portion of the Meatus already mention'd; but also by Ligaments, which are two in Number, one anterior, the other posterior. The anterior Ligament is fix'd by one Extremity to the Root of the Apophysis Zygomatica of the Os Temporis, at the anterior, and a little toward the superior, Part of the Meatus Osseus, close to the Corner of the Glenoid Cavity; and by the other Extremity to the anterior and superior Part of the cartilaginous Meatus.

The posterior Ligament is fix'd by one End to the Root of the Mastoid Apophysis, and by the other to the posterior Part of the Convexity of the Concha, so that it is opposite to the anterior Ligament. There is likewise a kind of superior Ligament, which seems to be only a Continuation of the Aponeurosis of the Frontal and Occipital Muscles.

Of the Muscles of the *external Ear*, some go between the Cartilages and Os Temporis, others are confin'd to the Cartilages alone. Both Kinds vary in different Subjects, and are sometimes so very thin, as to look more like Ligaments than Muscles. The Muscles of the first Kind are generally three in Number, one superior, one posterior, and one anterior, and they are all very thin. The superior Muscle is fix'd in the Convexity of the Fossa Navicularis, and of the superior Portion of the Concha; from whence it runs up to the squamous Portion of the Os Temporis, expanding in a radiated manner, tho' not in the same Degrees, in all Subjects; and is inserted principally in the Ligamentary Aponeurosis, which covers the posterior Portion of the Temporal Muscle.

The anterior Muscle is small, more or less inverted, and like an Appendix to the superior. It is fix'd by one Extremity about the Root of the Zygomatic Apophysis, and by the other in the anterior Part of the Convexity of the Concha.

The posterior Muscle is almost transverse, and of a considerable Breadth, being fix'd by one End to the posterior Part of the Convexity of the Concha, and by the other in the Root of the Mastoid Apophysis. It covers the posterior Ligament; but the Division of it into several Portions, mention'd by some Author, seems to be merely artificial, that is, owing to Dissection.

The small Muscles, which are confin'd to the Cartilages, are only small Strata of Fibres, found on both Sides of the Cartilages. In many Subjects they are of so pale a Colour, as not to look at all like Muscular Fibres. Of this Number are those which *Valsalva* discover'd in the different Cavities on the back Side of the Cartilage, and those found by *Santorini* on the Tragus, and along the convex Part of the anterior Portion of the Helix.

The Skin of the *external Ear* is, in general, a Continuation of that which covers the neighbouring Parts of the Temporal Region. The Skin on the fore Side of the Ear is accompanied by a very small Quantity of cellular Substance; and therefore we find all the Eminences and Cavities of that Side distinctly mark'd upon it, as far as the Bottom of the external Meatus Auditorius. In what I have said of the Skin, the Epidermis is likewise comprehended.

The back Side is cover'd by the Skin, continued from the fore Side; but as the Folds are there very close, it only passes over them, except that Portion of the Concha which surrounds

the Entry of the Meatus Auditorius, and which is join'd to the Os Temporis, by means of the cellular Substance. The Hollow of that common Fold, which lies between the Anthelix and Concha, does not appear on the back Side; for, as it is fill'd with the cellular Substance, the Skin passes over it.

The Lobe of the Ear, or that soft Portion, which lies under the Tragus, Antitragus, and Meatus Auditorius, is made up of nothing but Skin and cellular Substance. The Meatus Auditorius is partly bony, and partly cartilaginous. The bony Portion is the longest, and forms the Bottom of the Canal. The cartilaginous Portion is the shortest, and, in Adults, forms the external Opening, or Orifice of the Canal.

These two Portions, join'd endwise to each other, form a Canal of about three Quarters of an Inch in Length, of different Wideness in its different Parts, and a little contorted. It is lined on the Inside by the Skin, and cellular Membrane, thro' its whole Length; and thus these Integuments make up for the Breaks in the cartilaginous Portion, and form a kind of cutaneous Tube in the other Portion. The cellular Membrane is confounded with the Perichondrium and Periosteum of the Meatus.

The Skin which covers both Sides of the Cartilage contains a great Number of small Glands, which continually discharge an oily whitish Humour, collected chiefly near the Adhesions of the Ear to the Head, and under the Fold of the Helix; and these Glands are of the sebaceous Kind. The Skin which lines the Meatus Auditorius, contains another kind of Glands, of a yellowish Colour, and which may be plainly seen on the convex Side of the cutaneous Tube.

These Glands are disposed in such a manner as to leave reticular Spaces between them, and they penetrate a little way into the Substance of the Skin. They are call'd *Glandulae Ceruminosae*, because they discharge that Matter which is named *Cerumen*, or the Wax of the Ears. The inner Surface of the cutaneous Tube is full of fine Hairs, between which lie the Orifices of the ceruminous Glands. The first Place, in which we meet with these Glands, is on that Part of the convex Side of the cutaneous Tube, which supplies the Breaks of the cartilaginous Meatus.

The Arteries of the *external Ear* come anteriorly from the Arteria Temporalis, and posteriorly from the Occipitalis, which is a Branch of the external Carotid. It is proper to observe here, that the Occipital Artery communicates with the Vertebralis, and thereby with the internal Carotid. The Veins are Branches of the Jugularis Externa. And the Occipital Vein communicates not only with the Vena Vertebralis, but immediately with the neighbouring lateral Sinus of the Dura Mater.

The Portio Dura of the Auditory Nerve, having pass'd out of the Cranium, thro' the Foramen Stylo-mastoidaeum, in the manner that shall be afterwards described, gives off a Branch which runs up behind the Ear, to the back Side of which it sends several Filaments; and the Trunk of this Branch sends likewise Filaments to the Meatus, and fore Side of the Ear. The second Vertebral Pair sends also a Branch to the Ear, the Ramifications of which communicate with those of the other Branch from the Portio Dura.

All the bony Organ of Hearing may very naturally be divided into four general Parts:

1. The external Meatus Auditorius.
2. The Tympanum, or Barrel of the Ear.
3. The Labyrinth.
4. The internal Meatus Auditorius.

It may likewise be divided into immoveable or containing Parts, which take in all the four already mentioned; and moveable or contain'd Parts, which are four little Bones lodg'd in the Tympanum, call'd *Incus*, *Malleus*, *Stapes*, and *Os Orbiculare*, or *Lenticulare*.

The external MEATUS AUDITORIUS.

The external Auditory Passage begins by the external Auditory Hole, the Edge of which is rough and prominent; but backwards, towards the Mastoid Apophysis, it appears very much sloped. The Passage itself is about half an Inch in Length, running obliquely from behind forward, in a curve Direction, and sometimes winding a little in the Middle, like a Screw. Its Cavity is almost oval, wider at the Entry than at the Middle, after which it widens again by Degrees.

It terminates inwardly by an even circular Edge, lying in a Plane very much inclined, the upper Part of it being turn'd outward, and the lower Part inward; so that the whole Canal is longer on the lower Side than on the upper. The concave Side of the circular Edge is grooved quite round.

In Children this bony Canal is wanting, as well as the Mastoid Apophysis; and the inner circular Edge is a distinct Ring, which, in an advanced Age, unites entirely, and becomes one Piece with the rest: It is termed the *Bony Circle* in Infants; and, indeed, it is very easily separated from all the other Parts.

It should seem therefore, that the whole bony Canal in Adults is only a Prolongation of the bony Circle in Children; because, even in a more advanced Age, the whole Canal may without much Difficulty be taken out. The circular Groove lies between the Mastoide Apophysis and the articular Fissure or Crack.

The FIGURE and SITUATION of the TYMPANUM.

The *Tympanum* or Barrel of the Ear is a Cavity irregularly semispherical, the Bottom of it being turned inward, and the Mouth joined to the circular Groove already mentioned. Both Eminences and Cavities are observable in it.

EMINENCES.

The remarkable Eminences are three in Number: A large Tuberosity lying in the very Bottom of the Barrel, a little toward the back Part; and a small irregular Pyramid, situated about the Tuberosity, and a little more backward; the Apex of it is perforated by a small Hole, and on one Side of the Basis two small bony Filaments are often found in a parallel Situation; and, indeed, I believe they are seldom wanting, though their tender Structure exposes them to be often broken. In the third Eminence is a Cavity shaped like the Mouth of a Spoon, situated at the upper, and a little towards the anterior Part of the Bottom of the *Tympanum*. This Cavity is Part of a Half-canal, of which hereafter; and at a very small Distance from its Point, is a little bony Ridge, which goes from one Edge of it to the other, but is sometimes not entire.

CAVITIES.

The principal Cavities in the *Tympanum* are, the Opening of the Mastoide Cells or Sinusities, the Opening of the *Eustachian Tube*, the bony Half-canal, the *Fenestra Ovalis*, and *Rotunda*; and to these may be added the small Hole in the Pyramid.

The Opening of the Mastoide Cells is at the posterior and upper Part of the Edge of the Barrel. The Cells themselves, which end there, are dug in the Substance of the Mastoide Process, being very irregular, and full of Windings and Turnings.

The Opening of the *Eustachian Tube* is at the anterior, and a little toward the upper Part of the Edge of the Barrel. This Tube, in France generally term'd the *Aqueduct*, runs from the *Tympanum* towards the posterior Openings of the Nasal Fossæ, and Arch of the Palate. The bony Portion thereof, of which alone I here speak, is dug in the Apophysis Petrosa, along the Duct of the carotid Apophysis; and when it leaves that, it is lengthened out by the spinal Apophysis of the Os Sphenoides. These two Cavities, the Mastoide Cells, and the *Eustachian Tube*, are, in some measure, Prolongations of the *Tympanum*, one anterior, the other posterior.

The bony Half-canal, of which the Cavity resembling the Mouth of a Spoon is the Extremity, lies immediately above the *Eustachian Tube*, towards the upper Side of the Apophysis Petrosa, or rather in the very Substance of that upper Side. In a natural State, a small Muscle is lodged in it.

The *Fenestra Ovalis* is a Hole of Communication between the *Tympanum* and Labyrinth. It lies immediately above the Tuberosity, the upper Side of it being a little rounded, the lower a little flattened; and one Extremity being turned forward, the other backward. Towards the Labyrinth this Opening has a little flat thin Border quite round it, which renders it narrower at that Place than any-where else.

The *Fenestra Rotunda* is something less than the *Ovalis*, and situated in the lower, and a little towards the posterior Part of the large Tuberosity; the Opening of it, which is the Orifice of a particular Duct in the Labyrinth, lying obliquely backward and outward.

The Hole in the Apex of the Pyramid is the Orifice of a Cavity, which may be named the Sinus of this Pyramid.

The OSSICULA AUDITUS.

The *Tympanum* contains several little Bones, called the Bones of the Ear. They are generally four in Number, denominated from something to which they are thought to bear a Resemblance, as the *Incus*, *Malleus*, *Stapes*, and *Os Orbiculare*, or *Lenticulare*.

INCUS.

The *Incus* or *Anvil* resembles in some measure one of the anterior Grinding Teeth, with its Roots, at a great Distance from each other; at least it comes nearer to this than to the Shape of an Anvil. It may be divided into Body and Branches. The Body is a large Substance; the Branches or Legs are two, one long and one short. The Body is turned forward, the short Leg backward, and the long Leg downward.

The Body of the *Incus* is broader than it is thick. It has two Eminences, and two Cavities between them, much in the same manner as we see in the Crown of the first Grinders.

The short Leg is thick at its Origin, and from thence decreasing gradually, it ends in a Point. It is situated horizon-

tally, its Point being turned backward; and joined to the Edge of the Mastoide Opening of the *Tympanum*.

The long Leg, view'd through the external auditory Passage, appears to be situated vertically; but if we look upon it either on the fore or back Side, we see it is inclined, the Extremity of it being turned much more inward than the Root or Origin. The Point of the Extremity is a little flattened, and bent inward like a Hook, and sometimes a little hollowed like a kind of Ear-picker. By this we may distinguish the *Incus* of one Ear from that of the other, when out of their Places; for, turning the short Leg backward, and the long Leg downward, if the Curvature of this long Leg be toward the Left Hand, the Bone belongs to the Right Ear; if towards the Right, it belongs to the Left Ear.

MALLEUS.

The *Malleus* or *Hammer* is a long Bone, with a large Head, a small Neck, and two Apophyses, one in the Neck, the other in the Handle.

The Top of the Head is considerably rounded, and from thence it contracts all the Way to the Neck. Both Head and Neck are in an inclined Situation; and the Eminences and Cavities in it answer to those in the Body of the *Incus*.

The Handle is look'd upon as one of the Apophyses of the *Malleus*; and, in that Case, it is the greatest of the three. It forms an Angle with the Neck and Head, near which it is something broad and flat, and decreases gradually toward its Extremity.

The Apophysis of the Handle, termed by others the small or short Apophysis of the *Malleus*, terminates the Angle already mentioned, being extended towards the Neck, and lying in a strait Line with that Side or Border of the Handle which is next it.

The Apophysis of the Neck, called also Apophysis Gracilis, is in a natural State very long, but so slender withal, that it is very easily broken, especially when dry, which is the Reason why the true Length of it was for a long time unknown. It arises from the Neck, and sometimes appears much longer than it really is, by the Addition of a small dry'd Tendon sticking to it.

When the *Malleus* is in its true Situation, the Head and Neck are turned upwards and inwards; the Handle downwards, parallel to the long Leg of the *Incus*, but more forward; the Apophysis of the Handle upwards and outward, near the superior Portion of the Edge of the *Tympanum*, near the Centre of which is the Extremity of the Handle; and the Apophysis Gracilis forward, reaching all the Way to the articular Fissure in the Os Temporis. It is easy, after what has been said, to distinguish the *Malleus* of the Right Side from that of the Left.

STAPES.

The *Stapes* is a small Bone, very well denominated from the Resemblance it bears to a Stirrup. It is divided into the Head, Legs, and Basis.

The Head is placed upon a short flattened Neck, the Top of it being sometimes flat, sometimes a little hollow.

The two Legs, taken together, form an Arch like that of a Stirrup, in the concave Side of which is a Groove, which runs through their whole Length. One Leg is longer, more bent, and a little broader, than the other.

The Basis resembles that of a Stirrup, both in its oval Shape, and Union with the Legs, except that it is not perforated as the Stirrups now are, but solid, like those of the Antients. Round its Circumference, next the Legs, is a little Border which makes that Side of the Basis appear a little hollow. The other Side is pretty smooth; and one half of the Circumference is something more curve than the other.

The Subject being in an exact Posture, the *Stapes* is to be considered as lying on its Side, with the Head turned outward, near the Extremity of the Leg of the *Incus*; the Basis, inward, being fixed in the *Fenestra Ovalis*; the longest Leg, backward; the shortest, forward; and both in the same Plane. By this Situation it is easy to know the *Stapes* belonging to each Ear.

OS ORBICULARE.

The orbicular or lenticular Bone is the smallest Bone in the Body. It lies between the Head of the *Stapes* and Extremity of the long Leg of the *Incus*, being articulated with each of these. In dry Bones it is found very closely connected, sometimes to the *Stapes*, sometimes to the *Incus*; and might in that State be easily mistaken for an Epiphysis of either of these Bones.

LABYRINTH.

The *Labyrinth* is divided into three Parts, the anterior, middle, and posterior. The middle Portion is termed *Vestibulum*, the anterior *Cochlea*, and the posterior the *Labyrinth*, in particular, which comprehend the three semicircular Canals.

In the true Situation and Direction of the *Apophysis Petrosa*, the *Cochlea* lies forward and inward, towards the Extremity of

the Apophysis; the semicircular Canal backward and outward, toward the Basis of the Apophysis, and the Vestibulum between the other two.

VESTIBULUM.

The *Vestibulum* is an irregularly round Cavity, less than the *Tympanum*, and situated more inward, and a little more forward. These two Cavities are, in a manner, set Back to Back, with a common Partition-wall between them, perforated near the Middle by the *Fenestra Ovalis*, by which the Cavities communicate with one another.

The Cavity of the *Vestibulum* is likewise perforated by several other Holes; on the Outside, or towards the *Tympanum*, by the *Fenestra Rotunda*, but this is commonly seen in dry Bones only; on the back Side, by the five Orifices of the semicircular Canals; on the lower Part of the fore Side, by two Holes which are the Entry of the *Cochlea*, but one of them is shut up in fresh Bones; and on the fore Side, towards the internal *Meatus Auditorius*, opposite to the *Fenestra Ovalis*, by a great many very small Holes for the Passage of the Nerves. On the upper Side there are only small Pores.

SEMICIRCULAR CANALS.

The semicircular Canals are three in Number, one vertical and superior, one vertical and posterior, and one horizontal. The superior vertical Canal is situated transversely with respect to the Apophysis Petrosa, the convex Side or Curvature of it being turned upward, and the Extremities downward; one inward, the other outward. The posterior vertical Canal lies parallel to the Length of the Apophysis, the Curvature being turned backward, and the Extremities forward, one upward, the other downward; and the superior Extremity of this Canal meets and loses itself in the internal Extremity of the former. The Curvature and Extremities of the horizontal Canal are almost on a Level, the Curvature lying obliquely backward, and the Extremities forward, ending under those of the superior vertical Canal, but a little nearer each other; and the inner being almost in the middle Space, between the Extremities of the posterior vertical Canal.

The horizontal Canal is generally the least of the three; the posterior Vertical is often, and the superior Vertical sometimes, the greatest; and sometimes these two are equal. All the three Canals are larger than a Semicircle, forming nearly three Quadrants; they are broader at the Orifices, than in the Middle. These Orifices open into the back Side of the *Vestibulum*, as has been said, being but five in Number, because two of them are lost in each other. So that in the posterior Part of the *Vestibulum*, two appear towards the Inside, and three towards the Outside.

In Children the Substance of these Canals is compact, while that which surrounds them is spongy, so that they may be easily separated from the rest of the Apophysis Petrosa. In Adults, all the Parts of the Bone are so solid, that these Canals appear only like Passages dug in a Piece of Ivory. From this Description it is easy to distinguish the Right *Labyrinth* from the Left.

COCHLEA.

The *Cochlea* is a sort of spiral Shell, with two Ducts, form'd in the anterior Part of the Apophysis Petrosa, in some measure resembling the Shell of a Snail. The Parts to be distinguished in it, in its true Situation, are the Basis, the Apex, the spiral Lamina, or Half-septum, by which its Cavity is divided into two Half-canals, the Spindle round which the *Cochlea* turns, and lastly the Orifices and Union of the two Ducts.

The Basis is turned directly inward, toward the internal Foramen Auditorium; the Apex, outward; and the Axis of the Spindle is nearly horizontal; but in all of them Allowance must be made for the Obliquity of the Os Petrosum, in which they lie.

The Basis of the *Cochlea* is gently hollow'd; and towards the Middle, perforated by several small Holes. The Spindle is a kind of short Cone, with a very large Basis, which is the Middle of the Basis of the *Cochlea*. Through its whole Length runs a double spiral Groove, which, through a Microscope, shews a great Number of Pores.

The *Cochlea* makes about two Turns and an half from the Basis to the Apex; and the two Ducts, being strictly united together through their whole Course, form an entire common Septum, which must not be confounded with the Half-septum or spiral Lamina, as is often done. The first might be termed the common Septum; the other, the particular Septum, or Half-septum.

Both of them are closely joined to the Spindle, being thicker there than in any other Place. The common Septum is complete, and separates the Turns entirely from each other; whereas the Half-septum in the Sceleton is only a spiral Lamina, the Breadth of which is terminated all round by a very thin Border lying in the middle Cavity of the *Cochlea*. In the natural State

there is a membranous Half-septum, which completes the Partition between the two Ducts.

The two Half-canals turn jointly about the Spindle, one being situated towards the Basis of the *Cochlea*, the other towards the Apex; for which Reason I have always termed one of them internal, the other external; the Division of them into the upper and lower Flight not being agreeable to the natural State, but liable to convey a very false Idea thereof.

The Spiral or Volute of the *Cochlea* begins at the lower Part of the *Vestibulum*, runs from thence forward to the Top, then backward down to the Bottom, afterwards upward and forward, and so on from the Basis, which is turned inwards, to the Apex, which is turned outwards.

From this Description it is easy to know to which Ear any *Cochlea* belongs, when we see it prepared. It likewise teaches us, that in the Right *Cochlea* the Direction of the Turning is the same as in Garden-snails, and almost all the other common Shells; but in the Left *Cochlea* the Turnings are in a contrary Direction, as in one Kind of Shell, which is rarely met with.

The two Half-canals communicate fully at the Apex of the *Cochlea*. Their separate Openings are towards the Basis, one of them being immediately into the lower Part of the fore Side of the *Vestibulum*, the other into the *Fenestra Rotunda*. These two Openings are separated by a particular Turning, which shall be explained.

FORAMEN AUDITORIUM INTERNUM.

The internal auditory Hole is the Backside of the Apophysis Petrosa, in some measure behind the *Vestibulum* and Basis of the *Cochlea*. It is a kind of blind Hole, divided into two Fossulae, one large, the other small. The large one lies lowest, and serves for the Portio Mollis of the auditory Nerve, or seventh Pair. The small one is uppermost, and is the Opening of a small Duct, through which the Portio Dura of the same Nerve passes.

The inferior Fossula is full of little Holes, which, in the natural State, are filled with nervous Filaments of the Portio Mollis, which go to the Spindle, to the semicircular Canals, and to those of the *Cochlea*. It is this Fossula which forms the shallow Cavity at the Basis of the Spindle of the *Cochlea*.

The Passage for the Portio Dura of the auditory Nerve runs behind the *Tympanum*; and its Orifice is the Stylo-mastoide Hole. *Fallopian* gave to this Duct the Name of *Aqueduct*, from its Resemblance to some Aqueducts in Italy. It begins by the small Fossula, and pierces from within, outwards, the upper Part of the Apophysis Petrosa, making there an Angle or Curvature. From thence it is inclined backward, behind the small Pyramid of the *Tympanum*, and runs down to the Stylo-mastoide Hole, through which it goes out. It communicates likewise by a small Hole with the Barrel of the Ear.

In some Skulls this Aqueduct of *Fallopian* is open on the upper Part of the Apophysis Petrosa, a kind of Break appearing in it, formed by a double Hole. It is at this Place that it makes the Angle already mentioned. But commonly it is covered with a bony Lamina.

The other Parts of the Ear are principally the Membrana Tympani, the Periosteum of the Barrel, the Membrana Mastoidea Interna, the Muscles of the Ossicula, the Parts which complete the Formation of the Eustachian Tube, the Arteries, Veins, and Nerves. I find myself, however, under a Necessity of beginning by the Tuba Eustachiana, for two Reasons: First, because the bony Parts of that Tube are but of very small Use for the Knowledge of its whole Structure and Composition. And, secondly, because we are obliged to mention it in describing the Muscles.

The *Eustachian Tube*, otherwise called *Ductus Auris Palatinus*, and in France generally the *Aqueduct*: This, however, must not be confounded with the *Aqueductus Fallopii*. It is a Canal or Duct which goes from the *Tympanum* to the posterior Openings of the Nares, or Nasal Fossae, and toward the Arch of the Palate; it is dug in the Apophysis Petrosa, along the carotid Canal; and it is lengthened out by the spinal Apophysis of the Os Sphenoidale.

In its natural State, this Duct reaches from the Cavity of the Barrel to the Root or superior Part of the internal Ala of the Apophysis Pterygoidea; and through this whole Course it is made up of two Portions, one intirely bony, and the other partly bony, partly cartilaginous, and partly membranous.

The bony Portion lies through its whole Length immediately above the Fissure of the Glenoid, or articular Cavity of the Os Temporis, and terminates at the Meeting of the spinal Apophysis of the Os Sphenoidale with the Apophysis Petrosa of the Os Temporis, that is, between that spinal Apophysis and the inferior Orifice of the carotid Canal.

The other or mixed Portion reaches in the same Direction from this Place to the internal Ala of the Apophysis Pterygoidea, or to the posterior and outer Edge of the Nares. But, to form a more exact Idea of it, it will be proper to consider it as divided into four Parts, two-superior, and two inferior.

The

The two upper Parts or Quarters are bony; and of these the innermost is formed by the Side of the Apophysis Petrofa, the outermost by the Side of the Apophysis Spinalis of the Os Sphenoides, so that the upper Half of this Portion of the Tube is bony. Of the two inferior Parts, the internal is cartilaginous, and the external membranous; so that the lower Half of this Portion of the Tube is partly cartilaginous next the Os Sphenoidale, and partly membranous next the Apophysis Petrofa.

The Eustachian Tube, thus formed, is very narrow in the bony Part next the Ear; the other Portion grows gradually wider, especially near the posterior Nares, where the inner cartilaginous Side terminates by a prominent Edge, and the outer Side joins that of the neighbouring Nostril. The Cavity of the Tube is lined by a Membrane like that of the internal Nares, of which it appears to be a Continuation; and, on the prominent Edge, this Membrane is considerably increased in Thickness, representing a kind of half Pad.

The Situation of the two Tubes is oblique, their posterior Extremities at the Ears being at a greater Distance than the anterior at the Nares, and the convex Sides of the prominent Edges are turned toward each other. The Openings of the Tubes are oval at this Place, as is likewise their whole Cavity, especially that of the mixed Portion.

The Eustachian Tube is furnished with three Muscles, according to Valsalva, who discovered, that the *Pterygostaphylinus*, and the *Sphenopterygopalatinus*, do not properly belong to the Uvula, but to this Tube. To these he adds a third, which is the *Palatofalpingæus*, since called by some Authors, *Musculus Tubæ Novus Valsalvæ*. It arises broad and tendinous from the Edge of all the lunated Part of the Os Palati, several of its Fibres being spread upon the Membrane that covers the Foramen Narium; then growing into a small thin Tendon, it is reflected about the Hook-like Process of the inner Ala of the Processus Pterygoideus; but soon turning into a narrow and thin fleshy Belly, it runs close along the Inside of the *Musculus Pterygoideus Internus*, and is inserted carnosus into all the membranous, fleshy, and cartilaginous Part of the Tube.

Its Use is to dilate and keep open this Chancel, as Valsalva first has most ingeniously taken Notice.

The *Membrana Tympani* is a thin transparent flattish Pellicle, the Edge of which is round, and strongly fixed in the orbicular Groove, which divides the bony Meatus of the external Ear from the Tympanum, or Barrel. This Membrane is very much stretched, or very tense, and yet not perfectly flat; for, on the Side next the Meatus Externus, it has a small Hollowness which is pointed in the Middle; and, on the Side next the Tympanum, it is gently convex, and also pointed in the Middle.

This Membrane is situated obliquely, the upper Part of its Circumference being turned outward, and the lower Part inward, suitable to the Direction of the bony Groove already mentioned. It is made up of several very fine Laminæ, closely united together. The external Lamina is, in some measure, a Production of the Skin and Cuticula of the external Meatus; for they may be pulled at the same time like the Finger of a Glove. The internal Lamina is a Continuation of the Periosteum of the Tympanum; and, when the Membrane has been first macerated in Water, each of these Laminæ may be subdivided into several others, which I have sometimes made to amount in all to six. In very young Children, this Membrane is covered on the Outside by a thick mucilaginous Web.

The Depression in the Middle of the *Membrana Tympani* is caused by the Adhesion of the little Bone called *Malleus*, the Handle of which is closely joined to the Inside of the Membrane, from the upper Part of the Circumference all the Way to the Centre, to which the End of the Handle is fixed. This Handle seems to lie in a very fine membranous Duplication, by means of which it is tied to the *Membrana Tympani*, and which serves it for a Periosteum.

The Periosteum of the Tympanum, or Barrel of the Ear, produces that of the small Bones, and it may be made visible by means of Anatomical Injections, which discover capillary Vessels very distinctly ramified on the Surface of the *Ossicula*. It is likewise continued over the two *Fenestræ*, and enters the *Eustachian Tube*, where it is lost in the inner Membrane of that Duct.

The *Cellulæ Mastoideæ* are very irregular Cavities in the Substance of the Mastoid Apophysis, which communicate with each other, and have a common Opening towards the Inside, and a little above the posterior Edge of the orbicular Groove. These Cells are lined by a fine Membrane, which is partly a Continuation of the Periosteum of the Tympanum, and partly seems to be of a glandular Structure, like a kind of *Membrana Pituitaria*. The Mastoid Opening is opposite to the small Opening of the *Eustachian Tube*, but a little higher.

The Ligaments of the *Ossicula* come next in Order; the *Incus* is tied by a strong short Ligament fixed in the Point of the short Leg to the Edge of the Mastoid Opening. Between the *Incus* and *Malleus* we find a small thin Cartilage. The *Malleus* is connected through the whole Length of its

Handle, to the Inside of the *Membrana Tympani*, in the manner already said. I need only add here, that, by Help of a Microscope, we discover round the Point of the Handle, in the Substance of the Membrane, a small orbicular Plane, of a whitish Colour, a little inclined to red.

The *Malleus* has three Muscles, one external, one anterior, and one internal; and the *Stapes* has one Muscle. The external or superior Muscle of the *Malleus*, attributed to *Cassorius*, and mentioned by *Fabricius ab Aquapendente*, is a thin Fasciculus of fleshy Fibres, lying along the upper Part of the bony *Meatus Auditorius*, between the Periosteum and the other Integuments. The outer Part of it is pretty broad, and it contracts by Degrees as it advances towards the upper Part or Break of the orbicular Groove of the Tympanum, into which it enters by a small Tendon, above the *Membrana Tympani*, and is inserted in the Neck of the *Malleus*, near the small Eminence, or short Apophysis, of the Handle. This Muscle is sometimes so pale as hardly to be distinguished.

The anterior Muscle of the *Malleus*, called by Mr. *Duvernoy* the *External*, is fleshy, long, and thin. It runs along the Outside of the *Eustachian Tube*, to which it adheres very closely through its whole Length. Its anterior Extremity is fixed in that Side of the Tube just before the Sphenoidal Spine; and the posterior Extremity ends in a long thin Tendon, which runs in the Articular or Glenoid Fissure of the Os Temporis, thro' a small oblique Notch, at which Fissure it enters the Tympanum, and is inserted in the long thin Apophysis of the *Malleus*. It is partly accompanied by a Nerve, which forms what is called the *Chorda Tympani*.

The internal Muscle of the *Malleus* is very fleshy and distinct. It lies along the Inside of the *Eustachian Tube*, partly on the cartilaginous, and partly on the bony Portion, being fixed by one Extremity in the Apophysis Petrofa. Afterwards it runs along the Cavity of the bony Half-canal of the Tympanum, within which Cavity it is invested by a Portion of a membranous or ligamentary Vagina, which, being fixed to the Edges of the Half-canal, forms an entire Tube therewith; and this Vagina must be cut open before we can see the Muscle.

At the Extremities of this bony Half-canal, where we observe the Cavity shaped like the Mouth of a Spoon, this Muscle ends in a Tendon, which is bent round the transverse bony or ligamentary Ridge in the last-named Cavity, as over a Pulley, and is inserted in the Neck of the *Malleus*, above the small Apophysis, advancing likewise as far as the Handle. The Extremities of the anterior and internal Muscles sometimes meet, and there they cover the mixed Portion of the *Eustachian Tube*.

The Muscle of the *Stapes* is short and thick, and lies concealed within the small bony Pyramid at the Bottom of the Tympanum. The Cavity which it fills, touches very nearly the bony Canal of the Portio Dura of the Auditory Nerve; and it terminates in a small Tendon, which goes out of the Cavity through the small Hole in the Apex of the Pyramid. As it goes through the Hole, it turns forward, and is inserted in the Neck of the *Stapes*, on the Side of the longest and most crooked Leg of that Bone.

The three Parts of the Labyrinth, that is, the *Vestibulum*, *femicircular Canals*, and *Cochlea*, are lined by a fine Periosteum, which is continued over all the Sides of their Cavities, and shuts the two *Fenestræ* of the Tympanum.

In all the Subjects which I ever examined, I have found the femicircular Canals simply lined by a Periosteum adhering to their inner Surfaces, without any particular membranous Bands. The two Half-canals of the *Cochlea* are lined in this manner: The Periosteum of the two Sides of the bony Spiral Lamina advances beyond the Edge of that Lamina, and forms a membranous Duplication, which extending to the opposite Side, completes the Spiral Septum.

This Septum separates the two Half-canals from the Basis to the Apex, but there it leaves a small Opening, by which the small Extremities of the Half-canals communicate with each other. The large Extremity of the external Half-canal ends by an oblique Turn, in the *Fenestra Rotunda*, which is shut by a Continuation of the Periosteum of that Canal. The large Extremity of the other Half-canal opens into the *Vestibulum*; and these two Extremities are entirely separated by a Continuation of the Periosteum.

All the Periosteum of the internal Ear, especially that of the *Ossicula* and Tympanum, is in Children no more than a Mucilage; and in them likewise the *Membrana Tympani* is thick, opaque, and covered with a whitish slimy Matter.

Through the whole Extent of the Periosteum of the Internal Ear, especially on that of the *Ossicula*, femicircular Canals, and Half-canals of the *Cochlea*, we discover a vast Number of Blood-vessels, not only by Anatomical Injections, but in Inflammations, and even without the Help of a Microscope; for I have often shewn them to the naked Eye in the femicircular Canals, and Half-canals of the *Cochlea*. The Arteries come partly from the Internal Carotid, and partly from the Arteria Basilaris, which is a Continuation of the Vertebralis; the small capillary

capillary Ramifications of which may be observed to accompany the Auditory Nerve, through the Internal Foramen Auditorium.

The Portio Mollis of the Auditory Nerve ends by its Trunk at the great Fossula of the Internal Auditory Hole, from whence the Filaments pass through several small Holes in the Basis of the Cochlea, partly to the Periosteum of the semicircular Canals, and partly to the Internal Periosteum of the Half-canals of the Cochlea.

The Portio Dura, which I name *Nervus Sympatheticus Minor*, runs first of all into the small Fossula of the Foramen Auditorium Internum; then passes through the whole bony Duct, called *Aquæductus Fallopii*, and comes out again through the Stylomastoide Hole of the Os Temporis. In this Course it communicates with the Dura Mater on the upper or anterior Side of the Apophysis Petrofa, at the Place where the bony Duct is interrupted.

Having reached behind the small Pyramid in the Bottom of the Tympanum, this Nerve sends a small Filament to the Muscle of the *Stapes*; and, a little before it goes out by the Stylomastoide Hole, it gives off another more considerable Filament, which enters the Tympanum from behind forward, passes between the long Leg of the *Incus*, and Handle of the *Malleus*, and afterwards runs cross the whole Breadth of the Tympanum a little obliquely, and goes out at the same Place at which the Tendon of the anterior Muscle of the *Malleus* enters.

This small Nerve is generally called *Chorda Tympani*, because, in its Passage through the Tympanum, it has been compared to the Cord of a Drum. Having left the Cavity of the Internal Ear, it advances toward one Side of the Basis of the Tongue, where having joined the small Nervus Lingualis, it is considered as a kind of Recurrent.

The Portio Dura passes through the small Fossula in the internal Auditory Hole into the winding Duct of the Apophysis Petrofa, and goes out by the Foramen Stylomastoideum, to the Face and other neighbouring Parts. As it passes through the winding Duct, or Aqueduct of Fallopius, it touches the Dura Mater at the small Opening on the upper Side of the Apophysis Petrofa, where it joins some Filaments from the fifth Pair.

It likewise gives off a Filament to the Muscle of the *Stapes*, and, as it goes out, it gives or receives another Filament, which passes by the Tympanum, and joins the Lingual Branch of the inferior Maxillary Nerve.

I chuse to call this Portion of the Auditory Nerve, *Nervus Sympatheticus Minor*; to the Description of which I now proceed.

The Trunk of each Nerve of the Portio Dura, or of the *Sympathetici Minores*, having passed through the Ductus Petrofus Fallopii, and having communicated with the Dura Mater, as has been already said, sends off, at about the Sixth-part of an Inch from where it goes out at the Stylomastoide Hole, two Branches, one upward, the other downward.

The superior Branch runs up chiefly to the posterior Parts of the External Ear, to which it is distributed, communicating as it passes behind the Ear, with a Branch of the Second Pair of the Cervical Nerves; and forward with a Branch of the Maxillary Inferior.

The inferior Branch is spent on the three Musculi Styloidei, Digastricus, and on the superior Extremity of the Sternomastoideus, reaching in some Subjects as far as the Middle of that Muscle. Instead of these two single Branches, small Ramifications go out sometimes from the Trunk.

Afterwards the Trunk of the Portio Dura advancing forward, through the Parotid Gland, to which it gives several Filaments; some of these Filaments running from without inwards, and surrounding that Branch of the external Carotid Artery, which runs behind the Ear; sometimes, though very seldom, the Trunk itself is split to give Passage to the Artery.

This Trunk, having passed through the Parotid Gland, behind the Angle of the lower Jaw, is divided into two large Branches, one superior, the other inferior.

The superior Branch of the Portio Dura is the most considerable of the two; and, having run upwards for about the Third-part of an Inch, it divides into seven or eight Branches.

These Branches are spread superficially, and in an irregular radiated manner, on all the lateral Parts of the Face, from the Hair as low as the under Lip, between the Ear and Nose, distributing a prodigious Number of cutaneous Nerves.

In some Subjects these Branches, at their first Separation, form a kind of Plexus, which resembles a Goose's Foot.

The first, second, and third Branches, are distributed to the anterior Parts of the Ear, on the lateral Parts of the Head, the Temporal and Frontal Muscles, and the neighbouring Parts.

One of these Branches, and sometimes the large superior Branch, detaches inward behind the Condyle of the lower Jaw, and before the Temporal Vein, two or three Filaments, which communicate with the inferior Maxillary Nerve.

The fourth Branch goes to the Foramen Superciliare, or

Supra-orbitarium; giving in its Passage several Filaments to the external lateral and superior Parts of the Musculus Orbicularis Palpebrarum, and afterwards communicating with the Orbital Nerve, which goes out by the same Foramen.

The fifth Branch is distributed by small Filaments on the lateral Part of the Cheek; and is partly lost in some small Holes at the Basis or Root of the Zygoma, giving likewise some Filaments to the external lower Part of the Musculus Orbicularis Palpebrarum.

The sixth and seventh Branches, and likewise the eighth, when it is found, are spread on the whole Cheek as far as the Nose.

One of these latter Branches passes under or behind the Musculus Zygomaticus, to which it gives Filaments; and then perforating and giving Filaments to the middle lower Part of the Musculus Orbicularis Palpebrarum, it goes to the inferior Orbital Hole in the Os Maxillare, and communicates with the Nervus Maxillaris Superior.

The last Branch communicates by some Filaments, with a neighbouring Branch of the large inferior Ramification of the Portio Dura.

This large inferior Branch, which is something less than the superior, runs under the Angle of the lower Jaw, and is distributed by several Branches to all the inferior lateral Parts of the Face, and to the neighbouring Parts of the Throat, where it chiefly terminates by a vast Number of cutaneous Filaments.

The upper Branches of the large inferior Branch run upon the Musculus Masseter to the lower Part of the Zygomaticus, Buccinator, and other Muscles of the Lips.

One of these superior Branches communicates with one of the inferior Ramifications of the upper Branch, and by the Intervention thereof it communicates likewise, in some measure, with the Suborbital Branch of the Nervus Maxillaris Superior, or that which goes out by the Foramen Suborbitarium.

The most considerable of all these Branches runs forward along the Basis of the lower Jaw, sending Filaments to the Musculus Cutaneus, and to the Muscles of the under Lip, which it perforates near the Skin, and there communicates with the Nervus Maxillaris Inferior.

The inferior Branches run under the lower Jaw, giving Filaments to the Glandula Submaxillaris, and are distributed to the Throat on the Musculus Cutaneus, intersecting the external Jugular Vein. One or more of these Branches are observed to run down to the Middle of the Musculus Sternomastoideus, where it communicates with a Branch of the second Vertebral Pair.

As Winslow has not given the Uses of the different Parts of the Ear already described, I shall supply this Defect from Du Verney.

We may justly consider the external Ear as a kind of natural Horn, the clean and smooth Cavity of which serves to collect Sounds, and consequently render their Impressions on the other Organs of Hearing stronger. This Opinion is confirmed by Experience; for those who have the Misfortune to have their Ears cut off, labour under so great a Difficulty of Hearing, that they are obliged to use Horns, or their Hands formed into a kind of Tube, in order to supply this Defect. For the same Reason also, some Animals, such as Deer and Hares, for the sake of hearing more distinctly, direct their Ears to that Quarter, from which any Noise they hear, comes.

Some are of Opinion, that the direct Lines of Sound, whilst insinuating themselves into the Sinuses of the Ear, are there several times reflected before they reach the Concha; and that these Sinuses, and repeated Reflexions, serve to augment the Impression made upon the other Organs of Hearing, just as in a semicircular Vault, the Phonic Rays, reflected at equal Angles, according to the Circumference of the Angle of the Vault, at last pass from one Extremity to the other, by a great Number both of strong and faint Reflexions.

The Motion of the Muscles of the external Ear, is a Matter attended with a good deal of Obscurity; but yet it seems probable, that the Concha, must, by their Action, be either contracted or dilated, according to the Impetus or Faintness of the tremulous Motions of the Air.

The Meatus of the Ear, by redoubling the Reflexions, renders the Vibrations more brisk and lively; and the Obliquity of its Structure not only guards the Membrana Tympani against the Injuries of the Air, but is also the Reason why the Surface of the Meatus itself is larger than it would otherwise be; by which means a greater Number of Reflexions are made in it, a Circumstance which evidently tends to render the subsequent Impression proportionably stronger.

That Species of Wax, or viscid Substance, lodged in the anterior and cartilaginous Part of the Meatus, by the Greeks called *ῥίμα ἐν τοῖς ὠσὶ*, by the ancient Latin Physicians, *Aurium Sordes*, and now commonly *Cerumen*, retains, and, as it were, inviscates, any extraneous Substances or Insects, which might possibly convey themselves into the Ear, and infallibly injure the Membrana Tympani. But though this Wax answers very noble and excellent Purposes, 'tis nevertheless, on some

Occasions,

Occasions, productive of very considerable Inconveniences; for, unless the Ear was frequently cleansed, this viscid Substance would be accumulated in too large a Quantity, become inspissated by its long Continuance in the Ear, and at last hinder the tremulous Motions of the Air from reaching the *Membrana Tympani*. Some time ago, when I made an Attempt to discover the Cause of a Deafness, under which a certain Man had laboured for some Years before his Death, much about two Lines from the *Membrana Tympani*, I found a soft thick Pellicule, to the exterior Side of which a large Quantity of indurated Sordes adhered; and I don't, in the least, doubt, but this Species of Deafness occurs very often.

The cartilaginous Meatus, which is winding and variously interrupted in several Places, forms a certain Ridge, resembling a small Tongue, before the *Concha*, just at the Extremity of the Cheek, and at the very Entrance of the Meatus. This Ridge hinders the Reflexions, made within the *Concha*, from slipping out of its Cavity, and propels them more directly to the more remote and internal Parts of the Meatus. 'Tis also probable, that this Ridge serves to close up and stop the Ear on which we lie; and consequently hinder the Impression of the Air on its Parts; so that it may be said to perform the same Office to the Ear, which the Eyelids, when shut, do to the Eyes.

There are three nervous Branches arising from three different Pairs of Nerves, distributed upon the cartilaginous Meatus; and these Branches render that Part of so fine and exquisite a Sensation, that we instantly become sensible of the small and most minute extraneous Body, insinuating itself into the Cavity of the Ear.

I now come to consider the internal Ear, the first Part of which, that occurs, is the *Membrana Tympani*; and tho' we cannot affirm, that this Membrane is absolutely and indispensably necessary to Hearing, since deaf Persons, upon taking the Handle of any musical Instrument into their Mouths, are by that means, without the Assistance of this Membrane, enabled to hear the musical Sounds; yet 'tis nevertheless certain, that the *Membrana Tympani* is of such Importance to Hearing, that, if any Animal has the Misfortune to have it perforated or torn, the Hearing of that Animal cannot be long preserv'd, but becomes gradually weaker and weaker, till 'tis at last quite lost and destroy'd.

This Membrane is both render'd tense and relax'd, by means of those small and minute Muscles affix'd to the *Malleus*, which is situated immediately behind this Membrane. The external Muscle, by restoring it to the State and Condition of a perfect Plane, relaxes it; but the internal Muscle, situated on the Surface of the *Os Petrosum*, draws it inwards, and by that means renders it more tense than it was in its natural State. But this is perform'd in such a manner, that in the Tension of the *Membrana Tympani* both Muscles act at one and the same time; whereas its Relaxation is produced by the Action of the external Muscle alone. The Reason of this Phenomenon is plainly this: As the Insertion of the external Muscle is near the Head of the *Malleus*, and the Insertion of the other somewhat farther off, towards the Extremity of the *Manubrium*, the Effect produced by the Action of the internal Muscle is augmented by the Action of the external; for, by this means, these two Actions push inwards the Extremity of the *Manubrium* of the *Malleus*, to which the Tension of the *Membrana Tympani* ought principally to be ascribed.

'Tis therefore certain, that these small Muscles act; nor is it less evident, that the *Membrana Tympani* is render'd tense by the one, and relax'd by the other, in the manner already mention'd: But 'tis no easy Task to know, on what particular Occasions they act, or what determines them to put that Membrane into the various States and Conditions necessary for receiving the vast Variety of Impressions made by different Noises and Sounds.

If we affirm, that the *Will* determines and influences them to Action, this is not at all probable, since Noises, for the most part, strike our Ears before we are aware. I should therefore be inclined to think, that the Objects themselves, according to their respective Natures, determine these Muscles to render this Membrane tense, or relax it, as Exigencies require.

'Tis absolutely necessary, that the *Membrana Tympani* should, on different Occasions, be differently disposed, that thus it may be qualified for receiving the different tremulous Motions of the Air; and, indeed, 'tis impossible it should transmit these, such as they really are in themselves, unless it was in some measure adapted to their Natures, and accommodated itself, if I may so speak, to the Impressions made on different Occasions, by assuming Degrees of Tension, fit for representing the various Tones of sonorous Bodies. If, when two Lutes are laid upon a Table, you strike a String in one with your Fingers, in order to move the corresponding String in the other, every one knows, that, before you can produce this Effect, the corresponding String must be tuned to the same Key; or, as Musicians express it, must be in Unison with the String first struck, whether its

Note be an Octave, a double Octave, a fifth, a fourth, or any other Note whatever; otherwise the Vibrations of the String which is struck, will produce but slight, and scarce perceptible, tremulous Motions in the corresponding String of the other Lute.

Since, then, the Diversity of Noises and Sounds depends upon the different Natures and Collisions of sonorous Bodies; since, for Instance, an acute Tone proceeds from a Body, whose Parts are so disposed as to render them fit for producing only the most instantaneous Vibrations, which they forthwith convey to the ambient Air; since, on the contrary, a grave Tone is excited by the Collision of a Body which is only capable of slow and protracted Vibrations, it must of course follow, that the *Membrana Tympani* does, in its various Degrees of Tension and Relaxation, adapt itself to the several Natures and States of sonorous Bodies, and assume, if I may so speak, their respective Characters. For Instance, it is render'd tense for the Reception of acute Sounds, because, in such a State of Tension, it is susceptible of quick and instantaneous tremulous Motions. 'Tis, on the contrary, relax'd for the Admission and Conveyance of grave Sounds; because, during such a Relaxation, 'tis qualified and disposed for the Reception of the more slow and languid Undulations of the Air. In short, it is rendered tense and relax'd in a thousand different Degrees, according to the various Natures of different Noises and Sounds: But I must confess, 'tis no easy Matter to comprehend the Manner in which all this is brought about; for these mechanical Motions are not subjected to our Senses, and consequently it must be very difficult, if not impossible, to explain their Natures; and the several Laws to which they are subjected.

The *Membrana Tympani*, then, receives the various tremulous Motions of the Air, and, when not disorder'd, faithfully conveys them to the other Parts of the internal Ear. But it performs these Functions in consequence of its being dry, thin, and diaphanous; and if its State is changed, with regard to any of these three Qualities, 'tis no Wonder, if the Hearing becomes of course proportionably duller.

'Tis pretty probable, that the Air lodged in the internal Ear, being put into a Commotion by the tremulous Motions of the *Membrana Tympani*, serves at least in some measure to convey these Motions to the immediate Organ of Hearing: But 'tis by no means probable, that so small a Quantity of agitated Air is able to put the *Os Petrosum*, or rather the Labyrinth contained in it, into a Commotion sufficiently strong for the Purposes of Hearing; so that we may, with greater Appearance of Truth, affirm, that the Agitations of the *Membrana Tympani* are communicated to the *Malleus*; that the *Malleus* conveys them to the *Incus*; and the *Incus* to the *Stapes*, whose Agitation at last puts the *Os Petrosum* and Labyrinth into a Commotion; just in the same manner as the intermediate Air between two Lutes, placed on the same Table, is not able sufficiently to convey the tremulous Motion of the String of one of the Lutes to the corresponding String of the other; unless the String, which is struck first, agitates the wooden Plates to which it is affix'd, these Plates the Table, the Table the Plates of the other Lute; and these Plates at last that particular String affix'd to them, which is in Unison with the String which was first struck. Now, that this Effect is produced precisely in the manner now specified, is plain from this Circumstance, that if either of the Lutes is held at never so little a Distance from the Table, the Experiment does not succeed.

The Nature, Mechanical Structure, and Articulation of these three small Bones, seem very much to favour this Conjecture; for, in consequence of their Hardness, Driness, and Smallness, they must be very easily put into a Commotion: The *Manubrium* of the *Malleus* is uninterruptedly affix'd to the *Membrana Tympani*, in its whole Length: Hence 'tis obvious, that this Membrane cannot be put into Commotions, without communicating its tremulous Motions to the *Manubrium*, and so on successively to the other Bones, which are join'd by a mutual Articulation; and, as this Articulation is without the Intervention of Cartilages, it must of course facilitate the Communication of Motions from one to another.

'Tis no easy Matter to determine the precise Use of the *Musculus Stapedis*. However, we may reasonably conjecture, that by drawing the Basis of the *Stapes*, which is placed immediately above the *Fenestra Ovalis*, a little outwards, it renders the Pellicule, with which the superior Part of this Basis is cover'd, tense; and that, according as it renders it more or less tense, it gives it a proportionably greater or less Disposition for receiving the tremulous Motions of the *Membrana Tympani*, in order to be convey'd to the *Vestibulum* and *Labyrinth*.

We may farther add, that this Muscle, by drawing the *Stapes*, which is otherwise pretty flexible, renders it in some measure tense, and keeps it in a firmer State, and consequently disposes it for the better Reception of the tremulous Motions of the *Malleus* and *Incus*.

On the Sides of the *Tympanum* are two *Meatuses*, or Conveyances, one of which terminates in the Palate, but the other is continued to the Sinuses of the *Apophysis Mastoidea*. 'Tis

not improbable, that the Air contained in the *Tympanum* retires into these two *Meatuses*, when the *Membrana Tympani* is drawn inwards, and that it again returns into the *Tympanum*, when this Membrane is relax'd; otherwise the Motion of the *Membrana Tympani* might be obstructed by the Resistance and Elasticity of the Air; and, indeed, one may reasonably believe, that the Return of this Air into the *Tympanum* favours and assists the Reduction of that Membrane to its natural Situation.

The Conveyance from the Palate to the Ear supplies a Fund of Air necessary for renewing, at Intervals, that which is lodg'd in the *Tympanum*: But, that the Coldness of the external Air may not prove injurious to the Parts of the internal Ear, it undergoes all those Modifications, which are necessary to render it suitable to the Parts to which it is to be convey'd, whilst it ascends thro' the Nostrials, and during the Whole of its Passage to the *Tympanum*. Neither by this means does it lose that Degree of Elasticity, which renders it fit for the Purposes to which it was destin'd. For this Reason the Air which returns from the Lungs, and which is tainted with impure Vapours, cannot easily enter this *Meatus* or Conveyance, since its Orifice is so situated and disposed in the Mouth, as rather to admit the Air drawn in by the Nostrials, than that which returns from the Lungs. Almost every one believes, that some deaf People are, by means of this Conveyance, enabled to hear the Sounds produced by such musical Instruments as have Strings; and since their Deafness is owing to a Defect of the *Membrana Tympani*, as to the Performance of its Office, it is not to be wondered at, if the tremulous Motions of the external Air being communicated to the *Tympanum* by means of this Conveyance, these Persons should hear the Sounds of musical Instruments: But in order to shew, that those Commotions of the Air, contained in the *Tympanum*, which are produced by the Impulse of the Air carried through the *Meatus* or Conveyance, are not sufficient to enable deaf Persons to hear the Sounds of any musical Instruments, let it be observed, that these Persons must lay hold of the Handle of the Instrument with their Teeth, otherwise they will not hear the Sound at all, or at least not so distinctly. Hence we may infer, that the Teeth, being by this means put into a Commotion, communicate a tremulous Motion to the Jaw-bone, the Temporal Bones, and the small Bones more immediately employ'd in the Offices of Hearing, and this seems to favour my Conjecture relating to the Use of these small Bones; for People, who are by no means deaf, hear the Sounds of musical Instruments in a stronger and more forcible manner, if, after having shut up their Ears, they lay hold of the Handle of the Instrument with their Teeth. There are also some deaf Persons, who hear far better when the Voice is utter'd above the Crowns of their Heads: In these Persons the whole Cranium is, by this means, put into a Commotion, which is successively convey'd to the *Ossa Petrosa*, and all the other Parts employ'd in Hearing.

The *Fenestra Ovalis* is entirely block'd up by the Basis of the *Stapes*. After this dry and small Bone, one of whose Sides is covered with a Membrane, and whose Basis is very slender, has received the tremulous Motions of the other two Bones, and of the Air contained in the *Tympanum*, it can easily communicate them to the *Vestibulum*, and to the Air contain'd in it, and thence to the *Cochlea*, and the three semicircular Ducts.

Besides the *Fenestra Ovalis*, there is another called the *Fenestra Rotunda*, which is shut up by a Membrane not unlike the *Membrana Tympani*. We may conjecture, that this *Fenestra Rotunda* receives the tremulous Motions of the Air contained in the *Tympanum*, and conveys them to that included in the inferior Part of the *Cochlea*, in which the Air being strongly compress'd, for want of an Exit, is excellently calculated for putting the *Lamina Spiralis* into Commotions; and thus the tremulous Motions of the Air are convey'd to the immediate Organ of Hearing itself, of which we come now to speak.

This Organ, then, is comprehended under the general Name of *Labyrinth*, which, being included in the *Ossa Petrosa*, consists of two principal Parts, the *Cochlea*, and the *Vestibulum*, together with their three semicircular Ducts.

As for the *Cochlea*, no one can doubt of its being a constituent Part of the immediate Organ of Hearing; since this is sufficiently proved by its Make and Structure; for, first, the *Spiral Lamina*, which is a principal Part of it, is hard, dry, slender, and easily broken, all which Conditions are absolutely requisite in Bodies susceptible of tremulous Motions. Secondly, this *Lamina* does not lie within the semioval Spiral Canal; but is stretch'd out betwixt the *Spindle* to which it adheres, on one Side, and the slender Membrane which is join'd to the Surface of this Canal, to which it adheres, on the other; so that this Situation of the *Spiral Lamina* remarkably favours the Disposition or Tendency it ought to have, to be easily and readily put into a Commotion.

Thirdly, the *Spiral Lamina*, by means of this Pellicule, divides the Whole of the Spiral Canal into two Orders, as it were, of Gradations, whose Construction resembles that of a winding Shell, which rest upon the same *Spindle*, and of which the superior does not at all communicate with the inferior Order.

The *Fenestra Rotunda* opens within the inferior Order, and has no Communication either with the superior Order of Gradations in this Canal, nor with the *Vestibulum*: By this means, therefore, the Air included in the inferior Order is both agitated by the tremulous Motions of the *Fenestra Rotunda*, and by the Vibrations of the Air contained in the superior Order of Gradations of the semioval Canal; which is itself put into a Commotion, both by the tremulous Motions of the Air contained in the *Vestibulum*, with which it communicates, and also by the vibratory Motions of the Air contain'd in the inferior Order of Gradations in this Canal: And thus the undulatory Motions of the *Spiral Lamina* must be rendered more brisk and lively, since it is agitated on both Sides.

Fourthly, the Spiral Figure of this *Lamina* seems greatly to support the Truth of the above-mentioned Circumstances; for, whilst it makes two Circumvolutions and an half round the *Spindle*, it, in several Parts, receives the vibratory Motions of the Air; and this same curious Piece of Mechanism is observ'd in the Structure of the Tongue and Nose.

Fifthly, when the large Branch of the soft Portion of the Auditory Nerve arrives at the Basis of the *Cochlea*, it is divided into a great Number of smaller Branches, which, passing thro' all the small *Meatuses*, with which the *Spindle* is perforated, are distributed to the various Windings and Meanders of this *Spiral Lamina*, where they lose themselves. In a Word, this *Lamina* is not only calculated for receiving the vibratory Motions of the Air, but its Structure also ought to be look'd upon as a convincing Proof, that it is qualified and disposed for accommodating itself to all their different Characters and Degrees of these Motions; for since it is broader at the Beginning of its first Circumvolution, than at the Extremity of its last, and since the Breadth of its other Parts are, in like manner, proportionably diminished, we may venture to affirm, that its broader Parts are only fit for the Reception of slow and languid Vibrations, which are productive of grave Tones, since they may be put into a Commotion without its other Parts undergoing any Change; and, *vice versa*, that, when its narrow Parts are struck, their Vibrations are brisk and lively, and consequently produce acute Tones or Sounds; just in the same manner as the broad Parts of a Steel-spring excite slow and languid Vibrations, which are productive of grave Tones; whereas its narrow Parts excite more frequent and brisk Vibrations, and consequently are productive of acute Tones. In a Word, therefore, according to the various Commotions of the *Spiral Lamina*, the Nerves, distributed thro' its Substance, receive the various Impressions of the Air, which exhibit and represent various Tones, or Modulations of Sound.

As for the *Vestibulum*, and the three semicircular Ducts, tho' some imagine, that they only serve to heighten and augment the Impression of the tremulous Motion of the Air; and others, that their Use consists in diminishing and lessening this Impression; yet the following Reasons induce me to think, that they are constituent Parts of the immediate Organ of Hearing.

First, all Birds have only three Canals or Ducts, bended into a semicircular Form; and a fourth, which is strait, and shut at one of its Extremities, but which, with the others, opens into the common Cavity, which serves instead of a *Vestibulum* to them. These three Ducts are also found in Fish; but the *Cochlea* is neither found in Birds, nor in Fish, and yet both hear. 'Tis therefore obvious, that these semicircular Canals must be the immediate Organ of Hearing, both in the one and in the other. Why, then, should not they be subservient to the same Uses in Man, since, in all these three Species of Animals, their Structure is alike? Hence it follows, that these three semicircular Ducts must, at least, be a constituent Part of the immediate Organ of Hearing; and that thus that Organ must consist of two essential Parts.

Secondly, nobody doubts, but that the soft Portion of the Auditory Nerve conveys the Impressions of Sounds to the Brain; but two Branches of this soft Portion enter the Cavity of the *Vestibulum*, and are diffused and expanded into the Filaments and Membranes, which constitute the internal Coverings of the semicircular Canals: Hence I conclude, that this Part of the *Labyrinth* also constitutes a Part of the immediate Organ of Hearing.

Thirdly, such is the Mechanism and Structure of the *Vestibulum*, and semicircular Ducts, that we may, upon good Grounds, suppose, that the Impression of Sounds is augmented and heighten'd in their winding Meanders, and consequently better qualified for putting the Nerves, dispersed in these Places, into a Commotion.

But what I just now asserted of the *Spiral Lamina*, which is, that it did not simply receive the Vibrations of the Air, and that all its Parts were not indiscriminately adapted and accommodated to the same Tones or Sounds, holds also good with regard to these semicircular Ducts. Each of these Ducts, in Figure, resembles two Trumpets, whose narrow Extremities are joined together; for both Orifices of these Canals, in the Cavity of the *Vestibulum*, are found to diverge like the wide Extremity of a Trumpet; and their middle Part, which is just-

ly represented by the Place where the two Trumpets are join'd, is proportionably narrower. Two of these Canals have one common Opening within the *Vestibulum*, and at the same time expand their Extremities very wide, in Comparison of the others: But Experience proves, that the larger Circles, at the broad Extremity of a Trumpet, may be put into Commotions, at the same time that the lesser Circles are subjected to no sensible Change or Commotions whatsoever; and also, that the Vibrations of the larger Circles are slower, and more sensible, and that, in this Case, the Trumpet produces grave Sounds. On the contrary, 'tis equally confirm'd by Experience, that when the lesser Circles of this wide Extremity of the Trumpet are put into Commotions, the larger in the mean time remaining without any sensible Motion, an acute Sound is produced by the Trumpet; because the Vibrations of these smaller Circles are brisker, and more frequent, than in the former Case. The same holds true with regard to the *semicircular Canals*; for their wider Parts may be put into Commotions, whilst the others remain unmoved; at which time the Vibrations of these Parts will be slow, a Circumstance necessarily productive of grave Sounds. On the other hand, when the narrower Parts of these Canals happen to be put into a Commotion, whilst the wider and more diverging remain unmoved, an acute Tone will necessarily be form'd; because the Vibrations of these narrower Parts will be proportionably quicker. From what has been said, we may then justly conclude, that the *Cochlea*, and *semicircular Ducts*, are common and immediate Organs, which not only receive the vibratory Motions of the Air in general, but also the genuine Qualities and different Characteristics of Sounds, according to the different Parts of these Organs, which happen to be put into Commotions.

It may possibly be objected, that these semicircular Canals are too solid, and adhere too strongly to the rest of the *Os Petrosum*, to be so easily moved in their various Parts, and in so many different manners: But, besides that a considerable Noise can scarce be excited without the *Os Petrosum* being put into a Commotion, when these Circles are prepared for the sake of Anatomical Demonstrations, 'tis obvious, that they are only surrounded with a kind of spongy Substance. In the Heads, indeed, of old People, the bony *Laminae*, which cover these Circles before and behind, are pretty hard; but that Substance, which fills up the Space round about these Circles, is of a more porous Nature; for which Reason they are always sufficiently free and disengaged, and easily susceptible of Commotions and Vibrations.

The mutual Sympathy and Connexion between Hearing and Speech generally uses to be accounted for by the Communication of the soft Portion of the Auditory Nerve with those Branches of the fifth Pair of Nerves, which run off, and are distributed to the Parts destin'd for the Formation and Modulation of the Voice; for Anatomists think, that the Commotion of the Nerves of the Ear is propagated to the Nerves of the fifth Pair; whence the Spirits which flow from the Brain into those Nerves, which are distributed to the Parts destin'd for the Formation of the Voice, dispose their Muscles in such a peculiar manner, as to form Sounds exactly corresponding and similar to the Impressions made on the Brain by the Voice. For this Reason 'tis said, that Men and Birds can mutually incite each other to sing; and that those who are deaf from their Birth, must of course be dumb too.

Anatomists are also of Opinion, that the Communication of the second Vertebral Pair with the external Ear, is the Reason why, upon hearing the least Noise, we turn our Heads to the Quarter whence it comes; and why the Whole of the Body is disposed to various Motions, according as the Causes of the Noise are imagined to be hurtful or beneficial to itself: And since these Nerves communicate with those of the Lungs and Heart, hence it is, that we become sensible of proportionable Alterations in our Pulse and Respiration, according to the Diversity of Noises. But all are not agreed with regard to the Effects of all these Communications.

DISEASES of the ORGAN of HEARING.

Having thus given an Account of the Structure, and several Uses, of the Organ of Hearing, it now remains, that I consider the several Disorders incident to the Ear: And in executing this Part of my Design, I shall have a particular Regard to the Structure of this Organ, that it may appear, how indispensably necessary a Knowledge of the Parts is, in order to explain and account for its Diseases. Neither shall I follow the several Divisions of these Disorders commonly proposed by different Authors; but, adhering to the Method I have hitherto observed, I shall first examine the Disorders incident to the external Parts of the Ear; then I shall consider those which attack the *Membrana Tympani*, the *Tympanum*, and *Labyrinth*; after which I shall take a View of those which affect the Auditory Nerve itself; and, in the last place, shall explain and account for what we call a *Tinnitus Aurium*, since it is a common Symptom in all the Disorders incident to these Parts; and whatever I advance shall be supported by the Authorities of good Writers, and the

the Discoveries which I myself have made on the several Occasions, when I have had an Opportunity of dissecting the Ear.

The Symptom which most commonly attacks the external Parts of the Ear, is a Species of Pain which the *Greeks* called *Otalgia*: This Symptom generally seizes the *Concha*, and the Whole of the *Meatus*, as far as the *Membrana Tympani*; and Experience affords us a certain, but melancholy Proof, that it is accompanied with Punction, Erosion, Tension, Puffation, and a Sense of Weight.

Though 'tis not necessary on this Occasion to explain the Nature of Pain in general, yet 'tis not amiss to observe, that it arises from a Solution of Continuity in those Particles, by whose Union animal Bodies are originally formed; for this Solution of Continuity throws the animal Spirits into preternatural and tumultuous Commotions; and in these two Circumstances the very Nature and Essence of Pain consist.

Upon this Hypothesis 'tis obvious to every one, that whatever can occasion a *Solution of Continuity* in the Particles of that Membrane which covers the *Meatus* of the Ear, and excite this irregular and tumultuous Motion of the animal Spirits, must of course prove the Cause of Pain. Thus Inflammations, extraneous Bodies falling into the *Meatus*, Worms, and, in a Word, whatever excites Pain in other Parts, are likewise capable of producing the same Effect in the Ear. The Antients, indeed, imagin'd, that Pains of the Ears might be produced without Inflammation, and without the Concurrence of what they called a conjunct Cause: Hence they accounted for these Pains from abstract and immaterial Distemperatures, which, according to them, proceeded for the most part from an Excess either of Heat or Cold. But since these immaterial Distemperatures have only an Existence in the Imagination, and not in the Nature of Things; and since the Causes exciting these violent Pains may be found in the Parts themselves; I shall give my Sentiments on this Particular, in as concise a manner as I possibly can.

I find from Experience then, that the Wax lodged in the Ear is bitter and viscid, and consequently impregnated with acrid lixivial Salts, mixed with pinguous and oily Particles. These Principles render its Qualities pretty much the same with those ascribed to the Bile, with which it agrees in many Particulars; so that if on any Occasion these saline Juices should become active and disengaged, or, being exalted above their common Pitch, should exercise their Spiculae or Points more briskly than in a natural State, 'tis evident they must create great Pain and Uneasiness in the *Meatus* of the Ear, on account of the exquisite Sensibility of the Part. But this Effect is for the most part produced either by Heat or Cold; for Cold, by condensing this Wax, and rendering it more viscid, is the Cause of its becoming adhesive, and blocking up the excretory Ducts of the Glands, just as it happens in other neighbouring glandular Bodies, in which a like Action of the Air produces similar Obstructions. Hence it follows, that the saline Juices, having acquired a Motion, must distend and tumefy the Glands in which they are lodg'd; and that being rendered more acrid by their long Continuance, they must vellicate the tender Extremities of those Nerves dispersed thro' the Membrane of the *Meatus*: Hence arises a terrible Perturbation of the Spirits, and consequently an acute and racking Pain of the Ear. External Heat, on the other hand, divides and colliquates the saline Juices of this Wax, and by so doing produces the same Effect. The same is observed in Pains proceeding from the Bile excited by an Excess of Heat or Cold in the Parts destined for Nutrition.

But this Wax is not the sole and only Cause of these violent and racking Pains; for it often happens, that an acrid and saline Serum, discharged from the Glands of the Ear, excites a Pain in the *Meatus*; and this plainly appears in the Suppurations which happen in that Part; for when the Matter discharged is of a saline or acid Quality, it vellicates the Membrane of the *Meatus*, and excites that ungrateful and uneasy Sensation which we call Pain.

As for the Difference of Pains in the Ears, I think they may be accounted for in this manner: When the Particles of Wax, or other Humours contained in the Glands, are become saline, acute, and rigid, and, by their tumultuous Agitation, put the Filaments of the *Meatus*, which is full of Nerves, into a Commotion, they excite a pricking Pain, which happens in all Inflammations, but more especially in Persons of dry and bilious Constitutions, whose Humours abound with acid and saline Juices of this Kind; as also in People of melancholic Habits, whose Serum is also of an acid and saline Nature. When these Salts become very acrid and corrosive, they produce, as it were a Sense of Erosion or Gnawing, which is principally observed in Ulcers of these Parts. When the Wax, whilst as yet contain'd in the Glands, ferments either by itself, or in Conjunction with any other Substance, the Particles of the Membrane are extended and dilated, and hence arises a Sense of Tension. And, lastly, when the Glands are become turgid by the too great Quantity of their Contents, a Sense of Weight is the Symptom of which the Patient complains. As for that Species of Pain, which is

accompany'd

accompany'd with Pulsation, I am of Opinion, that the *Meatus* is never attack'd by it, except in Cases where there is an Inflammation.

The Violence of this Pain has something of a very singular and surprising Nature in it; for it scarce ever seizes the Patient without bringing along with it an acute Fever, which is attended with an Incapacity of Sleep, Deliriums, Convulsions, and Faintings; which Symptoms very often prove mortal, as appears from the Observations of many Authors. But that we may conceive more justly the Violence of this Pain, we are to observe,

First, that the Membrane, which lines the *Meatus Auditorius*, is very slender, full of Nerves, and of the same delicate Texture with the nervous Coat of the Stomach and Intestines; and that it has not, like them, a villous Crust to guard and defend it against the Acrimony of the Humours.

Secondly, this Membrane is stored with innumerable Nerves, arising from the fifth Pair, the hard Portion of the Auditory Nerve, and the second Vertebral Pair; so that this Membrane may justly be said to contain more Nerves, *ceteris paribus*, than any other in the human Body.

Thirdly, 'tis certain, that those Membranes which adhere to Bones, are possess'd of a far more exquisite Power of Sensation than others; which may probably be owing to this, that being firmer, more tense, and adhering to the Bones, by means of all the minute Vessels with which they supply them, 'tis impossible they should be vellicated, without at the same time all their minute Filaments being put into a Commotion. Hence it is, that the *Periosteum* and *Pericranium* are endow'd with so acute and exquisite a Sense of Pain; and perhaps, for the same Reason, violent and racking Head-achs are owing to the Adhesion of the *Dura Mater* to the superior Part of the *Cranium*, as has been observed by some. This may easily be applied to the Membrane of the *Meatus Auditorius*, which is partly bony, and partly cartilaginous; and as that Part of the Membrane which lies upon the Cartilage, is not so tense as that which lies upon the Bones, hence it happens, that those Pains which are felt in the Bottom of the Ear, and which have their Seat near the bony Part of the *Meatus*, are of all others the most severe and racking.

Fourthly, the Connexion of this Membrane with the neighbouring Parts, which are endowed with an exquisite Power of Sensation, may also contribute very considerably to the Violence of this Pain; for this Membrane is extended as far as the *Membrana Tympani*, which communicates with the Membranes of the *Tympanum* and *Labyrinth*; and, by their means, with the *Dura Mater* itself. If we carefully consider these Circumstances, we have no Reason to be surpris'd, that the Pains of the *Meatus* should prove so severe and torturing.

Though most of the Symptoms which accompany the Pains of the *Meatus*, may also occur in Pains of other Parts; yet as these Symptoms are most common, and most violent in it, I thought it might not be improper to account for them.

When the Pain proceeds from an Inflammation, 'tis no difficult Task to account for the Fever, and the Train of other subsequent Symptoms; but as I am thoroughly persuaded, that the Violence of the Pain alone may produce these Symptoms, without either Inflammation or Tumor, I shall confine myself precisely to this Supposition, and consider the Subject in this Light.

I shall begin then with that acute Fever, which almost always accompanies a Pain of the Ear; and I believe it may be owing to this, that the Spirits being hurried into preternatural and tumultuous Agitations by the Violence of the Pain, augment the Motion of the Heart and Arteries: And hence proceed such an elevated Pulse, and an intense Heat, as are observable when the Mind is under the direct Influence of any lawless and exorbitant Passion, especially that of Anger. But this accelerated Motion of the Heart and Blood could not produce a Fever, without inducing a Change on the Principles of the Blood itself. Now 'tis no great Difficulty to conceive, that when, by these strong and vigorous Contractions of the Heart, the Parts of the Blood are more divided and broken, its most active Parts should be then exalted, and its oily Part, whose accelerated Motion produces the febrile Heat, dissolved. Besides, the acrid and corrosive Juices of the Wax, and other Humours accumulated in the Ear, may again be mixed with the Mass of Blood, and there produce a preternatural Fermentation, in which the very Essence of a Fever consists. We shall be easily able to form a Judgment of the Nature of this Fever, if we consider, that Fevers, in Catarrhs and Rheums, are no otherwise produced, than by the Commixture of the acrid Juices, which, separating from the Mass which constitutes and cherishes the Rheums, join themselves to the Blood.

Though what Du Verney says of the Distempers of the Ear merits Attention, I must apprise the Reader, that a great deal of what he says with respect to Fevers, is not to be depended on, being mere Fargon.

The Incapacity of Sleep depends upon the preternatural Agitation of the Spirits, which, being irritated by the Violence of

the Pain, flow continually into the Parts, and do not permit them to cease from performing their Functions.

The *Delirium* does not differ from the Incapacity of Sleep, except that, in the former, the Spirits having acquired an irregular Motion in the Brain, imprint, as it were, many Traces upon the Memory and Imagination at one and the same time: Hence arises that surprising Confusion of Ideas, which these Spirits exhibit to the Mind.

Upon this Hypothesis the Convulsions are also very easily accounted for, and explained; for since the involuntary Contraction of the Muscles depends upon the tumultuous Motions of the Spirits, no more is requisite, than that the saline Juices should stimulate the Nerves dispersed in the Membrane of the *Meatus*, in order to transmit this Stimulus or Irritation to all the Spirits, by the Communication of the Nerves and Membranes; and this Irritation afterwards proves the Cause of Convulsions in the Muscles. Besides, it may happen, that these acrid Juices should return into the Mass of Blood; and being carried to the Brain, there irritate the Origins of the Nerves.

In order to conceive in what manner the *Lipothymia* or Fainting is produced, let us only consider, that whilst the Spirits flow with Rapidity, and in great Abundance, into the muscular Fibres, which contract and shut the Orifices of the Heart, they stop the Motion of the Blood; and that when this Contraction ceases, and the Blood again enters the Ventricles of the Heart, the Pulse begins again to beat, and Warmth returns. The Uneasiness about the Heart, and the Oppression of the Breast, which are felt in this Case, sufficiently prove that the Fainting proceeds from the Cause now assigned; and indeed this Uneasiness of the Heart may sometimes continue so long, as to prove the immediate Cause of Death.

As an Instance of a violent Pain in the Ear accompanied with the most formidable Symptoms, I shall only bring the fourth Observation, of the first Century, of *Fabricius Hildanus*, because it seems to comprehend all the principal Symptoms which occur in this Disorder. "Whilst," says he, "a Girl of ten Years of Age was taking her Diversion with her Companions, a Glass Bead, as large as a Pea, slipped into the Cavity of her Left Ear. Her Mother, being apprised of the Accident, called a Surgeon to extract it; but his Attempts were in vain. Then a second, a third, and a fourth, were called at different times; but the Patient was so far from being relieved by any of them, that the Glass Globule was lodged still deeper and deeper by their Attempts to extract it. Upon this the Mother despaired of the Possibility of dislodging it; and tho' she was grieved for the Fate of her Daughter, who was rack'd with uninterrupted Torments, yet she resolved to submit to the Will of Heaven, and patiently wait for the Result of Nature's own Operation. Soon after, the Pain of the Ear was indeed allay'd; but all that Part of her Head, as far as the Longitudinal Suture, was excessively painful, both in the Night and Day-time, tho' her Pains were acute, or the Reverse, according to the State and Constitution of the Air. Her Torments were most severe in moist and rainy Weather, such as what we usually have in the Winter and Autumn. Besides, her Left Arm was seized with a kind of Stupor, which reached as far as her Thumb and fore Finger, and affected her Loins, her Leg, and her Foot; and, in short, her whole Left Side languished under these Stupors. But her Torpors afterwards assumed another Shape; and in the Night-time, and during cold and moist Weather, appeared in violent Pains of her Shoulder, Arm, and Leg. She was continually afflicted with a dry Cough; and her monthly Evacuations, being in a great measure suppressed, flowed either very sparingly, or only once in the Space of three Months. After she had groaned under this Load of Misery for four or five Years, she at last began to be now-and-then seized with Epileptic Fits, and the Arm itself fell into an Atrophy. Her Mother, startled at the Appearance of such formidable Symptoms, employed several Physicians, Surgeons, and Empirics; and as she had no Pain in her Ear, (for it seems the Intenseness of her other Pains had in a manner destroyed it) she only complained of the other Symptoms, neglecting and overlooking the original Cause of the Disorder. But all their Efforts for her were vain and fruitless; and the Symptoms were so far from being abated, that they were rather augmented. At last, in the Month of November 1595. she apply'd to me (*Hildanus*). I purged her several times, anointed her Shoulder, her Arm, and the rest of the Parts affected, with hot and anodyne Oils; and, in short, apply'd every thing which to me seemed calculated for removing her Disorder; but, notwithstanding all my Attempts, I had as little Success as those who had gone before me. When I saw, that her Disorder would yield to no Medicines, however proper, I began to despair of her Recovery; for I was entirely ignorant of the Cause of her Disorder, unless it might have possibly proceeded from a Catarrh. In the mean time, whilst I was considering with myself what more efficacious Measures I should take for her Relief, she herself began to give me an Account of the Cause of her Disorder, though

" though she was not sensible of its being so; for she told me, that, about eight Years ago, a small Glass Bead had slipped into her Ear, which could not afterwards be dislodged. Upon hearing this Circumstance, I began to suspect, that it might possibly be the Cause of her subsequent Torments: And though she was very averse to an Operation; on account of the fruitless Attempts of the other Surgeons, when her Discharge was recent, yet at last she submitted to undergo it; upon which I happily, and without any Violence, extracted the Bead, though it was lodged very deep, near the *Tympanum*, and stuck very firmly in the Sordes of her Ear. The Pains of her Head; and of the other Parts of her Body, soon after disappeared; and next Night she was a little better: Thus, by gently anointing the Parts with Oil of Worms, she gradually recovered. Her Pains, her Stupors, her Epileptic Fits, and all her other Symptoms, disappeared; her Arm also was restored to its natural State; and, by the peculiar Blessing of Heaven, she has continued in perfect Health ever since."

Many things relating to this Observation of *Hildanus* might, on this Occasion, come under our Consideration; but as I have already explained the principal Symptoms with which the Patient was afflicted, I shall only insist on some of the most peculiar Circumstances of her Case. Pains then, and Convulsions, seized the Whole of her Left Side, and reached as far as her Foot. *Hildanus* accounted for this Symptom by saying, that the hard Portion of the auditory Nerve was distributed through all the Arm and Thigh; but since this Distribution is purely chimerical and imaginary, I shall endeavour to account for this Symptom in a manner more consonant and agreeable to the real Structure and Conformation of these Parts. I say then, that the Irritations and tumultuous Motions of the Spirits were, by the Communication of the second vertebral Pair, transmitted and conveyed to all the Nerves proceeding from the spinal Marrow on that Side; which would not have happened, if the Irritation had been communicated to the Brain; for in this Case 'tis probable, that the Patient would have been afflicted with Pains and Convulsions in all the Parts of her Body. But on the Supposition, that the spinal Marrow on her Left Side was affected, we may easily conceive in what manner the Disorder was communicated to her Arm and Leg, since we very well know, that all the *vertebral Nerves* of that Side communicate with each other by transverse Branches, after they have gone out of the *Foramina* of the *Vertebrae*.

All the Symptoms were aggravated in the Night-time, and in rainy Weather, on account of the Humidity of the Air, which, as it rendered the Glands and Membranes of the *Meatus* tumid, was the Cause of their embracing the fatal Bead more closely, and hence the Irritation was augmented.

The Stupors might, in all Probability, arise from this, that the irritated Spirits opened and dilated the Orifices of the Nerves to such a Degree, that they not only gave Admission to the Spirits themselves, but also to some gross Substances, which, being crowded into their small Ducts, produced a kind of Obstruction, sufficient to stop the Motion of the Spirits. A Circumstance abundantly able to bring on a Stupor! Besides, these gross Substances, being rendered more acrid by their Continuance, must of course have augmented the Pains and Convulsions. And when these made their most violent Attacks on the Patient's Arm, its Nerves must have been block'd up with such a Redundance of this extraneous and noxious Matter, as to interrupt the Motions of the Spirits: Hence the Arm was emaciated and wither'd, as in a Palsy.

The Bead being at last extracted, the Irritations caused by it, and consequently the Pains and Convulsions, ceased; upon which the Spirits again resuming their usual Motions, dissipated all extraneous and noxious Substances: Hence the Arm was restored to its former Motion and Vigour.

I now come to treat of the several Measures to be taken in the Cure of Pains of the Ears; and these ought to vary, according to the different Causes which produce the respective Disorders. As for those Pains of the Ears produced by Cold, they are sometimes cured only by removing the external Causes; or, in other Words, by defending the Ear from the Cold and Winds, and applying to it every thing that can warm it, such as greasy Wool, or hot Bread dipt in Spirit of Wine. But for the most part the Pain does not yield to these first Applications, in which Case we must have recourse to general Remedies. Venesection is necessary, in order to prevent the Congestion of the Matter pent up by the Cold: But Purgatives ought not to be exhibited, till the Pain is somewhat abated. Fomentations in the mean time are used with Success, or Injections of the Juice or Decoction of Bawm, Hyssop, Calamint, Origanum, and Marjoram; to which may be added a few Drops of the Gall of an Ox, or of the Oil of bitter Almonds, Chamomile, Cloves, or Anise; and some Physicians highly recommend the Practice of stopping the Ears with Cotton impregnated with Musk. 'Tis no difficult Matter to account for the Effects of these Medicines, since they are all impregnated with a highly penetrating volatile Salt, which, by warming all the Parts, opens the

Pores and Eminencies of the Glands; and promotes a Discharge of the peccant Matter pent up and detained by the Action of the Cold.

Pains of the Ears, proceeding from an Excess of Heat, are for the most part carried off by general Remedies, and especially Venesection, which is absolutely necessary, in order to prevent the Fluxion and Inflammation which might otherwise seize the Parts affected. During the Use of these Remedies, we may very successfully use Injections of Milk beaten up with the White of an Egg; and for this Purpose Womens Milk is far more proper than any other whatsoever. Injections may be also made of some emollient and cooling Decoctions, in which a proper Quantity of the Oil of sweet Almonds has been diluted. The Oil of Eggs is also highly extoll'd in this Case, by *J. de Vigo*. We may also apply over the Ear some anodyne and emollient Cataplasms; and, when the Pains are extremely violent and acute, we must have recourse to Narcotics, which are not only to be mix'd with the topical Applications, but may also be exhibited internally. All these Remedies are so well known, and so universally us'd, that I shall not spend Time in accounting for their Effects.

When Pains of the Ears are produced by Defluxions of an acrid and saline Serum, we in that Case use the Water of *Cardus Benedictus*, in which Millepedes, Earth-worms, and Ants Eggs, have been boiled; to this Decoction we may also add a few Drops of the Oil of Box. As these Remedies abound in a volatile alkaline Salt, they destroy that Acidity of the serous Humours, which was the primary Cause of the Pain.

Another Disorder to which the *Meatus Auditorius* is subject, is Inflammation, which is generally succeeded by Abscesses and Ulcers. This Inflammation is the Consequence of Wounds or Contusions in these Parts, and may even be produced by some Fevers, as well as a Pleurisy, a Quinsy, and several other Disorders of an inflammatory Nature. An Inflammation may happen in the *Meatus Auditorius* in two Manners: First, by an Obstruction of the Glands, which, by compressing the Vessels, is the Cause of the Blood's stopping, and bursting the Vessels, in which it is contain'd. Secondly, an Inflammation may be produced in the *Meatus*, by the Wax acquiring such a Degree of Acrimony, as to corrode the Vessels, and by that means occasion an Extravasation of the Blood. However, this Inflammation, and the subsequent Abscess, have nothing peculiar in their Symptoms, except the Violence of the Pain, of which I have already spoken.

As for the Ulcers of the Ears, they are form'd in the same manner with Ulcers of the other Parts; either by the Breaking of an Abscess, or by the Acrimony of some Humour. I generally observe, that a very large Quantity of Matter is discharged from these Ulcers, and that they are not cur'd without a considerable deal of Difficulty, especially when they happen in the bony Part of the *Meatus*. The great Quantity of discharg'd Matter is supply'd, not only by the suppurating Blood; but also by the Glands, which, being irritated by the Pus, furnish their excretory Ducts with a large Quantity of Liquor. As to the Difficulty of curing these Ulcers, 'tis owing to this Circumstance; that, being always moisten'd by the Humours flowing from the Glands, 'tis impossible they should be dry'd up, till that glandular Discharge be remov'd. Besides, the Matter secreted from these Glands being of an acrid and saline Quality, must, of Consequence, prevent their Reunion and Cicatrization. The same Symptom occurs in Ulcers of the Nose, and salival Ducts. Ulcers form'd in the bony Part of the *Meatus* are with more Difficulty cured, than those appearing in its cartilaginous Part; because the bony Part of the Canal declines towards the *Membrana Tympani*, and has a considerable Depressure at the Place where it declines, which is the Reason that the Pus is with Difficulty convey'd out of it; whereas the cartilaginous Part of the *Meatus* declining towards the *Concha*, Pus, and other offensive Substances, are easily discharged from it, and are not retain'd, as in the bony Part of the *Meatus*.

In old and fordid Ulcers of the Ears, Worms of different Sizes are sometimes discharg'd along with the Pus, as we may see in the Observations of *Forestus*, *Schenkius*, and in the *German Ephemerides*. I shall not here inquire, whether these Worms are produc'd by the Corruption of the Humours, or whether the Heat of these Ulcers only hatches the minute Eggs, which the numberless little Insects floating in the Air may have deposited on the Parts, since I shall afterwards have Occasion to handle this Subject.

Besides the Pus discharg'd from the Ears, when Ulcers are form'd in them, we observe, that the Ears almost of all Children discharge a great deal of Humidity, and that this Evacuation is very conducive to the Preservation of their Health. For this Reason we ought to beware of stopping this Discharge, lest the Children should, by that imprudent Step, be thrown into convulsive or epileptic Fits. This Circumstance has induced some People to believe, that not only this Liquor, but also the clear and fetid Serum flowing from the Ears of some Adults, and the Blood evacuated from them when the Head is wounded, proceeded

proceeded from the Brain: But, 'tis certain, there are no apparent Ways, or Passages, by means of which any thing can be convey'd from the Brain to these Parts*; for in the *Os Petrosum* there is only one Hole, which is imperforated at that Extremity which lies next the *Ear*, and which is closely shut up by the auditory Nerves; so that we cannot reasonably suppose, that any thing should be convey'd from the Brain to the *Ear* in this manner. But, supposing the Blood and Serum lodg'd in the Basis of the Cranium capable of corroding the Bottom of this Hole, and making a Passage to themselves thro' it, yet still they could only enter the *Vestibulum* and *Cochlea*; and before they can pass into the *Tympanum*, they must corrode the Membrane which shuts up the *Fenestra Rotunda*, the Basis of the *Stapes*, and the Membrane with which it is cover'd; and even after they should happen to be lodg'd in the *Tympanum*, they would, without Doubt, be convey'd to the Mouth by means of the Eustachian Tube, rather than corrode the *Membrana Tympani*, and discharge themselves by the *Meatus Auditorius*†. Upon my Hypothesis, I am involv'd in none of these Difficulties, and can easily account for these seemingly surprising Phenomena: For if a great deal of Serum is discharg'd from the Ears of Children, this is to be ascribed, not only to the State and Condition of their Blood, which is aqueous and serous, but also to the Relaxation of the Glands of the *Ear*, which is also observ'd to happen to the Glands of the adjacent Parts: And if the Suppression of this Evacuation should throw Children into convulsive or epileptic Fits, this Phenomenon is also easily accounted for, since the suppressed Juices may reasonably be suppos'd to become more acrid by their Continuance, and consequently occasion Irritations in the Membrane of the *Meatus*, and even enter the Mass of Blood again, and thus discharge themselves upon the Brain. As for those whose Ears discharge a clear and fetid Serum, 'tis to be observ'd, that tho' the Glands of the *Ear*, when in their natural State, are only destin'd for the Secretion of the Wax, for the Purposes I have already mention'd; yet, in this Case, they may also serve as a proper and commodious Drain for the Evacuation of the peccant Humours; which is evidently observ'd to be the Case in all the conglomerate Glands. And as for the Blood discharg'd from the Ears in Cases where the Head is wounded, 'tis sufficiently known, that it proceeds from a Rupture of the Vessels appointed for moistening the *Meatus*. 'Tis no hard Matter to conceive, how, by the violent Concussion of the Cranium, this Rupture should be produc'd in these Parts, as well as in the Brain: And, lastly, that the suppurated Matter, discharg'd from the Ears, has no manner of Communication with the Brain, is sufficiently plain from the following Observations.

A certain Man of sixty-five Years of Age, pretty corpulent, and of a sanguine Constitution, had labour'd under a plentiful Suppuration of both his Ears, but especially of the Right, for the Space of twenty-five Years, tho' in every other respect the State of his Health was very good. The Matter discharg'd was fetid, and considerably thick. And when this Evacuation was suppressed, he died of an Apoplexy within the Space of twenty-four Hours; upon which I laid open his Cranium, and, viewing the Parts of the Brain near the *Os Petrosum*, I found them perfectly sound, and the Bone itself in its natural State; neither did I find any Collections of Serum in any Part whatever, except in the Ventricles and Meanders of the Brain itself. But these Collections of Serum differ'd very much from that Matter, which, during his Life, had been discharg'd from his Ears. I have also dissected the Ears of several Children, in whom I have found the *Tympanum* filled with Pus; whilst, at the same time, I could never find any Indisposition or Disorder, either in the Brain itself, or the *Os Petrosum*.

In curing Inflammations of the *Meatus Auditorius*, we must be guided by the same Indications which are followed in all Inflammations of the external Parts. The Fluxion of Humours to the Parts affected is to be stopp'd by Venesections, and by anodyne Medicines, to which may be added Oil of Water-lilies, and the Juices of Lettice and Nightshade. But if the Inflammation continue, and tend to a Suppuration, we are then to apply maturing Medicines, such as Cataplasms of the Crum of Bread, or Cataplasms made of boil'd

Onions, Lily-roots, fresh Butter, and the Oil of Chamomile and Melilot.

When the Abscess is open'd, we must use detergent Injections, made of Barley-water and Honey of Roses; and, if more powerful Medicines are necessary, we must have recourse to Decoctions of Agrimony, Birthwort, and other vulnerary Plants, in White-wine, to which we may add a proper Quantity of Honey of Roses, or of Squills. If the Ulcer is sordid and putrid, we are to use Tincture of Aloes, extracted with Spirit of Wine; if 'tis deep, the *Balsamum Viride Metense* is proper.

When the Ulcer is deterg'd, it must be dry'd and cicatrized. Decoctions of Plantain, Birthwort, and Galls, are excellent for answering these Intentions; the Wine of Pomgranates, described by *J. de Vigo*, is also excellently calculated for this Purpose. As these Medicines have nothing peculiar in them, and are used in Inflammations and Ulcers of all kinds, 'tis not necessary I should here account for their Effects, or explain the Manner in which they operate: I shall only add, that, during the Time we use them, we ought not to neglect general Remedies, which are highly proper in all the various Stages of these Disorders. In order to kill the Worms, some People drop bitter Liquors into the *Ear*, such as the Juices of Wormwood, and the lesser Centaury, Decoction of the bitter Gourd, or a few Drops of the Oil of bitter Almonds, or of Box: In the *Ephemerides Eruditorum*, for the Year 1677, Spirit of Wine is affirm'd to be a most efficacious Remedy against Worms ingender'd in the *Ear*; but of all the several Medicines recommended for this Purpose, those which are somewhat thick, and of an oily Nature, are the most efficacious, because they block up the Bronchia of the Insects, and suffocate them in a Moment.

As for the Discharges of serous Matter, which I have call'd Suppurations, since, for the most part, they are not accompanied with Pain, and cannot be suppressed without bringing on a Train of very dangerous Symptoms, they are not, for this Reason, to be rashly and imprudently stopp'd: But, if at any time they should prove painful, we are to have recourse to the Medicines I recommended when I was treating of the Pain of these Parts.

A third Disorder, to which the *Meatus Auditorius* is subject, is an Obstruction, which is generally the Consequence of Inflammations, Abscesses and Ulcers, which usually swell these Parts; but this Disorder may be also produc'd by other Causes. First, extraneous Bodies may slip into the *Meatus*, such as Pease, Shot, or the Stones of some Fruits; and, when these Bodies happen to be lodg'd pretty deep, they are not easily extracted, because they are lodg'd in the bony Part of the *Meatus*, which is very oblique, and declining towards the *Tympanum*. Besides, they are in some measure detain'd by the Congestion of Wax and Sordes in that Part. Pease, and all other Seeds, are extracted with still greater Difficulty, since they not only distend themselves in the *Meatus*, but may also happen to germinate in it, as we may see in Instances given by *Fabricius Hildanus*, and *Schenkius*. The most common and ordinary Cause of the Obstruction of the *Meatus* is a Congestion and Inspissation of the Wax. In those who neglect to cleanse their Ears, this Wax is sometimes so largely accumulated, and in Process of Time so inspissated, as entirely to block up the *Meatus*. In Men of cold and phlegmatic Constitutions, whose Juices are tough and viscid, this Wax may sometimes happen to be naturally very thick. The Cold also of the external Air may contribute not a little to the Production of the same Effect. It is also probable, that this Wax may, on some Occasions, assume the Consistence and Hardness of a Stone; in which Case it produces an incurable Deafness. The Truth of this seems to be sufficiently prov'd by the near Resemblance and Analogy between this Wax and the Bile, which frequently petrifies in the Gall-bladder: And this is farther confirm'd by the forty-fifth Observation of the first Volume of the Journals of *Bartholine*, who tells us, that, after his Wife had been long afflicted with a Pain about one of her Ears, she discharg'd small Stones from the *Meatus Auditorius*, along with the Wax, after which the Pain ceas'd. However, 'tis certain that this Wax is often found inspissated like Plaster, and in so large a Quantity, as entirely to block up both the bony and cartilaginous Parts of the *Meatus*; Instances of which I myself have seen in more than

* *Jobus a Mekeru*, a celebrated Surgeon in *Amsterdam*, in a Letter to *Barbet*, endeavours to shew the Manner in which Blood is convey'd into the Ears, in Cases where the Head is wounded, in these Words:

"As soon, says he, as I had observ'd a considerable Depression in the superior Part of the Cranium, I found a large Mass of coagulated Blood, a Part of which had been discharg'd thro' the Ears, and another Part of it had closed up the *Meatus Auditorius*; upon which I was very desirous of discovering by what Ways this Blood had descended into the *Meatus Auditorius*. Whilst I was employ'd in this Research, I happily found the Reason why, in this Place, the Pericranium covers the temporal Muscles, but not the Bone lying under them. Upon this, I perceived the Truth of what *Tulpius* asserts, in his Answer to that Question, *Whence comes that Blood which is often discharg'd by the Ears in Wounds of the Head?* For I myself have found, as *Tulpius* asserted to me, that this Blood descended from the superior Part of the Head, between the Cranium and Pericranium, and so enter'd the Space between the *Os Parietale*, and the *Os Petrosum*; and that from thence it was percolated, as it were, thro' a Sierce, into the *Meatus Auditorius*. In this Dissection I found the *Os Petrosum* remov'd at a great Distance from the *Os Parietale*; so that in the Place where they had receded from each other, the Traces of their Motion might be observ'd beginning at the *Os Petrosum*, and ending in the *Os Parietale*; where a certain Symphysis, indented in the *Os Jugale*, and internally callous, is observ'd to prevent the Attrition of the Parts, as in all other Articulations."

† It is observable, that many People have got a Trick of letting the Fume of Tobacco, taken in at the Mouth, pass out of the Ears: Hence it is certain, that, in some Subjects at least, Things may pass from the internal to the external *Ear*, without a Rupture of the *Membrana Tympani*.

ten or twelve Subjects, during the Time I apply'd myself to the Dissection of the *Ear*. I have also consulted with several skilful Surgeons upon this Affair, who communicated to me more than thirty Observations, proving that this Species of Deafness is at once the most common, and the most easily cur'd. And indeed that celebrated Surgeon of *Mons*, who acquired such a Reputation for his Dexterity at curing Deafness, undertook the Cure of no Species of Deafness but this; and, that he might the better discover the immediate Cause of the Disorder, he turn'd the Patient's *Ear* to the Rays of the Sun, and, when he perceiv'd any Obstruction in the *Meatus*, he made use of a certain Instrument, proper for cleansing it; and by these simple Measures cur'd vast Numbers of deaf People.

Certain Membranes are also sometimes form'd within the *Meatus*, which shut it up entirely, and produce a particular Species of Deafness. I have already said, that upon inquiring into the Causes of a Deafness with which a certain Person had for a long time been afflicted, I found in his Right *Ear*, of which he was deaf, a pretty thick and lax Membrane, before which there was a very considerable Collection of Sordes, of the Consistence of Plaster, which was undoubtedly the Cause of his Deafness; for the *Membrana Tympani*, and all the other Parts of the *Ear*, were in their natural State and Condition.

The fungous and fleshy Excrescences, which sometimes succeed Ulcers of the *Meatus*, or those Excoriations accidentally made in cleansing the *Ear* with too sharp an Instrument, may also rise to such a Height, as entirely to close it up.

There is another Species of Obstruction incident to the *Meatus*, which happens when the adjacent Glands are tumefy'd, and drench'd with a superfluous Serum, just as it happens in the spongy Membranes of the Nose, which are sometimes so tumefy'd and distended, as to intercept all Passage of the external Air. This Species of Obstruction is always accompany'd with a Relaxation of the *Membrana Tympani*; and for that very Reason produces a Deafness, or at least a Difficulty of Hearing, which is remov'd by the Evacuation of this superfluous Serum, either by the *Ear* itself, or by some other Conveyance, in the same manner as in other Catarrhs.

In the first Species of Obstruction, the Whole of the Indication consists in extracting the extraneous Bodies. But, to succeed in this Attempt, we must carefully consider, whether these extraneous Substances are capable of becoming soft, such as Pease; or whether they are hard and solid, such as Shot, and the Stones of some Fruits: We must also diligently observe, whether they are lodg'd in the cartilaginous, or in the bony Part of the *Meatus*. In order to extract soft Bodies lodg'd in the cartilaginous Part of the *Meatus*, we must endeavour to break them; or the *Ear*-probe, or Spoon, is to be thrust beyond them, which may sometimes be easily done, in a pliant flexible Part, such as the Cartilage of the *Ear* is; and thus they are to be extracted from the *Meatus*. This Method may also be us'd with regard to hard Bodies lodg'd in the same Place, which may be extracted either with the *Ear*-probe, or the Trepan. As for Bodies lodg'd in the bony Part of the *Meatus*, they are with great Difficulty extracted, as we have already observ'd, especially when they fill the *Meatus* entirely up; for, in this Case, we may easily perceive, that neither the *Ear*-probe, nor the Trepan, can be of great Service. In a Case of this Nature I therefore think, that an Incision may safely be made in the posterior and superior Part of the *Ear*, since there are no considerable Vessels to forbid it, and since, in that Part, the Duct is only cover'd with a glandular Skin. The Obliquity of the *Meatus* is, in some measure, shunn'd by this Method, and we may use the Trepan which is apply'd for extracting Bullets. If a Fruit-stone should happen to be lodg'd in the bony Part of the *Meatus*, since by reason of its oval Figure it may be laid hold on by one of its Ends, we may in this Case make use of an Instrument describ'd by *Hildanus*, *Cent. 1. Observat. 4* which he calls a *Tenacula*, and which, properly speaking, is no more than a double *Ear*-picker, or Spoon, made in form of a Pair of Tongs; but for this Purpose the Branches of the Instrument must be very slender, and made of fine Steel. I need not, on this Occasion, describe all the minute Circumstances of these Operations, nor warn the Operator to lubricate and relax the *Meatus* with Oil of sweet Almonds, since I take it for granted, that these Circumstances are already well enough known.

In the second Species of Obstruction, produc'd by the Induration of the Wax, this Substance must be broken, and cleans'd out by means of Injections of warm Water, emollient Decoctions, Hydromel, Lintseed-oil mixed with a few Drops of the Spirit of Wine, Oil of bitter Almonds, and Oil of sweet Trefoil. Some, for this Purpose, use mineral Waters; and this Intention is very successfully answer'd by the Galls of all Animals in general. Others prefer warm Water to all other Liquors whatever, and add a few Drops of Spirit of Wine to it, with a View to render it more penetrating.

The Wax is sometimes disengag'd and discharg'd within five Days, and sometimes not till after fifteen; which is an evident Reason, that we ought patiently to persist in the Use of Injections, till the desir'd Effect be produc'd.

In the third Species of Obstruction, in which there is commonly a Congestion of Wax before the preternaturally-form'd Membrane, we must first cleanse the *Meatus* by means of the above-mention'd Injections, and afterwards perforate the Membrane itself; but, in this Operation, the Surgeon ought to take particular Care not to injure the *Membrana Tympani*.

In order to form a just Idea of the Method of Cure to be observ'd in the fourth Species of Obstruction, which is produc'd by fungous and fleshy Excrescences, little more is requisite almost, than to read the first Observation of the third Century of *Fabricius Hildanus*, where he gives us a Description of a fungous and scirrhous Excrescence, which appear'd in the *Meatus* after an Abscess. Before he attempted its Extirpation, he carefully prepar'd the Patient's Body for the Operation; after which he took as much of it off by the Ligature as he possibly could; but as the Root of the Excrescence was pretty deep, and as his Instruments could not reach the Bottom of the *Meatus*, he was oblig'd to use some Caustics, which he apply'd by means of a small Lamina of Wax, for fear of wounding the *Meatus*; which Method succeeded according to his Desire. But, to illustrate still farther the Method to be us'd in the Cure of Disorders of this Nature, 'tis to be observ'd, that if the fleshy Excrescence is very large, and appears without the Entrance of the *Meatus*, we may in that Case cut it off, either with the Scissors, or the Bistoury; or as much of it as can be laid hold of, may be tied with a Thread; but I should rather choose to cut it, because by that means more of it is taken off, than by tying it. As we are afterwards oblig'd to stop the Blood, we for that Purpose use a small Piece of Vitriol, fix'd in the End of a Quill, in the manner of a marking Pencil, that a small Point of the Vitriol may only appear without the Extremity of the Quill, in order to touch only such Parts as stand in need of it, and stop the Blood by inducing an Eschar, which also carries off a small Portion of the Carnosity. In order to consume the Remains of the Carnosity, which are deep-lodged in the *Meatus*, as we must guard against wounding the Membrane by Caustics, of which the most common are Powder of Savin, burnt Alum, and red Precipitate, boiled with Wax and Turpentine, I would not make use of Laminæ of Wax; but I believe we may safely apply Caustics in the Form of an Ointment put upon the End of a Tent, and introduced into the *Meatus*, having first pass'd in a small Leather Tube made in the Form of the Finger of a Glove, through which it would be no hard matter to push the Tent with the Caustic Ointment on its Extremity, without any Danger of hurting the Membrane of the *Meatus*. Instead of the Leather Tube, a small one may be used, either of Brass or Silver, and bended so as to answer the several Windings of the *Meatus*. After the Eschar is formed, we must drop a little of the Oil of Eggs, or of Almonds, into the *Ear*, not only to ease and lubricate the *Meatus*, but also to procure a Separation of the Eschar. These Remedies must be repeated till the Whole of the Carnosity is consumed; after which, we may make Tents, and arm them with the *Unguentum Ægyptiacum*. These Tents must be introduced and pushed beyond the Tube, that the Ointment may be applied to the Remains of the superfluous Flesh adhering to the Surface of the *Meatus*, where the Carnosity was, in order to prevent their sprouting out again, and with a View to procure a laudable Suppuration; after which we must use detergent and lenitive Medicines in order to incarn and cicatrize the Ulcer, always remembering now-and-then to mix with them some Substance that has a Tendency to prevent the Regeneration of fungous Flesh. A little Vitriol dissolved in a sufficient Quantity of some vulnerary and deterfive Decoction, to give it a small Astringency, is very proper for this Purpose. This is to be injected into the *Ear*, and a little Lint soaked in the same Liquor introduced, which, when it can be easily done, proves of excellent Service, because it compresses the Ulcer, and prevents the Generation of a new Fungus.

In the fifth Species of Obstruction, which is caused by a Distension and Inflation of the Glands of the *Meatus*, we must prescribe the same general Remedies as in all Rheums. The *Ear* is, in this Case, to be fumigated with the Vapour of *Cardus Benedictus*, or of the Decoctions of *Florentine Orris*, *Marjoram*, *Cardus Benedictus*, *Wormwood*, *Calamint*, *Bajoram*, and *Anise-seeds*. A Decoction of the bitter Galum in Oil is very much commended for this Purpose. *Barbet* uses a Decoction of Cloves in Red-wine, some Drops of which are to be convey'd into the *Meatus*, which he afterwards shuts up with a Clove. *Platerus* prescribes a particular Water for this Purpose, the Efficacy of which he highly extols. *Mendererus* proposes another Water, which has been corrected by *Zwelfer*, in his Notes on the *Pharmacopœia Augustana*; and *Hadrianus à Mynsicht* commends a certain compound Spirit of Wine, as very proper for answering this Intention. The expressed Juice of *Marjoram* alone is highly esteemed, as also Hares Urine, either alone, or mixed with Spirit of Wine, or the Water of the common Ash-tree, and the *Hungary Water*. It also affords some Relief, to close up the *Ear* with Cotton impregnated with Musk. Some People think the Membrane of the *Meatus*, and the

the *Membrana Tympani*, so delicate, and endowed with so exquisite a Power of Sensation, that they will not admit of Injections of acrid and spirituous Liquors. In this Case, a few Drops of these Liquors are only to be poured upon hot Bread, which is to be held upon the *Ear*. These Liquors are also with Success held in the Patient's Mouth; for their spirituous Parts, being elevated, ascend through the Eustachian Tube to the *Ear*. For the same Reason, Masticatories are used with Success.

'Tis no hard Task to account for the Action and Operation of these Medicines; for, since they are of a subtle and penetrating Quality, they must of course open the Pores of the Glands, and promote the Discharge of the superfluous Serum. To all these I shall subjoin an Observation communicated to me by that skilful Surgeon Mr. *Passerat*.

A young Gentleman about eleven or twelve Years of Age, about the Beginnings of the Spring and Autumn, used sometimes to have the Glands of the *Meatus Auditorius* so distended and swelled, that they touched each other, and it was impossible to introduce any thing between them. At first Oil of Sweet Almonds was dropped into his *Ear*, in order to allay the Pain; then a Decoction of Barley and Agrimony was used, which is of a detergent and drying Quality. By this means the *Ear*, after having discharged an apparently purulent Humidity for three or four Days, at last returned to its natural State.

I now come to consider the Disorders incident to the *Membrana Tympani*, which are Relaxation, too violent Tension, Induration, and Rupture. The Relaxation is caused by a superfluous Humour moistening this Membrane. This Symptom generally accompanies that Obstruction of the *Meatus*, which is produced by a Distension of the Glands, of which I have spoken already; and it contributes very much to a Dulness of Hearing in those Persons who are subject to catarrhus Defluxions. 'Tis also for this very Reason, that Southerly Winds, Fogs, and rainy Weather, impair the Sense of Hearing, as we find from daily Experience.

An extraordinary Tension of the *Membrana Tympani* produces a quite different Effect, by causing the least Noises to become insupportable. This Tension happens in violent Headachs, and in acute Fevers, because the Tensions and Irritations of the Membranes of the Brain communicate themselves to all the neighbouring Membranes.

The Induration of the *Membrana Tympani* may proceed from its becoming too dry, which is sometimes the Case with old People. Besides, we know from numberless Observations, that the Membranes of the Body may not only become callous, but also ossify. This I myself have particularly observed in the *Dura Mater*, and in the Coats of some Arteries, which I have often found ossified. This shews us, that the *Membrana Tympani* may sometimes become hard and cartilaginous, the Consequence of which is an incurable Deafness.

Lastly, the *Membrana Tympani* may be broken either by some external Cause, such as an Ear-picker, for Instance, inadvertently pushed too far, or by some strong Effort, such as is made when one shuts his Nostril and Mouth, and afterwards lets go the retained Breath with Violence, which happened to one of my Acquaintance. This Action of the Air is observed in Sneezing, when we feel, that the Air, which suddenly ascends through the Duct, drives the *Membrana Tympani* outwards, and occasions a painful Tension. This may also happen in Quinsys, and in Difficulties of Breathing; where the Bottom of the Mouth and Nose are distended and inflated by any Defluxion of Humours, or an Inflammation; for when the Air, thrust out of the Breast, cannot find a free Exit, it enters with such Violence into the Duct which goes from the Palate to the *Ear*, that it is capable of bursting the *Membrana Tympani*. *Tulpius* gives us two very remarkable Instances of this in the thirty-fifth Observation of his first Book. It is not easy to explain how the *Membrana Tympani*, which is so strongly inserted, as it were, in a Groove, should not be able to resist the Impulses of the Air. But if we consider, that this Groove does not run quite round it, but ends at that Part which corresponds to the Entry of the *Meatus*, which penetrates into the Sinuses of the *Mastoide Apophysis*; and that in that Part the *Membrana Tympani* only adheres simply to the Border of the bony Part of the *Meatus*; we shall easily perceive, that it may very readily be torn in this Place, and by that means afford a Passage for the Air to the external *Ear*.

By this we see how much *Tulpius* has been mistaken, when he imagined, that the Duct which goes from the *Ear* to the Palate, not only served to renew the Air in the *Tympanum*, but also, on some Occasions, to afford a Passage for the Air returning from the Lungs in Expiration; which Opinion he endeavours to confirm by the Observation concerning the two Asthmatic Cases already mentioned, and by the Authority of *Alcmeon*, who, according to *Aristotle*, imagined that certain Goats breathed through their *Ears*. Besides, the *Membrana Tympani* may be corroded by the Acrimony of the Pus retained in the *Tympanum*, or in the *Meatus Auditorius*, as is plain from Numbers of Instances brought by *Fabricius Hildanus*, *Schenkius*, and several others. But, in whatever manner the *Membrana Tym-*

pani is broken, the Air is discharged from that *Ear*, when the Mouth and Nostrils are shut, with such Violence as to extinguish a Candle. In such Cases as these, the Sense of Hearing remains for some time, but is gradually impaired, till at last it is quite lost; from which we may infer, that the *Membrana Tympani* is not absolutely necessary for the Purposes of Hearing, but that its principal Use consists in transmitting its Vibrations to the Air contained in the *Tympanum*, and to the small Bones employed in hearing, and in defending the Parts against the Injuries of the external Air. When this Membrane is broken, the external Air alone is indeed able to put the small Bones, and the immediate Organ of Hearing, into a Commotion, and thus excite the Sensation of Hearing; but since it destroys all the Parts of the internal *Ear* by Cold, or any Excess of its other Qualities, it at last destroys the Sense of Hearing.

In Cases where the *Membrana Tympani* is relaxed, we are to apply the same Remedies prescribed in other catarrhus Disorders; but in Cases where 'tis too tense, besides the Remedies prescribed in Diseases produced by Tension, we are to foment the *Ear* with Milk, Oil of Sweet Almonds, or any emollient Decoction. Both the Induration and Rupture of the *Membrana Tympani* are incurable.

As for the *Tympanum* and *Labyrinth*, as these Parts are bony, and only covered with a single Membrane, I can scarce allow myself to think, that they are subject to any other Disorders than Caries of the Bones, and Inflammation of the Membranes. Caries of the Bones sometimes happens after those Abscesses which open behind the *Ear*. In Cases of this Kind, Fistulas have been observed above the *Mastoide Apophysis*, which have penetrated its Sinuses, and made the little Leaves, of which it is composed, fall off in the Form of Scales. This Caries is attended with a very nauseous Smell, and very dreadful Symptoms; for the Caries sometimes penetrates into the *Tympanum* by means of a Duct which leads to it, where, destroying all the Parts included in it, it produces Deafness; but this is rarely the Case, and I have never met with more than one or two Instances of it. As for an Inflammation of the Membranes, when I applied myself to the Dissection of the *Ear*, I often found the *Tympanum*, the *Vestibulum*, the semicircular Ducts, and *Cochlea*, stuffed with a thick Sanies, which might have come from Abscesses of the Membranes which line these Parts. I don't doubt but Deafness is very often produced by this Cause, as well as by a Congestion of any other Matter in all these Cavities; and that so much the rather, because this Matter cannot easily be discharged from the *Tympanum*, since its Cavity descends lower than the Opening of the Duct which goes from the *Ear* to the Palate; and hence it happens, that these Humours cannot fall down into the Mouth, unless the Head be placed in a certain Situation. But, in order to make their Way through the *Meatus Auditorius*, they must corrode the *Membrana Tympani*, which they cannot do, till they have acquired a very considerable Acrimony. We have also Reason to suspect, that the Spiral Lamina may be corroded by the Acrimony of the Pus, and also become relaxed or callous, as well as the *Membrana Tympani*; but I will not positively assert, that this is the Case, since I have no Instances of the Fact to justify the Assertion.

I cannot possibly recommend more efficacious Medicines for curing a Caries of the Bones of the *Ear*, than those prescribed by that skilful Surgeon Mr. *Deymier*, from whom I had this Observation. He first of all dilated the *Ear* with a prepared Sponge, which made a considerable Opening, so that the Medicines could by that means be applied immediately to the carious Bone. Then he applied Lint soaked in *Imperial Water*, in which a little Camphire had been dissolved. But as that Medicine incarn'd the lateral Parts of the Ulcer too soon, whilst the Caries as yet remained, he had recourse to the Powder of Euphorbium, which produced very happy Effects. Slight and momentaneous burning Pains were indeed excited by it; but the Application of a very small Quantity of it answered the Intention by procuring an Exfoliation, and hindering the Flesh from sprouting out afresh. He also used the Tincture of Euphorbium extracted with Spirit of Wine, adding to it some Myrrh and Aloes. The Caries being consumed, and an Exfoliation made, he used the *Imperial Water* till the Cure was completed, applying to the Part affected Lint, and the *Emplastrum de Betonica*, to which a little of the Essence of Juniper, Cloves, and the Oil of Marigold, had been added.

In Inflammations of the *Tympanum* and *Labyrinth*, Topical Applications are scarcely of any Service; and we must only use internal and general Remedies, which are also attended with small Success, because the Abscesses open within the *Tympanum*, and the Cavities of the *Labyrinth*; whence, as I have already observed, the peccant Matter cannot be discharged; so that Humours accumulated in these Cavities produce an incurable Deafness.

The Disorders incident to the *Auditory Nerve* are Obstruction and Compression. When the whole Brain is overflowed and drenched with a sordid Serum, as in *Apoplexy* or *Palsy*, 'tis plain this Nerve must be obstructed as well as the other Nerves.

Besides,

Besides, the sole Obstruction of this Nerve, even when no other Fault is found in the other Organs of Hearing, may also produce Deafness, for the same Reason that an Obstruction of the Optic Nerve occasions a *Gutta Serena*. The Compression of the *Auditory Nerve* produces the same Effect; and this Compression may be owing to several Causes; the Blood, for Instance, or other Humours extravasated; as also to Tumors, of which we have an Instance recorded in the fifty-third Observation of the second Section of *Bonetus's Anatomia practica*, who informs us, that *Drelincourt* found in the Brain of a Man, who died of an Apoplexy, a *Steatoma* between the Cerebrum and Cerebellum, which at first produced Blindness, then Deafness, and, last of all, a Privation of all the Animal Functions.

'Tis easy to discover this Obstruction or Compression in the *Optic Nerve*, because all the Parts are transparent and diaphanous; and, when we discover no Defect in them, we have Reason to suspect an Obstruction of the *Optic Nerve*. But the internal Parts of the *Ear* are not subjected to our Sight; for which Reason 'tis very difficult to discern whether the Fault is in the Organ of Hearing, or in the *Nerve*. But if a Drowsiness or Palsy has preceded the Deafness, or if any of the rest of the Senses is also destroyed, we have Reason to believe, that the Brain, and the *Auditory Nerve*, are either obstructed, or too strongly compressed. In this Case we are to use the same Medicines prescribed in a *Palsy*, as repeated Purges, Vomits, Cephalic Waters and Spirits, Sudorifics, Baths, Masticatories, and Sternutatories. A Compression of the *Auditory Nerve*, produced by a Tumor, is absolutely incurable.

The Disorders already explain'd either impair, or quite destroy, the Sense of Hearing; but what we call a *Tinnitus*, is a Depravation of it; and this Depravation consists in this, that the *Ear* perceives Sounds which have no Existence, or, at least, which are not produced by the Motion of the external Air; so that, being already filled with a certain Species of Sound, it cannot admit the Impressions of external Sounds, unless they are pretty strong and violent.

The Antients imagined, that this Symptom was produced by the Motion and Agitation of the Air, which is lodged within the *Ear*: They also thought, that this Agitation was occasioned by Flatulencies and Vapours being conveyed to the *Ear*; and that those Vapours arose either from the whole Body, as in Fevers; or from some particular Part, such as the Stomach or Brain; or from any pituitous Humours lodged in the Cavities of the *Ear*. They also attempted to account for all the several Differences of *Tinnituses* from the Quality, Consistence, and Motion of the Humours or Vapours collected within the Organs of Hearing. I shall not here make it my Business to point out the Weakness and Absurdity of this Theory, since these will sufficiently appear from the Account of a *Tinnitus*, which I am now to give. I shall only observe, that there is little Probability, that all these different Noises, which People believe they hear, should be caused by something which in reality strikes the *Ear*, in order to produce the Sounds of Bells; for Instance, the Murmurs of Waters, and several other Noises, which People subject to a *Tinnitus* every Day seem to hear; and that 'tis probable, that most Part of these are false Noises, which may be produced in the *Ear* without either Wind or any other Matter striking the Membranes externally, as I shall now shew.

As I apprehend then, a *Tinnitus* consists in the Perception of a Sound which is not real, or, at least, of a Sound which is within the *Ear*. In order to conceive how People may hear Sounds which do not really exist, we must observe, that as the Action of Hearing consists in the Agitation of the immediate Organ appointed for that Purpose, it is sufficient, that, in order to form a Sound, such Agitation be produced, whether it be produced by the Air or not; for just as we conceive that Vision, which depends on the Manner in which the Retina is agitated by the visual Rays, may be performed without these Rays, when some other Causes produce the same Agitation, as happens when the Eyes see Sparkles in the Dark, upon receiving any Blow; so we may also affirm, that when any other Cause, besides the agitated Air, produces in the Organ of Hearing, I mean within the Substance of the Membranes, this Agitation modified in the same manner as it ordinarily is by the Air, which conveys Sounds, the *Ear* appears to be struck with a Sound, which is not more real, than the Sparkles in the other Case are real Light. But what renders this Comparison sufficiently just is, that, as these false Appearances of Light, which are not caused by external Objects, have nothing distinct and determinate, but only a simple Light, the circumstantiated View of an Object demanding a Concurrence of more Circumstances; so it happens, for the most part, that those Noises of the *Ear*, of which we are now speaking, are confused; for the Hummings and *Tinnituses*, which in this Symptom are the most distinct Noises, are still very simple.

In order to determine precisely what may be the Cause of this Agitation in the immediate Organ of Hearing, we need only examine the Disorders in which a *Tinnitus* occurs, and these are Inflammations and Abscesses of the *Tympanum* and *Laby-*

rinth, and the Disorders of the *Meatus Auditorius*. Inflammations of the *Tympanum* and *Labyrinth* necessarily produce Agitations in the *Spiral Lamina*, and in the *semicircular Ducts*; either by the Tension of the Membranes, or by the Vapours which transpire, and mix themselves with the Air in the *Tympanum*; acrid Substances, Worms, extraneous Bodies, a Constriction of the *Meatus* succeeding a Distension of the Glands; and in general every thing which can cause, in the *Meatus Auditorius*, Pain, and the other Symptoms I have mentioned, agitate the Membrane of the *Meatus*, and the *Membrana Tympani*; and this Agitation is able to communicate itself to the immediate Organ of Hearing.

The second Species of *Tinnitus* is, when one perceives a true Noise, but formed within the *Ear* itself. Thus we hear a humming Noise when we stop our *Ears*. This Noise is produced by the Friction of the Hand, or by the Compression which influences the Skin and Cartilages, whose Parts, being put into a Commotion, may produce an Agitation there. The Elasticity of the Air, and the Vapours which continually exhale from Bodies, may also contribute to this Effect, when those flowing from the Hand, joined to those proceeding from the Membrane of the *Meatus*, being pent up, strike the Sides of this Cavity, and produce Agitations, which, though very small, yet form a real Sound, which becomes sensible by reason of the Proximity and Continuity of the Parts, as also by means of the Reflexions which are made in this Cavity when blocked up.

Commotions of the Cranium, and Disorders which contract the *Meatus*, may also produce these Species of *Tinnitus*, if we suppose, that all the Shocks the Cranium receives, are communicated to the immediate Organ of Hearing, by means of the Continuity alone of the Temporal Bone; but this ought to be restrained to the very Time in which the Agitation happens; for those *Tinnituses* which afflict the Patient afterwards, must be accounted for from a Disorder of the Spirits, as we shall afterwards see. In like manner, the Distension of the internal Membrane of the *Meatus*, by rendering it narrower, may produce a like Effect with that of the Hand which shuts up the *Ear*. Besides, it frequently happens, that People feel a Pulsation within the *Ear*, which makes them imagine, that they hear something striking; and this Pulsation is sometimes so strong, that other People may also hear it. A Gentlewoman of *Picardy* afforded me an Instance of this, who, upon the least violent Exercise, feels so troublesome a Pulsation in her *Ear*, that she imagines a Pendulum to be tied to her Head; and this Pulsation is also heard by those who come near her. Now this Pulsation is undoubtedly produced by a dilated Artery, because it always keeps perfect Time with the Pulsation of the Heart; and this Perception of an interior Sound to me seems perfectly analogous to that Symptom observed in imperfect Cataracts. Persons who labour under this Disorder, see Motes and Flies dancing before the Objects they look at; and these Motes and Flies are no other than the thick and viscid Particles beginning to be accumulated in the aqueous Humour, which by their Motion agitate the Retina, and necessarily produce a certain Sensation. But it may be objected; If these are true Sounds, and if the Organ of Hearing distinguishes them as they really are in themselves, why should they be ranked among the Species of *Tinnituses*? I answer, That, in reality, these Sounds are perceived such as they are; but the Sense of Hearing is depraved, so far as it ascribes these Noises to some external Object; just as those in whom a Cataract begins to form itself, attribute the Motes and Flies to external Objects, and stretch out their Hands to catch them.

Besides, I am of Opinion, that there may be a Perception of a false Noise, without any Fault in the Organs of Hearing; which happens when the Parts of the Brain where the Filaments of the Auditory Nerve terminate, are agitated in the same manner they use to be by Objects. What induces me to believe this, is my observing, that many Disorders of the Brain, such as Delirium, Phrensies, and Vertigos, are accompanied with a *Tinnitus*; and that those who are subject to epileptic and fainting Fits, hear humming Noises, which are, as it were, the unwelcome Harbingers of the Paroxysm. As in all these Disorders there is an irregular and tumultuous Motion of the Spirits, it is much more easy to conceive, that the agitated Spirits may put the Extremities of the Auditory Nerve into Commotions, and by that means excite a Sensation of Noise, than to suppose any Fault or Defect in the Organs of Hearing. This Method of accounting for a *Tinnitus* to me appears sufficiently satisfactory and just; and I think I may say, that as the Motion of the Spirits is very irregular and tumultuous in these Disorders, so the Sounds and *Tinnituses* we hear, when labouring under them, must be very different from the Sounds we hear on other Occasions. I shall undoubtedly be told, That this is an Error of the Imagination, and not an Affection of the *Ear*. I agree to it; for 'tis the very thing for which I contend. As 'tis thought we can never hear any thing without the *Ear* being struck, we ascribe all Sounds to that Organ. But 'tis a matter of Indifference, whether the Fibres of the Nerve be agitated

A U R

tated in the Brain, or in the Ear, since in both Cases the same Sensation will be produced. This happens in a manner analogous to that in which a *Vertigo* is produced; in which 'tis obvious, that the circular Motion of the Spirits produces the same Effect as the Objects seen would do, if they were actually in a gyratory Motion; or as it happens to phrenetic Patients, who imagine, that they see Motes, which have no real Existence; and this Symptom is only occasioned by the Agitation of the *Optic Nerve* within the Brain. Thus as we ascribe the Symptoms of Cataracts and Phrenies to a depraved Imagination, we must also ascribe to the same Origin those *Tinnituses*, which succeed the Disorders of the Ear, which very often by no means depend on the Indispositions of the Organs of Hearing.

On this Hypothesis we may establish two Species of *Tinnituses*, one of which is produced by the Disorders of the Brain, and the other by those of the Ear. Those produced by the Disorders of the Ear, as has been already said, are either true or false; and, of these last, some are called *Tinnituses*, some *humming Noises*, some *Tinglings*, and others *Murmurs*. And in general we may affirm, that dull and heavy Noises are produced by a languid Agitation, and sharp tingling Noises by a brisk and lively Agitation, which is sufficiently confirmed by the remote Causes of these Symptoms. Rheums, for Instance, and Suppurations, where the Membranes are relaxed, generally produce a heavy dull Noise; whereas Inflammations, and Pains of the Ear, where the Parts are generally tense and dry, produce *Tinnituses*, and acute Sounds. We have Reason to believe, that all these Noises make the same Impression on the *Spiral Lamina*, and *semicircular Ducts*, that acute and grave Sounds would do.

The Cure of a *Tinnitus*, in general, is to be managed according to the Diseases of the Brain, or Ear, which have produced it. I add, that in *Tinnituses*, or sharp Noises, we must use almost the same Remedies as in acute Pains, and Tensions of the *Membrana Tympani*; and that, in humming heavy Noises, we may use those prescribed against that Pain which is produced by Cold, and against a catarrhus Obstruction; after which it will be no great Difficulty to chuse the most proper, if we only have a due Regard to all the several Circumstances, from which just Indications may be taken. *Du Verney*.

DISORDERS of the EARS. From CELSUS.
